A 2022 REVIEW OF THE FARM BILL
(CONSERVATION PROGRAMS)

WEDNESDAY, FEBRUARY 2, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON CONSERVATION AND FORESTRY,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:03 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Abigail Davis Spanberger [Chair of the Subcommittee] presiding.

Members present: Representatives Spanberger, Pingree, Kuster, O'Halleran, Panetta, Schrier, LaMalfa, DesJarlais, Allen, Kelly, Johnson, Miller, Moore, and Thompson (*ex officio*).

Staff present: Paul Babbitt, Prescott Martin III, John Busovsky, Patricia Straughn, and Dana Sandman.

OPENING STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER,
A REPRESENTATIVE IN CONGRESS FROM VIRGINIA

The CHAIR. This hearing of the Subcommittee on Conservation and Forestry entitled, *A 2022 Review of the Farm Bill: Conservation Programs*, will come to order. Welcome, and thank you for joining today's hearing. After brief remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions.

Good morning to our witnesses, and welcome to today's hearing to update Members on the status and operation of NRCS and FSA conservation programs. We are here today to examine how America's voluntary conservation programs are working for producers, how investments in USDA's conservation programs are addressing our resource needs, and how these programs can be utilized to help address the climate crisis.

This hearing presents an opportunity for us to discuss what is working and what can work better as we look ahead to the 2023 Farm Bill.

I would like to welcome both Chief Cosby and Administrator Ducheneaux to the Subcommittee today. I know Subcommittee Members on both sides of the aisle are looking forward to hearing your updates as to how the programs that you oversee are working for farmers, ranchers, and foresters across the nation.

Your agencies have been hard at work, and Administrator Ducheneaux, I would like to first mention the work you are doing to get folks enrolled in CRP through a new signup and to expand CREP by enabling negotiations of matching funds. And Chief

Cosby, I know that January has been a big month for NRCS, and I commend all that you are doing to expand access to conservation across the country. Your announcement of 118 new Equity Conservation Cooperative Agreements shows a commitment to bringing the benefits of conservation to historically underserved communities.

In addition, I am especially excited about the work that NRCS is doing to expand available resources for farmers embracing climate-smart agriculture. Farmers are the original conservationists, and there is so much we can learn from our growers and producers on how to combat the climate crisis.

That is why I am proud to be the sponsor of the bipartisan Growing Climate Solutions Act (H.R. 2820). Our legislation is supported by nearly every major American farm group, as well as many major environmental groups and Fortune 500 companies, not to mention, many growers and foresters across Virginia's 7th District.

In a time when bipartisanship is hard-earned, this bill stands as a testament to how we can work together for our constituents, if only we are willing to come to the table in good faith and set partisanship aside. This legislation passed the Senate last year on a vote of 92 to 8, and it is long past time for the House to follow suit and do right by our farmers, rural America, and our planet.

Today, I am thrilled that the USDA is already taking bold steps to bring farmers to the table on climate-smart agriculture. NRCS's recent announcement that EQIP conservation incentive contracts will be available nationwide, and that the USDA will be launching a new streamlined cover crop program demonstrates the agency's commitment to making it easier for farmers to work to address climate concerns while benefitting their bottom lines.

In addition to your update to CSP that allows producers to immediately re-enroll the following year, it is a great step towards making it easier for producers to participate.

Finally, the \$225 million investment in RCPP will enable more investments that leverage partner dollars and participation. All of these programs deliver on-the-ground resources that help us mitigate and adapt to climate change, and benefit our producers.

I am eager to hear more about the changes that you all are making and your plans for the future.

[The prepared statement of Ms. Spanberger follows:]

PREPARED STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER, A REPRESENTATIVE IN
CONGRESS FROM VIRGINIA

Good morning—and welcome to today's hearing to update Members on the status and operation of NRCS and FSA conservation programs.

We are here today to examine how America's voluntary conservation programs are working for producers, how investments in USDA's conservation programs are addressing our resource needs, and how these programs can be utilized to help address the climate crisis. This hearing presents an early opportunity for us to discuss what is working and what can work better as we look ahead to the 2023 Farm Bill.

I would like to welcome both Chief Cosby and Administrator Ducheneaux to the Subcommittee today. I know Subcommittee Members on both sides of the aisle are looking forward to hearing your updates as to how the programs that you oversee are working for farmers, ranchers, and foresters across the nation.

Your agencies have been hard at work. Administrator Ducheneaux, I would like to first mention the work you are doing to get folks enrolled in CRP through a new sign-up and expand CREP by enabling negotiation of matching funds. And Chief Cosby, I know that January has been a big month for NRCS, and I commend all

that you are doing to expand access to conservation across the country. Your announcement of 118 new Equity Conservation Cooperative Agreements shows a commitment to bringing the benefits of conservation to historically underserved communities.

In addition, I am especially excited about the work NRCS is doing to expand available resources for farmers embracing climate-smart agriculture. Farmers are the original conservationists, and there is so much we can learn from our growers and producers on how to combat the climate crisis. This is why I am the proud sponsor of the bipartisan *Growing Climate Solutions Act*. Our legislation is supported by nearly every major American farm group, as well as many major environmental groups and Fortune 500 companies. In a time when bipartisanship is hard-earned, this bill stands as a testament to how we can work together for our constituents, if only we are willing to come to the table in good faith and set partisanship aside. This legislation passed the Senate last year on a vote of 92–8, and it is long past time that the House follow suit and do the right thing for our farmers, rural America, and our planet.

Today, I am thrilled that USDA is already taking bold steps to bring farmers to the table on climate-smart agriculture. NRCS' recent announcement that EQIP Conservation Incentive Contracts will be available nationwide and that the USDA will be launching a new, streamlined EQIP cover crop program, demonstrates the agency's commitment to making it easier for farmers to work to address climate concerns while benefiting their bottom-lines. In addition, your update to CSP that allows producers to immediately re-enroll the following year is a great step toward making it easier for producers to participate. Finally, the \$225 million investment in RCPP will enable more investments that leverage partner dollars and participation.

All of these programs deliver on the ground resources that help us mitigate and adapt to climate change.

I am eager to hear more about these changes and your plans for the future.

With that, I look to the Ranking Member, Mr. LaMalfa of California, for his comments.

The CHAIR. And with that, I look to the Ranking Member of the full Committee for his opening comments.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, thank you, Chair Spanberger, and I think hopefully Ranking Member LaMalfa is going to be able to join us here virtually momentarily. Thank you both for holding today's hearing.

It is hard to believe that it has already been just over 3 years since the 2018 Farm Bill, when the bill was signed into law. Today begins the process of reviewing the implementation of the farm bill, allowing Members the opportunity to hear how program changes are working, and ensuring these changes are being administered as Congress intended. This is an immensely important responsibility of this Committee, oversight, and review of each title must be completed before we can even begin to contemplate the next farm bill reauthorization.

As a former Chairman of this Subcommittee, I am excited to kick off this process by reviewing conservation programs. I have long appreciated great benefits that locally led, incentive-based voluntary conservation provides for both the environment, agriculture producers, the economy as an effective tool for de-listing endangered species, and climate. All great outcomes as a result of these great conservation programs that we have codified over the years.

Now, during the writing of the 2014 Farm Bill when I chaired this Subcommittee, there was a concerted effort to strengthen, simplify, and streamline our conservation programs, and since then, including the 2018 Farm Bill, this Committee provided further re-

forms to increase the financial support and improve the delivery of these programs to producers.

Now, I would have to say that it must remain the conservation title and not be repurposed as the climate title. I think sequestering greenhouse gases is an obvious outcome of our conservation programs. That is why American farmers, ranchers, and foresters are climate heroes. They really lead the way in the world on the issue of climate and sequestering over 6.1 gigatons of carbon annually, far more than what is emitted in that vast land space of what is considered all under the title of natural land solutions. But it must be the conservation title.

While a number of conservation programs can clearly provide climate benefits, as I have discussed, the broad emphasis of Title II and its programs must remain on the proven conservation practices that will directly benefit the producer and support the sustainability of American agriculture.

With that in mind, I remain concerned over a rush to implement some of the climate-related proposals through farm bill programs, or administratively by USDA before being fully vetted by this Committee. The agriculture portion of the Build Back Better (Pub. L. 117–169) is just one example of pursuing questionable policies with significant funding through the Agriculture Committee without any vetting to any degree or considering long-term impacts of such action. Our conservation programs are critical for the sustainability of our farms and ranches, and as such, long-term changes should be made through thoughtful consideration by this Committee.

With all this in mind, I am really pleased that we are holding today's hearing, and that we are finally beginning the oversight process of the 2018 Farm Bill, ensuring programs are implemented as Congress intended.

Chief Cosby and Administrator Ducheneaux, thank you both for participating today and being here. Your leadership is much appreciated and we look forward to your testimony.

And with that, Madam Chair, I yield back.

The CHAIR. Thank you, Mr. Ranking Member, and I want to just express my appreciation that you so consistently come to our Subcommittee hearings. I think that speaks to the importance that you put on this issue, so I appreciate you being here.

I am looking now to confirm that we are going to move forward with the witnesses testimony, and I will invite the Ranking Member of the Subcommittee to give his opening remarks when he is able to join us. Again, there were some travel challenges and I greatly recognize sometime the challenges facing our West Coast Members. So, he will join us when he is able.

And with that, I would also request that other Members submit their opening statements for the record so that witnesses may begin their testimony and ensure that there is ample time for questions.

So, I am pleased to welcome two distinguished witnesses to the Committee today. Our first witness is Mr. Zach Ducheneaux, the Administrator of the Farm Service Agency, and our second witness is Mr. Terry Cosby, the Chief of the Natural Resources Conservation Service. You will have 5 minutes to deliver your testimony.

There is a timer that is visible before you. It will count down to 0, at which point your time has expired.

So, Mr. Ducheneaux, I welcome you to begin first. Please begin when you are ready.

STATEMENT OF ZACH DUCHENEUX, ADMINISTRATOR, FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Mr. DUCHENEUX. Good morning. Chair Spanberger, Ranking Member LaMalfa, and distinguished Members of the Subcommittee. It is an honor and privilege to appear before you, today. To those I have not yet had the pleasure of meeting, my name is Zach Ducheneaux and I am the Administrator of the Farm Service Agency. Prior to joining the Farm Service Agency, I was a third-generation rancher on my family's operation on the Cheyenne River Sioux Indian Reservation.

While folks don't always think of the Farm Service Agency, as a conservation-focused agency, our Conservation Division oversees several programs that protect our drinking water, improve soil health, reduce erosion, preserve wildlife habitat, and restore forests and wetlands for future generations. Our emergency conservation programs also support producers whose operations are damaged by natural disasters.

I have always appreciated FSA's commitment to voluntary, producer-focused, working lands conservation, and I am committed to maintaining those key pillars in our conservation programs. At the same time, we have a unique opportunity to expand, and in some cases, reimagine these programs to bring in new and diverse partners, better address the climate crisis, and invest in the long-term health of our land and the producers who care for it.

In my written testimony, I have highlighted FSA's key conservation programs, and today I would like to share some of the changes and updates we have implemented, since I have become Administrator.

The Conservation Reserve Program is FSA's flagship conservation program and is one of the largest private lands conservation programs in the United States. Through CRP, FSA provides program participants with an annual rental payment in exchange for removing environmentally sensitive land from customary agricultural production and planting long-term resource conserving species. Last year, we made several improvements to increase producer interest and enrollment in CRP, while strengthening the climate benefits of this program. Specifically, we adjusted soil rental rates, where data supported such an adjustment, increased payments for practice incentives, and increased payments for water quality practices. We also added the climate-smart practice incentive for CRP general and continuous signups to better leverage this program towards climate outcomes, including carbon sequestration.

Our changes to CRP have already begun to pay off. Last year, producers and landowners enrolled 5.3 million acres through signups, turning the tide of declining enrollment from the previous 4 years. The total signup of 5.3 million acres surpassed USDA's 4 million acre goal, and reversed the trend of decreasing enrollment,

and we are especially happy with our signup for the Grasslands Program, 2.6 million acres.

Also in my written testimony, I provided information on several key conservation programs under the CRP umbrella, but given the limited time today, I want to focus on the Conservation Reserve Enhancement Program and the changes we made there that will further inspire public-private partnership and also work more with our underserved communities, including Tribal Governments.

I want to take a moment or two to discuss two of our disaster assistance programs that are housed within FSA's Conservation Division. First, the Emergency Conservation Program provides assistance to farmers to repair damage caused during natural disasters. In response to the drought, we expanded our policies to allow producers of livestock to use portable pumps to better distribute grazing in their overtaxed property because of the drought. Second, the Emergency Forest Restoration Program provides payments to owners of non-industrial private forests to carry out emergency measures and to restore land damaged by natural disasters. In Fiscal Year 2021, we allocated \$56.9 million to critical EFRP assistance, as well as \$140 million to the Emergency Conservation Program.

In closing, I want to take this opportunity to express my gratitude and admiration for the entire USDA workforce, especially the team that I get to work with at the Farm Service Agency. There isn't a farmer or rancher in the country that would be disappointed at the caliber and quality of work of those I get to surround myself with every day, and I make sure that I give them the proper credit they deserve. In the last 2 years, we have delivered nearly double our normal program allocations, and done so oftentimes home-schooling our children in the background. So, we really want to take our hats off to that staff, let them know we appreciate the good work, and also, thank the Committee and the Congress for the opportunity that we get to deliver the programs that you authorize and fund for us to carry out to improve outcomes for our producers all across the country.

Thank you.

[The prepared statement of Mr. Ducheneaux follows:]

PREPARED STATEMENT OF ZACH DUCHENEUX, ADMINISTRATOR, FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chair Spanberger, Ranking Member LaMalfa, and distinguished Members of the Subcommittee, it is an honor and privilege to appear before you today. To those who I have not yet had the pleasure of meeting, my name is Zach Ducheneaux, and I am the Administrator of the U.S. Department of Agriculture's Farm Service Agency. Prior to coming on board at the Farm Service Agency, I was a third-generation rancher on our family ranch on the Cheyenne River Sioux Reservation.

While this is my first formal appearance before your Subcommittee, over the past year since I was sworn in, I have enjoyed the opportunity to speak with many of you and your staff, along with farmers and ranchers in your districts across the country. I am grateful to have the opportunity to visit with you today and share our vision at the FSA to expand upon our conservation programs.

While folks don't always think of the Farm Service Agency as a conservation-focused agency, our Conservation Division oversees several programs that protect our drinking water, reduce soil erosion, preserve wildlife habitat, restore forests and wetlands, and improve soil health for future generations. Our emergency conservation programs also support producers whose operations are damaged by natural disasters.

I have always appreciated FSA's commitment to voluntary, producer-oriented, working lands conservation. I am committed to maintaining those key pillars of our

conservation programs. At the same time, we have a unique opportunity to expand, and in some cases, reimagine these programs to bring in new and diverse partners, better address the climate crisis, build resilience for our agricultural producers, and invest in the long-term health of our land and the producers who care for it.

In my testimony today, I'd like to highlight some of our key conservation programs, along with some of the changes and updates we have implemented since I've become Administrator.

Farm Bill Program Implementation of FSA Conservation Programs

The Conservation Reserve Program (CRP) is one of the largest voluntary private lands conservation programs in the United States. Through CRP, FSA pays producers a yearly rental payment in exchange for removing environmentally sensitive land from agricultural production and planting species that will improve environmental quality and address issues raised by state, regional, and national conservation initiatives. The long-term goal of the program is to reward producers who reestablish valuable land cover, which in turn helps conserve and improve soil and water quality, prevent soil erosion, and reduce the loss of wildlife habitat. Contracts for land enrolled in CRP are generally from 10 to 15 years in length.

There are several ways for producers to participate in CRP, including through our grassland enrollments, our general signup, and our continuous signup. Last year, producers and landowners enrolled 5.3 million acres through CRP signups, including nearly 2.6 million in the grassland signup, nearly 1.9 million acres for the general signup, and 902,000 acres for the continuous signup (as of September 10, 2021). This year's signup surpassed USDA's 4 million acre goal.

In accordance with the 2018 Farm Bill, in Fiscal Year 2021, CRP was capped at 25 million acres, and in Fiscal Year 2022, CRP is capped at 25.5 million acres. In Fiscal Year 2023 the maximum acreage enrollment will increase to 27 million acres. Now, despite Congress raising the CRP enrollment targets in the 2018 Farm Bill, there was a decrease in enrollment for the past 2 years. As a priority last spring, we took a hard look at CRP and made changes to put us on a path to reverse this trend. In order to increase producer interest and enrollment, FSA adjusted soil rental rates where data supported such an adjustment, increased payments for practice incentives, and increased payments for water quality practices. We also added a Climate-Smart Practice Incentive for CRP general and continuous signups to better leverage this program toward climate outcomes, including carbon sequestration. Climate-Smart CRP practices include the establishment of trees and permanent grasses, the development of wildlife habitat, and wetland restoration. The Climate-Smart Practice Incentive is annual, and its amount is based on the benefits of each practice type.

Additionally, we established a grassland CRP minimum rental rate. The grassland CRP program helps landowners and operators protect grassland, including rangeland and pastureland, and certain other lands, while managing these lands under an NRCS-approved grazing management plan that are designed to ensure these working lands provide biodiversity of plant and animal populations and improve environmental quality, while positively contributing to the economy of the region. FSA updated the grassland CRP signup in Fiscal Year 2021 to establish a minimum rental rate of \$15 per acre that increased rental rates in 1,300 counties across the nation. FSA also established National Grassland Priority Zones that aim to increase enrollment of grasslands in migratory corridors and environmentally sensitive areas.

Haying and grazing of CRP acres is authorized under certain conditions to, among other things, improve the quality and performance of the CRP cover, or to provide emergency relief to livestock producers due to certain natural disasters. There are two types of haying and grazing authorizations: emergency and non-emergency. Emergency haying and grazing of CRP acres may be authorized to provide relief to livestock producers in areas affected by severe drought or other natural disasters. During the 2021 program year, 1,181 counties in 23 states became eligible for CRP emergency haying and grazing.

Through CRP, producers can also enroll land in FSA's Farmable Wetlands Program (FWP). FWP is designed to restore previously farmed wetlands and wetland buffers to improve both vegetation and water flow. FWP is a voluntary program to restore up to 750,000 acres of farmable wetlands and associated buffers. Participants must agree to restore the wetlands, establish plant cover, and to not use enrolled land for commercial purposes. Plant cover may include plants that are partially submerged or specific types of trees. FSA runs the program with assistance from other government agencies and local conservation groups.

Additionally, FSA announced efforts to enhance natural resource benefits through CRP by moving the highly popular State Acres for Wildlife Enhancement (SAFE)

practices from general signup to the continuous CRP signup. Unlike the general signup, producers can sign up year-round for the continuous signup and be eligible for additional incentives. FSA also made Highly Erodible Land Initiative (HELI) practices available in both the general and continuous signups.

Notably, we also expanded both the CRP's Soil Health and Income Protection Program (SHIPP) and the Clean Lakes, Estuaries and Rivers (CLEAR30) 30 year contracts, in addition to investing \$10 million in the CRP Monitoring, Assessment and Evaluation (MAE) program, that will enlist partners and establish an ambitious effort to measure and monitor the soil carbon and climate resilience impacts of conservation practices through soil sampling and testing on land enrolled in over the life of CRP contracts.

The last component of CRP that I'll highlight is the Conservation Reserve Enhancement Program (CREP). CREP targets specific locally-driven conservation concerns, and Federal funds are supplemented with non-Federal funds. We currently have CREP Agreements in 26 states, and these partner-led efforts are driving important environmental outcomes. In exchange for removing environmentally sensitive land from production and establishing permanent resource-conserving plant species, farmers and ranchers are paid an annual rental payment along with other Federal and non-Federal incentives as applicable per each CREP agreement. Participation is voluntary, and the contract period is typically 10–15 years.

In a rule published December 13, 2021, FSA updated two discretionary requirements found to be adversely affecting participation in CRP. The first change amended a requirement that CREP partners provide at least half of their matching funds in the form of direct payments to participants. As a result of this change, partners may now provide matching funds in any combination of cash, in-kind contributions, or technical assistance. In the second change, FSA eliminated a 25 percent payment reduction for land required to be in compliance with resource conservation measures or practices required by Tribal, state, or other local laws, ordinances, or regulations. We made this change to increase enrollment of acres under CRP not only through the enrollment of acres subject to existing state regulations, but also contiguous acres eligible for complimentary practices.

FSA has added three regional staff serving the eastern, central, and western regions to improve the efficiency and effectiveness of engagement with potential CREP partners to promote conservation initiatives. FSA continues to expand outreach efforts to encourage participation across the board in all components of CRP.

Next, I would like to discuss FSA's Emergency Conservation Program (ECP), which helps farmers and ranchers to repair conservation structures and damage to farmlands caused by natural disasters, and to help put in place methods for water conservation during severe drought. The ECP does this by giving ranchers and farmers funding and technical assistance to repair conservation structures and damaged farmland or to install methods for water conservation.

In response to the 2021 drought, FSA expanded its policies to allow financial assistance to livestock producers for portable pumps used to temporarily pump water from available sources. This allowed producers to continue grazing activities when water sources were not safely accessible by the livestock. In Fiscal Year 2021, FSA allocated a total of \$140.4 million in ECP funds to assist producers in response to weather-related disasters. I will note that unlike CRP, which receives mandatory funding through the farm bill, ECP is funded by Congress through discretionary and supplemental appropriations.

FSA also administers the Emergency Forest Restoration Program. The EFRP helps the owners of non-industrial private forests restore forest health damaged by natural disasters. The EFRP does this by authorizing payments to owners of private forests to restore disaster-damaged forests. In Fiscal Year 2021, FSA allocated a total of \$56.9 million in EFRP funds to assist producers in response to weather-related disasters. EFRP is also funded by Congress through supplemental and discretionary funding through the appropriations process.

FSA's compliance with the National Environmental Policy Act (NEPA) ensures the agency diligently considers the effect of ECP's and EFRP's restoration activities on the environment. Following widespread damage occurring due to disasters, FSA has streamlined reviews to the maximum extent allowable by law for practices and restoration activities that will not result in ground disturbance, or "above the plow-line." This creates efficiencies in the environmental compliance process for farm and forest land restoration and reduces the time necessary for FSA to approve applications for assistance.

Heirs' Property Relending Program

In addition to programs authorized by Congress that are specifically targeted for conservation purposes, FSA is providing \$67 million to community-based lenders to

make competitive loans through the new Heirs' Property Relending Program (HPRP). These loans aim to help agricultural producers and landowners resolve land ownership and succession issues among heirs to enhance their ability to participate in farm programs and the ag economy. Intermediary lenders—cooperatives, credit unions, and nonprofit organizations—can apply for loans up to \$5 million at 1% interest. The first application period closed on October 29, 2021. Selection of successful eligible intermediary lenders is expected to be announced in early 2022.

Through participating community-based lenders, heirs can not only apply for loans, but can also receive critical assistance not typically offered through commercial lenders. Heirs' property issues have long been a barrier for many producers and landowners to access USDA programs and services, and this relending program provides access to capital to help producers find a resolution to these issues. Heirs may use the loans to resolve title issues by financing the purchase or consolidation of property interests and financing costs associated with a succession plan. This may also include costs and fees associated with buying out fractional interests of other heirs in jointly-owned property to clear the title, as well as closing costs, appraisals, title searches, surveys, preparing documents, mediation, and legal services.

Our efforts to assist heirs in addressing unresolved title issues is vital in removing barriers to historically underserved populations in our farming and ranching community. This in turn makes the programs discussed earlier in my testimony, as well as the other standing and ad hoc Farm Programs, more accessible, bringing in more participants, and yielding more conservation practitioners across the country.

COVID-19 Challenges and Solutions

As the FSA Administrator, I also want to take this opportunity to express my gratitude and admiration for the entire FSA workforce. These are challenging times, and since the pandemic gripped our nation nearly 2 years ago, and the nearly 1 year since I came on board, the FSA workforce adapted and overcame many challenges. Not only did FSA administer all of our conventional farm programs and farm loan programs, but we also administered many new pandemic relief and disaster programs authorized by Congress that have provided billions of dollars in support to our farmers and ranchers.

The work we do at FSA is vital, and with the support of our partners in the Farm Production and Conservation Business Center, we developed and executed a plan that allowed our Service Centers to be staffed safely and reliably during the height of the pandemic. To me, the safety and well-being of our employees, along with their families and communities, comes first. So when localized COVID numbers require it, we reduce our in-office workforce, while continuing to ensure all of the needs of our producers are met through innovative solutions, including telework and new technology. I am proud of the FSA workforce, and of what they have accomplished at home, at the office, and in the fields of agriculture.

Conservation is an integral part of the work we do at FSA. We want to weave the tools and practices of conservation into the DNA of all of our programs so that producers, communities, and our natural resources continue to thrive. Congress is a vital partner in this effort. We value the tools and authorities this Subcommittee provides, and in the coming months I look forward to not only reviewing our conservation programs as they are currently administered, but also working together to shape them into the future, as we look forward to the next farm bill. Thank you.

The CHAIR. Mr. Ducheneaux, thank you for your testimony, and certainly, thank you for putting in perspective the tremendous work of the employees of the FSA, particularly given the unique challenges we have faced over the past year and a half, 2 years with the pandemic.

Mr. Cosby, please begin your testimony when you are ready.

STATEMENT OF TERRY COSBY, CHIEF, NATURAL RESOURCES CONSERVATION SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Mr. COSBY. Chair Spanberger, Ranking Member LaMalfa, and also Representative Thompson and Members of the Subcommittee, thank you for the opportunity to appear before you today to provide an update on the USDA's Natural Resources Conservation Service farm bill programs. My name is Terry Cosby, and I am honored to serve as the 17th Chief of NRCS. I have been with the agency for

more than 40 years, beginning my career as an NRCS intern in Iowa in 1979. I appreciate the ongoing support this Subcommittee has provided for voluntary private lands conservation, and I look forward to the conversation today.

The last 2 years of the COVID-19 pandemic has been extremely challenging, with unprecedented pressures on our staff and customers, directly influencing the way we operate at the field level. Our staff and agriculture producers have also faced devastating extreme weather events, including tornadoes, droughts, wildfires, and flooding.

In the face of these challenges, NRCS staff continues to successfully implement conservation programs, as well as offering innovative improvements that respond to the needs and challenges of our customers across the country.

As we will discuss today, addressing the climate crisis and advancing equity are core components of our work. I would note a few highlights from the past year that illustrates the impact of our conservation programs.

Our two core working lands conservation programs are the Environmental Quality Incentive Program, EQIP, and the Conservation Stewardship Program, CSP. In Fiscal Year 2021, we enrolled 34,054 EQIP contracts, totaling nearly \$1.26 billion. We also enrolled 4,495 CSP contracts on 5.8 million acres, and 2,709 CSP renewals on 3.8 million acres.

Our easement program, the Agricultural Conservation Easement Program, ACEP, supports landowners in protecting, restoring, and enhancing wetlands and working farms and ranches. During Fiscal Year 2021, we enrolled nearly 200,000 acres in ACEP.

I also highlight the Regional Conservation Partnership Program, which leverages partner investments to deliver conservation solutions. In Fiscal Year 2021, NRCS announced \$330 million for 85 RCPP Classic projects and \$75 million for 15 alternative funding awards. We also work with partners through the Conservation Innovative Grant Program, which supports the adoption and evaluation of innovative conservation approaches.

Administrator Ducheneaux will discuss FSA conservation programs, but I will note that NRCS provides the conservation planning and the technical assistance. In Fiscal Year 2021, NRCS provided conservation planning and technical assistance on 4.8 million acres for a total of 58,800 RCPP contracts.

As we deliver on our conservation programs, we are expanding and furthering targeting our investments for climate-smart agriculture and forestry. This includes announcements within EQIP, CSP, and RCPP, as well as an updated list of climate-smart conservation activities. That being said, our programs remain oversubscribed with demand for climate-smart practices and programs well exceeding available funding. The Build Back Better Act will make an historic investment in our voluntary conservation programs that support farmers, ranchers, and forestland owners in addressing the climate crisis.

Additional investment will target the most effective conservation activities to address the climate crisis, and NRCS is well positioned to quickly deliver these programs to producers across the country. As we expand our investment in climate-smart agriculture, we rec-

ognize the importance of quantifying conservation outcomes, which include carbon sequestration and greenhouse gas reductions. This work will contribute to solar monitoring efforts across the department.

Implementation of our conservation programs in need of important updates is, of course, dependent on our staff and capacity across the country. In Fiscal Year 2021, we used direct hire authorities to bring on 1,141 new employees, and an aggressive hiring strategy will continue to support our overall staffing goals, as we implement our key priorities. Currently, we have 10,361 staff directly employed by the agency, and 2,465 staff employed through partners.

Across program implementation, as well as hiring, the value of equity and inclusion are valuable components of our work. We recently announced \$50 million in cooperative agreements to expand access to conservation assistance. These agreements will expand the delivery of conservation assistance to farmers, who are new to farming, low-income, socially disadvantaged, or military veterans. Expanding access to programs and services also included ensuring support is available for urban producers. NRCS houses the Offices of Urban Agriculture and Innovative Production, which was established by the 2018 Farm Bill. While the office is located within NRCS, it is coordinated as a department-wide effort to leverage tools and services that support urban agriculture. To date, approximately \$11 million in grants and cooperative agreements have been awarded for projects that support food access, community gardens, urban farms, and food waste reduction.

In conclusion, thank you for the opportunity to come before this Subcommittee to provide an update on NRCS farm bill programs. I appreciate Congress' commitment and continued support for NRCS and voluntary conservation on working lands.

Thank you, and I look forward to your questions.

[The prepared statement of Mr. Cosby follows:]

PREPARED STATEMENT OF TERRY COSBY, CHIEF, NATURAL RESOURCES CONSERVATION SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee, thank you for the opportunity to appear before you today to provide an update on USDA Natural Resources Conservation Service's (NRCS) farm bill conservation programs. I appreciate the ongoing support and leadership this Subcommittee has provided for voluntary, private lands conservation and the improvement of our soil, water, air, and other natural resources as authorized under the 2018 Farm Bill and under our other authorities. The last 2 years of the pandemic have been extremely challenging with unprecedented pressures on our staff and customers, directly influencing the way we operate at the field level. At the same time, our staff and agricultural producers across the country have needed to respond to devastating extreme weather events, including tornados, drought, wildfires, and flooding. Producers are on the frontlines of the climate crisis, and we know that our farm bill programs and the technical assistance that our staff provides can play a critical role in supporting farmers and ranchers in their efforts to not only build more resilient operations but also to sequester carbon and reduce greenhouse gas emissions. In the face of these challenges, the entire NRCS team, from field staff to our National leadership team, has demonstrated innovation and dedication to ensure conservation services are delivered to our customers. Our team has continued to provide financial and technical assistance, working closely with our partners across the country to get conservation on the ground and implement innovative solutions to address natural resource concerns. As we will discuss today, addressing the climate crisis and advancing equity

are both core components of how NRCS is delivering conservation assistance and serving our customers.

COVID Challenges and Solutions

COVID-19 continues to have an impact on our operations, as we work to prioritize the safety of our staff and customers. We make changes to field office staffing levels based on local COVID-19 caseload numbers, which are monitored daily, and we are working closely with our pandemic coordinator to follow Centers for Disease Control and Prevention guidance and adjust Service Center staffing levels when a county is above our safety threshold of ten cases per 10,000 residents per day.

Our operations at USDA Service Centers must be conducted in a safe manner, and therefore we focus heavily on protecting both employees and customers through proper physical distancing, mask wearing, and cleaning. Critically important is the fact that we have not stopped providing services to our producers—we have continued to serve producers, through phone, email, and online tools, such as Teams, Box and OneSpan to enable collaboration and sharing/signing of documents. We value highly the in-person work that we do with our customers, and we look forward to when we can resume at 100% capacity. In the meantime, our staff continue to step up to the challenge to ensure we can rely on a combination of in-person support and virtual engagements to meet our customers' needs.

Farm Bill Program Implementation

In the face of pandemic challenges, NRCS staff continue to successfully implement the programs and authorities provided under the 2018 Farm Bill, as well as offer innovative administrative improvements that respond to the needs and challenges of our customers across the country. Program delivery in 2021 demonstrates the continued delivery of our core farm bill conservation programs:

- *Environmental Quality Incentives Program (EQIP)*: In Fiscal Year (FY) 2021, we enrolled 34,054 EQIP contracts, providing nearly \$1.26 billion on 343 million acres. Additionally, through newly offered EQIP Conservation Incentive Contracts option, piloted in FY 2021 in four states, we enrolled 528 contracts providing \$48 million in conservation assistance.
- *Conservation Stewardship Program (CSP)*: In FY 2021, through CSP Classic, we enrolled 4,495 CSP contracts providing over \$311 million on 5.8 million acres. Additionally, we renewed 2,709 CSP contracts on 3.8 million acres. Also under CSP, in FY 2021, we enrolled 1,428 contracts on 104,140 acres in the CSP Grassland Conservation Initiative.
- *Regional Conservation Partnership Program (RCPP)*: In FY 2021, NRCS announced new partnership projects under the RCPP Classic and Alternative Funding Arrangement (AFA) components. This included \$330 million for 85 RCPP Classic awards, and \$75 million for 15 AFA projects. There are currently 336 active RCPP projects that have more than 2,000 partners delivering conservation in all 50 states, Puerto Rico, and the U.S. Virgin Islands.
- *Agricultural Conservation Easement Program (ACEP)*: During FY 2021, \$230,490,000 was obligated to enroll 361 new ACEP easements totaling 197,734 acres that will help landowners protect, restore, and enhance wetlands or protect working farms and ranches. This includes \$102,903,110 in Agricultural Land Easements (ALE) and \$127,586,890 in Wetlands Reserve Easements (WRE). In FY 2021, we closed on 396 ACEP easements totaling over 145,000 acres. Additionally, we invested \$11 million in five Wetland Reserve Enhancement Partnership projects to enable conservation partners to assist NRCS with acquiring and restoring private wetlands.
- *Conservation Innovation Grants (CIG)*: In FY 2021, we awarded \$40 million to conservation partners for 37 new projects under the CIG program. These projects support widespread adoption and evaluation of innovative conservation approaches in partnership with producers. The Soil Health Demonstration Trial component of CIG focuses exclusively on conservation practices implementation and systems that improve soil health.
- *Conservation Reserve Program (CRP)*: In FY 2021, NRCS provided conservation planning and technical assistance on approximately 4.8 million acres for a total of 58,800 new CRP contracts across the nation. Technical assistance includes, but is not limited to, field visits to verify practice eligibility on the landscape, conservation planning, CRP practice survey and design, practice installation, operation and maintenance of practices and practice management. NRCS provides technical assistance for emergency use of CRP acres, such as haying and

grazing. NRCS is also working with the Farm Service Agency and selected partners to support CRP Monitoring, Assessment and Evaluation projects.

- *Conservation Compliance:* In FY 2021, NRCS completed over 39,000 highly erodible land determinations and over 21,000 certified wetland determinations. NRCS also completed approximately 22,000 compliance status reviews in 2021.

In addition to these overall program enrollments and project awards from the past year, we have made several recent announcements regarding improvements to our existing conservation programs, and there are several further opportunities that we plan to roll out in FY 2022:

Funding Allocations and Opportunities

We made several improvements to ensure the timely allocation of farm bill funds to the states and to provide added transparency regarding the sign-up and enrollment process. States received FY 2022 advisory allocations on October 1st, well before what has been provided in years past. This ensured states have the time they need to set sign-up dates and work with their customers on accessing the financial or technical assistance that is right for them. Additionally, in order to provide added transparency for producers and partners across the country, we launched a new webpage that houses all of the program sign-up dates. While producers can apply year-round for NRCS conservation programs, the new Program Application Ranking Dates webpage allows partners and producers to stay up-to-date on timelines relevant for their state or region, all the while maintaining the locally-led conservation process.

Targeted Climate EQIP Investments

USDA is engaged in a whole-of-government effort to combat the climate crisis, and over the past year NRCS has announced several targeted initiatives through EQIP to advance this priority. These opportunities include targeted EQIP funds for climate-smart practices in FY 2021, an 11 state EQIP cover crop pilot in FY 2022, and deployment of a nationwide EQIP Conservation Incentive Contracts program in FY 2022. The cover crop pilot, the sign up for which is still ongoing, will provide nearly \$40 million in funding for targeted cover crop adoption, in addition to funding available through our other conservation programs, enabling states to offer a streamlined enrollment process and bring new producers in the door. These targeted efforts enable us to deploy streamlined implementation approaches and address high priority resource concerns and climate-smart agriculture and forestry objectives. We will continue to build on this commitment within EQIP and across all of our programs and services.

Response to High Material Costs

Based on feedback from producers and our staff across the country, we were able to adjust payment rates for higher costs for certain materials since the prices for materials such as lumber, steel, PVC, and concrete have increased dramatically as a result of supply chain disruptions. These Coronavirus Agricultural Relief Payments (CARPs) were made available for participants with EQIP contracts who had implemented practices affected by these higher materials prices. In particular, we conducted an economic analysis and identified those practices most likely to be affected by these price increases. This increased financial assistance was made available for practices completed in calendar year 2021, and we have extended CARP availability for practices completed by March 31, 2022, recognizing continued supply chain disruptions.

New CSP Flexibilities to Support Streamlined Renewals

We also looked to improve access to CSP, based on feedback from producers and field staff. To support continued conservation efforts, we waived the CSP provision that had previously imposed a 2 year ineligibility for participants to reapply, following an unsuccessful renewal application. States are currently unable to fund all of the renewal requests that they receive given a limited availability of funds. Producers who are unable to renew at the end of their initial contract period, due to the limited availability of funds but no fault of their own, are now able to immediately reapply, rather than waiting a 2 year ineligibility period. The CSP regulation provides the Chief with the flexibility to waive this provision, and so we made the change to respond to the feedback from states and from producers across the country. This streamlines our conservation delivery process and also supports producers who wish to continue to build upon their existing conservation efforts.

Conservation Practice Standard Updates

We continue to update our conservation practice standards to reflect the latest science to protect and enhance resource concerns. Since January 2021, we released 28 conservation practice standard updates; 12 standards were updated and are being prepared for release; 24 standards have been reviewed and are ready for public review with a *Federal Register* posting; and seven are still under internal review. As part of the continued review of the development and implementation of our conservation practice standards, we are working to modify standards and data collection to capture climate-smart agriculture and forestry benefits.

Regional Conservation Partnership Program (RCPP) FY 2022 Funding Opportunities

In mid-January we released the National Funding Opportunities (NFOs) for RCPP Classic and RCPP Alternative Funding Arrangements for FY 2022. These NFOs reflected feedback from partners as well as State Conservationists to improve flexibility and accessibility of the program. We also released the two NFOs simultaneously to ensure that partners were able to assess the RCPP option best suited for their potential project. We will continue to improve implementation, including updates to the online portal and working to streamline reporting requirements.

Joint Chiefs' Landscape Restoration Partnership

In another demonstration of critical partnership across the Department and with communities across the country, NRCS and the Forest Service recently announced the investment of more than \$48 million through the Joint Chiefs' Landscape Restoration Partnership. These projects mitigate wildfire risk, improve water quality, and restore healthy forest ecosystems on public and private lands. Last month funding was announced for 41 projects, including \$15.3 million for 17 new projects and \$33 million to complete work on 24 projects previously selected in 2020 and 2021. Through the Joint Chiefs projects, the Forest Service and NRCS are working hand-in-hand with agricultural producers, forest landowners, and National Forest System lands to improve forest health using available farm bill conservation programs and other authorities. We're thankful to Congress for formally authorizing the Joint Chiefs program in the Bipartisan Infrastructure Law, ensuring its longevity into the future.

Evaluating Conservation Outcomes

We have made significant progress developing the tools and processes to measure and evaluate conservation outcomes associated with farm bill program implementation. This is especially important as it relates to soil carbon sequestration and greenhouse gas emissions reduction. We are moving forward with a new Conservation Evaluation and Monitoring Activities (CEMA) Program for Soil Carbon Stock Monitoring, allowing this measurement activity to be fully implemented within our planning process. The CEMA-Soil Carbon Stock Monitoring will collect empirical data using standardized protocols and will filter into a broader soil health monitoring effort, coordinated across USDA. Empirical data will increase science-based planning by helping calibrate estimated site conditions across the country when using COMET-Planner as part of the NRCS planning process. Further, NRCS quantifies the ongoing benefits of Nitrogen Management, Livestock and Manure Management, Rice Water Management, and many other voluntary conservation practices. NRCS scientists quantify the annual climate benefits of conservation practice delivery, working to integrate these quantified benefits into USDA reporting and the National Inventory of Greenhouse Gas Emissions and Sinks.

Staffing Updates

Expanding our staffing capacity remains a top priority as we work to support the delivery of conservation assistance through our farm bill conservation programs. In FY 2021 we used Direct Hire Authority (DHA) to bring on 1,141 new employees and have made significant progress in on-boarding these positions. Throughout this process we are implementing a hiring strategy to continue to improve the diversity of employees within the agency, with nearly half of the positions filled contributing to improving our overall diversity, while maintaining our level of scientific excellence. This hiring effort included increasing American Indian/Alaska Native females by 5%, Black or African American females by 12.5%, and Hispanic or Latino females by 5%. We are again pursuing DHA for FY 2022 and FY 2023, which will continue to support our overarching staffing goals as well as implementation of key priorities and initiatives. We are working closely with our states to identify the positions that are most critical for DHA and moving forward with robust training for both staff and partners. Currently we are at 10,361 staff directly employed by the Agency and

2,465 staff employed through partners to support the implementation of our conservation work.

Equity and Outreach

The values of equity and inclusion continue to be vital components in all we do in providing conservation assistance at NRCS. We are working to ensure that the programs we support and the investments we make are available to everyone, including producers and communities that have previously been unable to access assistance and faced discrimination. We have taken several recent steps to expand our capacity to do this work—through partnerships, staffing, and program improvements. First, on January 10th we announced awarding \$50 million in conservation cooperative agreements to expand access to conservation assistance among underserved producers to increase the adoption of climate-smart agriculture and forestry practices, address local natural resource concerns, and build and strengthen local food systems. These 118 Equity Conservation Cooperative Agreements will fund 2 year projects to expand the delivery of conservation assistance to farmers who are new to farming, low income, socially disadvantaged or military veterans. These agreements will support USDA's broader effort to address climate change and equitable access to programs. Additionally, I have directed all of our states to ensure that they have an Outreach Coordinator position in place. These positions will play a critical role in coordinating and supporting the dissemination of our equity and outreach strategy in the field. We are also working across the Department to advance Justice40—a whole-of-government approach to ensure 40 percent of the overall benefits of certain Federal investments support disadvantaged communities. Part of this work is closely evaluating and improving our farm bill conservation programs to address barriers to access for historically underserved producers.

Urban Agriculture

As we work to expand access to NRCS programs and services, that effort includes ensuring support is available for producers in urban areas as well. NRCS houses the Office of Urban Agriculture and Innovative Production (OUAIP), which was established through the 2018 Farm Bill. While the office is located within NRCS, it is coordinated as a Department-wide effort to leverage tools and services that support agriculture in urban communities. The office received \$5 million in funding in the FY 2020 Further Consolidated Appropriations Act and \$7 million in the FY 2021 Omnibus and COVID Relief and Response Act. The President's FY 2022 Budget Request includes \$9.5 million for OUAIP and \$1.6 million for the Farm Service Agency to administer an Urban Agriculture County Committees Pilot. To date, approximately \$11 million in grants and cooperative agreements have been awarded through the OUAIP to strengthen existing programs and create new projects in the focus areas of food access, community gardens, urban farms and controlled environmental agriculture, and food waste reduction. NRCS will continue to work with our partner agencies across the Department as well as staff and partners across the country to further invest in urban agriculture.

Build Back Better

As illustrated through these updates, the Agency continues to utilize our existing programs and funding to ensure that farmers across the country have the tools they need to respond to the climate crisis. That being said, our programs remain oversubscribed, with demand for climate-smart agriculture practices and programs well exceeding available funding. The Build Back Better Act would make a historic investment in our voluntary conservation programs that support farmers, ranchers, and forestland owners to continue leading the way in addressing the climate crisis. Farmers have long demonstrated leadership in environmental stewardship with strategies that provide benefits for the farm, the environment, and the public. The critical investments proposed in the bill would help meet the demand from the farming community for conservation support and enable producers to realize the full potential of climate benefits from agriculture. The additional investments in EQIP, CSP, RCPP, ACEP, Conservation Technical Assistance (CTA), and measurement and evaluation would target investments to the most effective conservation activities to address the climate crisis, and NRCS is well positioned to quickly deliver these programs to producers across the country, including outreach to historically underserved producers and those who have previously been unable to access our programs and support. We look forward to working with Congress as the work on Build Back Better legislation continues.

Disaster Relief and Prevention

Finally, NRCS continues to play an important role in responding to emergencies, including wildfires, hurricane, tornadoes, flooding, and other disasters. In FY 2021,

we entered into 170 agreements with local sponsors to implement Emergency Watershed Protection (EWP) measures, and \$237 million of EWP funds were obligated. Responses to 63 watershed emergencies were initiated in FY 2021, including: Hurricanes Zeta, Elsa, and Ida; western wildfires in Arizona, Utah, and California; and major winter and spring flooding events across the Southeast. NRCS also plays an important role in disaster prevention. In FY 2021, we obligated \$166M in Watershed Protection and Flood Prevention Operations (WFPO) Program funding to 65 projects in 23 states to address new and backlog projects that help restore and protect watersheds. NRCS also allocated \$31.5M in Watershed Rehab funding to help local sponsors in the assessment, planning, design, and construction of 152 projects (42 assessments; 56 planning; 20 designs; and 34 construction) in 22 states. Recognizing the significant role that these programs play in preventing disasters, I appreciate the further investment that Congress made through the Infrastructure Investments Jobs Act (IIJA) for our watershed programs. These additional investments, on top of the mandatory and discretionary funds previously provided, will deliver much needed assistance for communities across the country. We are working with our states and local sponsors to identify project requests, ensuring targeting assistance for underserved communities and climate related disasters.

I appreciate the opportunity to come before the Subcommittee today to provide an update on NRCS's farm bill conservation programs. We have made significant progress implementing and improving these programs under the authorities provided to USDA. NRCS will continue to utilize these programs to protect and enhance natural resources, support producers across the country, and advance key priorities related to climate change and equity. We know that farmers, ranchers, foresters, and landowners are on the frontlines of the climate crisis and NRCS stands ready to continue to support the implementation of conservation solutions that respond to the severity of the crisis. As we continue to build on current investments, I also look forward to working with Congress to continue to advance these shared priorities and will continue to work with you as you begin the process of crafting the 2023 Farm Bill. I appreciate Congress's continued support for NRCS and our work to invest in voluntary conservation on working lands. Thank you for the opportunity to submit written testimony.

The CHAIR. Thank you both for your testimony today.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to get in as many questions as possible. Please keep your microphones muted until you are recognized in order to minimize background noise.

I will begin by recognizing myself for 5 minutes.

Chief Cosby, I would like to ask you a question about the Regional Conservation Partnership Program, RCPP. It has brought diverse groups together to address natural resource concerns in a really focused manner that leverages USDA investment with private-sector dollars, and this program has worked very well since it was first authorized with the 2014 Farm Bill.

However, recently partners have expressed concerns about some of the bureaucratic hurdles and challenges. Have you heard about any of these concerns, and are you taking any steps to address them?

Mr. COSBY. Chair Spanberger, thank you for the question.

I have had an opportunity to work with this program, since it came in, in 2014, as a State Conservationist, and bringing partners together to leverage the Federal investment. It has worked really well. It is a great program. It continues to flourish.

We have heard concerns, and I will tell you that we are addressing those. We need our partners to really continue to bring those forward to us, as we talk about this. We recently announced RCPP and the new investment that we are going to make, and we think we have streamlined the process. We are working to train our field

staff on how to deliver it more effectively and efficiently, and so we have heard those concerns, and we are addressing those.

The CHAIR. Thank you, Chief Cosby. That certainly is music to my ears, and I would love to follow up and determine if there is any way that we can ensure that any challenges that might be brought to our Congressional offices are something that we can relay as you continue to make those improvements.

Moving on with my questions. On January 10, 2022, USDA announced the use of EQIP and CSP to promote select climate change-related goals, including a partnership with the Farmers for Soil Health Initiative, and targeted EQIP funding for cover crop adoption. How are these changes to farm bill programs expected to increase adoption of climate-smart practices?

Mr. COSBY. These types of partnerships are really important, because it gives us an opportunity to work with the folks, the boots on the ground. My staff, along with farmers that belong to a lot of these organizations we are working alongside of, provide some great opportunities for us to hear exactly what is happening on the landscape, and also partner with some organizations to get more conservation on the ground.

This is really important. We know that we can't do it all on our own and by ourselves, and so, the more partnerships that we have and the more investments from private organizations, I think we have a better chance of looking at how do we help with climate, drought, and all of the things that happen when we have this adverse weather going on around the country.

The CHAIR. So, one more question to follow up on that.

Last month, Secretary Vilsack identified several climate change-related achievements by NRCS and other agencies, including the investment of \$10 million to support climate-smart agriculture and forestry through voluntary conservation in EQIP, and funding for EQIP was authorized at \$1.8 billion in Fiscal Year 2021. Does NRCS plan to increase the amount of funding for EQIP directed to climate-smart agricultural practices, looking at Fiscal Year 2022? If so, by how much and frankly, how does that funding level for Fiscal Year 2021 compare with other USDA announcements citing EQIP or other voluntary practices?

Mr. COSBY. Well, not only EQIP. We are looking at how do we incorporate climate-smart solutions into all the programs that we administer through NRCS, and we are working very closely with our State Conservationists out across the country as we, for the first time ever, that I can remember, we gave states their budget in October. It gives them 12 months to plan, and also, it helps us to look at what are the resource concerns, what are the things that we really need to be keen on, and EQIP is that program that we need to really work through. It gives our folks an opportunity to work with the state technical committees out there across the country to set those priorities when we look at those resource concerns. And so, EQIP is an opportunity for us to keep adjusting and look at how efficient it is, and how effective it is.

And also, when we talk about the climate crisis that we are having, EQIP is one of those solutions that we have.

The CHAIR. Administrator Ducheneaux, I am short on time, but looking at how the 2018 Farm Bill reauthorized and amended CRP,

what challenges has your agency had in enrolling acres in CRP, and how could that program be amended to address those challenges?

Mr. DUCHENEAUX. As far as amending, ma'am, whatever Congress decides to do, we will work our best to implement it. But we have made some changes to soil rental rates that have really helped drive enrollment up. We made an increase in the grassland CRP, which significantly drove interest up.

And it is important to remember that every additional acre we enroll in CRP is another choice that a producer has to be an economic player in the global climate change mitigation effort.

The CHAIR. Thank you, and there is certainly financial impact for them.

Thank you very much to our witnesses, and I now recognize Ranking Member Thompson for 5 minutes.

Mr. THOMPSON. Well, thank you, Madam Chair. Gentlemen, Administrator, Chief, thank you both once again for being here.

In the stalled Build Back Better Act, there is \$28 billion in funding for climate practices. That money is almost equal to a doubling of funding for the current farm bill conservation programs. A significant portion of the funding is backloaded in the last 2 years of the bill. For example, the Regional Conservation Partnership Program, RCPP, receives over \$3 billion in Fiscal Year 2026, ten times the amount of funding it receives in the farm bill.

Chief Cosby, did the House or Senate, I mean, this was really done with little to no transparency. I would border on no transparency, as it through this legislative process and House. Did the House or Senate Democrats consult with the Department on this funding?

Mr. COSBY. Sir, what I would say to that is that we work very closely with all the Members, and we have a very capable staff out there. Whatever the dollar amount that Congress appropriates to these, we will be able to implement.

Mr. THOMPSON. Well, that will—

Mr. COSBY. We will be very happy.

Mr. THOMPSON. And we will get to that part. That is my next question, so thanks for anticipating it.

But this is about direct consultation. Did the House, I can tell you, the House Republicans were not consulted, and as Ranking Member, we were not consulted. So, was there direct consultation by the Department with House Democrats, well, let's just start with that, I guess.

Mr. COSBY. The way I would answer that is we provide technical assistance when asked by Members of Congress, and I am sure that there were some conversations that were had.

But we provide technical assistance when we are asked.

Mr. THOMPSON. So, you are not sure?

Mr. COSBY. I am not sure of that.

Mr. THOMPSON. Not sure.

Mr. COSBY. But I can take that question back and get you the answer.

[The information referred is located on p. 43.]

Mr. THOMPSON. I appreciate that. That would be great.

Do you believe that the department has the ability, and this was kind of what you were getting to, to get that money out the door, and if so, what would that plan look like?

Mr. COSBY. Sir, we have an aggressive hiring strategy. We had direct hiring authority last year. We were able to bring on a lot of employees. We also have a lot of partners across the country that really help us with this, and we do agreements and we have a lot of boots on the ground to help do this work.

We believe, no matter what Congress appropriates, we can deliver, and we have the right skill sets, we have the right men and women across the country just to do that.

Mr. THOMPSON. Well, trust me. I am obviously a big fan of USDA. We talked about that before we started, and I appreciate your leadership, and I appreciate the men and women who work at USDA. But what would you have me say to the farmers as I interact with them, whether it is here in Washington or crisscrossing the country as I have done and continue to do, because I want them to bring their voices to the 2023 Farm Bill process. How would you have me respond when they express their concerns with this, because they have concerns with just the current programs we have, getting that money out the door? And we are talking about, as I was referencing, an incredible increasing amount of funds, and we have frustrations now with the current programs. What should I tell them when I hear that, because I expect that is going to continue to be a common theme?

Mr. COSBY. What I would say is my agency, NRCS and also FSA, we are a trusted partner with the American producers across the country, and we deliver. And no matter what the program is, we have seen no letdown from anything. Our staff is able to deliver. As I described earlier, most of our programs are oversubscribed, so any dollars that are invested in conservation is going to be a great day, and our staff is there ready to deliver that. So, we are a trusted partner with the voluntary land users out there that do voluntary conservation.

Mr. THOMPSON. Yes, and I would agree with that, but there are serious concerns especially with the amount of money that the \$28 billion exponentially increased without really any farm bill hearings.

Well, many of the private companies have made major climate commitments. They oftentimes are struggling to find ways to achieve their goals, despite having significant financial resources. Simultaneously, the USDA conservation programs are oversubscribed, and agricultural producers have difficulty accessing these vital programs. And for this reason, I introduced the SUSTAINS Act (H.R. 2606, Sponsoring USDA Sustainability Targets in Agriculture to Incentivize Natural Solutions Act of 2021), which would allow USDA to accept and match donated private funds to stretch the Federal dollar. The idea is that third parties could directly partner with USDA to fund conservation programs, which we know are tremendously effective in dealing with climate, climate change. And that investment through the existing programs—do you support this legislation or do you support that concept of a public-private approach where we are able to create something that the pri-

vate-sector would be able to support USDA and the work that you do with conservation programs?

Mr. COSBY. Many of our programs support private and public partnerships, and so we are working through a lot of those like RCPP, and it is working. And so, we support that through the conservation programs that we have right now. I have not had an opportunity to study at length the bill that you are talking about, but I will do so, sir.

Mr. THOMPSON. I appreciate it. Thank you.

Thank you, Madam Chair.

The CHAIR. Absolutely. The chair now recognizes Congresswoman Pingree from Maine for 5 minutes.

Ms. PINGREE. Thank you very much, Madam Chair. Thank you for having this hearing, and thank you to both of our witnesses. I really appreciate the work that you are doing, and I am grateful to have you here with us today.

I wanted to talk first to Mr. Cosby, Chief Cosby. Thank you for being with us today. I want to talk first a little bit about CSP, and frankly, the important role it can play as a climate solution. It is the Conservation Stewardship Program, such a valuable tool.

Now, the Ranking Member just brought up this issue about the funding in the Build Back Better Act, and the increase in funding, but sort of contrary to what he was saying, I found in Maine we have only been able to fund about $\frac{1}{4}$ of the applications. So, the added resources in the Build Back Better Act would be extremely important to my state, and I am sure that is true in Pennsylvania as well, that there is not sufficient funding. So, I hope we are able to get increases in funding and make that money available to our farmers who are anxious to use this already.

But could you talk to me a little bit more about how we use CSP as a tool in combating climate change, and why that is a particularly helpful program?

Mr. COSBY. As a State Conservationist, I had an opportunity to administer CSP and now as Chief, and it is the biggest working lands conservation program that we have, and it is very successful. And you know, we have a lot of producers out there that transitioned from EQIP to CSP, which like I said, has been very successful.

One of the things we have seen is that in the fifth year, producers have an opportunity to re-enroll, and there is something in that that was in our policy that said that if you didn't re-enroll in that fifth year, you had to sit out 2 years and wait. So, we were able to waive that and make sure that producers have an opportunity to re-enroll right after that fifth year.

It is a very successful program. We have identified 81 enhancements in the CSP that we think have the best chance to help us with the climate crisis, and we have also identified some practices also in our EQIP program. But we have identified 81 enhancements that we know will help with soil sequestration and also greenhouse gas emissions.

Ms. PINGREE. That is great. Well, thank you. I really appreciate it: 81 is a big number. But, I know that is going to cover some of the things that I put in my bill, as you mentioned, soil health, carbon sequestration, a variety of other things.

I want to take a different tact here, and again, thank you, Chief Cosby, for talking to me about this question. That is about PFAS. Maine has been a little bit ahead of the curve on testing for PFAS (perfluoroalkyl and polyfluoroalkyl substances) contamination, which means that we have identified, unfortunately, a handful of farms that are affected by these forever chemicals. But we know there are many more in Maine, as we increase our testing and we know it is not just a Maine problem. Last week, the State of Michigan issued a consumption advisory about beef from one farm that was found to have high levels of PFAS.

I know that NRCS could assist farms if they make the difficult decision to dispose of contaminated animals, but I would like to hear more about what NRCS could be doing to support farmers in this devastating situation.

Mr. COSBY. And thank you for the question, and yes, we have been working on this. We identified some areas where we can be helpful, as we are out on those farms and working with those landowners. We can talk about what are some of the things that can help mitigate PFAS, and get those herds back to producing the high quality of milk that is needed.

Also on the disposal side, we are working very closely with our staff to identify how we can help with that. Now, our agency, while we may be able to provide some financial assistance to dispose of that herd, we have to make sure that we are following all state rules and regulations as far as disposing, where those animals can be buried. We do not make that decision on where those animals can be buried. So, we work with the state authorities to make sure that happens.

But we are working to look at our standard inspection, how we can help those landowners make decisions on getting those herds healthy and then if they can't get them healthy, then we have an opportunity to help them if they have to dispose of the animals.

Ms. PINGREE. Well, thank you for that, and I know you share my concerns that farmers in this situation not only face the devastating possibility of losing their animals and the challenges that faces with herds that you been cultivating your whole life, and also the economic loss it can have. This is a devastating problem, and we have to support it much more.

I just want to add one quick thing. In the 2018 Farm Bill, soil testing was added to the EQIP program, so I hope that NRCS could help defray some of the very significant costs of soil testing for PFAS that farmers in our state are currently taking on.

I am out of time, but I can connect with you about that. But I do want to reiterate that soil testing is extremely important, and we need some assistance with that.

So, I will yield back. Thank you, Madam Chair.

The CHAIR. The chair now recognizes Mr. Allen from Georgia for 5 minutes.

Mr. ALLEN. Thank you very much, Madam Chair, Administrator Ducheneaux, and Chief Cosby, thank you both for coming before this Committee today.

This is an important hearing, and obviously to write a new farm bill, we need to know how the existing farm bill is doing, and what improvements we can make to it. I am very glad that this Com-

mittee is taking up these issues, and of course, we have talked primarily about climate change. And I got to be honest with you. When I am in my district, I don't hear anybody talking about climate change. I hear them talking about, like, the cost of gasoline and finding gasoline, and the cost of everything. Obviously, there is a war on fossil fuel. I don't know what that is doing to agriculture. Obviously, it is increasing the price of food at the grocery stores.

There is also very much a concern about grocery store shelves being empty, and in fact, I got a question the other day about, "Hey, are we looking at a major food shortage in this country?" And so, obviously, we should have our eye on the ball here, but we may be so fixated on one issue that all of a sudden, we lose the whole intent of why we are here, and the reason for the farm bill is to ensure that we have an adequate food supply for this country, and that it be efficient and safe.

Going to my first question is how much, you talk about what you are dealing with here. The Ranking Member talked about the Build Back Better and the money involved in that. We are talking legislation this week, \$8 billion going to the U.N. for climate. What are we spending at USDA in dealing with climate, and how much is that raising the price of food? Have we looked at that at the grocery store? I mean, how much is that impacting the American people right now?

Mr. DUCHENEAUX. Thank you, Congressman Allen. I will jump in there.

We see our role at the Farm Service Agency and the USDA more broadly to provide support for producers to have economic opportunity, and to the extent that that means funding some of the initiatives that will benefit them in the long-term like promoting soil health, which also has the added benefit of sequestering carbon and improving our climate outcomes, that is going to improve production over the long haul, and it is going to help producers have more economic freedom in order to be partners in whatever initiatives the Federal Government decides to roll out.

As to whether or not our efforts are directly impacting the price of inputs, I think there are other supply chain issues that are impacting that, and the work at the broader USDA is trying to address some of those challenges. At the—

Mr. ALLEN. If I—

Mr. DUCHENEAUX.—Farm Service Agency—I am sorry, sir. Go ahead.

Mr. ALLEN. Well, what we need to do is we need to figure out one, all of a sudden in this new Administration it is all about climate, and we are seeing food prices skyrocket. And so, I just need to know what this is going to cost, and because the people out there are asking me, and they are saying what the heck is going on in this country? And so, it is a real problem.

But I would like to specifically ask a question about the CRP program. Right now the biggest problem in that program is flexibility. Every request that my office has made, say, for example, if you want to exchange this property for another piece of property and stay in the program, it has been denied. There is absolutely no flexibility, and of course, as you know, things change, property val-

ues change and that sort of thing. And you are in this program 10 to 15 years, why don't we have flexibility in that program?

Mr. DUCHENEAUX. Well, sir, I would offer that I haven't heard a producer ask me about exchanging properties. We will look into that. I know the Secretary has charged us with finding as much flexibility that we can within our existing authorities to benefit producers. So, I will definitely check on that.

[The information referred to is located on p. 43.]

Mr. ALLEN. Well, I have a constituent that has offered to put twice as much property in CRP, which obviously helps with carbon sequestration, which is obviously, trees need carbon to live, and in each case, they have taken it to the state board and they have denied their request.

So, yes. If you could get with our office and let's address this problem and see if something can be done, that would be most appreciated.

As far as the other thing that I was going to address is the Swine Eradication and Control Pilot Program, but I am out of time, and hopefully somebody else will ask about that.

But thank you very much.

The CHAIR. Thank you, Mr. Allen, and Mr. Ducheneaux, thank you for your questions. I think as follow up, the full Committee would be interested in follow up to Mr. Allen's question in the event that we may represent constituents with similar concerns.

The chair now recognizes Ms. Kuster from New Hampshire for 5 minutes.

Ms. KUSTER. Great. Thank you so much, Madam Chair, and I want to thank Chief Cosby and Administrator Ducheneaux for joining us today.

This is an excellent opportunity to take stock of where we are with the conservation programs in the farm bill, and I was so pleased to hear President Biden and Secretary Vilsack talk this week about the potential for agriculture to be the first sector of the American economy to reach net-zero greenhouse gas emissions. I believe we can realize that goal by recognizing and supporting farmers and foresters for the climate-smart steps they are already taking, while also being proactive in setting long-term goals for emissions reduction in agriculture and incentivizing further progress toward these goals.

To achieve net-zero agriculture emissions, the farm bill conservation programs run by NRCS and FSA are essential, and I want to thank the excellent staff on the ground in New Hampshire. Over 55,000 acres in the Granite State were enrolled in USDA conservation programs in 2020 alone, but there remains even more we can do. Just as Federal farm conservation efforts were born in the 1930s as response to the Dust Bowl and the Great Depression, we must continue to grow and enhance these programs in order to confront the greatest challenge facing our planet, and that is climate change, as we have heard in a bipartisan basis today.

To do that, we must ensure these programs are as accessible as possible to small family-owned farms and forestlands, and that means reducing unnecessary or duplicative regulations and reporting requirements, while still maintaining integrity in the programs.

In 2018, in advance of the last farm bill, I secured passage of bipartisan legislation to exempt farmers from the confusing SAM/DUNS registration process for NRCS. That process was mired with bureaucratic red tape and designed for billion-dollar government contractors, not small family farmers who want to utilize conservation programs to improve the environmental integrity of their farms.

Chief Cosby, as we approach the next farm bill, I am eager to continue efforts to streamline efforts to help small farmers and foresters, and as we look at what can be done legislatively, would you comment on anything you are already doing or considering within USDA to improve accessibility to NRCS programs?

Mr. COSBY. Representative Kuster, thank you, and I want to let you know that I had an opportunity to work in your great State of New Hampshire back a few years ago, so thank you for the question.

One of the things we are doing is that we talk about equity and everything that we do at NRCS and USDA, and also for administration, and equity is really important. I am a son of a farmer from Mississippi, and in the 1970s my dad had to give up farming operations because of being denied services that he needed to keep the operation flowing, and it was a sad day for my family to give up their farming operation. I will tell you that is something I get up every morning and I work hard on, not only conservation, but making sure that every person in this country that wants to benefit from USDA programs has that opportunity, and we are looking at what are the barriers that exist. We are getting rid of those, and my staff knows that this is something that we need to make sure is happening in every program that we administer, whether it is at NRCS, FSA. The Secretary has made it very clear, and also the President made it very clear that we want to make sure that folks have an opportunity, no matter where they live and no matter where they are, to participate in farm bill programs.

Ms. KUSTER. Great, thank you.

Shifting gears a bit, I wanted to ask about the Clean Lakes, Estuaries, and Rivers, also known as CLEAR Program, within the Conservation Reserve Program. Conservation groups in my district have found CLEAR to be beneficial and hope to see the program expanded further, especially by making the CLEAR30 Pilot Program permanent. Through this pilot contract supported by FSA, receive a water quality incentive and a climate-smart practice incentive.

Administrator Ducheneaux, could you explain the success of the program and its current operations?

Mr. DUCHENEAUX. Yes, ma'am, and thank you for the question, and thank you for the support of the CLEAR30 initiative.

As you are aware, it was initially composed of a pilot program that was in the Great Lakes and Chesapeake Bay area, and we took steps in June to expand that because of the popularity of the program, and that lets folks take that expiring CRP land and do something meaningful for it for a 30 year period. And I think that is a critical part of this, because it gives the producers some certainty on some of their acreage what assistance they are going to

have, what income they are going to be able to generate while contributing to improving the waterways of the country.

Ms. KUSTER. Thank you, and with that, I will yield back.

The CHAIR. Thank you very much.

The chair now recognizes Mr. Johnson from South Dakota for 5 minutes. Mr. Johnson?

Mr. JOHNSON. Sorry. Thank you very much, Madam Chair. I appreciate it.

I have some comments for Mr. Ducheneaux, and first off, I would say, sir, we are lucky to have you in your role because you really do understand grazing, coming from your part of the world. When I think about some of these working lands CRP programs, you are going to understand the importance of them better than just about anybody. And I should have started by thanking you all, because during the drought, the emergency haying and grazing is just so incredibly important, and your team has shown a lot of flexibility and I think a lot of understanding of how that can be a lifeline for people when times get tough.

But I want to talk a little bit about kind of a failure to launch with some of these grasslands CRP. The program has not gone like we wanted it to after the last farm bill. So, initially, sir, just give me a sense of any suggestions you would have for how we can make that program more effective?

Mr. DUCHENEAX. Thank you, Congressman Johnson.

We think we demonstrated great success with the changes we made to the CRP Grasslands Program this last year. We had 2 million acres subscribe to that. A lot of those acres were in some areas of emphasis, including the Dust Bowl Country and the Elk Migratory Corridor in Wyoming and Montana. So, I think give us a little time to see how that plays out in future years. We have some ideas about how we get out to our underserved populations with that program. As you are aware, some of the territory in South Dakota is operated on by Indian Country, and they haven't really been partners in CRP before. CRP Grasslands is a great opportunity to get meaningful watershed level enrollment into the programs that can help benefit producers in some of the most economically distressed areas in the country.

Mr. JOHNSON. And so, just give me an idea of what that outreach might look like.

Mr. DUCHENEAX. We are conducting outreach right now to talk about CREP, as an alternative to enroll in some of these. The flexibility that we have been offered in the Conservation Reserve Enhancement Program to work directly with Tribal Governments and state governments and other nongovernmental partners is going to be critical to building that public-private partnership that can really help producers have something to plan on.

Mr. JOHNSON. Sure, and let's talk a little bit more about working lands, because I do think some of the best stewardship, some of the best sustainability, some of the best habitat, I just think so many really good things can come from working lands.

So, talk to me more about how your agency views working lands conservation.

Mr. DUCHENEAX. At the Farm Service Agency, we are really trying to message that all of this land is working lands conserva-

tion. Take, for instance, CRP. During the last drought disaster we had in South Dakota, a lot of that land was opened up for emergency hay and grazing to help capitalize on the *reserve* portion of the Conservation Reserve Program. Now, there were some challenges with the primary nesting season and the haying of the land, but what we really want to emphasize in coming years is that producers can stockpile some of that forage hayed after that primary nesting season. As my dad always told me, hay in the stack is like money in the bank, and if we can stockpile that through non-emergency use, or make better use of it through non-emergency use, our producers are going to be better positioned to use their other non-enrolled acreages during times of drought and other disaster.

Mr. JOHNSON. So, Mr. Ducheneaux, I have some folks back home who talked to me about concerns that we may be headed toward what we saw maybe 10 years ago where there was a sense that some of the incentive payments and some of the land rates were really competing against young producers who were interested in getting into farming. Help me understand a little bit. Do you think that that is a legitimate concern? What should I tell those folks?

Mr. DUCHENEAUX. Sir, I think there are some limits built into it. One of the major limiting factors in having this be real competition is that there is a 25 percent acreage limit on a county-by-county basis. So, that leaves 75 percent of the other land in that county to adjust to the market. But you won't find a bigger champion in the department for young and beginning farmers than myself. I still identify as one, even though when I walk up those stairs, I don't feel like one. So, we are really going to focus on how do we build those connections? We have the Transition Incentives Program within CRP that really never gained any traction, so we are looking at how we can improve that program to make that connection with that next generation, sir.

Mr. JOHNSON. So, well said. Thanks for your service.

Madam Chair, I yield back.

Mr. DUCHENEAUX. Thank you, sir.

The CHAIR. Thank you very much.

The chair now recognizes Mr. O'Halleran from Arizona for 5 minutes.

Mr. O'HALLERAN. Thank you, Madam Chair, Ranking Member, and the panelists. I really appreciate your presentations.

I am pleased we are conducting a review of the conservation programs. These programs are critical to rural Arizona and rural America, particularly programs that help protect and restore land and water. As wildfire season has become longer, wildfires have become more dangerous and unfortunately, more deadly. The Natural Resources Conservation Service plays an important role in replanting and improving the land following wildfire burn scars. In 2019, the Museum Fire forced neighborhoods to evacuate, and cost more than \$9 million to control. It was only a little less than 2,000 acre fire. It has also left a burn scar in its wake. Now, several neighborhoods in Flagstaff face severe flooding. These are not neighborhoods that had been at risk for localized flooding before the fire, and it will be several years, it appears, before they are fully restored.

Post-Museum Fire flooding highlights the need for NRCS to have the ability to work on Forest Service lands. These are improvements that are supported by local governments in my district with no other resources and expertise provided by NRCS will help reduce flooding, replant trees, and restore the burn scars. And Chief, I know that you are in the process of working on that right now, and I appreciate it very much.

So, Chief, thank you for being here and for your testimony today. Can you discuss how NRCS resources are currently used to address fire burn scars in the aftermath of wildfire? I understand there are several examples, and are there potential ways to improve inter-agency collaboration with agencies like the Forest Service or BLM to better improve the resilience to wildfires?

Mr. COSBY. Thank you for the question, sir. A mixture of the land across this country is in private ownership, and we know that when there are fires, it doesn't stop at the fence, and we know that we have problems on public land also.

I have a very good working relationship with the Chief of the Forest Service, and we have been having meetings and talking about how can the NRCS help with not only private land, but on the public side of the fence also? And that is where we have something called the Joint Chiefs Initiative that the Chief of the Forest Service and the Chief of NRCS look at how we can work together. NRCS works on the private side of the fence, and the Forest Service works on the public side of the fence. We are also looking at how we can look in some of these watersheds to see how we can work together to restore that. We also have plant material centers around this country, where we are developing new species of plants, and we know that we have tools in our toolbox to help with a lot of those areas that need to be reforested, or even planted back to grass. So, we are consulting very closely with the Forest Service, and Chief Moore and I have a very good positive working relationship. And we are going to continue to do that, because we understand that public-private plays, it plays a very important part, and we have to look at how we can make sure there are not resource concerns not only on private land, but we need to be looking at the resource concerns on public land also.

Mr. O'HALLERAN. Thank you, Chief.

I highlighted that one fire, but I have had several in the district just in the past year, I appreciate all the work that you are doing towards that process.

Mr. Ducheneaux, Administrator, thank you for your testimony today. I commend you on your being the first Native American FSA Administrator, and thank you for all your work so far, and your work in the past. Under your leadership, what action is being taken to ensure that FSA resources are being used to improve conservation outcomes in underserved communities, particularly in Indian Country?

Mr. DUCHENEAUX. Thank you, Congressman O'Halleran.

I do have to give a little praise to the NRCS in this regard, because they have been leading in delivery of conservation programs in Indian Country. The CSP program was one of the most valuable tools that many of the producers in our communities have ever seen. But what the FSA is doing now with regard to the Conserva-

tion Reserve Enhancement Program, having someone that knows intimately the issues that are facing Tribal producers, as they try to enroll in these conservation programs at the head of the agency with partnerships across in the Department of the Interior to try to be able to work out more meaningful and implementable solutions is going to be critical in delivering services to those communities.

Mr. O'HALLERAN. Thank you very much, and I yield back, Madam Chair.

The CHAIR. The chair now recognizes Mr. DesJarlais for 5 minutes.

Mr. DESJARLAIS. Thank you, and thanks to our witnesses today.

Our farmers and ranchers have been unfairly labeled as climate criminals by some, and that cannot be further from the truth. What is the USDA doing today to recognize and promote awareness among the general public that our American farmers, ranchers, and foresters are already effectively doing to be climate heroes in increasing sequestration of greenhouse gases through their everyday agricultural practices?

Mr. COSBY. I will start for NRCS, and then I will turn it over to Administrator Ducheneaux.

I will tell you that as we work with landowners across the country, we know that private landowners are the best for conservation. These farmers out there, they have a lot of challenges. They work the land. They know the challenges that they are facing, and they are the best advocate for themselves also. As our staff works with them, we advocate for that also.

When we are out writing conservation plans for producers across the country, we look at resource needs and resource issues, and producers have a pretty good idea of how to fix a lot of these resource problems, and we are able to offer some financial assistance to help them through that. And so, as we administer these farm bill programs, we will continue to talk about producers and farmers and forestland owners as being champions, and USDA wants to be a champion right alongside of them.

Mr. DESJARLAIS. Okay, thank you. Let me ask another question.

We want to make sure that in this farm bill, the conservation title does not become the climate title. Farm bill conservation programs have garnered bipartisan support in Congress and are popular with farmers and ranchers. That popularity stems from farmers and ranchers having the ability to address natural resource concerns that are specific to their individual farms. I also believe these programs work because of the locally-led component where local work groups and state technical committees prioritize the practices that are important to their region or state.

What I have concern with is turning the conservation title into the climate title. For example, post-harvest flooding rice fields provides enumerable benefits to wildlife, but might not score high in climate dominated ranking systems. I also worry about some crops like wheat that can't always take advantage of cover crop incentives.

To both witnesses, will you pledge to support this long-held model of locally-led incentive-based conservation system rather than refocusing Title II as a climate title?

Mr. COSBY. Sir, I will start with that, and I will tell you that the local-led process is something that we wholeheartedly support. From my time in the field, as a soil conservationist and also as a district conservationist, and then as a State Conservationist that locally-led process really works. We had meetings in all the counties out there to talk about what the local resource issues were, and then they filtered it up to factor into how a lot of these programs work at the state level. And then working alongside the state technical committee, which is a very important group of folks from all segments of society, and they sit along with myself when I was a State Conservationist, and also the FSA Director, and talk about, from a statewide perspective, how should these programs work? So, it worked building it up from the local, and then marrying it at the state and then also looking at what are the national priorities.

So, when we look at this, we talk about local priorities, we talk about state priorities, and then we talk about national priorities, and that has worked.

Mr. DESJARLAIS. Okay. My district is home to the famous Jack Daniels distillery and several other hardworking distilleries. White oak trees are crucial to the industry for making their world-famous barrels, and unfortunately, the industry is in worsening shortage. The last thing they need, and so many others in agriculture, is more regulations. There is a lot of fear about tax revisions such as the Stepped-Up Basis Program, which is critical to ensuring that generational family farms remain intact, could be going away. Can you talk about what the Department is doing to ensure these producers are supported?

Mr. DUCHENEAUX. Thank you, Congressman DesJarlais.

We at the Department, and specifically in the Farm Service Agency, we see our role, as I have stated, to support producers and ensure that they have enough of their production income left at the end of the year so that they can make choices. We see the 3.4 million ag producers out there in the country as champions of the initiatives that the Administration is touting more and better markets, climate-smart solutions, recovery from the pandemic, and improving access for the next generation. If we don't have producers that have production income in their pocket at the end of the production year, that next generation isn't going to be interested anyway.

Mr. DESJARLAIS. Thank you. That is pretty much all the time I have. Thank you both, and I yield back.

The CHAIR. The chair now recognizes Mr. Panetta for 5 minutes.

Mr. PANETTA. Thank you, Madam Chair, and Chief Cosby as well as Administrator Ducheneaux, thank you very much for being here. Thank you for your testimony, and of course, thank you for your work on the Federal conservation programs.

As you have testified, obviously these types of programs have played a vital role throughout our nation's agricultural history, and let me tell you, they helped a lot in my district on the Central Coast of California, in which they have protected farmland, and obviously helped develop effective conservation practices that have benefitted not just our farms, but our farmworkers and our food for sure.

Now, on the Central Coast of California, we have a lot of diversity when it comes to what type of crops we grow, over 100 specialty crops, as I am sure both of you know, and therefore, some of the challenges are when it comes to conservation practices, because one size doesn't fit all, unfortunately, in my district, but fortunately for its diversity, which helps them out.

Now, that being said, obviously I do believe that is why it is so important to ensure that, and Chief, especially what you just said, that especially crop producers and people at the local level are at the table in this conversation, especially when it comes to conservation.

And Administrator Ducheneaux, you obviously understand this, and I say that based on, and Chief, but especially the Administrator, and I say that personally because you have someone working for you, Riya Mehta, who understands how important it is to have everybody at the table. As you know, she was a former employee of mine and a damn good one, and good on you for having her work for you, but also good for our agriculture and good for our specialty crops on the Central Coast, knowing that she is still working on programs like this. So, thank you. Thank you very much.

Now, let me talk about specialty crops, or at least let me ask you a question about them, especially when it comes to the Climate-Smart Commodities Initiative. Obviously, you know that that is funded by the Commodity Credit Corporation, and can you explain how specialty crops are included in the Climate-Smart Commodities Initiative, and Administrator, I will go ahead and put that first one to you.

Mr. DUCHENEAUX. Thank you, Congressman, and thank you for not taking me too hard for stealing your good staff. I agree, she is top notch.

Since I have been at the agency—and this maybe was going on long before—we have engaged with very diverse stakeholder groups. We have had several groups from the specialty crop arena giving us input on program construction, instead of us going out there and saying here is the programs we are doing, figure out how to fit in. We are bringing them in at the front of these conversations. So, by definition, whatever we do with regard to the CCC funding that we are going to have an opportunity to deploy is going to have taken into account the needs of those specialty crops producers.

One of the other aspects of the work that we do that really isn't tailored to fit specialty or organic crops is our farm loan programs, and we are working very diligently with those groups to try to find a way to craft those tools to better suit their needs, so they are not so reliant on the small segmented parts of the work that we get to do to suit their industry.

Mr. PANETTA. Great, thank you.

Chief, do you have anything to add to that?

Mr. COSBY. Just a little bit on the locally-led. It is very important, especially when we have local conditions. It is very important that we have local folks at the table to talk about what those resource issues are and what those resource needs are, and then our folks are able to look at it and say, "Hey, let's sit down, let's write

this conservation plan, let's walk the land, let's talk about the crops that you are growing. How can we solve the resource issues, and also make sure it is beneficial to your bottom line?" And so, that is what is so great about the NRCS team. We are able to look at whatever is grown there and take that into consideration when we are writing that conservation plan.

Mr. PANETTA. Great. Thank you, Chief.

Now, in regards to cover crops. Obviously, specialty crops kind of have a little bit more difficult time applying these types of cover crops for some conservation practices. Now, I know there is a proposal and you know there is a proposal for a nationwide pandemic cover crop incentive, the Pandemic Cover Crop Program that is out there. Mr. Administrator, how will the FSA work with the RMA to administer this?

Mr. DUCHENEAUX. We work very closely with Administrator Bunger on that, and we were partners in delivering that program last year. We were expecting 2 million acres, and we enrolled nearly 14 million acres in that Pandemic Cover Crop Program, so I think the need is there, and you have the commitment of myself and Administrator Bunger to work together. She brings the added benefit of having been a county executive director for us in the past.

Mr. PANETTA. Outstanding, thank you.

My time is up. I yield back, Madam Chair.

The CHAIR. Thank you very much.

The chair now recognizes Mr. Moore for 5 minutes. Mr. Moore, you might be muted.

Mr. MOORE. I apologize, Madam Chair. I thought I hit the button. I guess it didn't go through.

The CHAIR. We can hear you now. Thank you.

Mr. MOORE. Okay, very good.

Chief Cosby, what is the staffing capacity level that you need to effectively implement the farm bill conservation programs and to provide needed technical assistance, and where are you currently compared to that number? And last, will the Administration request a level, you think, in the near future to meet the needs?

Mr. COSBY. Representative Moore, thank you for the question.

We have a very aggressive hiring strategy. Last year also, we had direct hire authority where we were able to take résumés and bring on a very capable staff to NRCS. Over the last 2 years, we have hired about 3,000 employees, and over the next 2 years, hopefully we will be able to bring on the same.

We are well above our attrition rate as people leave the agency for retirement. We have been able to maintain our numbers. We are at 10,300 right now. Our number is a little over 11,000 that we can staff up to, and we are going to make that number this year. But we are working very closely with our State Conservationists and our folks across the country to figure out what is the talent that we need, what is the skillset that we need, and we are looking at hiring those individuals with those types of skillsets that are so vastly needed across the country out in those field offices across the nation.

Mr. MOORE. Thank you, Mr. Cosby, and with that, Madam Chair, I will yield back.

The CHAIR. Thank you very much. The chair now recognizes Ms. Schrier for 5 minutes.

Ms. SCHRIER. Thank you, Madam Chair, and welcome, Chief Cosby and Administrator Ducheneaux.

I would like to touch on a few challenges with conservation programs that farmers and growers in Washington State have been experiencing, and I hope USDA can help with these.

The first is simply the lack of staffing at local USDA offices, which is impacting USDA's ability to meet the demand of farmers who want to participate in farm bill conservation programs. And I should just mention, the desire is there. I heard from some of my colleagues about not hearing about this. I am talking specifically, for example right now, about DeGoede Farms that has a hydroponic facility. This is all an EQIP supported endeavor that has solar panels and rainwater catch basins that is saving a ton of money and increasing yield. But it turns out that the local offices that help farmers on the ground are simply not staffed, and so, this puts undue burden on local conservation districts to fill in the gaps, and they are already strained by demand. So, for example, this last year in Pierce County, Washington, the conservation did 90 percent of the work to get farmers enrolled in EQIP. And I know things are improving, but I just wanted to emphasize that need for local staffing.

The second challenge is that while the EQIP program generally works well once it is implemented, boy, the paperwork and the bureaucracy is really overly burdensome, and the timelines from application to implementation is frustratingly long. And so, I would ask you to please work on streamlining the process to make it more accessible. And of course, I know some of that depends on meeting that first request of just more staffing.

And then the third has to do with funding, and there is just simply not enough funding for these programs. Only 30 percent of the farmers who applied for EQIP contracts in my district were awarded them, and reimbursement rates are also a problem. They are insufficient, particularly in places like King County and Pierce County in my district where land is so expensive that compensation for sacrificing working farmland needs to be much higher to incentivize conservation. So, I will work on increasing overall funding to meet the need, both the need of farmers for financial liability and access to these programs, and the need for more conservation programs in general. But I would ask you to consider land value in determining how to compensate farmers for opting in to conservation programs, because if that doesn't happen, farmland is going to turn into housing, which is in high demand and can bring huge financial reward to farmers who sell to developers, rather than conserving the land. And in addition, I would say there shouldn't be restrictions that block farmers from selling any of their land for development. For example, we should still incentivize conserving part of the land, even if they sell the rest.

So, Chief Cosby, I just was wondering if you could comment about what we could do here and what your plans are to ensure that farmers who want to participate in USDA programs are able to do so and are incentivized to do so?

Mr. COSBY. Thank you for the question, and I will try to hit on a couple of those that you mentioned.

And staffing, as I mentioned before, that we do have a very aggressive staffing model that we are implementing. We are hiring staff across the country. We have a very capable State Conservationist in Washington State, and we will be working with her to make sure that she has the right staffing for her state.

Also, on EQIP, one of the things that we are working on is making these programs a little more transparent, and also, we are working very hard in each of the states to have outreach coordinators that will be working and reaching out to producers to help them better understand how these programs work, how do you apply, how do you go through the whole process.

One of the things that we did this year is we gave states their budget in October, and so, they have 12 months this year to make sure they get folks in the door and also work through the process. And we also have a website on *USDA.gov* that talks about all of the signup areas across the country. It is one website, and so, producers that farm regionally or farm across state lines are able to go in and look at what those dates are.

And I just want to remind everyone that for most of our program, it is a year-round signup period, 365 days, and if you don't make it then, we will defer that application until the next year. So, it is 365 days, and we encourage folks to come in and sign up. If there are any misconceptions there, just reach out to that local staff.

Also on the funding side, your state is no different than the rest of the country. We are only able to fund about $\frac{1}{3}$ of the applications that walk through the door, and it is a very competitive process. We want to make sure that folks understand what that process is, and how to apply. And we are making it so that it is not by farm size or anything like that. When we look at our ranking system, we are trying to make it more flexible so that anyone that wants to participate, and they are going to do some great conservation work, has that opportunity.

Ms. SCHRIER. Thank you. I yield back.

The CHAIR. Thank you very much, Ms. Schrier, and to conclude our first round, and if the witnesses are able, we would enjoy doing a second round. To conclude our first round is Ranking Member LaMalfa. Mr. LaMalfa, you are recognized for 5 minutes.

**OPENING STATEMENT OF HON. DOUG LAMALFA, A
REPRESENTATIVE IN CONGRESS FROM CALIFORNIA**

Mr. LAMALFA. Thank you, Madam Chair. I am phoning in from home here today, so thank you for letting me work around things. I am under the weather a little bit, but as you see, the Pomeranian just woke up here this morning at the house.

That all said, thank you for this hearing, and G.T., thanks for sitting in, in the number two chair there.

I just have a couple questions for Mr. Cosby here quick. Up here in northern California, obviously we have been victim of an incredible amount of wildfire the last several years, but you know, more years than that, really. They are just getting bigger and bigger. So, one of the common concerns we are hearing from landowners up here is that to reduce wildfire risk, is we have a lack of forester

capacity, boots on the ground, so to speak, right? So, some states have very few foresters on hand to do the work. So, Chief, what is NRCS doing to try and boost that number and help address this very important problem that we are seeing because of just flat staffing numbers? We are seeing a lot of frustration with COVID closures as well, and what will you be doing or what are you strategizing that we can do to implement more of these practices to protect our communities and other barriers that are standing in the way of forest management?

Mr. COSBY. Congressman, last year the State Conservationist of California identified a great forestry need of foresters, and one of the things that he did was a percent of his staff that he brought on out there were foresters, and we have identified that need across the country. And so last year, we were able to bring on numerous foresters. And as we look at how do we move through this next round of hiring, we are also looking at that need.

Also, we do have men and women from other agencies, like state agencies and other groups that have helped us with this over the years, but we saw that internally we need to have more foresters on staff. So, we are in the process of doing that, but we were able to bring on several last year, and we will be bringing on several this next year.

Mr. LAMALFA. Thank you, and I think you kind of touched on my next thought here on regional flexibility. Different regions have different concerns and unique needs, so are the programs flexible enough to allow that kind of practice [inaudible] regions and for needs? [inaudible] resources around to meet each region's unique needs? Is there something we need to be doing to help give that flexibility to move personnel or have the programs work from one region to the next where you have unique landscapes, *et cetera*?

Mr. COSBY. And I think we built that flexibility into most of our programs. As we talked before, we talk about the locally-led process where folks on the local level get together, talk about what the resource needs are, and also, then we look at statewide what are those resource needs, and then nationally what are the resource needs? And we try to marry those and make sure we have a balanced approach when we are implementing these programs. So, that is already baked into the pie, and so, we are happy about that. And the folks on the local level and at the state level have a lot of flexibility when it comes to these programs, working through and with the state technical committee, and all the groups out there that make up that state technical committee.

Mr. LAMALFA. Okay, and last, and I will yield back, but the COVID closures, again, are really making it difficult to get timely assistance through the conservation programs in certain areas. Some of the offices in my district are just having a devil of a time, folks getting in there and getting things signed up, *et cetera*. So, I hope we can release more people and have more flexible hours under the COVID closures, and so I will leave it at that.

Thank you, Madam Chair, and I will yield back.

The CHAIR. Thank you very much to the Ranking Member, and to the witnesses, thank you for your efficiency in answering questions. I think we have made great time and answered a wide array of questions.

So, with that, I would like to move forward with a second round, and I will recognize myself first for 5 minutes.

I wanted to begin by just commenting on the comments from my colleague, Mr. DesJarlais, who talked about our producers being climate heroes, and I could not agree with him more. And certainly, I have heard from producers in my district the challenge that they sometimes feel like they are positioned to seem like, to use Mr. DesJarlais' term, *climate criminals*. And so, I am really excited about the work that this Subcommittee does, and certainly the work of your agencies, because I think that it does affirm what my colleague from Tennessee said, which is our farmers and producers are the original conservationists, and they are the climate heroes.

And so, in being really forward leaning and hearing some of the comments from my colleagues on the other side of the aisle, there is the discussion of making sure that the conservation title stays the conservation title and not the climate title. And I think I would just note that there is real great value in seeing all of the benefits of these incredible programs. As Chair of the Conservation and Forestry Subcommittee, and as the only Virginian on the Agriculture Committee, and as someone who has been daydreaming of working on a farm bill since I first arrived in Congress, I do look forward to continuing to strengthen the conservation title, but recognizing that it has real benefits and value to our climate, but also to our farmers and producers.

So, to that end, I would like to begin with you, Mr. Ducheneaux, to follow up a little bit on the line of answers that you were giving earlier where, some of us have really been talking a lot about the climate benefits of these different programs, right, that is an exciting element of these programs. But I was wondering if you could explain a bit more—and Mr. Cosby, I welcome you to follow suit. Can you explain a little bit more why farmers and producers want to be a part of this program? And so, while we call them conservation programs, they have climate value, they also have economic value to our rural communities and our producers.

So, could you maybe walk me through, what is the financial gain or the benefit to our nation's producers of these programs?

Mr. DUCHENEUX. Thank you, Madam Chair.

Conservation equals soil health. Soil health equals improved production, and the fact of the matter is that according to the last time the ERS tabulated the data, only 7¢ to 14¢ of the food dollar are getting back to the producers. So, we have to find a way to improve income streams for producers so that they have the capability to join us in the fight to sequester carbon and mitigate climate change. And I think it is important that we include them in the conversations very early on, as to what is climate-smart, what are climate change mitigation strategies, and we have done that through a couple of different requests for input, getting hundreds of comments from diverse stakeholders, big ag companies, and the like, so that we know what we are going forward into is going to be beneficial all the way across the ag industry.

The CHAIR. To just dig into that a little bit more, and I open this up to either one of you. Your experiences on the ground, what are the financial benefits? What are the cost savings? What does it

mean for a farmer producer to actually participate in this program from an economic standpoint of their day-to-day operation?

Mr. DUCHENEAUX. I will go ahead.

Take our CRP Grasslands Program, for instance. That lets the producer get into an NRCS-approved plan, continue to have the same level of production, but also be able to quantify the amount of increased production that they are generating. So, then in addition to getting a rental payment, they are also getting added production out of their existing resources.

The CHAIR. So, in layman's terms, rental payment equals income incoming. Increased production is they are producing more that they can sell.

Mr. DUCHENEAUX. Exactly, yes.

The CHAIR. Mr. Cosby?

Mr. COSBY. Ma'am, we could talk all day about this topic, and I would love to have this conversation because it is exciting to be part of the conversation. When we work with producers out in the land, it is just great to see the enthusiasm they have for conservation, and they want to do the right thing. And they will do the right thing, if they have the right information, and my agency is a science-based agency, and everything we do is science-based. And just the benefits of soil health, having that healthy soil and being able to raise that crop and looking at the profitability from that. The resiliency of these farms out there, it is outstanding.

When you look at most of the programs that we administer, you look at the co-benefits of all the things that we do, from water quality to quantity and quality, also for wildlife habitat and some of the great things that are happening around this country on working lands, when we have that wildlife benefit. It is exciting to see farmers react to that and want to do the right things. And, we can do all of those things in a way that sustains farms. Sustainability is big for a lot of farmers, and I just wish my dad was here today to see some of these things that are happening, and be a part of the excitement around agriculture. It is very exciting to work in agriculture, right now.

The CHAIR. Thank you very much.

So, to the colleagues on this Subcommittee, whether we get to the table because we are super excited about conservation-related climate-smart benefits or climate benefits, or that we get to the table because it is so exciting to see that we can help ensure that farmers stay on their land, or whether or not we get to the table to put extra dollars in the pockets of our farmers and producers. As the current and future chair of this Subcommittee, that title is going to continue to be the conservation title. And so, I am glad that all of the reasons that bring us to the table have us here working on behalf of our producers.

With that, I now recognize Mr. LaMalfa for an additional 5 minutes. All right. Mr. LaMalfa, we will come back to you in the future.

Mr. Thompson, would you like an additional 5 minutes?

Mr. THOMPSON. Yes, absolutely. Thank you so much.

Gentlemen, thank you to both of you, and this question actually is for both of you. I will give you an opportunity to weigh in as we really begin to build out the framework for the 2023 Farm Bill.

I will start with Administrator Ducheneaux. It will be the same question for both of you. Can you explain about your individual agency perspectives on the 2018 Farm Bill program implementation strengths, and opportunities for improvement?

Mr. DUCHENEAX. Yes, sir, and thank you for the question.

When I came on board in February, there were several things that had their origins in the 2018 Farm Bill that hadn't quite made it across the finish line, so we are really interested in making sure that those get out there and make a meaningful impact, so that we have something to evaluate as we have our future conversations, sir.

One of them is Heirs Properties Relending Program. That hadn't really moved anywhere yet, and we are happy to announce that we have that out, and we have some prospects in the pipeline to help deal with the heirs properties issues all across the South and all across Indian Country.

Another aspect of that 2018 implementation is, for example, the CLEAR expansion and the CREP expansion. Finding that flexibility and then deploying that flexibility, so that we have meaningful information to make future decisions on is really critical, sir.

Mr. THOMPSON. Very good.

Chief Cosby, kind of the same question.

Mr. COSBY. Yes, from the NRCS side, I have talked about it a little bit that we were able to make sure our states had their budget in early October, and that provided 12 months out of the year for them to do planning. And I think that extends the season that we have to work for producers.

Also, when we look at our programs, we talk about CSP, we have been able to modify that to talk about in that fifth year if a producer doesn't have an opportunity to re-enroll, they do—can come right back and not have to sit out for the 2 year period. And when we talk about EQIP, we are looking at how do we make it more flexible? How do we make sure that anyone that wants to benefit from the programs—and that is where the money, the \$50 million that we put out across the country comes in really strong is that we are able to make sure that anyone that wants to walk through the door benefits from USDA programs to have that knowledge and experience, and we are able to work with community-based organizations and universities and a lot of folks across the country to make sure folks understand how these programs work, because they do get a little complicated at times, and we want to make sure they have that opportunity to participate.

And so, we have been looking at the flexibilities of all of our programs, and we have been working through those, RCPP, the flexibility we built there. So, that is something from day 1 that we have been doing, because we want producers to be able to participate without barriers.

Mr. THOMPSON. Very good. Thank you, both of you, and Madam Chair, I yield back.

The CHAIR. The chair now recognizes Ms. Pingree for 5 minutes.

Ms. PINGREE. Thank you very much, Madam Chair, and again, thank you to our witnesses for being here and all of your very helpful answers to our questions.

Mr. Cosby, I am coming back to you again. I just want to ask a little bit about composting as a conservation practice.

So, I have been interested in this for a long time, and pushing NRCS to adopt composting as a conservation practice for several years. But I was encouraged to hear the interim soil carbon amendment process, which includes compost and biochar, was beginning to be rolled out last year. So, could you give me an update on the soil carbon amendment practice, and where and how it has been used so far?

Mr. COSBY. I will tell you, it is something we are pretty excited about, especially when you talk about the standard and also as it applies to our urban folks when you talk about food waste and composting. That standard is working its way through the process, and we are hoping to be able to release it real soon. It is pretty important when you start talking about soil amendments and some of those type things; but we are working through the process and hopefully we will be able to have that out the door really soon.

Ms. PINGREE. And are there some places that it is being used?

Mr. COSBY. We put in interim standards when we do this, and so we are able to use those interim standards until they are fully vetted and finalized, so there are some places that are using it, and we are also doing studies on that to make sure that we hit the mark when we do release it finally. But we do develop interim standards for everything that goes through this process.

Ms. PINGREE. Great. Well, I am glad that is coming out soon, and I look forward to seeing that.

I ran out of time in my last question, so I just want to reinforce the issue I was bringing up about PFAS, and encourage you, and I am happy to follow up with this, to have NRCS doing more, supporting more of the soil testing. I know that you help with soil testing to a certain extent, but the original language was really to have EQIP be used to identify and deal with contaminants. And again, because PFAS is a growing problem because costs of testing are challenging for farmers, it seems to me we could use this more as a tool.

I don't know if you want to comment on that, but I certainly will follow up to encourage that is a possibility that it could be used.

Mr. COSBY. And I would like to visit more with you about this, and hopefully we can follow up after this hearing and we can work through it, and we can look at what the recommendations are and work with your staff to get to a place where we can support our farmers in your state.

Ms. PINGREE. Great. Well, thank you for that, and again, thank you for being with us today and we will be chatting with you in the future. So, thanks so much.

Mr. COSBY. Thank you.

The CHAIR. I see we have two remaining Members. We are going to go to Mr. LaMalfa and then Mr. Allen.

Mr. LaMalfa, you are recognized for 5 minutes.

Mr. LAMALFA. Thanks again, Madam Chair.

To both of our witnesses, I was wondering how something that Mr. O'Halleran had touched upon on the post-fire projects, and how are these watershed protections and such coming along as we had an incredible amount of rain and snowfall in northern California

here immediately after the end of the fire season, and we had a giant washout that took out one of our state highways for weeks. But also, the great concern is about what is that going to do for our waterways, as basically my district is the well for a lot of the rest of the state. And so, we need to be sure that we are advancing this watershed protection and conservation, *et cetera*.

So, how is it? How are they coming along in your view at this point here? Do you have what you need? Are people moving at a swift pace to try and get ahead of over 1 million acres worth of damage?

Mr. COSBY. I will start for NRCS. I will let you know that the watershed program is one of our oldest programs that we administer, and we have had great success. One of the things I am planning—and on some of these watersheds, we do have a 2,025 acre limitation unless written by you folks to say that we can waive that. Under our flood prevention, we do have our Emergency Watershed Program. It does work very well. We have had a number of requests for things like debris removal and log jams and some of those types of things. So, the staff is receiving those requests. When we receive those in the field, we go out and do a disaster survey to look at what the impacts are on the land, and then those come in for funding as we have the funding. Funding is limited, and so, the staff does work through that to make sure that happens.

And then on the rehab side, we do have some dams out there that have lived past their life expectancy, and we have pipes that are rusting. And so, we are looking at those and seeing how we can go in and rehab those dams.

And so, the process is working very well. It is a sponsor-led program where the sponsors contact us and they do a lot of the work, and then we come in with financial assistance to help with that. So, the program is working well, and so we hopefully can continue that.

Mr. LAMALFA. Thank you.

Also, you mentioned what is called the Joint Chiefs Landscape Restoration Partnership that NRCS works with Forest Service on. We have several of those projects underway in my own district, and one called the Big Valley South Landscape Restoration. Can you talk a little bit more about the work on these projects and the benefits you are seeing with the collaboration, with the partnership? What does that do to enhance what we haven't had before?

Mr. COSBY. It is a great partnership, and as a State Conservationist, I had an opportunity to work with the Forest Service on the Wayne National Forest in southern Ohio. And, we have private land interspersed in and around public land, and a lot of times, there was work being done on public land that should have been done on private land also. And so, it works very well when we are able to partner with the Forest Service to look and ask them where they are going to be working, and then we are able to contact those landowners in and around that area that they are going to be working in, and we can offer conservation planning assistance, we can offer financial assistance so that once the work on public land is done, we can also achieve the same benefits on private land, especially when you get into things like timber stand improvements

or like grape vine removal and some of these things that encroach on other areas. And so, it has been a great collaboration between the two agencies, the Forest Service, and we hope that continues. We know it will continue. We don't hope it continues; we know it will continue. Like I said, we have a great working relationship with the Chief at the Forest Service.

Mr. LAMALFA. Thank you, Chief Cosby, and Madam Chair, thank you. I will yield back to you.

The CHAIR. The chair now recognizes Mr. Allen for 5 minutes.

Mr. ALLEN. Okay, thank you, Madam Chair.

Chief Cosby, let's go back to the announcement of funding of projects for the Feral Swine Eradication and Control Pilot Program. Can you update the Committee on the status of these projects?

Mr. COSBY. Yes, and thank you, sir, for the question.

We have been involved. It is a program where the money is embedded to other agencies to carry out. We help with things like trapping, but we do not provide money to actually exterminate those animals. It has been really popular in the southern part of the country. I know as the feral hogs move further, we will be probably getting into more of that. But it has been very popular. It has worked very well for us to work with those agencies, like APHIS and some of the rest of them, to transfer those dollars to help with this, and we know it is a problem.

Mr. ALLEN. And obviously, it continues to be a problem. Will there be additional projects, amounts, and funding in the coming year?

Mr. COSBY. We hope so. We will take that back and take a look at it, and as we look at programs and how they are funded, we will take that under consideration.

Mr. ALLEN. Okay, and Administrator, going back to the climate thing. Of course, you mentioned that the farmers are only getting like 7¢ to 10¢ of the value of that. Have we looked at, from the standpoint of this carbon initiative, how much production land have we taken out of the equation, and could that be a possibility of the shortages we are seeing or the increase in food prices?

Mr. DUCHENEAUX. Thank you for the question, sir.

I don't necessarily think that is a factor, because it is a voluntary incentive-based program, and we are really emphasizing the working lands aspect of our Conservation Reserve Program. We hope producers take a look at that, as an opportunity to stockpile feed or foodstuff for the future use, and capitalize on that as an asset. There is a growing movement in the climate industry that is talking about soil wealth, as opposed to soil health, and how do you start to quantify the improved value of your real estate when you are engaging in these practices.

Mr. ALLEN. Exactly.

Mr. DUCHENEAUX. And do that. Yes, sir.

Mr. ALLEN. Well, here is what we need to get to the bottom one. One is obviously to do some of these initiatives, we are using taxpayers' money to do that, correct?

Mr. DUCHENEAUX. Yes, sir.

Mr. ALLEN. Yes, okay. So, we are using the taxpayers' dollars to do that, but then the result of that is we have these empty grocery

shelves and we have inflation as far as the food source is concerned. Input costs have gone out the roof. What efforts is USDA doing to get to research and get to the bottom of what the heck is going on in this economic situation, and really, it is a crisis that we have to deal with. Where are you on that, and what are you trying to do to explain what the heck is going on?

Mr. DUCHENEAUX. Sir, I have not done any research on that, but I will visit with our folks at the Economic Research Service, and see if there is anything that they have, and get in touch with your office on that. But I don't think that it is necessarily a cause-and-effect relationship. The assistance that we provide with taxpayer resources allocated to us through Congressional action is the driver of higher food prices, because it sure isn't getting back to the producers.

Mr. ALLEN. No, and see, that is what my point is. Where is the money going?

Mr. DUCHENEAUX. We will do some research and get back to you. [The information referred to is located on p. 43.]

Mr. ALLEN. Okay. Yes, I think that would be very helpful to our Committee, particularly when we are looking at the new farm bill, because that is, that whole farm bill is an economic project to ensure that Americans have a safe and efficient food source, and in fact, that is what this Committee needs to be laser focused on.

Thank you so much for being with us today, and Madam Chair, I yield back.

Mr. DUCHENEAUX. Thank you, sir.

The CHAIR. Thank you very much.

Before we adjourn today, I invite the Ranking Member of the full Agriculture Committee to share any closing comments he may have.

Mr. THOMPSON. Well, thank you, Madam Chair. Thanks for this hearing. Chief and Administrator, thank you both for being with us here today.

As we work towards the 2023 Farm Bill, we know that we have a lot of responsibility and that means doing great oversight and learning the lessons of what we were able to put into what looks like a very successful 2018 Farm Bill. And so, as we work towards restoring a robust rural economy and really creating the conditions in rural America where we begin to rebuild our population, this was a great start of the conversation today, specifically within the jurisdiction of your two agencies. And so, thank you for that.

This is a great start. We look forward to continuing this conversation so that we are in a position to, at the end of the day when we get that 2023 Farm Bill across the finish line, it is something that we can be very proud of, but more importantly, will be very effective of serving all American families.

So, thank you so much, and I yield back.

The CHAIR. Thank you very much.

I want to thank you both so much for being here today. Thank you for your testimony. The conversation has been very informative. All of the Members who asked questions, I think that all of our notes are pretty substantial. And this is incredibly helpful as we look towards 2023 and the farm bill, as we work to ensure that we can expand access to conservation programs by really bringing

the programs that you all run to new communities, making it easier for producers to participate in programs that they know and that they benefit from.

So, my gratitude to the Ranking Member. We missed having him in person. My appreciation to the Ranking Member of the full subcommittee—excuse me, for the Committee, and just as we close out, Mr. Cosby, I thought that the comments that you made about the 81 new enhancements to CSP, I will be following up because I would love to get an itemized list of those. I am really appreciative of some of the comments and answers that you gentlemen brought to this discussion, and certainly as we close out today, again, Mr. Cosby, I want to say that the legacy that you discussed from your family's experience losing their farmland in Mississippi to the fact that you are now at the helm of programs that allow farmers across the country to make a bit more money and have a bit more stability and income and certainty on their lands is quite a trajectory. So, I am really appreciative that you have brought your perspective and your work here today. Thank you again to both you, Mr. Cosby, and you, Mr. Ducheneaux.

And with that, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any question posed by a Member.

This hearing of the Subcommittee on Conservation and Forestry is adjourned.

[Whereupon, at 11:55 a.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY USDA

Insert 1

Mr. THOMPSON. . . .

But this is about direct consultation. Did the House, I can tell you, the House Republicans were not consulted, and as Ranking Member, we were not consulted. So, was there direct consultation by the Department with House Democrats, well, let's just start with that, I guess.

Mr. COSBY. The way I would answer that is we provide technical assistance when asked by Members of Congress, and I am sure that there were some conversations that were had.

But we provide technical assistance when we are asked.

Mr. THOMPSON. So, you are not sure?

Mr. COSBY. I am not sure of that.

Mr. THOMPSON. Not sure.

Mr. COSBY. But I can take that question back and get you the answer.

Consistent with the expectation of Congressional offices, USDA generally does not distribute technical assistance beyond the requesting office to ensure we maintain the trust of requesting Congressional offices. Congressional offices may share any technical assistance generated by the Department with fellow Congressional offices and/or other entities.

Insert 2

Mr. ALLEN. . . .

But I would like to specifically ask a question about the CRP program. Right now the biggest problem in that program is flexibility. Every request that my office has made, say, for example, if you want to exchange this property for another piece of property and stay in the program, it has been denied. There is absolutely no flexibility, and of course, as you know, things change, property values change and that sort of thing. And you are in this program 10 to 15 years, why don't we have flexibility in that program?

Mr. DUCHENEAUX. Well, sir, I would offer that I haven't heard a producer ask me about exchanging properties. We will look into that. I know the Secretary has charged us with finding as much flexibility that we can within our existing authorities to benefit producers. So, I will definitely check on that.

Land offered for enrollment in the Conservation Reserve Program (CRP) is evaluated, ranked, and accepted based on how CRP will benefit and restore the land and the related resource concerns associated with that parcel of land. Land is accepted into CRP on a competitive basis where producers offer land during an enrollment period, which is then ranked using an Environmental Benefit Index (EBI) in addition to costs associated with addressing the resource concerns.

To suggest flexibilities to "trade land" would not serve the purpose for what CRP is currently designed to accomplish, nor would it comply with the statute and clear Congressional intent.

Insert 3

Mr. ALLEN. Yes, okay. So, we are using the taxpayers' dollars to do that, but then the result of that is we have these empty grocery shelves and we have inflation as far as the food source is concerned. Input costs have gone out the roof. What efforts is USDA doing to get to research and get to the bottom of what the heck is going on in this economic situation, and really, it is a crisis that we have to deal with. Where are you on that, and what are you trying to do to explain what the heck is going on?

Mr. DUCHENEAUX. Sir, I have not done any research on that, but I will visit with our folks at the Economic Research Service, and see if there is anything that they have, and get in touch with your office on that. But I don't think that it is necessarily a cause-and-effect relationship. The assistance that we provide with taxpayer resources allocated to us through Congressional action is the driver of higher food prices, because it sure isn't getting back to the producers.

Mr. ALLEN. No, and see, that is what my point is. Where is the money going?

Mr. DUCHENEAUX. We will do some research and get back to you.

The Coronavirus (COVID-19) pandemic and related disease mitigation measures introduced numerous, interwoven challenges along food supply chains and caused a rapid, dramatic shift in consumers' food purchasing behaviors. As the pandemic changed and evolved and new issues emerged such as rising energy, agricultural commodity, and labor prices, producers and consumers have continued to adapt. FSA is working collaboratively across the Department to address concerns related

to the costs of inputs. The USDA Economic Research Service (ERS), which anticipates trends and emerging issues in agriculture, food, the environment, and rural America, assisted with providing research on this issue. ERS research and data products provide information related to the food supply chain from the farm to the consumer, including fertilizer prices, price spreads from farm to consumer, food expenditures, food price forecasts, and the distribution of the food dollar. These products can provide insight into the current economic conditions facing consumers and food producers.

Fertilizer Prices: ERS released the *latest farm income forecast*¹ on February 4, 2022. Farm sector production expenses—including expenses associated with operator dwellings—are forecast to increase by five percent (\$20.1 billion) in 2022 from 2021. Nearly all expense categories are forecast to rise during the year, largely due to expectations of higher prices paid by farmers for production inputs. In particular, fertilizer-lime-soil conditioner expenses are forecast to increase 12.0 percent (\$3.4 billion). Based on data from USDA’s National Agricultural Statistics Service (NASS), prices paid by farmers for fertilizers increased 15 percent in 2021 and ERS is forecasting that prices will continue to increase in 2022. The next farm income forecast will be released on September 1, 2022.

Price Spreads from Farm to Consumer: ERS estimates farm to consumer price spreads—the difference between a food’s retail price and the value of the farm commodities used in the food—for a select group of food products. Payments to farmers represent about half of what consumers spend for whole milk, $\frac{1}{3}$ of what they spend for head lettuce, and 20 percent of what they spend for white, all-purpose flour. These estimates can be used to project how changes in a food’s farm value might affect retail food prices, if that change were fully passed on to consumers without changes in costs for processing, transportation, packaging, and other marketing services. The All-Milk price, a broad measure of prices received by farmers for milk, increased from \$17.50 per one hundred pounds (cwt) in January 2021 to \$24.20 cwt in January 2022 (a 38 percent increase). Hard red winter wheat meanwhile rose from \$5.41 per bushel to \$7.47 per bushel over the same time period (also a 38 percent increase). However, *ERS research shows that increases in farm prices have a less than proportional effect on retail prices.*^{2*} If white all-purpose flour sold at retail stores for \$0.50 per pound with a farm value of \$0.10 per pound, for example, then an increase in the product’s farm value to \$0.14 (a 40 percent increase) could raise the retail price to \$0.54 (an eight percent rise). Of course, if costs for milling, transportation, or another marketing services were also rising, the cumulative impact on retail prices will likely be much greater.

Share of income spent on food in U.S. dropped ten percent in 2020 to historic low: The share of U.S. consumers’ disposable personal income⁽¹⁾ (DPI) spent on food in the United States was relatively steady over the last 20 years, decreasing from 9.95 percent in 2000 to 9.58 percent in 2019. However, during the COVID-19 pandemic and economic recession in 2020, the share of DPI spent on food decreased 10.1 percent from the previous year to 8.62 percent, the lowest share in the past 60 years. Consumers spent 1.4 percent more of their incomes on food at supermarkets, convenience stores, warehouse club stores, supercenters, and other retailers (food at home) from 2019 to 2020, while they spent 22.2 percent less of their incomes on food at restaurants, fast-food places, schools, and other places offering food away from home over the same period. Changes in the shares of income spent on food in 2020 resulted, in part, from pandemic-related closures and restrictions at food-away-from-home establishments, as well as from the largest annual DPI increase in 20 years. The increase in DPI was driven by additional government assistance to individuals in 2020, including stimulus payments to households and increased unemployment insurance benefits.

* **Editor’s note:** footnotes annotated with † are retained in Committee file.

⁽¹⁾ DPI is the amount of money that U.S. consumers have left to spend or save after paying taxes.

Share of income spent on food in U.S. dropped ten percent in 2020 to historic low

Percent of disposable income spent on food

Note: The percentages in the chart are rounded to the nearest hundredths place. The percent for total on food in 2019 does not equal the sum of the percentages for food at home and food away from home due to rounding.

Source: USDA, Economic Research Service, using data from the Food Expenditure Series.

During the Coronavirus (COVID-19) pandemic and economic recession in 2020, the share of U.S. consumers' disposable personal income (DPI) spent on food decreased 10.1 percent from the previous year to 8.62 percent, the lowest share in the past 60 years. DPI is the amount of money that U.S. consumers have left to spend or save after paying taxes. The share of DPI spent on food in the United States was relatively steady over the last 20 years, decreasing from 9.95 percent in 2000 to 9.58 percent in 2019. Consumers spent 1.4 percent more of their incomes on food at supermarkets, convenience stores, warehouse club stores, supercenters, and other retailers (food at home) from 2019 to 2020, while they spent 22.2 percent less of their incomes on food at restaurants, fast-food places, schools, and other places offering food away from home over the same period. Changes in the shares of income spent on food in 2020 resulted, in part, from pandemic-related closures and restrictions at food-away-from-home establishments, as well as from the largest annual DPI increase in 20 years. The increase in DPI was driven by additional government assistance to individuals in 2020, including stimulus payments to households and increased unemployment insurance benefits. The data for this chart come from the Economic Research Service's Food Expenditure Series data product. Average share of income spent on food at home in the U.S. has fallen over time, but less sharply over the last 2 decades

Percent

Source: USDA, Economic Research Service (ERS) using data from the ERS Food Expenditure Series.

In 1960, U.S. consumers spent an average of 17.0 percent of disposable personal income (DPI) on food. By 2019, this share had shrunk to 9.5 percent. This decrease was driven by a decline in the share of income people spent on food at home. The share of DPI spent on food purchased at supermarkets, supercenters, convenience stores, and other retailers fell from 13.7 percent in 1960 to 5.7 percent in 2019. Over the same period, the share of DPI spent on food purchased from restaurants, fast-food places, schools, and other away-from-home eating places rose from 3.3 percent to 4.2 percent. The declining share of income spent on food at home reflects, in part, efficiencies in the U.S. food system (which kept inflation for food-at-home prices generally low) and rising disposable incomes. A slower decline in share of income spent on food at home after 2000 could reflect U.S. consumers opting to prepare more meals at home and purchasing more expensive grocery store options than they did in earlier decades. This chart appears in “Average Share of Income Spent on Food in the United States Remained Relatively Steady From 2000 to 2019,”⁶ in the Economic Research Service’s *Amber Waves* magazine, November 2020.

Last updated: Friday, December 11, 2020 **For more information, contact:** *Eliana Zeballos*⁷ and *Wilson Sinclair*⁸

Food Spending During the Pandemic (2020–2021): Analyzing data from the ERS *Food Expenditure Series*⁹ found expenditures at restaurants, school cafeterias, sports venues, and other eating-out establishments (*i.e.*, food away from home or FAFH) dropped 48 percent from February 2020 to April 2020, the beginning of the COVID–19 pandemic. Inflation-adjusted spending on FAFH in April 2020 was 51 percent lower than April 2019—but by May 2021 spending recovered to exceed the pre-pandemic record set in May 2019. FAFH spending remained strong in December 2021 at 4.4 percent higher compared with pre-pandemic December 2019. FAFH spending surpassed food-at-home (or FAH) expenditures by April 2021 and remained higher than FAH spending for much of 2021. FAH expenditures rose sharply starting in March 2020 and remained higher than 2019 levels, setting a new record of \$90 billion in December 2021. Total inflation-adjusted expenditures on food were 6.5 percent higher in December 2021 compared with December 2019. In March 2020, efforts to limit the spread of COVID–19 included stay-at-home orders that led

⁶ <https://www.ers.usda.gov/data-products/chart-gallery/gallery/chart-detail/?chartId=100002>.

⁷ <https://www.ers.usda.gov/authors/ers-staff-directory/eliana-zeballos/>.

⁸ <https://www.ers.usda.gov/authors/ers-staff-directory/wilson-sinclair/>.

⁹ <https://www.ers.usda.gov/data-products/food-expenditure-series/>.

to significant changes in U.S. consumers' food-spending patterns. Food spending patterns in 2021 reflect the effects of the increased reopening of restaurants and increases in household income with economic recovery.

Food Prices: The Food Price Outlook tracks recent trends and provides forecasts on farm-, wholesale-, and retail-level food prices as measured by the Producer Price Index (PPI) and Consumer Price Index (CPI) published by the Bureau of Labor Statistics. The all-food CPI increased by 3.4 percent in 2020 and 3.5 percent in 2021, well above the 20 year average of 2.4 percent. In January and February 2022, the all-food CPI increased by 1.0 percent, and increased by 7.0 percent and 7.9 percent from a year earlier, respectively. The most recent food price forecasts were released February 25th, at the very beginning of the most recent conflicts in Ukraine. At the time of this forecast, food prices were predicted to increase between 2.5 and 3.5 percent in 2022, faster than the historical average. Food-away-from-home prices are predicted to increase between 4.0 and 5.0 percent; food-at-home prices are predicted to increase between 2.0 and 3.0 percent.

The Food Dollar: The ERS *Food Dollar*¹⁰ 'Food at Home: Industry Group' (FAH-IG) series tells us what the distribution of value accumulation (or costs) are along the sequence of activities between farm production, food processing, transportation, marketing, and other supporting activities, culminating in grocery store and related retail food purchases. According to the FAH-IG, 15.2 percent of spending for all grocery store and related retail food purchases covered agribusiness (farm inputs) and farm production cost contributions, with another 63.5 percent of cost contributions coming from food processing (24.5%), wholesalers (16.6%) and food retailers (22.4%). The remaining 21.3 percent of costs come from various other supporting industries. Spending of this type totaled \$876.8 billion in 2020 (see *Food Expenditures*¹¹).

Although food price inflation in 2019 was not nearly as pronounced as in 2020, 2021, or to date in 2022, the 2020 FAH-IG series does show how price pressures were in play between 2019 and 2020. For example, primary factor value added (labor and overhead) costs per unit of output increased most among agribusiness (4%) and farm production (6%) establishments serving the domestic food retail market. More modest per-unit cost increases are shown in other supply chain industry groups, whereas per-unit costs among energy commodities used in domestic food production declined ten percent in 2020—a trend that has clearly reversed in 2021–22. For example, according to the Bureau of Labor Statistics, the year-over-year change in the producer price index (PPI) for electric power rose by over 21 percent in 2021, and the February 2022 monthly PPI is 5.9 percent above the December 2021.

On March 11, 2022, USDA also announced plans to support additional fertilizer production for American farmers to address rising costs and spur competition. USDA will make available \$250 million through a new grant program this summer to support independent, innovative and sustainable American fertilizer production to supply American farmers.

SUBMITTED LETTER BY LOTANNA OBODOZIE, CLIMATE CAMPAIGN DIRECTOR,
NATIONAL YOUNG FARMERS COALITION

Re: In Regards to the Farm Bill Conservation Programs Hearing before the U.S. House of Representatives Committee on Agriculture, Subcommittee on Conservation and Forestry

Date: February 2, 2022

¹⁰ <https://www.ers.usda.gov/data-products/food-dollar-series/>.

¹¹ <https://www.ers.usda.gov/data-products/food-expenditure-series/>.

The National Young Farmers Coalition (Young Farmers) thanks the U.S. House of Representatives Committee on Agriculture for holding this hearing on farm bill conservation programs. Climate change is an increasing and persistent threat to agriculture, disrupting food production across the country and the rest of the world. The agricultural sector, however, is uniquely poised to be able to directly mitigate the disastrous effects of climate change through practices that sequester carbon in the soil and provide other ecosystem services to build on-farm climate resilience. Farm bill conservation programs are critical elements in combating climate change as well as improving access to land for the next generation. We thank the Honorable David Scott, Glenn “GT” Thompson, Abigail Spanberger, and Doug LaMalfa for holding this hearing to discuss impacts of and opportunities for improving farm bill conservation programs.

The National Young Farmers Coalition works closely with young farmers across the country to assist them in building resilience to climate change through training, building farmer networks across the U.S., and advocating for policy change at the state and Federal level. Our campaigns focus on key issues, identified by our members, to address the major obstacles young farmers face.

In a 2017 national survey of our coalition, 66% of respondents reported experiencing unpredictable weather and 53% attributed those changes to climate change.¹ Furthermore, in a 2020 survey of policy issues, our members across the country identified addressing climate change as their number one priority.² Young farmers, particularly Black, Indigenous and other people of color (BIPOC) farmers are on the frontlines of experiencing and responding to this crisis. Our farmers have experienced increased pest pressure, uncertainty and severe fluctuations in water supply, and increased rates of disease, with seemingly no end in sight. Young farmers have lost crops and sustained damage to their farms due to extreme weather events, have had disrupted growing seasons, suffered severe economic losses, and have shut down operations due to droughts and unsafe conditions from uncontrolled wildfires.

Further compounding this issue is the lack of access to affordable, quality land, as farmland, agriculture, and the climate crisis are deeply intertwined. Land is the foundation of nourishment and resiliency and is the number one tool available to farmers in the fight against climate change. Land that is stewarded plays a critical role in climate change mitigation and resilience, yet accelerating trends of farmland loss are occurring disproportionately on soils rated highest for productivity, versatility, and resiliency.³ Additionally, the dispossession of land from BIPOC individuals and the ongoing consolidation of land into the hands of fewer and fewer owners makes this issue all the more difficult for BIPOC farmers. Secure land tenure is critical to farmers’ ability to remain in the field long-term and to making deep-rooted and long lasting climate interventions. Despite being heavily affected by climate change, farmers have the transformative power to sequester carbon by using climate-smart methods including planting cover crops, using no- and reduced-till methods, and managed grazing. By incorporating these methods and others like them, farmers can simultaneously provide healthy food to their local communities—but they can only do so with access to land.⁴

Farm bill conservation programs, such as the Environmental Quality Incentives Program (EQIP), the Agricultural Conservation Easement Program (ACEP), the Regional Conservation Partnership Program (RCPP), the Rural Energy for America Program (REAP), and the Conservation Stewardship Program (CSP) are all tools that can assist farmers in achieving climate resiliency, however, many of our farmers are not using these programs. Only 46% of our national survey respondents reported using Federal programs, and first-generation farm owners in particular were less likely to have used Federal programs.⁵ The number one reason cited by our farmers is that they’re not using these programs because they do not know about

⁵ Sophie Ackoff, et al., “Building a Future with Farmers II,” † November 2017, <https://www.youngfarmers.org/resource/building-a-future-with-farmers-ii/>.

them—a sentiment that has been echoed over and over again. The USDA must expand accessibility by prioritizing the design and modification of new and existing programs that resource farmers and encourage a new generation of farmers to fight climate change. Intentional outreach must also take place, and this outreach will require resources and trust-building.⁶

Time and administrative burdens were also reported to be a significant barrier to accessing these programs.⁷ In addition to farm work, many of our farmers have other concurrent responsibilities—supplemental jobs, caretaking, education, *etc.*—and do not have the time or bandwidth to spend on laborious application processes. There is also the perception among young farmers that these programs were not made for them, and therefore are not appropriate for their operations. Young farmers are operating small, diversified farms, and many have stated that they do not feel as if these farm bill programs will work for them. USDA officials and technical assistance providers often lack the cultural competency to advise young farmers because of the type of operations they run. To support the next generation of young farmers and ranchers, transition productive farmland, and revitalize our nation's rural communities, considerable progress must be made in the way that USDA serves young farmers.

Recent efforts to improve EQIP and the Conservation Stewardship Program (CSP) will increase accessibility for young, marginalized farmers and are a step in the right direction,⁸ however more work needs to be done to fully enable farmers to invest in on-farm conservation. By increasing the transparency of programs that help historically underserved farmers and ranchers gain access to land and other government services, we can begin the important work of addressing the climate crisis and investing in a sustainable and resilient future with farmers leading the way.

Young Farmers would like to thank the Honorable David Scott, Glenn 'GT' Thompson, Abigail Spanberger, and Doug LaMalfa for convening this hearing to discuss farm bill conservation programs. These programs are critical for combating climate change and improving access to land. We look forward to working with you to find ways to make these programs work for young, beginning, and BIPOC farmers.

Sincerely,

LOTANNA OBODOZIE,
Climate Campaign Director,
National Young Farmers Coalition.

SUBMITTED STATEMENT BY LESLI ALLISON, EXECUTIVE DIRECTOR, WESTERN
LANDOWNERS ALLIANCE

Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee, the Western Landowners Alliance (WLA) appreciates the opportunity to submit this statement on Farm Bill Conservation Programs. The Western Landowners Alliance is a landowner-founded, landowner-led nonpartisan organization that advances policies and practices that sustain working lands, connected landscapes and native species. Our members represent millions of acres of leased and deeded land across the West.

Background

Every year we lose more farms and ranches to development. Those that remain are under increased pressure to provide not just food and fiber but a range of other public benefits such as wildlife habitat which can increase the cost of production. Farm bill programs represent an important public-private partnership that enables producers to provide these public benefits while remaining economically viable.

WLA appreciates the efforts of Members of the Subcommittee in developing and passing the 2018 Farm Bill. Certain changes made to programs improved the availability of programs for farmers and ranchers throughout the West. For example, improvements to the Grasslands Conservation Reserve Program (GCRP), including expanded ranking criteria and adjusted payment rates, resulted in record-breaking signups, a win-win for producers and native grasslands.

⁶National Young Farmers Coalition, "2021 Climate Policy Recommendations," † May 2021, <https://www.youngfarmers.org/2021/05/2021-climate-recommendations/>.

⁸National Sustainable Agriculture Coalition, "Release: NRCS Announces Improvements to CSP and EQIP," † January 2022, <https://sustainableagriculture.net/blog/release-nrcs-announces-improvements-to-csp-and-eqip/>.

At the same time, this and other farm bill programs could be further refined and better implemented to support both agriculture and natural resource conservation in the region. Following GCRP sign-up 203, we surveyed our membership on their interest in the program and their experience enrolling. Based on the feedback we received, along with other first-hand experience with other USDA conservation programs, we offer the following general comments on farm bill conservation programs.

WLA Comments

Agency Capacity

Landowners reported that internal communication challenges and capacity issues within the USDA hinder program delivery. Any discussion on successes and challenges of conservation programs must include a focus on increasing capacity of the agencies charged with implementing them. Providing the Natural Resources Conservation Service (NRCS) and the Farm Service Agency (FSA) with sufficient staffing and resources is key to effective implementation of conservation programs. Without adequate staffing, these agencies are unable to provide sufficient technical assistance, expertise and process enrollment applications. Beyond staff capacity, the issue of staff turnover and relocation was also cited as a considerable barrier to more effective implementation of farm bill programs in rural communities.

Program Complexity and Delivery

Complexity of the enrollment and agreement processing also limits the efficacy of staff and serves as a barrier to entry for interested landowners. The amount of paperwork required to carry out programs should not be so cumbersome that staff do not have time to learn conservation programs or assist landowners in the field. Landowners reported being overwhelmed by the number of steps required to enroll, additional uncommunicated requirements after enrolling, and felt a lack of transparency around the process. Some of this likely stems from USDA capacity issues again, but it is clear that moving forward, program delivery and improved outreach to landowners is an essential component of improving farm bill conservation programs.

Resource Coordination

Increased funding for Federal conservation programs will only do so much without a dedicated focus on simplifying the process for producers and exploring how to better leverage the capacity of trusted, local leaders to conduct community outreach and assist producers in navigating the suite of conservation programs offered. To improve program delivery, and increase outcomes for producers and the resource, USDA should explore placing jointly-funded, dedicated “resource coordinator” staff positions within community-based organizations. Coordinators would be trained experts, providing capacity for outreach as well as an informative, time-saving point of contact for landowners. They would be knowledgeable on a wide range of USDA programs, but also familiar and able to work across state and Federal departments and jurisdictions to help align interagency expertise, priorities and funding. This approach would provide for greater coordination, efficiency, cost-savings and more effective utilization of Federal funding while also increasing local capacity for collaborative conservation.

Rewarding Biodiversity Stewardship

The cost of at-risk species conservation and listed species recovery efforts is often disproportionately placed on farmers and ranchers. Species displaced by land development, resource extraction or other activities often find safe harbor on private lands. Recent improvements to GCRP are a powerful step in the right direction toward the farm bill better recognizing this, particularly with refinement in the areas above. The Working Lands for Wildlife program also effectively advances proactive, collaborative conservation on private land and warrants additional funding as threats to biodiversity mount.

Conclusion

WLA appreciates the opportunity to submit this statement. The 2018 Farm Bill took significant strides forward in advancing WLA priorities addressed above. We look forward to working with you to continue to improve conservation program accessibility and practicality for western working lands. This work is imperative if we are to combat threats such as climate change, habitat fragmentation and biodiversity loss while ensuring economic viability of producers and rural communities.

SUBMITTED STATEMENT BY COLIN O'NEIL, LEGISLATIVE DIRECTOR; ANNE SCHECHINGER, MIDWEST DIRECTOR, ENVIRONMENTAL WORKING GROUP

To avoid the worst effects of climate change, we must swiftly reduce greenhouse gas emissions from agriculture. But a small fraction of Department of Agriculture conservation spending flows to practices that reduce greenhouse gas emissions, and the reforms included in the 2018 Farm Bill have done little to make these practices a priority.

To address the climate crisis, Congress must quickly enact the Build Back Better Act, which includes \$27 billion for conservation practices that reduce greenhouse gas emissions, and must fundamentally reform the Environmental Quality Incentives Program (EQIP), Conservation Stewardship Program (CSP), Conservation Reserve Program (CRP), and other voluntary conservation programs to make the reduction of emissions as well as long-term and permanent storage of carbon the focus of these programs.

Structural practices designed to boost farm income—such as irrigation pipelines, manure lagoons, roofs and roads—should not be financed through conservation programs.

Agriculture is not only one of the biggest sources of water pollution in the United States, *impairing drinking water*¹ for millions of Americans and contributing to toxic algae blooms and hypoxic dead zones. Agriculture is also a significant and growing *source*² of greenhouse gas emissions that, if left unaddressed, will jeopardize our efforts to avoid a climate crisis. In particular, *nitrous oxide*³ emissions from fertilizing crops and animal feed, and the *methane*⁴ emissions from livestock and their manure, are growing sources of greenhouse gas emissions. Carbon dioxide from tilling fields is also important to agriculture's emissions footprint. Unless we reduce nitrous oxide, carbon dioxide and methane emissions from agriculture, we will fail to make the greenhouse gas reductions *needed*⁵ to avoid the worst impacts of climate change.

Voluntary conservation programs administered by the USDA could play a significant role in reducing the impacts of farm pollution, reducing greenhouse gas emissions, and mitigating the effects of climate change.

But many farmers are *turned away by USDA*⁶ when they apply to participate in voluntary conservation programs, because the department lacks the resources to accommodate them. Last year, more than 100,000 farmers were *turned away*⁷ by USDA from participating in its two flagship working lands conservation programs. What's more, most conservation funding flows to practices that fail to reduce emissions and actually increase emissions, in some cases.

Congress must provide more resources for USDA's voluntary conservation programs and must ensure that conservation funds get directed toward the conservation practices that will reduce greenhouse gas emissions. The same practices that reduce nitrous oxide and methane emissions also improve air and water quality and make our farms better able to withstand the extreme weather caused by climate change.

To address the climate crisis, the Committee should:

(1) Make climate change the primary focus of conservation practices. Congress must significantly increase USDA resources targeted at reducing agricultural greenhouse gas emissions and increasing climate resiliency. The historic investments proposed in the Build Back Better Act would provide a once-in-a-generation opportunity to increase funding and target conservation investments in practices that reduce greenhouse gas emissions. Congress should look to the policy reforms in the Climate Stewardship Act introduced by Sen. Cory Booker (D-N.J.) and Rep. Abigail Spanberger (D-Va.) for additional guidance on climate investments and reform ideas.

⁷<https://www.ewg.org/news-insights/news/2021/08/growing-farm-conservation-backlog-shows-need-congress-spend-smarter>.†

In the past year, USDA has taken steps to incorporate climate goals in its conservation programs, including, among other things, establishing a *pilot program*⁸ within EQIP for “climate-smart” agriculture and forestry practices in FY 2021; announcing a *new initiative*⁹ to finance the deployment of climate-smart agriculture and forestry practices; *creating*¹⁰ a new Climate-Smart Practice Incentive for general and continuous signups within CRP; and most recently *releasing*¹¹ an updated list of climate-smart agriculture and forestry practices for CSP and EQIP for FY 2022 enrollment.

Although that is an important first step, much more must be done to ensure that existing conservation programs focus on climate goals and do not fund practices that exacerbate the climate crisis.

For example:

- Many of the practices identified as “priority practices” by states to be eligible for higher 90 percent cost share under EQIP don’t reduce greenhouse gas emissions, or they actually increase emissions. (*e.g.*, Agrichemical Handling Facility, Livestock Pipeline and Well Decommissioning; see *Appendix*).
- Several practices eligible for enrollment in EQIP’s Conservation Incentive Contracts (CIC)^[i] either do not address greenhouse emissions or actually increase emissions, as is the case with Surface Roughening and Short Term Storage of Animal Waste and Byproducts (see *Appendix*).^[ii]
- The list of climate-smart agriculture and forestry practices identified within CSP fails to include bundles of enhancements (*e.g.*, Buffer Bundle, Crop Bundle #1—Precision Ag-No Till), which consistently rank among the most effective conservation activities eligible for CSP payments.
- Agricultural land easements do not require that producers adopt any of the climate-smart agriculture and forestry identified within EQIP or CSP as a condition of enrollment.

(2) End or reduce support for practices that do not reduce pollution. USDA should fund only practices that provide clear public health benefits or are highly effective at addressing the most pressing resource concerns, such as reducing agricultural greenhouse gas emissions and protecting sources of drinking water from farm runoff.

A number of conservation practices (*e.g.*, Land Clearing and Deep Tillage) financed through EQIP actually contribute to the climate crisis, according to the government’s own data (see *Table 9* in *Appendix*).^[iii] Meanwhile, other practices fi-

⁸ <https://directives.sc.egov.usda.gov/viewerFS.aspx?hid=46894>.†

⁹ <https://www.usda.gov/media/press-releases/2021/09/29/usda-announces-3-billion-investment-agriculture-animal-health-and>.†

¹⁰ <https://www.fsa.usda.gov/news-room/news-releases/2021/usda-announces-new-initiative-to-quantify-climate-benefits-of-conservation-reserve-program>.†

¹¹ <https://www.usda.gov/media/press-releases/2022/01/10/usda-offers-expanded-conservation-program-opportunities-support>.†

^[i] The Conservation Incentive Contracts subprogram of EQIP was established by the 2018 Farm Bill. It provides NRCS with unique tools to address the most pressing resource challenges across the country, including addressing climate change through reducing agricultural greenhouse gas emissions and increasing carbon sequestration efforts. However, EWG analysis finds that in its current form, EQIP CIC does not meet the clear intent of Congress. When Congress passed the 2018 Farm Bill, the managers included clear guidance about how such a program should be implemented. Report language states that the managers anticipate incentive practices with “broad resource benefits (including, but not limited to, cover crops, transition to resource-conserving crop rotations, and incorporation of precision agriculture technologies into agriculture operations) will be available to producers within the program.”

^[ii] Section 2304(b)(2) of the Agriculture Improvement Act of 2018 allows states to identify ten highly effective conservation practices to be eligible for higher 90 percent cost-share payments through EQIP. Under current law, states are only allowed to offer higher 90 percent cost-sharing for new and beginning, veteran or socially disadvantaged farmers. All other producers are eligible for only up to 75 percent cost-sharing. Among other things, the 2018 Farm Bill Conference Report notes that the managers intend for the increased incentives to promote further adoption of these highly beneficial practices by producers in high priority watersheds.

^[iii] To assess the environmental benefits of EQIP practices, EWG used the *Conservation Practice Physical Effects* (https://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/econ/tools/ncid=nrcs143_009740) (CPPE) matrix—a tool NRCS uses in combination with other proprietary software to evaluate and rank the effectiveness of conservation activities in addressing specific causes of impairment (*e.g.*, nutrients in surface water) within resource concerns (*e.g.*, water quality). The CPPE scores how effective a practice is for addressing an impairment with –5 meaning it makes it demonstrably worse, and +5 meaning it’s highly effective. EWG added the scores each practice received across all 47 specific causes of impairment and created a total score. The highest EQIP practice, riparian forest buffer, received a 98. The lowest practice, land

nanced through EQIP and CSP provide little to no benefit to the environment or public health.

Many capital-intensive infrastructure improvements currently funded by conservation programs should instead be financed through an expanded conservation loan program. According to *EWG analysis*,¹² historically, payments for high-cost structures, equipment or facilities appeared in 38 percent of contracts but received 62 percent of EQIP payments.

Congress sought to incentivize the adoption of highly effective conservation practices through EQIP and CSP in 2018 Farm Bill. Although the Natural Resources Conservation Service (NRCS) has improved its implementation in the past year, EWG analysis finds that the practices eligible for higher cost-sharing or priority under EQIP often do not align with Congressional intent.

In 2021, few states chose to include the highest ranking EQIP practices when choosing which ten practices would be eligible for higher 90 percent cost sharing. NRCS must provide clearer guidance or limits on the types of conservation practices that states can elect as being high priority practices for purposes of higher cost sharing (see *Appendix*).

(3) Focus investments on long-term and permanent benefits. USDA must swiftly prioritize and expand the number of acres enrolled in long-term CRP contracts and permanent easements to reduce nitrous oxide emissions from fertilizer applications, protect drinking water supplies and ensure long-term storage of carbon in soils and biomass while reducing support for short-term land retirement contracts where benefits are fleeting.

The 2018 Farm Bill included a number of reforms^[iv] to prioritize long-term contracts within CRP, but much more needs to be done to prioritize longer-term contracts or permanent easements for environmentally sensitive lands and end the enrollment of prime farmland in short-term contracts. For instance, *EWG analysis*¹³ has found that millions of acres of land enrolled through 10 year general CRP contracts go back into production when the contracts expire or crop prices rise. When contracts expire and land is returned to farming, soil carbon is released into the atmosphere.

Although USDA has increased incentive payments for continuous CRP and water quality practices, the number of acres enrolled through high priority categories like Conservation Reserve Enhancement Program (CREP) *stand*¹⁴ roughly 500,000 acres less than they were a *decade ago*,¹⁵ and CLEAR30 enrollment accounts for less than one percent of total acres enrolled in Clean Lakes, Estuaries and Rivers (CLEAR). It is critical that we shift priorities within CRP from short-term contracts to temporarily restore farmland in favor of long-term or permanent restoration projects that will produce long-lasting benefits.

Finally, long-term contracts for working lands practices must focus on highly effective conservation activities with broad resource benefits. When Congress established EQIP CIC in the last farm bill, it anticipated that USDA would focus this longer-term, 5 to 10 year contract period on incentive practices with “broad resource benefits.” However, EWG analysis finds that too many practices eligible for incentive payments are one-time practices that do not deserve long-term contracts (*e.g.*, Emergency Animal Mortality Management) or are more akin to on-farm projects a farmer would presumably fund themselves (*e.g.*, Surface Roughening; see *Appendix*). Focusing on highly effective management and vegetative practices would be the most cost-effective way for NRCS to focus limited resources and meet Congressional expectations.

clearing, received a -22. EWG then gave each practice a rank from 1 to 166 for how well each practice scored.

¹² <https://conservation.ewg.org/>.

¹³ <https://www.ewg.org/research/retired-sensitive-cropland-here-today-gone-tomorrow>.†

^[iv] The 2018 Farm Bill established for the first time a minimum number of acres to be enrolled through the continuous categories of CRP, like CREP and new CLEAR Initiative. It also established a CLEAR30 Pilot Program where producers could enroll eligible land for 30 year contracts. Unlike general CRP contracts, which pay farmers to convert large tracts of land to grass for 10 years and then return them to production, CLEAR30 will result in longer-lasting climate, environmental and public health benefits in watersheds that are significantly impacted by farm pollution, like the Western Lake Erie Basin and Chesapeake Bay.

SUBMITTED QUESTIONS

Questions Submitted by Hon. Chellie Pingree, a Representative in Congress from Maine

Response from Terry Cosby, Chief, Natural Resources Conservation Service, U.S. Department of Agriculture

Question 1. Following up on our discussion at the hearing, can you provide an update on the interim soil carbon amendment practice (808)? Where has it been authorized for use to date? Where has it been implemented so far?

Answer. NRCS is in the process of revising the Soil Carbon Amendment Conservation Practice Standard for publication in the National Handbook of Conservation Practices. The practice has been an interim practice under code 808 since FY20. When it becomes a national practice standard, it will be given a new practice code number. A final national practice standard is expected to be available to all states in FY23.

All states currently have the option to make available the interim practice, and 22 states have adopted the interim practice (808) in FY22. From FY20–22 the practice has been installed on 2,150 acres primarily in CA and UT. For FY22–25 the interim is planned on 34,000 acres across AR, CA, CO, CT, DE, ID, IN, MA, MT, NE, NH, NJ, NY, OR, PIA, UT, WY, and VT.

Question 2. There has been a lot of discussion about the need for additional technical assistance to help farmers adopt climate-smart practices. One specific area where I've heard a need is additional technical assistance and support for organic production systems. What can NRCS do to expand technical assistance for organic operations and farms transitioning to organic production? How can NRCS increase organic literacy for NRCS staff on the ground?

Answer. Conservation financial and technical assistance plays a critical role in supporting certified organic producers and producers transitioning to organic production.

Organic Technical Assistance: NRCS provides technical assistance (TA) through the Conservation Technical Assistance (CTA) program prior to providing financial assistance funding (FA) for conservation program funding. NRCS follows a nine-step conservation planning process that identifies the producer's conservation objectives and assesses and analyzes the natural resources issues on the land related to soil, water, animals, plants, air, energy, and human interaction while considering the resources the producer has available. The plan offers alternatives, documents decisions, records progress and tracks successful completion of conservation practices and systems, and provides guidance and direction for continued maintenance once established. NRCS is continuing to explore and expand innovative opportunities to provide technical assistance to farmers transitioning to organic.

EQIP and CSP Organic Initiative: Producers who are exempt, in transition, or organic may apply for funds through the Environmental Quality Incentives Program (EQIP) National Organic Initiative (NOI) and compete in separate NOI funding pools. Exempt, in-transition, or organic producers may also apply for assistance through any of the EQIP funding pools that they are eligible for and are not limited to EQIP NOI. The benefit of other EQIP funding pools is the increased payment limitation of \$450K *versus* the \$140K for the NOI.

The Conservation Stewardship Program (CSP) has specific statutory language requiring NRCS to provide funding to states to support organic production and transition to organic production based on the number of certified and transitioning organic operations, and the number of acres of certified and transitioning organic production, within a state. In FY 2022, NRCS set aside \$13.7M for CSP assistance for organic production and transition.

Training: NRCS developed a new training course "Working Effectively with Organic Producers" and had a very effective virtual rollout in FY 2021. Delivered 16 sessions to 650 participants. For organic producers, NRCS has an organic team to provides direction, training and tools for states to help with outreach and delivery at the local level. NRCS also has a team of organic champions available to help NRCS staff help producers who are interested in transitioning, or are in transition, or are already organic, to learn about NRCS programs and the types of assistance that are available.

There are several actions that NRCS has taken and will continue to do to increase organic literacy for our field staff, including:

- Provide leadership communications on the importance of assisting organic producers

- Encourage staff to complete the new Working Effectively with Organic Producers course
- Set performance goals for assisting organic/transitioning producers
- Reward employees for outstanding delivery of services
- Encourage attendance at organic agricultural events
- Encourage mentorship relationships with organic farmers
- Encourage establishing working relationships with organic certifiers
- Require each State Organic Champion to be an official co-lateral duty
- Provide more permanent staff for direct support to organic producers

In addition, other USDA agencies, such as the Agricultural Marketing Service (AMS), are also working to develop new opportunities to better support U.S. producers interested in transitioning to organic production. As you have heard firsthand from producers in your state, our data from the National Agricultural Statistics Service backs it up that the number of non-certified organic farms actively transitioning to organic production has dropped by nearly 71 percent since 2008.

**A 2022 REVIEW OF THE FARM BILL
(COMMODITY GROUP PERSPECTIVES ON TITLE I)**

TUESDAY, MARCH 1, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, Costa, Adams, Spanberger, Hayes, Delgado, Brown, Rush, Pingree, Sablan, Kuster, Bustos, O'Halleran, Carbajal, Khanna, Lawson, Correa, Craig, Harder, Axne, Schrier, Panetta, Bishop, Thompson, Austin Scott of Georgia, Crawford, DesJarlais, LaMalfa, Davis, Allen, Rouzer, Kelly, Bacon, Johnson, Baird, Jacobs, Balderson, Cloud, Mann, Feenstra, Miller, Moore, Cammack, Fischbach, and Letlow.

Staff present: Lyron Blum-Evitts, Carlton Bridgeforth, Prescott Martin III, Ashley Smith, Joshua Tonsager, Patricia Straughn, Trevor White, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. The hearing will come to order. Ladies and gentlemen, I would like to start our hearing with a prayer for one of our distinguished Members who passed away, Jim Hagedorn. Won't you join me in standing?

Dear Heavenly Father, we come before your throne of grace to say thank you. We thank you for sending our friend, Jim Hagedorn of Minnesota, our way, and Dear Heavenly Father, we respectfully ask and humbly ask that you put your arms and your hands of your loving comfort around his family, his wife, Jennifer, and also, Dear God, around the wonderful people from Minnesota who sent Jim to Congress. We are so grateful. Jim Hagedorn fought a good fight. He finished his course, and Dear God, Jim Hagedorn kept the faith. And I know now that you have put that crown of righteousness on his head. Dear Heavenly Father, Jim Hagedorn played a pivotal role and did great work for agriculture, which he loved dearly. And so, Dear Heavenly Father, we thank you for sending Jim Hagedorn our way. Amen.

Okay. Thank you all, and I welcome you for joining us today. Today's hearing is entitled, *A 2022 Review of the Farm Bill: Commodity Group Perspectives on Title I*. After brief opening remarks,

Members will receive testimony from our witnesses today, and then the hearing will be open to questions. I will start with my opening statement.

I want to, again, say good morning to everyone, and thank you for joining us. We have some very distinguished panelists who will give us great perspectives from our commodity groups, on the commodity title programs in our 2018 Farm Bill. And I am pleased to have this distinguished panel of nine representatives from a variety of national commodity associations. In particular, I am also proud to say that we have two farmers from my home State of Georgia testifying this morning who are representing our important cotton and peanut industries. Georgia is number one in the country for peanut production and number two for cotton production.

I know several of the organizations our witnesses represent will be convening at Commodity Classic next week, which is an important venue for our policy discussions. And I know that you all will be working hard throughout this year, developing recommendations for the next farm bill.

Today's hearing is an important opportunity for us to, first of all, reflect on our commodity programs in our 2018 Farm Bill and gather input from key stakeholders on what is working and what is not working for our wonderful farmers across our nation. And to all of our witnesses, I appreciate you taking the time to join us today for what I am sure will be a very informative hearing. Thank you all again for coming.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning and thank you to everyone for joining us today as we gather perspectives from commodity groups on the Commodity Title programs in the 2018 Farm Bill.

I am pleased to have this distinguished panel of nine representatives from a variety of national commodity associations.

In particular, I am proud to say that we have two farmers from my home state of Georgia testifying this morning who are representing our important cotton and peanut industries. Georgia is number one in the country for peanut production and number two for cotton production.

I know several of the organizations our witnesses represent will be convening at Commodity Classic next week, which is an important venue for policy discussions. And I know that you all will be working hard throughout this year developing recommendations for the next farm bill.

Today's hearing is an important opportunity for us to reflect on commodity programs in the 2018 Farm Bill and gather input from key stakeholders on what is working and is not working for farmers across the country.

To all of our witnesses, I appreciate you taking the time to join us today for what I am sure will be an informative hearing. Thank you all again.

With that, I now yield to the distinguished Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for any opening remarks he would like to give.

The CHAIRMAN. And with that, I now would like to welcome our distinguished Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for his opening remarks.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, Mr. Chairman, thank you very much.

Before we begin, I would like to take a brief moment to echo Chairman Scott and send my thoughts and prayers to the family and staff of our late friend and colleague, Representative Jim Hagedorn. Jim was a tireless advocate on behalf of our nation's farmers, ranchers, producers, and foresters, and his love for this Committee and rural America will not soon be forgotten. I consider myself blessed to call Jim a dear friend, and I am honored to have known him and worked alongside him. I send my heartfelt condolences and prayers to his entire family and staff during this time of significant loss. Our hearts are with you.

Chairman Scott, thank you for convening this hearing today, and giving the Members of this Committee the opportunity to hear directly from these representatives of the commodity organizations regarding Title I of the farm bill. We have 19 months before the 2018 Farm Bill expires, but before we can begin thinking about the 2023 reauthorization, we must first have a thorough understanding of how current policy is performing, and we kick that audit process off here today.

I want to thank the witnesses who agreed to participate in this hearing, as well as the organizations they represent. Unfortunately, in the past, we have seen what can happen to the farm bill when there is divisiveness and a lack of consensus among key stakeholders, such as during the process leading up to the 2014 Farm Bill, which ultimately took over 3 years and a lot of ups and downs before it was enacted. Compare that to the 2018 Farm Bill, which may have been tumultuous at times, but it marked the first time in almost 30 years that a farm bill was introduced in both chambers and enacted into law within 1 calendar year. Plus, the conference report was passed by a record margin in both the House and the Senate.

From my perspective, the key difference that led to the success in the 2018 Farm Bill was that the commodity organizations were all rowing in the same direction. During the development of the 2023 Farm Bill, there may be some differences of opinion along the way, but I am hopeful and I challenge all of our key stakeholders to make sure that they are unified as we fight back against the critics of farm policy. Our farmers are the lifeblood of the rural economy, and having a reliable domestic source for food is a matter of national security. Yet those who are not involved in agriculture likely don't comprehend the enormous risks that our farmers and ranchers take on year in and year out to ensure that there is food on the shelves. The disruptions from the COVID-19 pandemic opened many Americans' eyes to the importance of reliable food production, and while for the average consumer things may have somewhat returned to normal, for our farmers, it is anything but. They are facing unprecedented disruptions in the supply chain for critical inputs, skyrocketing energy costs, and difficulty transporting their commodities. Though there is no silver bullet, the safety net is intended to help absorb some of the risks our farmers face.

I look forward to an honest conversation about how Title I is performing in that regard. I hope the Members of this Committee walk away from this hearing with a thorough understanding of what is working and what needs improving. The path to success in any

farm bill reauthorization begins on the front end with hearings like this. The primary responsibility of the organizations represented here is to provide the key input Congress needs to get the policy right. Each farm bill is different and each one comes with its own unique challenges. It is critical at this stage of the game for stakeholders to give us an honest assessment of where we stand, and moving forward to focus on developing the safety net our producers need, rather than trying to dictate the process.

So, I would like to, again, thank our witnesses here today, and I look forward to working with each of you and the organizations you represent. Thank you, Mr. Chairman, and I yield back.

The CHAIRMAN. Thank you, Ranking Member.

And now, I am very pleased to recognize the Chair of our General Farm Commodities and Risk Management Subcommittee, the gentlewoman from Illinois, Mrs. Bustos, for any opening remarks she would like to make.

**OPENING STATEMENT OF HON. CHERI BUSTOS, A
REPRESENTATIVE IN CONGRESS FROM ILLINOIS**

Mrs. BUSTOS. All right. Thank you very much, Mr. Chairman, and I also want to thank the Ranking Member for allowing me to offer some very short opening remarks about this important hearing.

As the Chair of the Subcommittee with jurisdiction over Title I programs, I think this hearing is an important component for the work that our full Committee is undertaking so that we understand what is working and what is not working with our commodity programs so Congress is able to make informed decisions as we head into the next farm bill reauthorization process.

Last month, our Subcommittee had the opportunity to hear from, and then engage with, Under Secretary Robert Bonnie on the state of farm policy, and we were able to hear his perspectives on USDA's implementation of farm bill programs, and on other very important work that the Department has done so it can continue to support farmers over the past year and into the future. The input combined with the testimony that we will hear this morning from our national commodity associations really is key to our oversight work, and I am looking forward to the input from our witnesses this morning, and also having a continued dialogue with each of our witnesses as we move forward.

Thank you very much to our witnesses for your testimony today, and I look forward to your input about how our existing commodity programs are working.

Thank you, Mr. Chairman, and I will yield back.

The CHAIRMAN. Thank you, Chair Bustos.

And now, I am also pleased to recognize the Ranking Member of our General Farm Commodities and Risk Management Subcommittee, my friend from Georgia, Mr. Austin Scott, for any opening remarks he may have.

**OPENING STATEMENT OF HON. AUSTIN SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

Mr. AUSTIN SCOTT of Georgia. Thank you, Chairman Scott, and thank you to the witnesses that are here before us today. Before

I go into my opening statement, I want to point out that I dug deep into my closet to find the closest colors I had in support of the Ukraine today. I see Chair Bustos did as well, and certainly, our thoughts and prayers go out to President Zelenskyy and the Ukrainian people who are doing a tremendous job of fighting the Russians and the arcane person who is in charge of that country, Vladimir Putin. I think one of the things that the world is about to realize, unfortunately, is just how important the food supply is around the world. I think that over the next several weeks, we will probably see a tremendous number of human beings that will be starving because of the actions of one sick individual.

As Ranking Member of the General Farm Commodities and Risk Management Subcommittee, I am particularly looking forward to taking a deep dive into the policies within Title I of the farm bill. I am looking forward to working with Chair Bustos and the full Committee leadership for the remainder of this Congress. I am hopeful that the work we do this year will set us up for success in delivering an on-time reauthorization in 2023. Many of us are fortunate enough to represent rural districts. We get the opportunity to interact with farmers back home, and yet, even still the producers and the risks that they take each year are hard to fathom. It takes a special individual to be willing to borrow more money than the average American will borrow in their lifetime just to plant seed in the ground and hope to make a crop and pay it off. For them, farming isn't just an occupation. It is their heritage, their livelihood, and a way of life.

Title I is meant to provide a base level of assistance when times are tough and prices fall so that farmers can survive to the next year. Yet, as we look back over the past several years, I am concerned with how much we have had to rely on assistance outside of the farm bill to help our farmers. Natural disasters, retaliatory tariffs, and the coronavirus pandemic are a few of the things that come to mind. These events, we weren't able to see them coming, but I hope we can have a conversation here today, going forward, about what improvements we can make to the safety net to provide farmers more certainty in the face of these kinds of events.

If you dig into the *Census of Agriculture*, there is a statistic that underscores the importance of getting these policies right. There are only 239,000 operations in this country that generate over \$250,000 or more in sales. That is sales, Mr. Chairman, not income. In my district, it would probably take about 300 acres of cotton to hit that number. Of those 239,000 farm operations, just 12 percent produce about 90 percent of all of our food supply. I am going to say that again: 239,000 operations in this country, 12 percent of the farms generate 90 percent of the food supply for our country and what we export. Those are still by and large family farm operations that have had to expand to offset reducing margins. That underscores just how important a working farm safety net is. If things go south, some of those farm operations start to get out of the business of agriculture, we could see significant impacts on our food and fiber production.

Today's hearing is a vital examination of where we stand today, and the start of a conversation about where farm policy needs to be in the future. Mr. Chairman, before I thank you one last time

for this hearing, I want to also mention the impact of bad tax policy on our family farms. Eliminating stepped-up basis and increases in the estate tax will be devastating to America's farm families and America's food supply.

Mr. Chairman, thank you again. Thank you to the witnesses here today. I look forward to hearing from each of you and working with each of you in the groups, and I hope that you will all pray for President Zelenskyy, the Ukrainian people, and those who are out there fighting for freedom hour by hour.

The CHAIRMAN. Thank you, Ranking Member Scott.

And now, the chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony, and to ensure that we have ample time to make sure we answer all questions.

And now, it is my deep pleasure to introduce our panelists and witnesses for today, and to introduce our first witness, I would like to yield to our colleague from Arkansas, Mr. Crawford.

Mr. CRAWFORD. Thank you, Mr. Chairman. Full disclosure, our first witness is a constituent of mine who I have been friends with for some 20 years. Brad Doyle is a farmer from Poinsett County, Arkansas, and serves as President of the American Soybean Association. He has been a member of the ASA Board of Directors since 2017. In 2017, Brad received the Arkansas Farm Bureau's Stanley E. Reed leadership award. The Doyle family has been recognized as ASA conservation champions. They have implemented two tailwater recovery and canal systems on their own farm to conserve rain water, soil, and nutrients. I appreciate the great work they are doing and I am proud to represent them.

Brad, thank you for being here today, and I appreciate you and all that you do, and Mr. Chairman, thank you for the opportunity to introduce my constituent.

The CHAIRMAN. Thank you.

And our second witness today is Dr. Robert Johansson, the Director of Economics and Policy Analysis for the American Sugar Alliance. He was previously the Chief Economist at the U.S. Department of Agriculture.

Our next witness is Ms. Nicole Berg, a farmer from Paterson, Washington, who is here today testifying on behalf of the National Association of Wheat Growers.

Our fourth witness today is Mr. Chris Edgington, a farmer from Saint Ansgar, Iowa, who is here today testifying on behalf of our National Corn Growers Association.

And to introduce our fifth witness today, I would like to yield once again to my colleague from Georgia, Mr. Austin Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Chairman Scott.

I would like to welcome our next witness, Ms. Jaclyn Dixon Ford, from Alapaha, Georgia. In addition to working her family farm, she manages Dixon Gin Company and is here today testifying on behalf of the National Cotton Council. She is a graduate of the University of Georgia, home of the national champion Georgia Bulldogs, and has been working in the cotton industry for over 25 years. She serves on the ABAC Foundation Board with my wife, Vivian, and Jaclyn, we are glad to have you here.

The CHAIRMAN. Thank you. Our sixth witness is Ms. Verity Ulibarri, a farmer from Melrose, New Mexico, who is testifying today on behalf of the National Sorghum Producers.

Our seventh witness today is Mr. Clark Coleman, a farmer from Bismarck, North Dakota, who is testifying today on behalf of the National Sunflower Association, the National Barley Growers Association, the U.S. Canola Association, and the USA Dry Pea and Lentil Council.

And to introduce our eighth witness today, I would like to yield once again to our colleague from Arkansas, Mr. Crawford.

VOICE. I hope you are doing well, and I will talk to you a little bit later—

The CHAIRMAN. Let me remind all Members, please make sure your microphones are muted when you are not recognized. Thank you.

Mr. Scott—I am sorry, Mr. Crawford.

Mr. CRAWFORD. Thank you, Mr. Chairman. I am doubly honored today to introduce another constituent, Jennifer James, who is a fourth-generation rice farmer from Newport, Arkansas. She is part owner of H and J Land Company, a diversified family farming operation, growing rice, corn, and soybeans. Jennifer and her husband, Greg, farm with Jennifer's father, Marvin Hare. The family takes great pride in their operations' commitment to providing over-winter habitat for water fowl and instituting practices that conserve natural resources. She serves on the USA Rice Federation and U.S. Rice Farmers Board of Directors. I appreciate the great work Jennifer and her family are doing, and I am proud to represent them. Jennifer, thank you for being here today.

The CHAIRMAN. Thank you, and I would like to introduce now our ninth and final witness today, and I would like to yield to our colleague from Georgia, Mr. Bishop.

Mr. BISHOP. Thank you very much, Mr. Chairman.

The CHAIRMAN. Mr. Bishop—

Mr. BISHOP. It is truly—can you not hear me?

The CHAIRMAN. We are having a little bit difficulty. You may want to get a little bit closer to the microphone, Mr. Bishop.

Mr. BISHOP. I apologize.

Again, is this better?

The CHAIRMAN. Yes, it is. You may continue.

Mr. BISHOP. Thank you very much, Mr. Chairman and Ranking Member Thompson, for having this very important hearing today. It is my pleasure and a distinct honor to introduce the witness from Georgia's second Congressional district, Meredith McNair Rogers. Ms. Rogers hails from Camilla, Georgia, in Mitchell County, which is one of the top ten agriculture producing counties in the State of Georgia. She comes from a long line of row crop and [inaudible] farmers, and she is the third generation. And her family is [inaudible]—

The CHAIRMAN. We are having some technical difficulties—

Mr. BISHOP.—[inaudible]. Meredith was the first [inaudible]—

The CHAIRMAN. Mr. Bishop, I hate to cut you there but you are having a little difficulty—

Mr. BISHOP.—leadership academy, which is a program for young leaders involved in the peanut industry, and she has a unique perspective as one of the [inaudible].

The CHAIRMAN. Thank you, Mr. Bishop.

Mr. BISHOP. Thank you.

The CHAIRMAN. And I thank Mr. Bishop for his comments, and apologize for the little difficulty we had technically on that.

I am so pleased to have such a very distinguished panel of witnesses before us today. Your commentary, your insight is very valuable to us to share with us what works, what doesn't work, so we can improve where we need to improve and make sure the American people have a farm bill that we all can be very proud of.

And so, now, witnesses, you will each have 5 minutes. The timer will be visible to you, and will count down to 0, at which point, your time has expired.

So, Mr. Doyle, let us begin with you when you are ready.

**STATEMENT OF S. BRAD DOYLE, PRESIDENT, AMERICAN
SOYBEAN ASSOCIATION, WEINER, AR**

Mr. DOYLE. Good morning, Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee. Thank you for the opportunity to provide testimony on Title I of the 2018 Farm Bill. My name is Brad Doyle. I am a soybean farmer from Arkansas, and I serve as the President of the American Soybean Association.

Soybean growers need a supportive farm safety net when markets fail or when significant economic disruptions occur. Based on farmer feedback we have received, it is clear that improvements are needed to make the Title I safety net effective for soybean farmers.

Since early 2022, ASA has held 12 virtual farm bill listening sessions, both by region and by topic, with interested soybean farmers across soy's 30 primary growing states. An in-depth farm bill survey was also administered to soybean growers in late 2021. Through these listening sessions and the survey, soybean farmers consistently share that the soybean reference price is insufficient. If there were ever a time that the farm safety net was designed for, it was during the China trade war in 2018 and 2019. China is a significant importer of soybeans, importing almost one in three rows of soybeans produced in the U.S. During the height of the China trade war in 2018, U.S. soy stopped flowing into the market during the peak export period that fall. Soybean prices fell about 20 percent. The soybean producers received no PLC payments, and little from ARC under the Title I safety net.

The reference price for determining Title I benefits was set at such a low level that PLC payments never were triggered. In fact, 2005 is the last time that PLC or CCP payment, the predecessor program, was triggered for soybeans. If soybeans, the second-largest crop planted by area in the U.S., did not get help from Title I during this critical situation, it is hard to imagine a scenario where the Title I safety net could provide meaningful help with the current reference price.

Through ASA's listening sessions and survey, soybean farmers also consistently shared the concern that soybean farmers have a

low level of base acres compared to planted acres. ARC and PLC payments are provided on base acres, not on planted acres. In 2021, soybeans were planted on over 87 million acres in the U.S. By comparison, soybean base total acres are 52½ million acres. So, 34½ million acres of soybean acres were not protected by the soybean provisions of ARC and PLC in 2021.

Farmers shared these scenarios throughout our listening sessions to describe these concerns: (1) a young, beginning farmer who is only ten percent base on his or her farm provided little access to the ARC and PLC farm safety net; (2) greater adoption of no-till conservation practices has enabled farmers to cultivate crops in new areas that have no base; (3) small farmers who have transitioned out of tobacco production and have no crop base; (4) farmers have exited the dairy business and have moved into production of other crops with no base acres; and (5), farmers have lost cropland to residential and industrial development, and sought other areas to cultivate.

When our survey respondents were provided options to improve the Title I farm safety net for soybeans, the leading two selections were to increase the soybean reference price for calculating ARC and PLC, and to provide an option to update base acres. Importantly, farmer feedback also suggests that a combination of remedies to address these deficiencies are needed. For example, if an option to update base acres is allowed, it may not be exercised if the reference price of soybeans remains where it is currently set.

In addition to these two specific areas of concern regarding the Title I farm safety net, my written statement provides highlights of a number of other interests.

Thank you again for this opportunity to share ASA's perspectives on Title I of the 2018 Farm Bill.

[The prepared statement of Mr. Doyle follows:]

PREPARED STATEMENT OF S. BRAD DOYLE, PRESIDENT, AMERICAN SOYBEAN ASSOCIATION, WEINER, AR

Good morning, Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee. Thank you for the opportunity to provide testimony on Title I of the 2018 Farm Bill.

I am a soybean farmer from Arkansas and serve as President of the American Soybean Association (ASA).

Founded in 1920, ASA represents more than 500,000 U.S. soybean farmers on domestic and international policy issues important to the soybean industry and has 26 affiliated state associations representing the 30 primary soybean-producing states.

Soybean Economic Impacts

The U.S. soybean industry has a positive impact on the U.S. economy.

In 2021, over 87 million acres were planted to soybeans in the United States with a record-high production total of 4.44 billion bushels according to USDA.

Soybean production alone accounts for close to 150,000 jobs (full-time soy equivalent), more than \$6 billion in wages and \$86.5 billion in revenues, according to a 2019 study by the United Soybean Board and National Oilseeds Processors Association. This does not include secondary soybean markets and supporting industries like biodiesel, grain elevators, feed mills, ports, rail, refining, barge and more, which brings soybean's national revenue impacts to a significant \$115.8 billion. New markets and new uses for soy continue to develop thanks to farmer investments in research and promotion by the soybean check-off and Federal investment in market development programs.

Soybeans have long been U.S. agriculture's top export crop. Foreign markets were destinations for more than 50% of U.S. soy production in the last marketing year.

Even with ongoing efforts to diversify and open new markets, our commercial export relationship with China is critically important, as it is the largest importer of soybeans in the world. Almost a third of all soybeans grown in the United States are destined for China under normal trade conditions.

In addition to a steady supply of production inputs and predictable regulatory environment, we rely on domestic and global markets for the success of soybean farmers.

When those markets fail or when significant economic disruptions occur, we rely on policymakers to ensure that a supportive farm safety net is in place.

Farmer Feedback—Gathering Process

Each year, ASA sets the annual policy priorities of the organization through a thorough resolutions review and adoption process. This process is currently underway and will culminate in a session of voting delegates at our annual meeting during the Commodity Classic farm trade show next week. Feedback regarding Title I has been received through this process.

In addition, ASA has recently taken greater steps to gather farmer feedback in preparation for development of the next farm bill.

Since early 2022, ASA has held 12 virtual farm bill listening sessions—both by region and by topic—with interested soybean farmers and state soy affiliates across soy's 30-state growing region. An in-depth farm bill survey was administered to soybean growers in late 2021. And, ASA has a farm bill-specific email address set up for those interested in sharing additional written feedback.

Farm bill feedback gathered from these steps will be developed into a set of farm bill principles and shared this spring with the Committee.

Title I Feedback From Farmers: Improvements Are Needed

While crop insurance is not a part of Title I, ASA must share for the record the high importance of crop insurance to soybean farmers. Soybean farmers consistently communicate that this is the most effective component of the farm safety net when viewed more broadly. This risk management tool allows farmers to elect coverage annually based on their own risk tolerance and responds accordingly when losses are triggered. Crop insurance must remain affordable for producers.

While crop insurance provides a safety net for risk within a growing season, it does not protect against longer-term structural risks. Title I is intended to do this, but the Agriculture Risk Coverage (ARC) and Price Loss Coverage (PLC) programs, specifically, need improvements to provide the intended protection. An effective soybean safety net does not exist today.

As noted earlier, China is a significant importer of soybeans, importing almost one in three rows of soybeans produced in the United States. During the height of the China trade war in 2018, U.S. soy stopped flowing to the market during the peak export period that fall. Soybean prices fell by about 20%, but the producers of the crop received no PLC payments and little from ARC under the Title I safety net. USDA stepped in with *ad hoc*, temporary support to farmers through the Market Facilitation Program (MFP).

The example above provides context to what we are hearing from farmers. They have consistently shared two deficiencies regarding the Title I farm safety net programs of ARC and PLC:

- (1) Soybeans have an insufficient reference price, on which ARC and PLC benefits are calculated.
- (2) Soybeans have a low level of base acres, the historical acreage on which ARC and PLC benefits are provided, relative to planted acres.

When survey respondents were provided options to improve the Title I farm safety net for soybeans, the leading two selections were related to those concerns; specifically, (1) increase the soybean reference price for calculating ARC and PLC, and (2) provide the option to update base acres.

Importantly, farmer feedback also suggests that a combination of remedies to address these deficiencies is needed. For example, if an option to update base acres is allowed, it may not be exercised if the reference price for soybeans remains where it is currently set.

Soybean Reference Price: Increase Is Needed

Farm safety nets are not created for the good times, but instead the bad times. Currently, we are experiencing strong soybean market prices, but agriculture is cyclical. An effective safety net is needed for the times when prices decline. During the trade war, soybean farmers experienced negative margins for their crop. USDA's

Economic Research Service estimated it cost soybean farmers \$37 more per acre in 2018 to produce than was received from the sale of the crop and \$74 more in 2019.

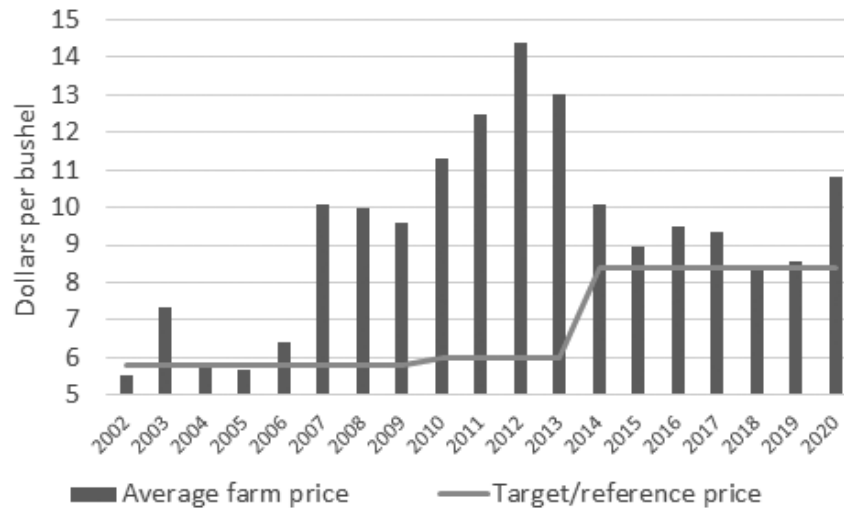

Soybean value of production less total costs

Source: USDA ERS.

If there were ever a time that the farm safety net was designed for, it was the trade war in 2018 and 2019. Factors well outside farmers' control structurally shifted, collapsing much of the demand for U.S. soybeans. Despite a large drop in the price producers were receiving which resulted in negative margins, the reference price for determining Title I benefits was set at such a low point that PLC payments never triggered. In fact, 2005 is the last time a PLC or CCP payment—the predecessor program—was triggered for soybeans.

Soybean prices

Sources: USDA NASS and FAPRI-MU.

Support prices were increased starting with the 2014 Farm Bill, but this price increase did not fully reflect the increased operating costs. While prices during the trade war remained above those from the early 2000s, a higher price is necessary to offset the higher cost of inputs. According to data from the Food and Agricultural Policy Research Institute at the University of Missouri (FAPRI-MU), operating costs have approximately doubled during this time. As a result, farmers experienced significant losses and received few ARC payments and no PLC payments. If soybeans, the second-largest crop by area in the U.S., did not receive help through Title I during this critical situation, it is hard to imagine a scenario where the Title I safety net could provide meaningful help with the current reference price.

Soybean Base Acres: Option to Update Base Acres Is Needed

The data clearly demonstrates the disparity in soybean planted acres compared to base acres, the historical acreage on which ARC and PLC benefits are provided.

In 2021, soybeans were planted on over 87 million acres in the United States. By comparison, soybean base totals 52.5 million acres. 34.5 million acres of planted soybean acres were not protected by the soybean provisions of ARC and PLC in 2021. While some of these 34.5 million soybean acres may have been corn or wheat base, for example, farmers' concerns are very real and important to share with you. These other crops may not correlate well with the losses being experienced on the farm.

ASA's farm bill survey results showed that 84% of respondents would like the option to update base acres, and less than 5% oppose the option. Commentary shared throughout our listening sessions includes these scenarios:

- A young, beginning farmer who has only 10% base acres on his or her farm, providing little access to the ARC/PLC farm safety net.
- Greater adoption of no-till conservation practices has enabled farmers to cultivate row crops in new areas that have no base.
- Small farmers have transitioned out of tobacco production and have no crop base.
- Farmers have exited the dairy business and moved into production of other crops.
- Farmers have lost cropland to residential or industrial development and sought other areas to cultivate.

To be clear, ASA supports maintaining planting flexibility and the approach of decoupling acreage to ensure compliance with trade commitments. Providing farmers an option to update base acres in a trade-compliant manner can be achieved.

Additional Title I Farmer Feedback

Although our testimony has focused on two specific areas of concern regarding the Title I farm safety net, we share with the Committee additional feedback on needs:

- Clear direction that if a standing disaster assistance program is created, the financial protection provided by Title I programs and crop insurance should not be reduced to fund the disaster program.
- Support for review of Farm Service Agency staffing and information technology (IT) capabilities in advance of eventual farm bill implementation. Of note, this applies to USDA more broadly as well to ensure implementation readiness.
- Support for modernizing IT systems to better allow farmers to share data and access programs.
- Support for the option to update program yields.
- Support for allowing ARC payments to trigger more easily.
- Support for the ARC cap on payments from the current 10% of the benchmark.
- Support for reviewing marketing loan rates.
- Support for increasing payment limits.
- Opposition to eligibility restrictions based on farmer size.

Conclusion

Thank you again for this opportunity to share the American Soybean Association, and in turn our farmers', views on Title I farm programs.

The soybean industry stands ready to work with the Committee in crafting a farm safety net that is effective for soybean farmers.

The CHAIRMAN. Thank you, Mr. Doyle.

And now, Dr. Johansson, please begin when you are ready.

STATEMENT OF ROBERT JOHANSSON, PH.D., DIRECTOR OF ECONOMICS AND POLICY ANALYSIS, AMERICAN SUGAR ALLIANCE, ALEXANDRIA, VA

Dr. JOHANSSON. Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. Thank you for this opportunity to testify before you today concerning the commodity title of the 2018 Farm Bill. My name is Robert Johansson. I am the Director of Economics and Policy Analysis at the American Sugar Alliance, the national coalition of sugarbeet and sugarcane growers, processors, and refiners.

U.S. sugar industry generates more than 140,000 jobs across 21 states, and contributes \$20 billion annually to the U.S. economy. American consumers benefit from a safe, high-quality, reliable, sustainably produced, and affordable source of sugar, an essential ingredient in the nation's food supply. Our product is stored and distributed from multiple facilities strategically located throughout the nation, ready for delivery when and where needed, according to the specifications required by our customers. Unlike some other food items, there were no bare spots on grocery store shelves throughout the pandemic. That success is attributable to U.S. sugar policy.

I will make four main points today. First, efficient U.S. sugar producers are threatened by less efficient foreign, subsidized, and dumped sugar that usually sells well below the exporter's cost of production. There are no signs of that changing in the foreseeable future. We must not become overly dependent on foreign suppliers for essential goods. That is why an effective sugar policy that main-

tains a strong domestic industry is essential to the food security of our nation.

Second, U.S. sugar policy comes at no cost to the U.S. Treasury. U.S. sugar policy has operated at zero cost to taxpayers 17 of the past 18 years, and is expected to do so again this year. The USDA projects zero costs over the next 10 years as well. The one time it did not operate at zero cost was due to Mexico's dumping of sugar onto the U.S. market at below Mexico's production cost, which the International Trade Commission unanimously held violated U.S. trade law.

However, the loan rate for raw sugarcane and refined beet sugar has not kept up with inflation nor the rising costs of production. It no longer provides a realistic safety net for our producers. Since the early 1980s, we have closed 68 processing facilities, and most outside investors have exited the remainder of the industry due to the high risk and low returns. It was our family farmers who stepped up to rescue the industry from further closures of their factories, mills, and refineries.

Now, many of those are struggling. Operating margins are being squeezed each year due to rising labor, fuel, seed, fertilizer, equipment, and interest rate costs. They hit our producers in the field as well as in the factories they own.

We would support examining how the farm bill safety net could be updated in the next farm bill for all Title I commodities to better match actual operating costs for producers.

Third, sugarcane and sugarbeets, like most crops, are grown in areas that experience weather disruptions. Crops are resilient, yet risk protection is needed. Sugarcane and sugarbeet farmers do have some insurance products available to them, but those crop insurance tools are not as well developed nor affordable as for some other commodities. Sugarbeet farmers have participated in WHIP+ previously, and cane farmers are considering how their losses in 2021 might be eligible for the most recent WHIP+ program. Note that WHIP+ is not currently authorized for recent 2022 disasters, such as the January freeze in Florida.

For those reasons, and because this Committee has signaled an interest in developing additional risk management programs in Title I to complement crop insurance, we are certainly receptive to new efforts to provide standing disaster coverage in ways that do not undermine crop insurance, and possibly even encourage greater participation and coverage levels.

And last, the current Title I sugar policy can provide an adequate economic safety net for American sugarcane and sugarbeet farmers so long as there remains in place effective responses to foreign sugar-producing countries' subsidizing and dumping. Without those responses, we would effectively outsource our sugar supply to heavily subsidized and unreliable foreign sugar suppliers whose environmental and labor standards simply do not measure up to our own. That would be the opposite of strengthening supply chains, and contrary to providing a safety net to American producers.

We encourage and welcome the Members and staff of the Committee to visit our farms and factories. We look forward to working with you as this Committee continues to hear from producers as you weigh options for improving the farm bill.

Thank you for your consideration, and for your support to the American sugarcane and sugarbeet family farmers. I look forward to any questions you might have.

[The prepared statement of Dr. Johansson follows:]

PREPARED STATEMENT OF ROBERT JOHANSSON, PH.D., DIRECTOR OF ECONOMICS AND POLICY ANALYSIS, AMERICAN SUGAR ALLIANCE, ALEXANDRIA, VA

Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. Thank you for this opportunity to testify before you today concerning the Commodity Title of the 2018 Farm Bill.

My name is Rob Johansson, and I am the Director of Economics and Policy Analysis at the American Sugar Alliance (ASA), the national coalition of sugarbeet and sugarcane growers, processors, and refiners.

The U.S. sugar industry generates more than 140,000 jobs in 21 states and \$20 billion in annual economic activity (see *figure 1*. Map of the U.S. sugar industry).¹

American consumers benefit from a safe, high-quality, reliable, sustainably produced,² and affordable source of an essential ingredient in the nation's food supply. Sugar is used as a natural sweetener, preservative, and bulking agent in 70 percent of U.S. food manufacturing. Our farmers, millers, processors, and refiners have built a strong and resilient supply chain for American sugar.³ Proudly, our product is stored and distributed from 90 strategically located facilities throughout the nation ready for delivery when and where needed according to the specifications required by our customers. Unlike some other food items, there were no bare spots on grocery store sugar shelves throughout the pandemic. That success is attributable to U.S. sugar policy.

Our industry proudly meets some of the highest labor and environmental standards in the world, unlike many other large sugar producing countries. Moreover, using best practices and continuous improvement, our sector has made huge strides in sustainability, mainly through productivity gains in soil fertility, mechanization, improved seed genetics, and refining efficiencies. In fact, over the past 20 years, we have increased production by 16 percent on 11 percent fewer acres, through improved sugarcane and sugarbeet yields.

Many of the jobs and businesses generated and supported by the U.S. sugar industry are in highly vulnerable and economically distressed rural areas.

This hearing is timely and important for sugarcane and sugarbeet farmers because Title I of the Farm Bill—the Commodity Title—represents a critical safety net for our farm families and the many employees of sugar mills, processors, and refineries throughout the country.

I will make four main points today.

First, efficient U.S. sugar producers are threatened by less efficient foreign subsidized and dumped sugar that usually sells well below the exporters cost of production. This makes the world sugar market the most distorted and volatile commodity market in the world (see *figure 2*. World's largest sugar exporters). There are no signs of that changing in the foreseeable future. The U.S. is also the third largest importer in the world of this essential commodity to meet 30 percent of our needs. This is because our trade commitments require these imports. Over the past 2 years it is clear that we must not become overly dependent on foreign suppliers for essential goods particularly for food, energy, computer chips, and the like. This is why an effective sugar policy, which maintains a strong domestic industry, is essential to the food security of our nation.

Second, U.S. sugar policy is structured to serve American farmers, consumers, food manufacturers, and taxpayers as it comes at no cost to the U.S. Treasury. U.S. sugar policy has operated at zero cost to taxpayers 17 of the past 18 years and is expected to do so again this year. USDA projects zero cost over the next 10 years, as well. The one time it did not operate at zero cost was due to Mexico's dumping of sugar onto the U.S. market at below Mexico's production costs which the International Trade Commission unanimously held violated U.S. trade law. That problem has been resolved.

However, the loan rate for raw cane sugar and refined beet sugar has not kept up with inflation nor the rising costs of production (see *figure 3*. Rising input costs).

¹ LMC International, "The Economic Importance of the Sugar Industry to the U.S. Economy—Jobs and Revenues," Oxford, England, August 2011.

² See <https://sugaralliance.org/producing-sugar-sustainably/sugar-sustainably-sweet-stories>.

³ We documented that supply chain resilience for American sugar supplies at our submission to USDA this past spring (<https://www.regulations.gov/comment/AMS-TM-21-0034-0437>).

It no longer provides a realistic safety net for our producers. Since the early 1980's we have closed 68 processing facilities and most outside investors have exited the remainder of the industry due to the high risk and low returns. It was our family farmers who stepped up to rescue the industry from further closures of their factories, mills, and refineries (see *figure 4*. Facility closures). Now many of those are struggling. Operating margins are being squeezed each year, due to rising labor, fuel, seed, fertilizer, equipment and interest rate costs that hit our producers in the field and at the factories they own.

Having a loan rate that is closer to actual costs of production would provide a more effective safety net to our producers. As such, we would support examining how the farm safety net could be updated in the next farm bill for all Title I commodities to better match actual operating costs for producers.

Third, sugarcane and sugarbeets, like most crops, are grown in areas that experience weather disruptions. Crops are resilient, yet risk protection is needed given the continued exposure to strong hurricanes, freezes, and frequent and more intense droughts. Sugarcane and sugarbeet farmers do have some insurance products available to them, but those crop insurance tools are not as well developed or affordable as for some other commodities. For sugarbeets, policies are limited to yield-based coverage and do not benefit from a revenue-based product like other commodities. For sugarcane, the Hurricane Insurance Program (HIP) has been an invaluable addition, but a prevented planting provision is needed. Participation and coverage levels for sugarcane lag significantly behind other crops so better addressing sugarcane's unique perils would be helpful. Price election methods should also be updated to better reflect market prices.

Sugarbeet farmers have participated in WHIP+ previously and cane farmers are considering how their losses in 2021 might be eligible for the most recent WHIP+ program (note that WHIP+ is not currently authorized for recent 2022 disasters such as the January freeze in Florida). For those reasons and because this Committee has signaled an interest in developing additional risk management programs in Title I to complement crop insurance, we are certainly receptive to new efforts to provide standing disaster coverage in ways that do not undermine crop insurance and possibly even encourage greater participation and coverage levels. Under any standing disaster program, we would certainly encourage the Committee to provide particular help to crops that might not have access to more successful crop insurance coverage options or for which the program has just not operated optimally.

Last, the current Title I sugar policy can provide an adequate economic safety net for American sugarcane and sugarbeet farmers, provided it is kept up to date and so long as there remains in place effective responses to foreign sugar-producing countries' subsidizing and dumping. Without those responses, we would effectively outsource our sugar supply to heavily-subsidized and unreliable foreign sugar suppliers whose environmental and labor standards simply do not measure up to our own—the opposite of strengthening supply chains and contrary to providing a safety net to American producers. Under that scenario, farmers, consumers, and taxpayers would all lose.

On behalf of the more than 11,000 sugarcane and sugarbeet farmers in the United States as well as the employees in our mills, processors, and refineries, I thank you for supporting sound U.S. sugar policy and strongly opposing harmful proposals that would undermine the success of this policy.

We encourage and welcome the Members and staff of the Committee to visit our farms and factories. We look forward to working with you as this Committee continues to hear from producers as you weigh options for improving the farm bill.

Thank you for your consideration and your support for American sugarcane and sugarbeet family farmers. I look forward to any questions you might have.

ROB JOHANSSON,
Director of Economics and Policy Analysis,
American Sugar Alliance.

The CHAIRMAN. Thank you.
 Ms. Berg, please begin when you are ready.

STATEMENT OF NICOLE BERG, VICE PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS, PATERSON, WA

Ms. BERG. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to testify before the House Agriculture Committee. My name is Nicole Berg, a fourth-generation farmer where I work alongside my dad and two brothers on our family farm in Paterson, Washington. We grow dryland and irrigated wheat on a diversified farm. Currently, I

serve as Vice President of the National Association of Wheat Growers.

NAWG is a federation of 20 state associations and other industry partners. Our members feel it is important to provide testimony before the Committee today as we reflect on the programs authorized under Title I of the farm bill. Today's hearing is timely, as NAWG is also evaluating the effectiveness of the farm safety net. These programs and how the U.S. Department of Agriculture administers them can be improved going into the next farm bill.

NAWG intends to outline our farm bill priorities in the coming months as Congress begins debating farm bill reauthorization. Wheat is one of the principle food grains produced in the United States and consumed around the world. Nationwide, there are six different classes of wheat grown in different climates and for different uses. In my State of Washington, there are roughly 2,500 wheat growers. The eastern part of the state is known for the home of soft white wheat.

Wheat farmers across the country have experienced multiple challenges over the past couple years, from trade disputes, impacts from COVID-19, current supply chain issues, difficulty in procuring inputs, and extreme drought and several other weather events. Supply chain issues and availability of inputs continue to present challenges for us farmers. These challenges include rising prices and availability of fuel, parts, vital equipment, and other crop protection tools that allow farmers to continue using climate-smart ag practices like no-till.

The current agriculture economy is strong with near record high prices, improving working capital, farmland value, farm income, and revenue. However, this is not without concern. The USDA projects net farm income to decrease by 7.9 percent when adjusted for inflation in 2022, thanks to rising input costs, supply chain crunches, and significant droughts through wheat country that negate the high wheat prices.

The high prices of these last 2 years will not last forever. It is important that Congress maintains a strong safety net for the farm economy, given its difficult nature. As part of the 2018 Farm Bill, wheat growers supported improvements in the crop insurance title, marketing assistance loans, and the ARC and PLC, and all these programs are necessary to maintain an effective safety net.

One such improvement for ARC and PLC was the ability for farmers to make annual elections between the two programs. This has provided a valuable option for farmers to better manage their risk. According to data from the USDA, since the 2018 Farm Bill, we have seen a major shift in wheat farmers' choices from ARC to PLC. Regarding service, the ability to reelect, and the application process is straightforward and has been easy to use.

On farmer education, the USDA and university extension agencies have done a good job providing tools to help farmers make an educated choice on the program election. Investment in these models is essential. One common complaint among farmers is the difficulty of using and interpreting models, and the lack of awareness of their existence. In my situation, we find it challenging to interpret the models—what it is telling us to do, so we have accountants that run models for us.

While wheat farmers almost universally enroll in PLC, there are still issues that persist with the program that the Committee should consider in the next farm bill. Wheat farmers consistently lose money producing wheat, according to USDA cost production data when factoring in total costs. Keeping this in mind, the Committee should consider how to make ARC more effective for the wheat farmers, and how to improve PLC to be more reflective of the current cost of production.

As the Committee continues to have these hearings and reflect on programs authorized under the 2018 Farm Bill, I look forward to working with the Members of the Committee, their staff, and other witnesses here today to help craft the next farm bill that works for wheat farmers and all of agriculture. Thank you again for the opportunity to testify before the Committee today.

[The prepared statement of Ms. Berg follows:]

PREPARED STATEMENT OF NICOLE BERG, VICE PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS, PATERSON, WA

Chairman Scott, Ranking Member Thompson, and Members of the Committee thank you for the opportunity to testify before the House Agriculture Committee. My name is Nicole Berg, a fourth-generation farmer where I work alongside my dad and two brothers on our family farm in Paterson, Washington. Currently, I also serve as the Vice President of the National Association of Wheat Growers (NAWG). We grow dryland and irrigated wheat; Blue Grass Seed; Field Corn; Sweet Corn, Sweet Peas, Green Beans, and Alfalfa. Thank you for holding this hearing today to discuss Title [I]—the commodity title—of the 2018 Farm Bill. The Title [I] programs established under the 2014 Farm Bill and reauthorized in the 2018 Farm Bill deliver important risk management tools for farmers and help protect producers from declines in either crop revenue or prices.

NAWG is a federation of 20 state wheat grower associations that work to represent the needs and interests of wheat producers before Congress and Federal agencies. Based in Washington, D.C., NAWG is grower-governed and grower-funded and works in areas as diverse as Federal farm policy, environmental regulation, the future commercialization of emerging technologies in wheat, and uniting the wheat industry around common goals. Our members feel it is important to provide testimony before the House Agriculture Committee today as we reflect on the programs authorized under Title [I] of the farm bill. Today's hearing is particularly timely as NAWG is also evaluating the effectiveness of the farm safety net programs, how those programs can be improved going into the next farm bill, and how the U.S. Department of Agriculture (USDA) administers these programs. Many of us at this hearing today will be at Commodity Classic next week, where our organization will continue to review the authorized farm bill program. NAWG intends to outline our farm bill priorities for lawmakers in the coming months as Congress begins debating farm bill reauthorization.

According to the USDA's Crop Production Summary released last month, wheat growers planted 46.7 million acres of wheat in 2021, up 2.3 million acres from the year prior. However, production was down from 1.83 billion bushels of wheat in 2020, to 1.65 billion bushels in 2021. The decrease in production—from 49.7 bushels per acre to 44.3 bushels per acre—was largely due to the severe drought, which is discussed later in my testimony. Wheat is the principal food grain produced in the United States and consumed around the world. In the last decade it ranked third among U.S. field crops in both planted acreage and gross farm receipts, behind corn and soybeans.

Nationwide, there are six different classes of wheat, each of which is grown for different uses. In my home state of Washington where there are roughly 2,500 growers, the eastern part of the state is known as the home of soft white and club wheat production. These varieties are known for their use in cookies, crackers, and cakes as well as flat breads. Washington farmers also raise superb hard red winter and spring wheats for bread.

Economic Conditions in Wheat Country

The agricultural economy can be described as nothing short of a roller coaster ride for most producers. Wheat growers across the country have experienced a multitude

of challenges the past couple of years, from trade disputes, impacts of COVID-19, extreme drought and other severe weather events, current supply chain issues and difficulty in procuring key inputs. As a result, wheat prices are generally the item most pointed to when looking at the agricultural economy. The graph below, made using USDA Economic Research Service (ERS) data, demonstrates the Marketing Year Average Price for wheat over the past decade.

Wheat Marketing Year Average Price

Wheat farmers caught a break these last 2 years in terms of price. These increased prices since the marketing year 2019/2020 have been primarily due to three factors, each of which will be discussed further in my testimony.

- The pandemic and inflation
- Droughts across the country
- International disruptions

These increases in price have been reflected in net cash income for farm businesses. Net cash income is the cash available to farmers to draw down debt, pay taxes, cover family living expenses, and invest. Thanks to the high prices, farmers have seen the highest net cash income since 2013. These prices have been a much-needed break from record low levels that preceded the 2018 Farm Bill. These recent developments have led to a decrease in farm debt, improved credit conditions, and increased farmland values. Prospects for farm income moving into the new year remain high. This can be seen when looking at the percent change from the 10 year average of net cash income in the graph below, which also uses ERS data.

Percent Change from 10 year Average of Farm Business Net Cash Income

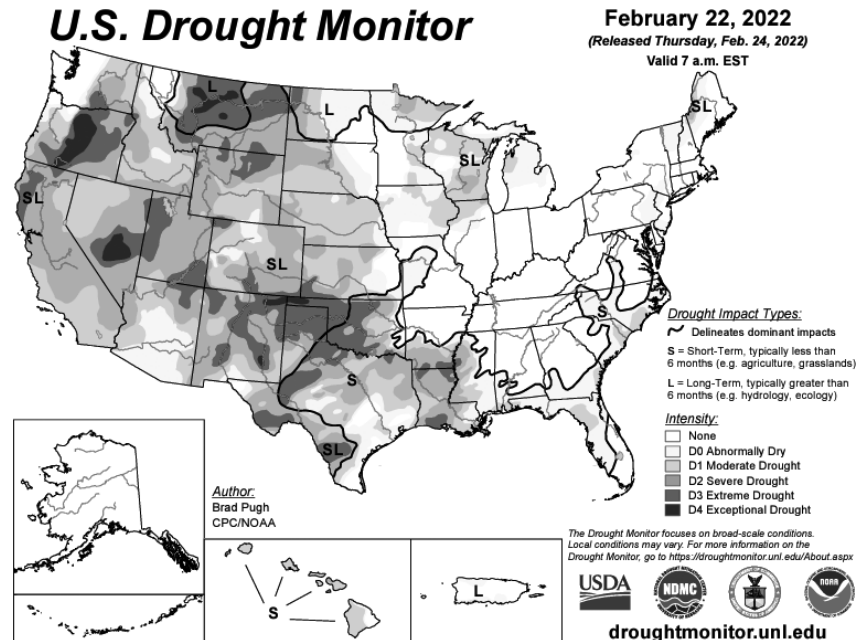

After sustaining massive financial losses from 2014–2018, the last 2 years have been crucial in keeping the American wheat farmer in business. Many farmers were facing bankruptcy, and indeed many lost their farm. However, USDA programs such as the Market Facilitation Program (MFP) and Coronavirus Food Assistance Program (CFAP), coupled with recent high crop prices, have helped the agriculture economy stay whole and begin to recover after years of economic turmoil.

Unfortunately, the three factors mentioned earlier that have helped increase prices and rebound the economy could ultimately threaten the viability of farmers once again.

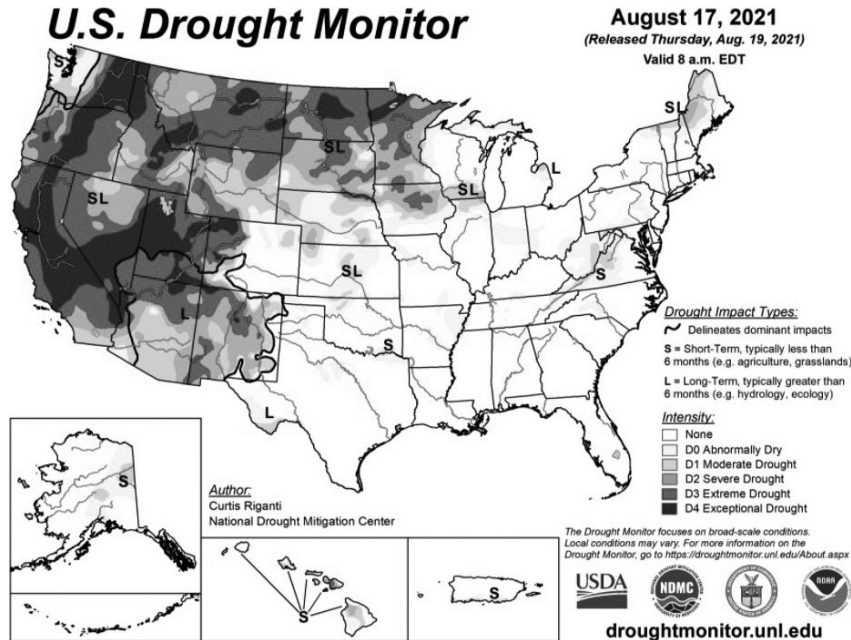

The pandemic has created reverberations across the entire economy. The agricultural economy was not immune to this. While prices have improved thanks to the increased demand for at-home food products, especially flour, it has also created inflation that threatens to eliminate the gains from price increases. As supply chains have been disrupted or halted, farmers have faced many different challenges. These challenges include rising fuel costs, increasing prices for parts—if they can get them at all—and vital equipment, such as tractors, combines, and implements. Some of these items have been on backorder for over a year. For example, it's tough to manage the 2022 wheat harvest when you have been waiting on a part for over a year or the combine you need will not be available until April 2023.

The supply chain challenges, and availability of inputs has also been felt in the case of fertilizer and other crop protection tools that are required to deploy climate-smart agricultural practices like no-till. One analysis that a wheat farmer in southwest Kansas made on his own 308 acres of no-till fallowed wheat showed that the price per acre of crop protection tools more than tripled between 2021 and 2022, an increase of \$27,981.80. This increased cost does not tell the whole story of increased input costs either as labor, and equipment parts and repairs. This is only a small fraction of the entire increases in costs that wheat farmers are now facing.

Droughts across the country were also a driving factor in the increase in prices starting in 2020 that continue to push prices today. Unfortunately, as drought worsens, the chances for a strong wheat crop also worsen. This drought map taken from February 24, 2022, shows that the vast majority of the wheat producing areas in the United States is in at least a severe drought.

Spring wheat country like my own state of Washington has been hit particularly hard by this drought. The drought map below shows the devastating reach of one of the worst droughts in recent history for growers in the Pacific Northwest and across the northern tier. This map is from August of last year as farmers were planning to plant winter wheat or wrapping up harvest.

According to the USDA 2021 Small Grains Report, spring wheat saw a 44 percent reduction in total bushels despite only a seven percent decrease in planted acres. In my home State of Washington, we only produced 87.1 million bushels of wheat, where in 2020 we produce 166.2 million bushels. No matter how high the price for wheat gets, if a farmer can't produce a crop thanks to drought, they can't turn a profit.

Last, the international disruptions in the market have led to massive volatility in recent weeks. As the world watched in horror as Russia invaded Ukraine, grain markets soared and then retreated some on Friday. The February World Agricultural Supply and Demand Estimates from the USDA projected both Russia and Ukraine to be a large exporter of wheat, which is largely transported through the Black Sea. The current high prices caused by not only this conflict, but previous international disruptions in trade may not last long, and the unknown outcomes of that conflict will undoubtedly create market volatility.

Overall, the current agriculture economy is strong with near-historically high prices improving working capital, farm income and revenue, and farmland value. However, it is not without concern. The USDA projects net farm income to decrease by 7.9 percent when adjusted for inflation in 2022 thanks to rising input costs, supply chain crunches, and significant droughts throughout wheat country that make high wheat prices irrelevant to many farmers. The important thing to remember is that good times in the farming economy rarely last. Removing essential pieces of the farming safety net can have disastrous consequences when the economy inevitably takes a downturn. Frequently throughout history, an improving farming economy is followed by changes to agriculture policy, only to see a farming economic recession. Therefore, the high prices brought on these last 2 years will not last forever, and it is important that Congress maintain a strong safety net in place given the cyclical nature of the farm economy.

2018 Farm Bill Safety Net and Risk Management Programs

NAWG supported the passage and enactment of the bipartisan 2018 Farm Bill, which provided certainty during a difficult time and improved upon the revolutionary 2014 Farm Bill, which established the Agriculture Risk Coverage (ARC) and Price Loss Coverage (PLC) programs. As mentioned earlier, farmers experience significant risk from market volatility to mother nature. As part of the 2018 Farm Bill, wheat growers strongly supported maintaining a strong crop insurance title, which, along with ARC and PLC, serve as key pillars to the risk management strategy kick

in for losses not covered by crop insurance. These additional tools are necessary to support American agriculture and our rural communities.

Since the revolutionary changes of the 2014 Farm Bill that did away with direct payments, the producer choice between revenue protection and price protection has continued to function as was intended. With the reauthorization in 2018, ARC and PLC, there were improvements made to both programs. One such improvement was the ability for producers to re-elect programs beginning with the 2019 crop year and then with the ability for annual elections since the 2021 crop year. The ability to elect annually has provided a valuable option for producers to help them better manage their risk. Additionally, as part of the 2018 Farm Bill, the Agriculture Committees recognized the importance of using consistent data in determining farm program payments, while making USDA Risk Management Agency (RMA) data its primary source, and for making key improvements to both ARC and PLC.

While there are still improvements to be made moving into the next farm bill, Title [I] Programs remain a popular and valuable tool in managing farmer's risk.

Agriculture Risk Coverage (ARC) program

As part of their farm program election choice, farmers are able to choose between county level or individual level coverage. County level coverage will continue to pay on 85 percent of base acres, while individual level coverage will continue to pay on 65 percent of base acres. Additionally, counties that are larger than 1,400² miles and contain more than 190,000 base acres had the opportunity to split into two administrative units for the purposes of ARC-County (up to 25 counties nationwide). Administrative improvements to ARC included a requirement that RMA yield data be used if it's available in a county and that the physical location of a farm be used to determine which county payment rate applies to that specific farm.

In terms of programmatic improvements, the bill increased the plug yield from 70 percent to 80 percent of the transitional yield, required USDA to calculate and use a trend-adjusted yield factor to adjust yields (similar to the crop insurance trend-adjusted yield endorsement), requires the use of an effective reference price (similar to the PLC change where reference prices can increase if certain market improvements happen over time), and it requires the publishing of separate irrigated and non-irrigated yields in each county. USDA is also required to publish payment rate information within 30 days of the end of the marketing year for each commodity publish the data source that was used.

Price Loss Coverage (PLC) program

The 2018 Farm Bill maintained the current statutory reference prices but requires the use of an "effective reference price." In any given year, the 5 year Olympic average market year average price will be multiplied by 85 percent; if that level is higher than the statutory reference price, then the effective reference price is that level up to 115 percent of the statutory reference price. The maximum level for wheat would be \$6.33 per bushel, and it cannot drop below the statutory reference price of \$5.50.

Current law also allows for all producers nationwide the option of updating their yields for PLC in the 2020 crop year. The yield update would be 90 percent of the average farm yield of the 2013–2017 crop years (with a plug of 75 percent for any year that a yield was lower than that), and that level is multiplied by a ratio obtained by dividing the 2008–2012 national average yield by the 2013–2017 national average yield, with the ratio limited to between 90–100 percent.

Marketing Assistance Loans

The Marketing Assistance Loan (MAL) program and Loan Deficiency Payments (LDP) were maintained in the 2018 Farm Bill. Loan rates used in the program were increased for several commodities during reauthorization, including a 15 percent increase for wheat from the current level of \$2.94 to \$3.38 per bushel. As the Wheat Marketing Year Average Price on page 2 illustrates, 2016 was a particularly bad year for wheat growers and was also the last time when the LDPs have been made available. Prior to 2016, it had been 16 years since wheat farmers were able to collect LDPs. While we are fortunate prices have not been at the level for these programs to kick in, as mentioned earlier, there were significant periods of depressed prices, and the loan rates may need further consideration and analysis to serve as effective programs. NAWG is currently reviewing the efficacy of these programs going into the farm bill reauthorization.

Accessibility of USDA Programs

The application process is straightforward and has been easy to use for growers. While some Federal programs have large amounts of paperwork that must be

combed through by lawyers, the application for ARC and PLC is just a signature form. This is one of the attributes that has led to the large amount of adoption.

In some instances, what has made this difficult is the staffing levels in county offices. The USDA currently has full hiring authority and is working to fill vacated positions at the county level. The USDA also maintains that they continue to provide pre-pandemic levels of service. However, some areas of the country were understaffed before the pandemic and continue to be so understaffed that farmers are receiving poor service, at no fault of the employees. Farmers have voiced these concerns within our organization. Some farmer's counties have no or significantly reduced FSA staff, and they are forced to travel to other counties to receive service. In some rural counties, this can amount to drives of 2 or more hours one way, which can be very onerous during planting or harvest season. Some counties are authorized to have multiple employees but are only staffed with one or fewer employees. This causes serious issues and frustrations to farmers. It is important that the House Agriculture Committee works with the USDA, other administrative agencies, and other Congressional committees to find ways to address these issues that impact other farm bill programs as well.

The USDA and university extension agencies have done a good job of informing farmers about Title [I] programs and providing tools that help them forecast the upcoming year to make an educated choice on program election. Investment in these models is essential as, without them, farmers are left to guess about what they think might happen and which program might protect them. However, one common complaint amongst farmers is the difficulty in using and interpreting the models and the lack of awareness that these modeling tools exist. In my situation, we find it challenging to interpret what the model is telling us to do, so we have accountants that run the models for other clients and us. These modeling tools, while extremely important, need accompanying technical support and training through FSA to help farmers utilize these tools more effectively.

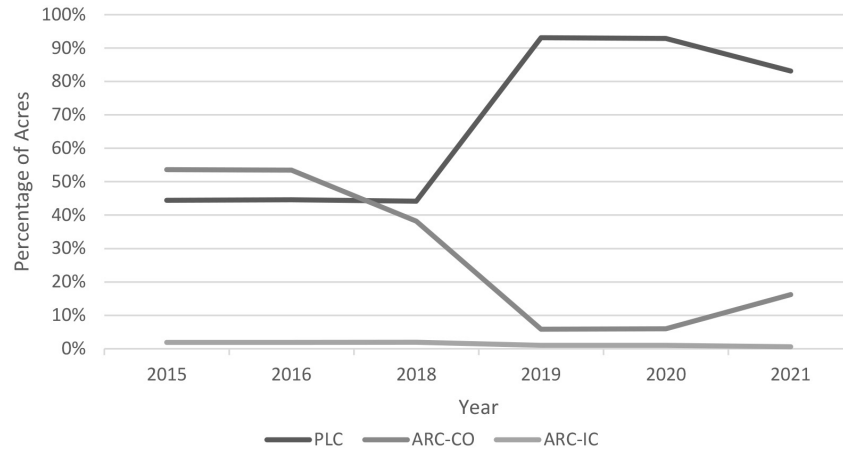

Implementation of Programs

NAWG is currently working through our priorities for the next farm bill and will make sure to share them with you once they are finalized. Looking back at the 2018 Farm Bill, however, there are certainly programs that excelled and other that could be refined to better serve grower needs.

One popular change from 2014 to 2018 was the ability to make yearly elections between ARC and PLC. In 2014, farmers were forced to forecast out the next 5+ years to determine which program they thought would best protect them. In many cases, farmers were wholly uninformed, unprepared, and made a choice based on the limited information that land-grant extension agencies were able to provide them with. They were then forced to remain in these programs even though they were not being adequately protected. The ability to choose between the programs allows farmers a much tighter safety net that varies year on year.

According to data from the USDA, prior to the 2018 Farm Bill, wheat farmers chose ARC more frequently than PLC. Since the 2018 Farm Bill however, wheat farmers choose PLC 78 percent of the time on average, with highs of 93 percent in 2019 and 2020. The percentage of acres enrolled in ARC and PLC can be shown in the graph below.

Percent of Enrollment by Program

While wheat farmers almost universally enroll in PLC, there are still issues that persist with the program that the Committee should consider going into the next farm bill. As established in my introduction, wheat is the staple food grain produced in the United States. Meanwhile, wheat farmers consistently lose money producing wheat according to USDA cost of production data when factoring in total costs listed by the USDA. In 2020, wheat farmers lost \$76.62 an acre, an increase from the lows of 2015 when wheat farmers were losing \$96.60 per acre. In fact, it has not been profitable for wheat farmers to grow wheat since 2012, when farmers made \$40.70 an acre. Enrolling in PLC has helped with this issue, but it does not prevent losses. In 2020, the value of production with PLC less total costs, according to USDA, was a negative \$36.05. This data can be found in the graph below. Without farm bill programs like those contained in Title I, these sustained losses and missed opportunities are what ultimately push farmers to bankruptcy and out of the industry.

Value of Production Less Total Costs

Keeping this in mind, the Committee should consider how to make ARC more effective for wheat farmers and how to improve PLC to be more effective at preventing these types of total losses. Both loan rates and PLC reference prices should undergo thorough investigation throughout this review process, especially given recent inflation and increases in input prices, not to mention land costs.

The 2018 Farm Bill attempted to remedy this issue with the effective reference price mentioned earlier in my testimony. This change to the reference price will help if the current high prices are sustained over multiple years. Overall, having an adjustment that takes years to occur is too slow with the current volatility of commodity markets and ever-increasing cost of production.

Another issue the Committee needs to think about is the timing of these payments. For wheat, payments come almost a year and a half after the crop is harvested. Farmers often need help more immediately. When major disruptions occur in the agriculture economy or in weather patterns that effect yield, waiting eighteen

months to hit the safety net can prove disastrous. By that time, some farmers may be forced into bankruptcy.

At the end of the day, farmers prefer producing a crop and selling it for a profit over government payments. However, Title [I] farm bill programs help provide certainty whereby growers can make long-term investments in land and equipment where it would otherwise be incredibly difficult if not prohibitive for growers. This is even more apparent when looking at farmers who don't have equity built up or enough working capital to withstand difficult years as established farmers can, which is a particular challenge with new or beginning farmers or socially disadvantaged growers. That is why Congress should evaluate program effectiveness and work to improve upon them in a timely manner.

Conclusion

NAWG's policy committees and board of directors will be meeting in the coming weeks to continue evaluating the effectiveness of these programs and work to finalize our key policy priorities over the coming months. These priorities will be shared with you and your staff upon being finalized. As the House Agriculture Committee continues to have these hearings and reflects on programs authorized under the 2018 Farm Bill, I look forward to working with the Members of this Committee, their staff, and the other witnesses here today to help craft the next farm bill that works for wheat growers and all of American agriculture. Farmers play a key role in helping sustain our rural communities and feeding the world. As the farm bill process continues, I would urge judicious and expeditious review of authorized programs and work to ensure a full reauthorization of farm bill programs prior to the expiration of the current farm bill on September 30, 2023, so that producers have certainty about the structure of the safety net moving forward.

We look forward to continuing to work with you to ensure a strong U.S. farm economy. Thank you again for this opportunity.

Sincerely,

NICOLE BERG,
Vice President,
NAWG.

The CHAIRMAN. Thank you, Ms. Berg.

Mr. Edgington, please begin when you are ready.

STATEMENT OF CHRIS EDGINGTON, PRESIDENT, NATIONAL CORN GROWERS ASSOCIATION, SAINT ANSGAR, IA

Mr. EDGINGTON. Chairman Scott, Ranking Member Thompson, and Members of the House Agriculture Committee, thank you for the invitation and opportunity to testify today. My name is Chris Edgington. I live and farm in Saint Ansgar, Iowa, where multiple generations of my family raise primarily corn and soybeans. I currently serve as President of the National Corn Growers Association, and we are a farmer-led trade association that works with our affiliated state associations to help protect and advance corn grower interests. On behalf of my fellow corn growers, thank you for you and your public service, dedication to agriculture, rural America, and the farm economy.

Since the passage of the 2018 Farm Bill, corn growers have faced volatility in the marketplace with periods of low prices and higher prices. Today's futures and cash prices appear strong; however, there are no assurances that commodity prices will continue to trend upwards or if they will even stay where they are at. Rising input costs are a major concern, specifically fertilizer. Prices have soared to record levels and several companies have unfortunately made a bad situation worse for growers by applying for tariffs to be applied to imports of phosphate and nitrogen fertilizers respectively. NCGA and our state affiliates continue to focus on addressing high input costs, including direct requests to those companies to voluntarily withdraw their tariff petitions.

Widespread drought and intense heat impacted much of the corn belt last year, and unfortunately, drought conditions have continued into 2022. In 2020, corn growers suffered major losses due to the devastating derecho that hit millions of highly productive cropland. In 2019, crop production was heavily impacted with flooding and excess moisture throughout the Missouri River basin. Federal crop insurance plays a significant role in the wake of natural disasters. Producers also appreciate your efforts to extend and improve disaster programs for 2020 and 2021 for uncovered risks and losses.

NCGA has long advocated for market-oriented farm policies. Our focus continues on tools geared toward revenue, which factors in both yield and price risk that growers face. We support the continued ability for producers to choose between Agriculture Risk Coverage, ARC-County, ARC-Individual, and Price Loss Coverage, or PLC programs. We appreciate the commodity program signup period are now similarly tied to crop insurance decisions. NCGA supported the development of the ARC county and ARC individual programs. In the 2018 Farm Bill, we supported shifting the primary focus away from using NASS yield data to RMA to help minimize county by county payment differences. We also supported additional improvements to yield calculations and transparency to payment components. The PLC program has historically provided limited support for corn growers. Given the trend of increased corn yields year after year, though, the growers appreciated the opportunity to increase their PLC yield in 2020. And while use of the marketing assistance loans is small among our members, the program remains an accessible tool for corn growers without base acres.

Implementation of the current farm bill has been fairly smooth, helped by the familiarity of the program, lengthy signup periods, and increased transparency of the program components. We commend the Committee for the continued support of web-based decision tools that help facilitate grower education and evaluation of the commodity programs and options. While COVID-19 has been difficult for face-to-face interaction with growers, we appreciate efforts at FSA to provide flexibility with producer signup. Opportunities exist to build upon those lessons, and to further reduce the reporting burden on producers.

NCGA and our state affiliates are gearing up to provide additional input and farm bill recommendations. NCGA has already commissioned and conducted a nationwide survey of growers on the usage and views of risk management tools and conservation programs. Next week, we will gather in New Orleans at the annual Commodity Classic, where growers will propose, debate, and vote on updates to our policies.

We look forward to working with the Committee as NCGA develops a more formal policy priority. Thank you to Representatives Cheri Bustos and Austin Scott for including corn growers in the previous Subcommittee roundtable discussion on farm safety net programs. As the Committee continues oversight of USDA and evaluates the structure of safety net programs, please do not hesitate to reach out to growers for perspectives at future hearings, listening sessions, roundtables, or farm tours.

In closing, NCGA recognizes the difficult task ahead to develop the next farm bill. We appreciate your consideration of our views regarding commodity programs, and the need for producers to have access to effective risk management tools.

[The prepared statement of Mr. Edgington follows:]

PREPARED STATEMENT OF CHRIS EDGINGTON, PRESIDENT, NATIONAL CORN GROWERS ASSOCIATION, SAINT ANSGAR, IA

Chairman Scott, Ranking Member Thompson, and Members of the House Agriculture Committee, thank you for the invitation and opportunity to testify today.

My name is Chris Edgington. I live and farm in St. Ansgar, Iowa, where multiple generations of my family raise primarily corn and soybeans. I graduated with a Bachelor of Science degree in animal science from Iowa State University.

I currently serve as the President of the National Corn Growers Association (NCGA). Founded in 1957, we are a farmer-led trade association that works with our affiliated state associations to help protect and advance corn growers' interests. The NCGA mission is to create and increase opportunities for corn growers and our vision is to sustainability feed and fuel a growing world.

On behalf of the nearly 40,000 dues-paying corn farmers nationwide and more than 300,000 corn growers who contribute to corn promotion programs in their states, thank you for your public service and dedication to agriculture, rural America, and the farm economy.

This morning, I will summarize key challenges corn growers face, our reflections on commodity programs, and thoughts on development of the next farm bill.

Farm Economy and Challenges Facing Corn Growers

Corn and corn products remain critically important to the U.S. agriculture economy, serving to supply rising domestic needs for food, feed, and energy. In 2021, U.S. growers planted over 93.4 million acres of corn, which produced over 15.1 billion bushels with a value projected at \$82.3 billion. Nearly 40% of the corn grown in the U.S. is used for livestock feed and another roughly 40% is used for food and industrial purposes, including ethanol production.

Since the passage of the 2018 Farm Bill, agriculture has faced volatility in the marketplace with periods of low prices and higher prices. In 2020, corn prices fell below \$3 during the peak of COVID-19, where we saw significant demand destruction for corn, livestock, and ethanol products. Today's futures and cash prices appear strong, however there are no assurances that commodity prices will continue to trend upwards or stay at their current level. In fact, during the recent U.S. Department of Agriculture (USDA) Outlook Forum, USDA projected that corn prices would decline in 2022 to an average of \$5 per bushel. This would represent an 8.3% decline from the average price of \$5.45 per bushel in 2021.

While farmers are fairly optimistic regarding potential returns with current market prices, rising input costs are a major concern. Early in February, USDA's Economic Research Service (ERS) forecasted that net farm income for all of agriculture will be \$113.7 billion in 2022. These estimates represent a decrease in net farm income of \$5.4 billion (4.5 percent) compared to 2021. While income from cash receipts is expected to be strong, ERS highlighted that higher production expenses are expected to counteract their net effects, along with lower direct government payments.

The Purdue University/CME Group Ag Economy Barometer for February 2022 captures the squeeze that producers are feeling on their farms. Last month's results had the second-lowest sentiment reading since July of 2020, which was during the height of the early stages of the pandemic. According to the report, "concerns about rising input costs and ongoing supply chain disruptions contributed to weakness in the current conditions index."

Specifically, fertilizer prices have soared to record levels, and several companies have unfortunately made a bad situation worse for growers by applying for tariffs to be applied to imports of phosphate and nitrogen fertilizers, respectively. NCGA and our state affiliates continue to focus on addressing high input costs, including direct requests that the companies voluntarily withdraw their tariff petitions.

Biofuels

Ethanol production and demand for low carbon fuel provides an important market for corn growers. For the 2021 corn crop, 5.3 billion bushels are expected to be used for ethanol production. This includes more than 1.1 billion bushels of distillers grains co-products returned from ethanol production to animal feeds. Between 2016 and 2021, U.S. corn ending stocks have averaged more than 1.5 billion bushels an-

nually, illustrating availability of additional feedstock to increase renewable fuel production, while continuing to meet and exceed current demands for food, feed, and exports.

Since Congress expanded the Renewable Fuel Standard (RFS) in 2007, farmers have increased corn production, not by bringing additional land into production, but through higher yields that have resulted in more production on less land and with fewer resources. Planted corn acres in 2021, at 93.36 million acres, were just less than planted acres in 2007, the year the RFS was expanded, at 93.5 million acres, yet production is forecast to increase by 15.9 percent for 2021 compared to 2007. Corn production has increased because crop yields have increased from an average of 150.7 bushels per acre in 2007 to 177 bushels per acre in 2021. With the average yield in 1980 at 91 bushels per acre, productivity growth is a long-term trend; domestic corn production has grown steadily at a 25 year average rate of around two percent, or 250 million bushels per year.

These yield increases are due to corn farmers adopting conservation and best management practices, along with technology advances. These improvements reduce the carbon intensity of both the corn feedstock and renewable ethanol, while also protecting and enhancing soil and water quality.

Weather Related Disasters

Widespread drought and intense heat impacted much of the corn belt during the 2021 growing season. Unfortunately, those conditions have continued into 2022 for many producers across the country. According to the U.S. Drought Monitor, as of February 22, 2022, approximately 31% of corn production is located in areas experiencing drought. Growers across the plains states and the Southeast are still facing severe and extreme D2 and D3 drought conditions, right as planting season kicks off.

In 2020, growers across Nebraska, Iowa, Illinois, and Indiana suffered major losses due to the devastating derecho. The storm and accompanying damaging winds hit millions of acres of highly productive cropland in August before corn harvest could begin.

Corn production was also heavily impacted in 2019 by wet weather conditions during planting season with flooding and excess moisture across the high plains and throughout the Missouri River Basin. The unusually wet spring prevented many farmers from accessing flooded fields. Nationwide, 2019 set a record with over 19 million acres of cropland reported as prevented from being planted. This included over 11 million acres of corn that were reported as prevented from being planted.

Federal crop insurance plays a significant role in resilience in the wake of natural disasters. According to the Risk Management Agency (RMA) Summary of Business, in 2021, corn growers purchased coverage on over 83 million acres and companion and endorsement policies on an additional 10 million acres nationwide. These risk management policies represent liabilities over \$52 billion.

Producers appreciate efforts by the Committee to extend and improve disaster programs for 2020 and 2021 for risks and losses that are uncovered by Federal crop insurance. We look forward to USDA's implementation of this assistance this year.

Farm Bill Commodity Programs

NCGA has a long history of advocating for market-orientated farm policies, including commodity and crop insurance programs that help growers manage their risks. Our focus continues to be on accessible and defensible tools geared towards revenue, which factors in both yield and price risks that growers may face throughout the growing and market seasons.

During the 2018 Farm Bill, we supported increasing the opportunities for producers to choose between the commodity programs. In 2019, producers were able to elect between the Agriculture Risk Coverage County (ARC-County), ARC-Individual, and Price Loss Coverage (PLC) programs for the 2019 and 2020 crop years. Producers now have an annual opportunity to change their elections, which started in 2021. Growers are currently working with their Farm Service Agency (FSA) offices ahead of the March 15, 2022, deadline for program elections for the upcoming crop year.

Corn producers have already used this new opportunity to change their elections based on market conditions. According to FSA data, for the 2019 and 2020 crop years, around 75% base acres nationwide for corn were enrolled in PLC, 19% were in ARC-County, and 6% in ARC-Individual. For the 2021 crop year, 51% of corn base acres were enrolled in PLC, 47% in ARC-County, and less than 2% in ARC-Individual.

We support the continued ability for producers to choose between programs, instead of being locked into a 5 year irreversible decision. We appreciate that com-

modity program sign-up periods are now similarly timed with crop insurance decisions.

For the 2020 crop year, the ARC and PLC programs issued a combined \$41.3 million in payments to corn growers, including \$27.3 million through the ARC-County and \$14 million through ARC-Individual. The PLC program did not trigger for corn farmers in 2020. For the 2019 crop year, the programs issued a combined \$1.56 billion in assistance for corn growers, including \$1.1 billion through PLC, \$280 million through ARC-County and \$183 million through ARC-Individual.

The design of the programs, combined with the delay in payments until October following the marketing year, results in only 2 years of payment data to evaluate. However, NCGA appreciates the Committee and USDA's work to provide more transparency to payment components. FSA now regularly publishes key information regarding benchmark prices, yields, revenues, and market average prices for both programs.

While neither commodity program is expected to trigger for many corn producers in 2022, this reflects the counter-cyclic design of the commodity programs. However, if conditions were to change through the growing and marketing seasons and result in a sharp decline in commodity prices along with major yield losses, the commodity programs could provide some level of assistance.

ARC-County and ARC-Individual

NCGA supported the development of the ARC-County and ARC-Individual programs and their continuation. During implementation of the 2014 Farm Bill, producers experienced large differences between payments in similarly situated counties. To minimize future county-by-county differences, in the 2018 Farm Bill we strongly supported shifting the primary source of yield data for the ARC-County program from the National Agricultural Statistical Service (NASS) to aggregated data from RMA. NCGA also supported requiring assistance be determined by physical location of the farm, not administrative counties.

We are thankful for multiple improvements to the ARC-County program including provisions incorporating trend adjusted yields and increasing the transitional yield, *i.e.*, yield plug. Given the nature of a county-based program, growers continue to experience some disparities in payments to producers in different counties, but there is now more confidence in the structure and data that supports the program.

PLC and MALs

The 2018 Farm Bill kept the statutory reference prices for the PLC program and raised loan rates across most commodities. For corn, the PLC reference price is set at \$3.70 and the loan rate under the Marketing Assistance Loan (MAL) program was raised from \$1.95 to \$2.20. The PLC program has historically provided more limited support for our growers than the ARC-County program. However, for the first 2 years of the 2018 Farm Bill more corn base acres were elected to PLC, reflecting the low-price environment for those years and producers' ability to change elections more frequently.

Given the continued trend of increased corn yields year after year, growers appreciated the option to update PLC yields on a farm and crop basis in 2020. The new effective reference price provision has not yet triggered for corn.

While use of MALs is small among our members, the program remains an accessible commodity program tool for corn growers without base acres. According to FSA, in 2019, there were 13,777 MAL loans issued for 782.8 million bushels of farm stored corn and in 2021 there were only 5,675 loans on 435 million bushels.

Farm Bill Implementation

FSA continues to be a great partner with producers and commodity organizations. Implementation of the current farm bill has been fairly smooth, helped by familiarity of the programs, lengthy sign-up periods, and increased transparency of the program components, as well as USDA fact sheets and additional resources on *farmers.gov*. We commend the Committee for continued support of web-based decision tools that help facilitate growers' education and evaluation of commodity programs and options.

Overall, the quality of customer service at the county offices can depend on whether there is adequate and experienced staffing. NCGA is supportive of providing resources for implementation and staff training, which makes a positive impact on the roll out of changes to commodity programs. While the COVID-19 pandemic has been difficult for face-to-face interactions with growers, we appreciate agency efforts to provide flexibility with producer sign-ups. USDA deserves credit for continuing to implement and administer commodity and disaster programs.

NCGA encourages the continuation of the Acreage and Crop Reporting Streamlining Initiative (ACRSI) and similar efforts to improve the farmer customer experi-

ence and create greater efficiency for multiple USDA agencies. The agencies are already working closer to together and should continue to share common data and best practices.

Opportunities exist to build upon the lessons of the pandemic and to further reduce the reporting burden on producers. USDA can continue to find more ways to use data already submitted to the department or for farmers to submit additional information electronically, which may reduce the number and length of in-person visits to county offices.

NCGA Farm Bill Process

NCGA and our state affiliates are gearing up to provide additional input and farm bill recommendations. Throughout our homework phase and policy development process, we are grounded in our grassroots process. The listening phase with our members has already begun with several state associations holding or planning listening sessions and collecting direct feedback from growers.

We will be data driven in our efforts. NCGA has already commissioned and conducted a nationwide survey of grower members and non-members on the usage and views of risk management tools and conservation programs. Grower led Action Teams continue to hold discussions on programs and have sought out additional analysis that will be helpful in developing future priorities. We look forward to sharing with the Committee the results, lessons, and key findings of this work in the months ahead.

Next week, corn growers will gather in New Orleans at the annual Commodity Classic where growers will propose, debate, and vote on updates to our policies. Later this summer will we gather for a second "Corn Congress" session. We look forward to working with the Committee as NCGA develops more formal policy priorities throughout the year.

Program Evaluation

We understand that complexity of the farm economy and commodity programs require constant education of Members of Congress on the importance and structure of the safety net. There will also be important conversations and considerations regarding the ability to accurately explain and defend farm programs to growers, taxpayers, and other interests. NCGA will continue to highlight lessons we have learned from the past, including when some have the mistaken belief that commodity prices will always stay high.

Thank you to Representatives Cheri Bustos and Austin Scott for including corn growers in previous General Farm Commodities and Risk Management Subcommittee round table discussions on farm safety net programs. As the Committee continues oversight of USDA and evaluates the structure of safety net programs, we appreciate additional opportunities to provide feedback. Please do not hesitate to reach out for growers' perspectives at future hearings, listening sessions, roundtables, and farm tours.

In closing, NCGA recognizes the difficult task ahead for the Committee to develop the next farm bill. We understand that there will be continued budget challenges and varied approaches to confronting current issues impacting agriculture. We appreciate your consideration of our views regarding commodity programs and the need for producers to have access to effective risk management tools.

The CHAIRMAN. Thank you.

Ms. Ford, you may begin when you are ready.

STATEMENT OF JACLYN D. FORD, DELEGATE, NATIONAL COTTON COUNCIL, ALAPAHA, GA

Ms. FORD. Good morning. I am Jaclyn Dixon Ford, a cotton producer and ginner from Alapaha, Georgia. My family and I grow cotton, peanuts, corn, pecans, and raise cattle. I am also Vice President and Manager of my family's ginning operation. I am testifying today on behalf of the National Cotton Council, the central organization of the United States cotton industry, representing all seven segments.

U.S. cotton acres are expected to increase this year due to higher prices. Although cotton prices are stronger than in recent years, higher input prices and supply chain disruptions have resulted in significant increases in production costs. Most producers are ex-

pecting a 25 to 40 percent increase in costs, largely due to higher fertilizer and pesticide prices.

While demand for U.S. exports has been very strong in the 2021 marketing year, transportation and logistics issues continue to impact U.S. cotton shipments. An effective safety net for producers must consist of two key components. First, an effective commodity policy that provides either price or revenue protection for prolonged periods of low prices and depressed market conditions; second, a strong and fully accessible suite of crop insurance products that producers can purchase and tailor to their risk management needs.

The yearly election of either ARC or PLC in the 2018 Farm Bill has worked well for growers and should continue in future farm bills. In this farm bill, producers have overwhelmingly enrolled seed cotton base acres in the PLC program at over 90 percent annually. We know that ag markets are cyclical, and an effective safety net is imperative for the inevitable times of low prices. The Non-Recourse Marketing Assistance Loan Program for upland cotton remains a cornerstone of farm policy for our industry during times of both low and high prices. It is necessary for multiple industry segments to effectively market cotton and provide cash flow for producers. In periods of low prices, if growers choose to forego the marketing loan, they may receive a Loan Deficiency Payment representing the difference in the market price and the loan rate. This important component of the program should be retained.

Our industry is opposed to any further tightening of payment limits and program eligibility requirements. We believe these policies are already too restrictive, given the size and scale of production agriculture necessary to be competitive in today's global market. Artificially limiting benefits is a disincentive to economic efficiency and undermines the ability to compete with heavily subsidized foreign ag products.

The 2018 Farm Bill continued the ELS Program, Cotton Loan Program, as well as a provision to ensure U.S. Pima cotton remains competitive in international markets. The balance between the upland and Pima program is important to ensure that acreage is planted in response to market signals.

The stability of the U.S. textile industry in recent years and their expected future growth can be attributed to the continued benefits of the Economic Adjustment Assistance for Textile Mills. Considering the need to re-shore or near-shore manufacturing of critical goods and materials, a strong and robust U.S. textile industry is key. This industry is vital to produce many products for our defense industry and personal protection equipment, as highlighted during the COVID pandemic.

In recent years, Congress authorized several rounds of *ad hoc* disaster assistance. While we recognize the budgetary constraints, we believe the Committee should review options to include either a permanent disaster program in the upcoming farm bill, or seek policy options to increase insurance coverage levels that are cost effective for producers.

Since the passage of the 2018 Farm Bill, there have been several forms of *ad hoc* assistance provided outside of the farm bill. As Congress begins to plan the path forward for the next farm bill, I

urge the Committee to seek additional funding for this important legislation.

In closing, I encourage the Committee to write a farm bill that provides long-term stability for the future. There will be price declines from where we are today. There will be disasters that are larger than the essential assistance commodity programs and crop insurance provide. There will be trade disputes that wreak havoc on our export markets. The NCC looks forward to working with the Committee, ag organizations, and other stakeholders to develop and pass a new farm bill that will effectively address the needs of all commodities and all producers in all regions of the country.

Thank you for this opportunity, and I would be pleased to respond to any questions.

[The prepared statement of Ms. Ford follows:]

PREPARED STATEMENT OF JACLYN D. FORD, DELEGATE, NATIONAL COTTON COUNCIL,
ALAPAHA, GA

Introduction

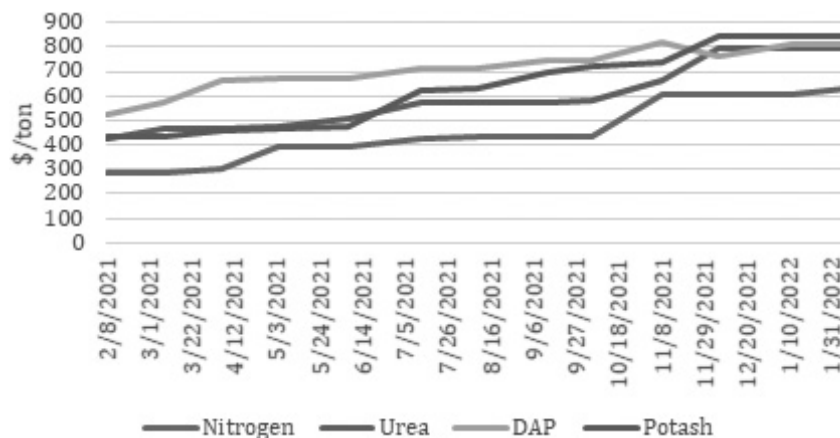

Good morning, I am Jaclyn Ford, a cotton producer and ginner from Alapaha, Georgia and serve as a delegate for the National Cotton Council. My family and I grow cotton, peanuts, corn, pecans and raise cattle in Berrien County. I am also Vice President and Chief Operating Officer of Dixon Gin Co., Inc. and serve as the company director of Commodities Marketing. Currently, I serve on the Georgia Economic Development Board and the Georgia Farm Bureau Commodities Committee for Cotton. I formerly served on the Georgia Farm Service Agency State Committee. In addition, I am serving as Vice Chair on the Board of Trustees for Abraham Baldwin Agricultural College, and on the Georgia Agribusiness Council Board, and the South Georgia Medical Center—Berrien Campus Authority.

The National Cotton Council (NCC) is the central organization of the United States cotton industry. Its members include producers, ginners, cottonseed processors and merchandizers, merchants, cooperatives, warehousemen, and textile manufacturers. A majority of the industry is concentrated in 17 cotton-producing states stretching from California to Virginia. U.S. cotton producers cultivate between 10 and 14 million acres of cotton with production averaging 12 to 20 million 480 lb bales annually. The downstream manufacturers of cotton apparel and home furnishings are in virtually every state. Farms and businesses directly involved in the production, distribution and processing of cotton employ more than 115,000 workers and produce direct business revenue of more than \$22 billion. Annual cotton production is valued at more than \$5.5 billion at the farm gate, the point at which the producer markets the crop. Accounting for the ripple effect of cotton through the broader economy, direct and indirect employment surpasses 265,000 workers with economic activity of almost \$75 billion. In addition to the cotton fiber, cottonseed products are used for livestock feed and cottonseed oil is used as an ingredient in food products as well as being a premium cooking oil.

Economic Overview

U.S. cotton acreage is expected to increase in 2022 due to higher prices. Recent estimates suggest that 2022 acreage could range from 12.0 to 12.7 million as compared to 11.2 million acres in 2021. Although planted acreage is expected to be higher than last year, unharvested acreage is also expected to be higher due to dry conditions in the Southwest. Acreage continues to decline in the West due to prolonged drought conditions and water availability issues.

Although cotton prices are higher than in recent years, higher input prices and supply chain disruptions have resulted in significant increases in production costs for 2022. Most producers are expecting a 25 to 40% increase in input costs in 2022, largely due to higher fertilizer and pesticide costs. As compared to a year ago, fertilizer prices have increased by 55–120% (*Figure 1*).

Figure 1. Fertilizer Prices

Source: USDA AMS.

World cotton demand remains strong and is projected to increase to almost 126.0 million bales for the 2022 marketing year, which represents an all-time high for cotton demand. While demand for U.S. exports has been very strong thus far in the 2021 marketing year, transportation and logistics issues continue to impact U.S. cotton shipments. The latest NCC estimate of U.S. exports for the 2021 marketing year is 13.8 million bales, which is 950 thousand bales below the February 2022 USDA estimate. The current supply chain challenges are adding economic stress to our merchandising segments that were still feeling the impacts of the sharp slowdown in demand when COVID shutdowns were at their peak. We continue to look for opportunities to assist these critical segments of the industry.

Safety Net Programs

While we are here today to talk about farm bill Title I programs, an effective safety net for producers must consist of two key components: (1) an effective commodity policy that provides either price or revenue protection to address prolonged periods of low prices and depressed market conditions that span multiple years; and (2) a strong and fully accessible suite of crop insurance products that producers can purchase to tailor their risk management to their specific needs to address yield and price volatility within the growing season.

The yearly producer election of either Agriculture Risk Coverage (ARC) or Price Loss Coverage (PLC) included in the 2018 Farm Bill has worked well for growers and should continue in future farm bills. Under the 2018 Farm Bill, producers have overwhelmingly enrolled seed cotton base acres in the PLC program, at over 90% annually. We know that agriculture markets are cyclical, and an effective safety net is imperative for the inevitable times of low prices. The combination of commodity program options and crop insurance gives farmers as well as their lenders the confidence entering planting season knowing that downside risk is mitigated in periods of steep price decline or a significant loss of production.

Upland Cotton Marketing Loan and Seed Cotton Loan

The non-recourse marketing loan program for upland cotton remains a cornerstone of farm policy for the U.S. cotton industry. While current prices are well above the loan rate, we know that will not always be the case. During times of low prices for U.S. cotton, the marketing loan program is an especially crucial tool for multiple segments of the cotton industry to effectively market cotton and provide cash flow for producers to meet financial obligations. Even in times of higher market prices, the marketing loan is utilized by the cotton industry to provide cash flow for producers and flexibility in marketing. One of the hallmarks of the marketing loan program is its function to ensure cotton flows through the marketing channels and encourages orderly marketing of the crop throughout the year. In recent years, over 50% of the upland cotton crop enters the loan and use of the loan approaches 80% when market prices drop. Also, in periods of low prices, if growers choose to forgo the marketing loan, they may receive a Loan Deficiency Payment (LDP) rep-

resenting the difference in the market price and the loan rate. This is an important component of the marketing loan program that should be retained.

Complete automation of the marketing loan program should be addressed in the next farm bill. During the December 2018 lapse in government funding, these programs were severely impacted due to the need for direct personnel involvement in portions of processing the entry and redemption of cotton in the marketing loan program. During this period, some growers were not able to enter cotton into the loan and access those funds, while others could not sell their cotton because they could not redeem the loan. We urge this Committee to work with USDA to provide the necessary support to ensure that any future lapse in government funding does not negatively impact the marketing loan program.

Another loan program that has been more utilized in recent years is the Seed Cotton Recourse Loan. Seed cotton recourse loans help upland and Extra Long Staple (ELS) cotton producers meet cash flow needs while waiting for their harvested cotton to be ginned so it is then marketable. Recourse loans also allow producers to store production at harvest and provide for a more orderly marketing of cotton throughout the year. Several factors such as the speed and efficiency of harvest operations and longer cotton ginning seasons have contributed to the increased use of this program.

Payment Limits and Program Eligibility

Our industry is opposed to any further tightening of payment limits and program eligibility requirements, as we believe these policies are already too burdensome and restrictive in light of the size and scale of production agriculture necessary to be competitive and viable in today's global market. The NCC has always maintained that effective farm policy must maximize participation without regard to farm size or income. Artificially limiting benefits is a disincentive to economic efficiency and undermines the ability to compete with heavily subsidized foreign agricultural products. Artificially limited benefits are also incompatible with a market-oriented farm policy. In fact, the current program limits are incompatible with the cost structure and capital investments necessary for today's family farms. We are encouraged that Congress has recognized this reality in recent disaster assistance that included increased payment limit levels to help account for more of the losses incurred. This same consideration should be given to Title I program limits when the next farm bill is being developed. Other proposed arbitrary restrictions regarding the contribution of management and labor through changes to the definition of 'actively engaged' are out of touch with today's reality on most farming operations and would only contribute to inefficiencies.

Extra Long Staple Cotton Policies

There are important policies in place for Extra Long Staple (ELS) or Pima cotton as well. The 2018 Farm Bill continued the ELS cotton loan program as well as a competitiveness provision to ensure U.S. Pima cotton remains competitive in international markets. The balance between the upland and Pima programs is important to ensure that acreage is planted in response to market signals.

Economic Adjustment Assistance for Textile Mills

After a decade of experiencing a precipitous decline in the amount of cotton used by U.S. textile mills, U.S. mill consumption has stabilized since 2008 due to ongoing assistance provided in the farm bill.

The recent years of stability and expected future growth can be attributed to the continued benefits of the Economic Adjustment Assistance for Textile Mills (EAATM), originally authorized in the 2008 Farm Bill. Recipients must agree to invest the proceeds in equipment and manufacturing plants, including construction of new facilities as well as modernization and expansion of existing facilities. EAATM funds have allowed investments in new equipment and technology, thus allowing companies to reduce costs, increase efficiency and become more competitive. By allowing U.S. textile mills to make the new investments necessary to remain competitive, the program supports a manufacturing base that brings jobs to U.S. workers. Furthermore, in the current global environment and the need to re-shore or near-shore manufacturing of critical goods and materials, having a strong and robust U.S. textile manufacturing sector is key to produce many products for our defense industry and personal protection equipment (PPE) as highlighted during the COVID pandemic.

Disaster Programs

In recent years, Congress authorized several rounds of *ad hoc* disaster assistance in response to hurricanes, wildfires, wind events, drought, and other natural disasters. While *ad hoc* disaster assistance has been extremely helpful to farmers and

allowed many of them to remain in business, they are never timely. The most recent disaster assistance was passed by Congress in September of last year and unfortunately USDA has yet to unveil most details of the program so crop producers can begin to apply for the assistance for disaster losses in 2020 and/or 2021. While it is helpful to know that assistance is coming, it makes planning for the next crop year extremely difficult for growers and lenders alike. While we recognize the budgetary constraints, we believe the Committee should review options to include either a permanent disaster assistance program in the upcoming farm bill or seek policy options to help further minimize the deductible producers are left to cover with most existing, affordable crop insurance products.

Farm Bill Resources

Since the passage of the 2018 Farm Bill there have been several forms of other *ad hoc* assistance provided to the agriculture industry outside of the farm bill construct. Whether it is disaster assistance with WHIP/WHIP+, the Market Facilitation Program (MFP) or COVID pandemic relief (CFAP), two things are certain: they all were necessary for various regions and commodities and they were separate from the farm bill because the existing policies and programs were not fully meeting the extraordinary and unpredictable need. As Congress begins to plan the path forward for the 2023 Farm Bill, I urge you to seek additional funding for this important legislation. The dynamics faced by the agriculture industry continue to change, evolve, and become more volatile. With those changes, America's farmers need a farm bill that has the resources to ensure that the American people and the world have a safe and affordable supply of food and fiber.

Conclusion

In closing, I encourage the Committee to write a farm bill that provides long-term stability for the future. There will be price declines from where they are today, there will be natural disasters with losses more severe than the essential assistance that commodity programs and crop insurance can respond to, and there will be trade disputes that can wreak havoc on our export markets.

The NCC looks forward to working with the Committee and all commodity and farm organizations and other stakeholders to develop and pass a new farm bill that effectively addresses the needs of all commodities and all producers in all regions of the country.

Thank you for this opportunity, and I would be pleased to respond to any questions.

The CHAIRMAN. Thank you, Ms. Ford.

And now, Ms. Ulibarri, please begin when you are ready.

STATEMENT OF VERITY ULIBARRI, MEMBER, FARM BILL ADVISORY COMMITTEE, NATIONAL SORGHUM PRODUCERS, MELROSE, NM

Ms. ULIBARRI. Good morning. Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee for the opportunity to speak to the Committee today. My name is Verity Ulibarri. I am a fifth-generation diversified farmer from Melrose, New Mexico, on the east central side of the state. I have been a member of the National Sorghum Producers for more than 10 years.

The climate in my region necessitates being very conscientious about the crops we grow, as we are very limited in the amount of rainfall we receive each year. The 20 year average for rainfall in my county is just under 16", and in 2020, we saw a record low of only 6.7" of rain in an entire year. The innate drought tolerance of sorghum as a resource-conserving crop makes it an excellent fit for my operation.

Just as the harsh climate in eastern New Mexico requires me to carefully consider the optimal crops to plant each year, it also requires me to take steps to mitigate my risk. This is where Title I becomes incredibly important, not just to me, but all farmers and

ranchers across the country, as we are seeing increasingly erratic weather patterns: longer and more extreme droughts in some regions, and more frequent flooding in other areas. The farm safety net and robust crop insurance that helps farmers adequately mitigate risk and volatility becomes vital to the sustainability and continuation of family farms.

We are thankful for the support provided by crop insurance. It continues to be the cornerstone of the modern safety net, and we appreciate all the work that has been done to defend and strengthen it. From a sorghum standpoint, there is still much work to be done in this area. Due to the nature of the program, drought tolerant, resource conserving crops like sorghum are not rewarded, but instead penalized, rated such that insurance for competing crops is more affordable. We worked closely with the Committee in the last farm bill to address this issue, and continue to work closely with RMA.

Due to the leadership of this Committee during the 2018 Farm Bill, we have had the opportunity to collaborate with RMA on a study paving the way for an irrigated insurance product that enables sorghum farmers to insure sorghum at higher yield levels and for less premium. Many irrigated farmers on the Western Plains are facing significant declines in ground water availability, and transitioning some or all of their irrigated acres to sorghum enables them to use water much more efficiently. However, under current yield and rating structures, most existing and perspective sorghum farmers actually face a penalty. Given the collaboration with RMA, we are optimistic that new options will be available for the 2023 crop year.

On Title I specifically, the changes to the ARC and PLC programs have been positive overall. Farmers in the sorghum belt use PLC more extensively than ARC, but for those that do use ARC, the new formula has been helpful. The change to the way in which the reference price is calculated was also a very positive development, as it makes reference prices more reflective of price and cost realities. However, given the level to which prices and costs have increased, and the speed with which this has occurred, PLC reference prices are now too low. The same situation is true in marketing loans, which remain an important cash flow tool for our farmers, but are now much too low relative to current risk.

We believe reference prices and marketing loan rates must be adjusted upward to remain relevant, and would urge the Committee to consider an index or inflator tied to fuel and fertilizer prices, as U.S. farmers need to maintain their productivity through such turbulent times.

Allowing an annual choice between ARC and PLC has also been a welcome change, and our farmers greatly appreciated the opportunity to update base acres. However, these now routine activities combined with existing program and the growing complexity of these programs sheds new light on the importance of staffing at FSA. Delivering these programs well requires resources, staff members that can actually go into the office and work with farmers. FSA programs will continue to be a key component of the farm safety net, so we encourage additional resources for FSA to deliver these programs.

Thank you for the opportunity to offer a firsthand account of how the existing farm bill Title I programs are functioning in the sorghum industry. I look forward to answering any questions you may for me today.

[The prepared statement of Ms. Ulibarri follows:]

PREPARED STATEMENT OF VERITY ULIBARRI, MEMBER, FARM BILL ADVISORY COMMITTEE, NATIONAL SORGHUM PRODUCERS, MELROSE, NM

Thank you, Chairman Scott and Ranking Member Thompson, for the opportunity to speak to the Committee today. My name is Verity Ulibarri, and I am a fifth-generation diversified farmer from Melrose, New Mexico, on the eastern central side of the state and have been a member of National Sorghum Producers for more than 10 years. The climate in my region necessitates being very conscientious about the crops we grow, as we are very limited on the amount of rainfall we receive each year. The 20 year average for rainfall in my county is just under 16", and in 2020 we saw a record-low of only 6.7" of rain for the entire year. The innate drought-tolerance of sorghum as The Resource-Conserving Crop™ make it an excellent fit for my operation.

Just as the harsh climate in eastern New Mexico requires me to carefully consider the optimal crops to plant each year, it also requires me to take steps to mitigate my risk. This is where Title [I] becomes incredibly important not just to me but all farmers and ranchers across the country. As we are seeing continuous erratic weather patterns—longer and more extreme droughts in some regions and more frequent flooding in other areas—the farm safety net and robust crop insurance program that helps farmers adequately mitigate risk and volatility becomes vital to the sustainability and continuation of family farms. Similarly, the disaster funding provided at various times over the past few years has been instrumental to this end, and if funding is available, sorghum farmers would like to see a disaster-type program become permanent law.

We are thankful for the support provided by crop insurance. I know it is not "Title [I]," but it continues to be the cornerstone of the modern safety net, and we appreciate all the work that has been done to defend and strengthen it. From a sorghum standpoint, there is still much work to be done in this area. Due to the nature of the program, drought-tolerant, resource-conserving crops like sorghum are not rewarded but instead punished—rated such that insurance for competing crops is more affordable. We worked closely with the Committee in the last farm bill to address this issue, and continue to work closely with RMA. However, we still have a long way to go in providing real solutions to farmers.

Due to the leadership of this Committee during the 2018 Farm Bill, we have had the opportunity to collaborate with RMA on a study paving the way for an irrigated insurance product that enables sorghum farmers to insure sorghum at higher yield levels and for less premium. Many irrigated farmers on the western plains are facing significant declines in groundwater availability, and transitioning some or all of their irrigated acres to sorghum enables them to use water much more efficiently. However, under current yield and rating structures, most existing and prospective sorghum farmers actually face a penalty. Collaborating with RMA, we are optimistic a new option will be available for the 2023 crop year.

On Title [I] specifically, the changes to the ARC and PLC programs have been positive overall. Farmers in the Sorghum Belt use PLC more extensively than ARC, but for those that do use ARC, the new formula has been helpful. The change to the way in which the reference price is calculated was also a very positive development as it makes reference prices more reflective of price and cost realities. However, given the level to which prices and costs have increased and the speed with which this has occurred, PLC reference prices are now too low. The same situation is true of marketing loans, which remain an important cash flow tool for our farmers but are now much too low relative to current risk. We believe reference prices and marketing loan rates must be adjusted upward to remain relevant, and would urge the Committee to consider an index or more aggressive inflator tied to fuel and fertilizer prices as U.S. farmers need to maintain their productivity through such turbulent times.

The CHAIRMAN. Thank you very much.
And now, Mr. Coleman, please begin when you are ready.

STATEMENT OF CLARK COLEMAN, BISMARCK, ND; ON BEHALF OF NATIONAL SUNFLOWER ASSOCIATION, NATIONAL BARLEY GROWERS ASSOCIATION, U.S. CANOLA ASSOCIATION, AND USA DRY PEA AND LENTIL COUNCIL

Mr. COLEMAN. Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. My name is Clark Coleman and I am a fourth-generation farmer from Bismarck, North Dakota. This year, I will plant ten different crops, including confection oil sunflowers, malting barley, canola, yellow peas, soybeans, grain and silage corn, spring wheat, Durum, and we calve out 600 head of cows. This crop diversity is not uncommon in the northern tier, where many farmers typically grow at least four or five different crops every year. I am past President and Chairman of the National Sunflower Association, and still serve on the National Sunflower Board. I will also speak today on behalf of the National Barley Growers Association, the U.S. Canola Association, the U.S. Dry Pea and Lentil Council. I will share perspectives on Title I program elections and dynamics for crops and the relationship of the reference prices to their market prices.

Overall, the Title I programs along with the crop insurance programs are the backbone of most important factors in the stability of our operation. Without them, it would be difficult or impossible to get financing from a credible lender for my seed, fertilizer, and other production input costs, which are experiencing significant increases this year.

The Title I programs are largely working as they were intended for my farm and for my crops that I produce. The options and flexibility provided under the 2018 Farm Bill allows producers to choose between ARC and PLC program options on a farm-by-farm and crop-by-crop basis. This has given the farmers the latitude to develop protection plans that best fit their operations.

The policy decoupling farm program payments from planting continues to work well, providing planting flexibility by tying income or revenue protection to recent historical base acres, rather than current year crop plantings has allowed farmers to respond to market signals rather than the prospect of receiving government payments.

As a producer of multiple crops, it is fundamentally important that my decisions are based on market signals. The Title I programs are serving as a safety net, not a market driver. The reference prices established in the 2018 Farm Bill for crops that I grow were reflective of the market for the first few years; however, the dynamic may be changing as we are experiencing a surge in prices of fertilizers and other inputs that significantly increase the production costs and risks.

I would like to take this opportunity to note that the current issues with input supplies and prices highlights the need to promote domestic fertilizer and chemical manufacturing. This should be considered a food security and national security issue and should be a focus of any efforts to make our supply chains more resilient.

For sunflowers, PLC program has been primarily used by producers, but ARC also has been used. Oil-type sunflowers are currently at \$33, and confections over \$40 per hundredweight. Last

year at this time, oil-type sunflowers were \$21.60 and confections were \$26.80 per hundredweight. The reference prices for the other oilseed categories under the current farm bill is \$20.15 per hundredweight. This reference price level, like others, has been unchanged since 2014. At this price, the other oilseed marketing loan rate at \$10.19 per hundredweight is not used very often, unless it is for cash flow. The same is true for loan rates for all the crops that I grow. If market prices move to the loan rates for these crops, it would be difficult to recover costs.

For barley, PLC has been the primary program election with a small amount of ARC payments. The barley reference price is \$4.95 per bushel, and production contracts for malting barley were in the \$6 range in 2020 and 2021, and barley prices are currently at the \$7 to \$8 range.

For canola, PLC has been the choice with very little under ARC. Canola prices this year have been in the range from 30¢ to 38¢ per hundredweight, while the reference price for other oilseeds is \$20.15 per hundredweight.

The pulse crops, dry peas, lentils, and chickpeas, have been primarily covered by PLC. Over the past several years, prices of pulses have experienced significant swings from low levels due to tariffs and disruptions in key markets to upward spikes in 2020. Unfortunately, the supply chain disruptions have prevented the pulse product producers from capitalizing on current high prices.

The reference prices for dry peas is 11¢ per pound, lentils and small chickpeas are 19¢ per pound, and large chickpeas is 21¢ per pound. The reference price for large chickpeas established in the 2018 Farm Bill did not reflect the average market price for Olympic and average market prices at the time, and it does not reflect the current average price. The inadequate reference prices combined with the current historic highs for input expenses is a primary farm bill concern for us pulse producers.

I want to take this opportunity to offer my perspective on the FSA offices and staff that administer and implement the farm programs. Staff vacancies and shortages in FSA offices is a significant and growing concern for producers. Retirements and workloads have resulted in lots of experience leaving the organization. The larger counties of western states require separate county offices for ease of access, personal service, and best execution of programs. We need more FSA resources, not consolidated offices.

In closing, I would reiterate the existing farm program structure that provides growers with the farm-by-farm, crop-by-crop options, and planting flexibility through de-coupling are working well. The ARC and PLC programs and reference prices have been working as intended, but adjustments may be needed to adjust to emerging dynamics. I hope the stability and certainty of the farm safety net that the Title I and crop insurance program represent remain the top priority and driving force in the timely reauthorization of the bipartisan farm bill of 2023. Farmers as well as consumers that rely on the food we produce are facing lots of challenges and uncertainty. Additional instability and uncertainty in the farm safety net and our food production system is the last thing we need.

Thank you again for the opportunity to participate.

[The prepared statement of Mr. Coleman follows:]

PREPARED STATEMENT OF CLARK COLEMAN, BISMARCK, ND; ON BEHALF OF NATIONAL SUNFLOWER ASSOCIATION, NATIONAL BARLEY GROWERS ASSOCIATION, U.S. CANOLA ASSOCIATION, AND USA DRY PEA AND LENTIL COUNCIL

Chairman Scott, Ranking Member Thompson, and Members of the Committee,

My name is Clark Coleman and I am a farmer from Bismarck, North Dakota. This year I will plant ten different crops, including confection and oil sunflowers, malting barley, canola, yellow peas, soybeans, grain and silage corn, spring wheat and Durum wheat. This crop diversity is not uncommon in the northern tier, where many farms typically grow at least four or five different crops every year.

I am a past President and Chairman of the National Sunflower Association and still serve on the National Sunflower board. I will also speak today on behalf of the National Barley Growers Association, U.S. Canola Association, and USA Dry Pea & Lentil Council.

I will share perspectives on the Title I farm program elections and dynamics for the crops that I grow and the relationship of their reference prices to their market prices.

Overall, the Title I programs, along with the crop insurance program, are the backbone and most important factors in the stability of my operation. Without them it would be difficult or impossible to get financing from a credible lender for my seed, fertilizer and other production input costs—which are experiencing significant increases this year.

The Title I programs are largely working as they were intended for my farm and for the crops that I produce. The options and flexibility provided under the 2018 Farm Bill allows producers to choose between the ARC and PLC program options on a farm-by-farm and crop-by-crop basis. This has given farmers the latitude to develop protection plans that best fit their operations.

The policy of decoupling farm program payments from plantings continues to work well. Providing planting flexibility by tying income or revenue protection to recent historical base acres rather than current-year crop plantings has allowed farmers to respond to market signals rather than the prospect of receiving government payments. As a producer of multiple crops, it is fundamentally important that my decisions are based on market signals. The Title I programs are serving as a safety net, not a market driver.

The reference prices established in the 2018 Farm Bill for the crops that I grow were reflective of the market for the first few years. However, that dynamic may be changing as we are experiencing a surge in the prices of fertilizer and other inputs that will significantly increase production costs and risks.

I would like to take this opportunity to note that the current issues with input supplies and prices highlights the need to promote domestic fertilizer and chemical manufacturing. This should be considered a food security and national security issue and should be a focus of any efforts to make our supply chains more resilient.

For **sunflowers**, the PLC program has been primarily utilized by producers, but ARC has also been used.

Oil type sunflowers are currently over \$33, and confections over \$40 per cwt. *Note: Oil sunflowers provide sunflower oil for the food ingredient market, while confection sunflowers are what you eat as a snack, especially baseball players and fans at sporting events!* Last year at this time, oil type sunflowers were at \$21.60, and confections were \$26.80 per cwt. The reference price for the other oilseeds category under the current farm bill is \$20.15 per cwt. This reference price level, like others, has been unchanged since the 2014 Farm Bill.

At these prices, the other oilseed marketing loan rate of \$10.19 per cwt is not used very often, unless it is for cash flow. The same is true of the loan rates for all of the crops that I grow. If market prices moved to the loan rates for these crops, it would be difficult to recover costs.

For **barley**, PLC has been the primary program election, with a small amount of ARC payments

The barley reference price is \$4.95/bushel and production contracts for malting barley were in the \$6 range in 2020 & 2021 and barley prices are currently in the \$7–\$8 range.

For **canola**, PLC has been the choice, with very little under ARC

Canola prices this year have been in the range of \$30 to \$38 per cwt while the reference price for canola/other oilseeds is \$20.15 per cwt.

The **pulse crops**—dry peas, lentils, and chickpeas—have all been primarily covered by PLC.

Over the past several years, prices for pulses have experienced significant swings from low levels due to tariffs and disruptions in key markets to upward spikes since

2020. Unfortunately, the supply chain disruptions have prevented pulse producers from capitalizing on the current high prices.

The Reference price for Dry peas is \$0.11 per pound, Lentils and Small Chickpeas is \$0.19 per pound and Large Chickpeas is \$0.21 per pound. The reference price for Large Chickpeas established in the 2018 Farm Bill did not reflect the average market price or the Olympic Average market price at that time and it does not reflect the current average price. The inadequate reference prices combined with the current historic highs for input expenses is a primary farm bill concern for pulse producers.

I want to take this opportunity to offer my perspectives on the FSA offices and staff that administer and implement the farm programs. Staff vacancies and shortages in FSA offices is a significant and growing concern for producers. Retirements and workloads have resulted in lots of experience leaving the organization. The larger counties of western states require separate county offices for ease of access, personal service and the best execution of programs. We need more FSA resources, not consolidation of offices.

In closing, I would reiterate that the existing farm program structure that provides growers with farm-by-farm and crop-by-crop options and planting flexibility through decoupling are working well. The ARC and PLC programs and the reference prices have been working as intended, but adjustments may be needed to address emerging dynamics.

I hope that the stability and certainty of the farm safety net that the Title I and crop insurance programs represent will remain the top priority and driving force in the timely reauthorization of a *bipartisan* Farm Bill in 2023. Farmers, as well as consumers that rely on the food we produce, are facing a lot of challenges and uncertainty. Additional instability and uncertainty in the farm safety net and our food production system is the last thing we need.

Thank you again for the opportunity to participate in this hearing.

The CHAIRMAN. Thank you.

Ms. James, you are now recognized for 5 minutes.

STATEMENT OF JENNIFER JAMES, MEMBER, BOARD OF DIRECTORS, USA RICE, NEWPORT, AR

Ms. JAMES. Good morning, and thank you.

As a fourth-generation rice farmer from Newport, Arkansas, I am honored to provide my testimony on behalf of the USA Rice Federation, the only farmer-led rice organization that advocates in the best interest of every farmer in the country, along with our meal merchant and allied members.

While I am a rice farmer first, my family farm is diversified, growing rice as well as corn and soybeans, while providing many acres of over winter habitat for migrating waterfowl every year.

U.S. rice farmers harvest 20 billion pounds of rice grown on 3 million acres of sustainably managed farmland, creating tens of thousands of jobs and billions of dollars in economic activity. Half of our production is consumed domestically, while the other half is exported to more than 120 countries around the globe.

U.S. rice farmers have long been committed to environmental stewardship, reducing greenhouse gas emissions by 41 percent, cutting our water usage in half, and decreasing energy usage by 34 percent, all while increasing yields dramatically over the last few decades. We will always strive to be more efficient and explore new ways to reduce emissions.

But here is the key point for today's farm bill hearing. Farm families must be profitable to have the wherewithal to pursue these important environmental dividends. This Committee on a bipartisan basis has a long history of recognizing this, and working with farm families like mine to ensure our profitability and capacity can serve our natural resources. This hearing is timely and important

because Title I of the farm bill, the commodity title, is the cornerstone of the safety net for rice farm families. Other commodities might regard crop insurance as their primary safety net. We have worked hard to make crop insurance a more effective tool but have historically lagged behind other crops in terms of participation and coverage levels. Title I is our true safety net. It helps us compete in a global marketplace that is highly distorted with high and rising foreign subsidies, tariffs, and non-tariff barriers.

As you know, China was found to illegally have over-subsidized three crops, including rice, by \$100 billion in a year. It would take 10 years for farm bill spending on all U.S. commodities to reach that level. U.S. rice farmers simply can't compete without U.S. farm policy to help level the playing field. The fact is, Title I rice policy helps to ensure that more of the world's rice is produced sustainably in the U.S., following the highest environmental safety and labor standards in the world.

Price Loss Coverage has been the most effective option for rice, with 99 percent of long and medium grain rice producers electing it over ARC. Despite the success of PLC since 2014, it does not look sufficient given current economic conditions. Rice simply has not enjoyed the rallying prices that other crops are experiencing. According to USDA, the current market prices for corn, cotton, soybeans, and wheat are 50 percent, 84 percent, 77 percent, and 73 percent higher than in 2020, but rice prices are only up eight percent. Unfortunately, our prices have risen only to reduce the modest benefits provided by PLC. To illustrate, the PLC benefit to rice is down 75 percent from where it stood in 2019. The payment rate per pound for 2021 is projected to be about $\frac{1}{3}$ the rate it was last year.

Current PLC reference prices were established based on 2012 cost of production. They were still relevant when the 2014 Farm Bill was enacted. The Market Assistance Loan rate for rice has not been relevant for many years now. While production costs have risen since 2012, notwithstanding low prices, the increases pale in comparison to what we are seeing this year. The Ag and Food Policy Center at Texas A&M found that fertilizer prices on average are higher per acre for rice than feedgrains, cotton, and wheat. Everyone testifying here today and all the farmers we represent are paying too much for inputs, but rice is taking a disproportionate hit on this front while our crop prices continue to lag.

A recent rice-specific AFPC study of all variable input costs estimates rice farmers will lose over \$500 million this year due to these increases. Because of the combined conditions of low rice prices and accelerating input costs, rice farmers are in trouble.

Important steps can and should be taken to shore up the nation's rice farm families in the near-term, even before the next farm bill. That is why we sent a letter to Secretary Vilsack last week seeking relief and I would ask for your support of this request. We remain committed to working with you to strengthen the safety net in the next farm bill. Establishing and maintaining the safety net levels relevant to the economic times ought to be our primary consideration. This includes payment limitations and actively engaged rules that simply have not kept pace with the fast-changing times in ag. They are outdated, as evidenced by the hundreds of Members of

Congress on both sides of the aisle who wrote USDA expressing concerns that the limitations for CFAP didn't cover the enormous losses suffered. This Committee took steps, important steps in the right direction in the 2018 Farm Bill. We look forward to working with you to build on those achievements. Thank you.

[The prepared statement of Ms. James follows:]

PREPARED STATEMENT OF JENNIFER JAMES, MEMBER, BOARD OF DIRECTORS, USA RICE, NEWPORT, AR

Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. Thank you for the opportunity to testify before you today concerning the Commodity Title of the 2018 Farm Bill.

My name is Jennifer James, and I am a fourth-generation rice farmer from Newport, Arkansas.

While I consider myself a rice farmer first, our family farm is very diversified. I farm with my father and my husband, and we primarily grow rice and soybeans and corn as well as provide many acres of over-winter habitat for migrating waterfowl every year. As we have built the habitat in and around our fields my family enjoys watching the ducks, geese, bald and golden eagles, swans, deer and a variety of wildlife coexist with production agriculture.

I am proud to serve as the Chair of the USA Rice Federation's Sustainability Committee and as a member of the USA Rice Federation Board of Directors, USA Rice Farmers Board of Directors, the USA Rice Domestic Promotion Committee, the USA Rice Communications Committee, and the USA Rice Asia, Turkey Promotion Subcommittee.

I'm very proud to be the first woman ever elected to serve on the Board of Directors of Riceland Foods, Inc.—the largest miller and marketer of rice in the United States. I'm also active on the state level and serve as vice chair of the Arkansas Rice Farmers Board of Directors, the Arkansas Ag Council Board of Directors, the Jackson County Farm Bureau Board of Directors, and the St. Louis Federal Reserve Bank Agribusiness Industry Council.

I'm truly grateful for having the opportunity to grow up and now help lead our family farm and to help guide the U.S. rice industry in a way where farm families can continue doing what they love to do—feed the country and much of the world—while also excelling at being good stewards of the land and natural resources.

Rice farmers in the United States harvest roughly 20 billion pounds of rice grown on 3 million acres of sustainably managed farmland. About half is consumed here at home while the other half is exported to more than 120 countries around the globe.

Family farmers primarily in six major rice producing states, including Arkansas, California, Louisiana, Mississippi, Missouri, and Texas, produce about 85 percent of all the rice consumed domestically.

In addition to putting rice on grocery shelves, in restaurants, and on the dinner table and in creating tens of thousands of jobs and billions of dollars in economic activity, U.S. rice farmers have also long been committed to environmental stewardship which dates back generations, long before sustainability became a buzzword.

Our conservation goals have long been and continue to be to produce more rice while using less water, energy, and other inputs, improving water quality, air quality, and soil conservation, while enhancing wildlife habitat and supporting biodiversity.

In addition to sustaining \$3.5 billion in migratory waterfowl habitat, rice fields in the U.S. also support crawfish and yellow rails along the gulf coast and even salmon nurseries in California.

Moreover, within the last 4 decades, rice producers are proud to have reduced greenhouse gas emissions by 41 percent, cut our water usage in half, and decreased our energy usage by 34 percent.

Although U.S. agriculture contributes less than ten percent to U.S. greenhouse gas emissions and, on a net basis eliminates more greenhouse gasses than it produces, with farmers, ranchers, and foresters removing some 72 million metric tons of CO₂ equivalent in 2017 alone, we are eager to partner with the Department of Agriculture to do even more.

One critical point to stress, however, is that farm families must be profitable in order to have the wherewithal to continue contributing these important conservation dividends.

And, it goes without saying that this Committee—on a bipartisan basis—has a long history of recognizing this fact and working alongside farm families just like mine to ensure their profitability and their capacity to protect and improve our land and natural resources.

This hearing is timely and important for rice farmers because title I of the farm bill—the Commodity Title—is the cornerstone of the safety net for rice farm families.

Rice farmers recognize and appreciate the fact that other commodity producers represented on this panel might regard crop insurance as their primary safety net, followed by the safety net provided under title I of the farm bill.

As rice farmers, we are certainly working to make crop insurance a more effective tool for our producers, but we have historically lagged well behind producers of other crops in terms of participation in crop insurance, coverage levels, and the like. This is because our growing conditions and perils are unique and the traditional policy that works so well for other crops does not work as well for us.

Title I of the farm bill is really our true safety net. It is what allows us to compete on a global playing field that is the most distorted of any sector due to high and rising foreign subsidies, tariffs, and non-tariff trade barriers.

Just to put things in perspective, China was found to have illegally over-subsidized just three crops—including rice—by \$100 billion in a single year. In comparison, it would take 10 years for farm bill spending on all U.S. commodities to reach that level.

In short, U.S. farm families cannot compete on such a distorted playing field without U.S. farm policy to help level the playing field. This policy not only helps U.S. farm families compete, but it also helps to ensure that more of the world's rice is produced in the United States, sustainably and under some of the highest environmental and labor standards anywhere.

In any case, the primary safety net that underpins U.S. rice farm families is Price Loss Coverage (PLC), with about 99 percent of all long grain and medium grain rice and anywhere from 68 percent to 76 percent of all Temperate Japonica rice enrolled under the PLC program.

This is in no way an indictment of the Agriculture Risk Coverage (ARC) program that may work better for producers of some other crops. We support what works best for each producer, crop, and region of the country.

But, for rice, the tool that has generally worked best is PLC, though there has also been at least some ARC participation by some of our producers.

Yet, despite the success of PLC in the years since its inception under the 2014 Farm Bill, this year's economic conditions are nullifying the effectiveness of this safety net.

How is this?

Well, first, rice simply is not experiencing the rally in prices that other crops are experiencing.

For example, according to the Economic Research Service, the current market prices for corn, cotton, soybeans, and wheat are respectively 53 percent, 86 percent, 54 percent, and 83 percent higher than in 2020 but rice prices are fairly static, up just eight percent.

As rice producers, we are thankful that our fellow producers are experiencing a rebound after 8 years of depressed prices, along with economic jolts due to trade wars and the pandemic.

We just wish rice prices were also rebounding right now. But unfortunately, our prices have risen only enough to reduce the benefits provided by PLC. To illustrate, the PLC benefit to rice is down 75 percent from where it stood in 2019. The payment rate per pound is projected to be about $\frac{1}{3}$ the rate it was just last year.

Exacerbating the economic problem facing rice producers is that the trade and pandemic relief provided to producers short-changed rice producers relative to the adverse economic impacts and losses we sustained.

These factors alone present significant hurdles for U.S. rice farm families.

But this year's skyrocketing input costs have compounded the rough economic picture for rice producers.

Again, to illustrate, PLC reference prices were established based on 2012 costs of production. They were still very relevant at the time of the enactment of the 2014 Farm Bill, although the Market Assistance Loan (MAL) rate for rice has not been relevant for many years now because it is set so low.

But, while production costs have risen since 2012 notwithstanding low prices, the increases pale by comparison to what we are seeing this year.

And, while these costs hit every farmer and rancher in the country, they are hitting rice disproportionately hard.

The Agricultural and Food Policy Center at Texas A&M found that fertilizer prices, on average, are up \$62.04 per acre for rice while fertilizer prices are up \$39.55 for feed grains, \$29.72 for cotton, and \$19.64 for wheat. These numbers have only worsened from the time the analysis was conducted earlier in the year. Every farmer on this panel today is paying too much for and all of the farmers that our organizations represent are paying too much for inputs, especially fertilizer, but rice is taking a disproportionate hit on this front even as our crop prices continue to lag.

Because of the combined conditions of low rice prices and accelerating input costs, rice farmers are in trouble.

As evidence of this, the value of rice production fell from \$3.2 billion in 2020 to \$2.9 billion in 2021, according to the Congressional Budget Office, although we expect that this is just the beginning unless conditions turn around soon.

We believe that important steps can be taken to shore up the nation's rice farm families in the near term. That's why USA Rice sent a letter to Secretary Vilsack last week seeking relief for rice farmers. I would ask for your support of our request in this time of real need.

However, we certainly believe that strengthening the farm safety net for rice in the context of the next farm bill will be imperative and we look forward to working with you to that end.

We believe that establishing and maintaining the safety net at levels relevant to the economic times ought to be a primary consideration in the next farm bill authorization.

Ninety-eight percent of farms in this country are family owned and operated. And, of the small percentage that are not considered a family farm by USDA, a large portion are still run by extended families, neighbors, and friends who decide they can cut costs and be more efficient if they team up to share equipment and divide up responsibilities on the farm.

Whatever their composition, these farms are all experiencing an astronomical rise in the stakes of what it takes to succeed in keeping a farm afloat.

Just as lenders have had to adjust how much they are willing to lend and what they will require as collateral in order to keep up with current conditions, so, too, must the farm bill's safety net adjust to the times, including relative to payment limitations and actively engaged rules that simply have not kept pace with fast changing times in agriculture.

They are outdated, as evidenced by the hundreds of Members of Congress on both sides of the political aisle who wrote to the Department of Agriculture expressing concerns that the limitations applied to pandemic and trade war relief simply do not cover the enormous losses suffered.

This reality led Members of Congress to pass more realistic program parameters in the context of the Wildfire Hurricane Indemnity Program Plus (WHIP+) for 2020 and 2021. I hope that Congress will take similar steps in the context of the next farm bill. For full time farm families, this is a remedy that is long overdue.

Farm policy rules can no more hold back market realities than auto or home mortgage lenders can expect to lend at loan levels set decades ago. It simply doesn't work.

The antidote to avoiding consolidation in agriculture and thus keeping farmers and ranchers independent and family owned is to ensure that the safety net works for regular full time farm families. If it doesn't, consolidation is absolutely inevitable.

On a bipartisan basis, you took some steps in the right direction in the 2018 Farm Bill and we are grateful to you for this. We look forward to working with you to build on these achievements.

Planting flexibility is extremely important to farmers, both economically and agronomically. Thankfully farmers have that planting flexibility now. We need to protect and preserve this feature of the farm bill.

However, even this simple principle has important wrinkles or details to be mindful of.

For instance, in the case of rice, it is absolutely vital to keep our infrastructure in place.

In the Commodity Title, we have a blend of coupled policies, such as the marketing loan, and decoupled policies, including PLC and ARC, with these latter programs tied to historical base acres.

Striking the right balance in this regard is essential not only with respect to these Commodity Title programs but also with other policies as well, including conservation programs tied to farming practices and crop insurance which attaches to planted acres. This issue comes into play even under the climate initiatives being announced by the Department.

From a rice perspective, if we were to lose so much acreage that the infrastructure could not be maintained, we would lose the U.S. rice industry—and once lost it would not come back. This is undoubtedly a concern for producers of other crops where infrastructure is unique to their crop industry.

The work you will do in this Committee to help achieve this balance is extremely important and I am grateful to have this chance to testify before you.

I am very appreciative of all the work that you have done in the past and are doing now to help farm families like mine carry on the important work we do for the country and for people around the world. Farming has been an honor of a lifetime for me and it means a lot that you would place such a value on the work that I love.

Again, thank you for the opportunity to visit with you about these issues of huge importance to farm families like mine.

JENNIFER JAMES.

ATTACHMENT

February 25, 2022

Hon. THOMAS J. VILSACK,
Secretary,
U.S. Department of Agriculture,
Washington, D.C.

Dear Secretary Vilsack:

Thank you for your work on behalf of America's farmers and ranchers. As you continue to develop and implement programs to provide assistance to the agriculture community, USA Rice can be counted on for open and direct dialogue with you and your staff about the needs of the rice farmers we represent.

As the Chairman of USA Rice Farmers, representing rice farmers in all major rice producing states, I am writing to respectfully request that you use the available authorities of the U.S. Department of Agriculture (USDA) to provide assistance to the nation's rice farmers who are facing both low commodity prices and disproportionately higher input costs, creating a severe financial squeeze that threatens the continued viability of U.S. rice farms and the rural communities they support.

Unlike other major crops, rice has not seen a recovery in prices and while all in agriculture are experiencing volatile input costs, the increase of input costs for rice vastly exceeds that of other crops. These twin conditions are threatening U.S. rice farmers' potential for profitability and puts rice at a significant competitive disadvantage when farmers are faced with financial decisions. This poses a very real danger to rice's unique infrastructure that is needed to maintain the domestic industry. Once this infrastructure is lost, it would be extremely difficult to re-establish. Producers of all crops are feeling the pressure of escalating input costs, but I believe it is important that I highlight the unique impacts on rice.

Commodity prices for rice have simply not kept pace with other major crops whose prices are much higher than they were in 2020. Compared to 2020 prices recorded by the Economic Research Service (ERS), the current market price for corn is 53 percent higher, the price of cotton is 86 percent higher, the price of soybeans is 54 percent higher, and the price of wheat is 83 percent higher, but current rice prices are relatively static since 2020, up just eight percent.

Similarly, the rise in input costs have hit rice farmers disproportionately hard. The Agricultural and Food Policy Center (AFPC) at Texas A&M University recently conducted a broad study to analyze the impact the increase in input costs is having on its representative farms. AFPC's study looked specifically at the increase in fertilizer prices and found rice farms would suffer most—a \$62.04 average per acre increase compared to \$39.55 for feedgrain, \$29.72 for cotton, and \$19.64 for wheat farms. More recently, AFPC conducted a more specific rice study looking at all variable input costs and found a weighted average per acre increase of \$174.20 for the 2022 crop year when compared to 2021. If rice planted acres in 2022 are on average with the past 5 years, these increases for inputs coupled with flat prices would result in a \$504.9 million loss to rice farmers.

The slight increase in rice prices that have been seen will be more than offset by lower Agricultural Risk Coverage (ARC) or Price Loss Coverage (PLC) program assistance. The PLC payment rate for long grain rice was \$0.014/lb. in 2020. In 2021, the PLC payment rate for long grain rice is expected to be \$0.005, roughly 1/3 of the previous year's payment rate. The Congressional Budget Office (CBO) estimates that total rice PLC payments declined from \$604 million in FY 2020 to \$382 million in FY 2021. This downward trend is expected to continue with current projections

for FY 2022 at \$272 million and expected support for the 2022 crop year falling to \$93 million. PLC has provided some assistance to our producers competing with heavily subsidized and protected foreign producers of rice but, unfortunately the support has not kept pace with the level of support that foreign rice producers enjoy, and it isn't equipped to respond to a rapid increase in input costs. In the recent past, rice producers have also received less support under the Market Facilitation Program (MFP), the Coronavirus Food Assistance Program (CFAP), and the Pandemic Assistance for Producers (PAP) initiative. Rice producers received less than 0.5 percent of the total payments made by MFP, CFAP, and PAP.

Given the current economic condition of U.S. rice farms, it is easy to see why the value of rice production fell from \$3.2 billion in 2020 to \$2.9 billion in 2021, according to the July 2021 CBO report. Even if rice acres hold in 2022, the small increase in value of the crop will not come close to making up the losses felt by farm families from increased input costs and the erosion of PLC assistance.

As a whole, the U.S. rice sector contributes \$34 billion annually to the U.S. economy, stretching far beyond the farm gate and creating jobs and economic activity on main street. Rice-dependent rural communities throughout the country are being adversely impacted by the ongoing recession within the industry. This could ultimately have a devastating impact on elevators, mills, trucking companies, and other businesses dependent on rice production, which once lost, will not return, further exacerbating economic consequences on these communities and their citizens.

Last September, you announced that USDA was preparing to invest \$3 billion to address urgent challenges such as market disruptions that are impacting America's agricultural producers—rice farmers are facing these challenges. Whether through the funding for market disruptions or by utilizing residual funds available under *ad hoc* programs, relief is necessary to ensure rice farmers survive the combination of stagnant prices and high input costs.

In the past, you have taken bold steps to address particular, unique hardships faced by commodity and specialty crop producers, as well as many others. We very respectfully urge you to consider similar relief in the current case of rice.

Thank you for your consideration of this important request, as well as your commitment to U.S. agriculture and support for the health of rural America. We hope to have further discussions with you and your staff at your convenience. In the meantime, please direct any follow up to our request to Ben Mosely at bmosely@usarice.com or 571-217-2848.

Sincerely,

KIRK SATTERFIELD,
Chairman,
USA Rice Farmers.

The CHAIRMAN. Thank you.

And now, Ms. Rogers, please begin when you are ready.

**STATEMENT OF MEREDITH McNAIR ROGERS, CAMILLA, GA;
ON BEHALF OF U.S. PEANUT FEDERATION**

Ms. ROGERS. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to appear before you today as you review Title I of the 2018 Farm Bill. Today, I am representing the United States Peanut Federation, USPF.

USPF is comprised of the Southern Peanut Farmers Federation, the American Peanut Shellers Association, and the National Peanut Buying Points Association. I have been farming with my family in southwest Georgia for over 25 years. I currently farm in a family partnership with my husband, my parents, and my siblings. We primarily farm row crops, cotton, corn, peanuts, and some fresh sweet corn.

When I met with the General Farm Commodities and Risk Management Subcommittee early last fall, I spoke of increased input costs such as fertilizer and equipment. Since the Subcommittee's

roundtable last year, the Center for Rural Prosperity and Innovation at Abraham Baldwin Agricultural College in Tifton, Georgia, has completed its review of U.S. representative peanut farm data, covering all the peanut production regions. What we have learned from this most recent comprehensive data is that peanut growers are struggling to cover their cost of production. The representative farms demonstrate that a significant number of farmers are using the equity in their land and their 401(k). The 2021 representative farm update revealed the average expected peanut yield to be 4,760 pounds per acre. In a cash flow analysis, the 2021 cash flow was \$545.97 per ton. The projected 2022 peanut total cash flow cost to produce a ton of peanuts is estimated to be \$666.94. That is a 22 percent increase over the 2021 cost of production. We are in the process of working on our farm budget for our farm this year, and we have found that our expected increase to be very high. The fertilizer costs alone are over double what they were a year ago, and availability is becoming a problem.

In the 2002 Farm Bill, this Committee eliminated the peanut supply management program and established a new marketing loan program. Since the 2002 Farm Bill, peanut planted acres have increased by less than two percent, when compared to recent plantings. Yet in a review of this same time period, production has increased approximately 59 percent. Our industry's increase in production is due to an increase in peanut yields, which was approximately 52 percent when compared with the same time period.

Peanut butter drives demand for peanuts due to its inexpensive source of plant-based protein. Domestically, according to the National Peanut Board, demand reached 7.9 pounds per capita in 2021. This is a 37.6 percent increase when compared to demand in 2002, according to the Center for Rural Prosperity and Innovation.

Peanut growers, shellers, buying points support the Price Loss Coverage Program, the PLC, in the 2018 Farm Bill. Clearly, peanut growers are facing economic challenges as discussed previously. These challenges are not a result of the PLC structure, but it is important that the Committee periodically evaluate, as you are today, the cost of production that growers are facing and determine if the specifics of these programs are keeping pace with the changing economics growers are experiencing.

We do have a number of growers in specific regions that have produced peanuts for years but do not have access to the PLC program because they lack base acres. We know that the issue is not specific to peanuts, but we hope the Committee will work with commodity organizations to assist these producers.

In conclusion, the Federation believes the 2018 Farm Bill PLC program for peanuts has been effective for our farm families and the peanut industry. We do believe that the Committee should review the specifics of the 2018 Farm Bill in light of the unprecedented cost that the production farmers are facing in the future. While some may argue that the costs will recede to their previous levels once these recent events have subsided, it is my experience that these increased costs do not return to the original level.

Thank you so much for allowing me to participate today.

[The prepared statement of Ms. Rogers follows:]

PREPARED STATEMENT OF MEREDITH MCNAIR ROGERS, CAMILLA, GA; ON BEHALF OF
U.S. PEANUT FEDERATION

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to appear before you today as you review Title I of the 2018 Farm Bill. I appreciate the Committee's seeking producers' input on commodity programs and their impact on farms across the U.S. Today, I am representing the United States Peanut Federation (USPF). USPF is comprised of the Southern Peanut Farmers Federation, the American Peanut Shellers Association and the National Peanut Buying Points Association. The Southern Peanut Farmers Federation includes the peanut grower organizations in Georgia, Alabama, Florida and Mississippi.

I have been farming with my family in southwest Georgia for over 25 years. I graduated from the University of Georgia in 1991 with a Bachelor of Business Administration, and later received my Masters of Accountancy from the University of Georgia. I currently farm in a family partnership with my husband, parents, and siblings. Our partnership primarily farms row crops including peanuts, fresh sweet corn, cotton, and corn. We also have a herd of about 200 head of brood cattle. I grew up on this farm and am very pleased that I have had the opportunity to work and raise my children on the farm.

The COVID-19 pandemic and subsequent supply chain issues have impacted peanut growers. When I met with the General Farm Commodities and Risk Management Subcommittee early last fall, I spoke of increased input costs such as fertilizer and equipment. In addition, I shared with you the delays in equipment parts and repair. Since the Subcommittee's Roundtable last year, the Center for Rural Prosperity and Innovation at Abraham Baldwin Agricultural College in Tifton, Georgia has completed its review of U.S. Representative Peanut Farm data covering all the peanut production regions. These 22 peanut farms, from Virginia to New Mexico, have been reviewed for 21 years (2001-2022). What we have learned from this most recent, comprehensive data is that peanut growers have struggled to cover their cost of production. Farmers typically have three types of loans to cover their operation:

- Traditional operating loan
- Equipment loan
- Mortgage on the farm's land

Farmers who were not able to cover their loans during a crop season rolled those payments into their mortgage note. The representative farms demonstrate that a significant number of farmers are using their equity in the land and [401(k)].

The 2021 representative farm update revealed the average expected peanut yield to be 4,760 lbs. per acre. In a cash flow analysis, the 2021 total cash flow was \$545.97 per ton. The projected 2022 peanut total cash flow cost to produce a ton of peanuts is estimated to be \$666.94. This is approximately a 22% increase over the 2021 cost of production.

We are in the process of working on the farm budget for this year and have found our expected cost increases to be very high. The fertilizer costs are well over double as compared to last year and availability is a problem.

To fully understand peanut policy, we have to compare production prior to the 2002 Farm Bill to today. In the 2002 Farm Bill, this Committee eliminated the peanut supply/management program and established a new marketing loan program. Since the 2002 Farm Bill, peanut planted acres have increased by less than 2% when compared to recent plantings. Yet in a review of this same time period, production has increased approximately 59%. Our industry's increase in production is due to an increase in peanut yields which was approximately 52% when comparing the same time periods.

Peanut butter drives demand for peanuts due to it being an inexpensive source of plant based protein. Domestically, according to the National Peanut Board, demand reached 7.9 lbs. per capita in 2021. This is a 37.6% increase when compared to demand in 2002 according to the Center for Rural Prosperity and Innovation.

Peanut growers, shellers, and buying points support the Price Loss Coverage program (PLC) as provided in the 2018 Farm Bill. Our state grower organizations have conducted county and regional meetings in Georgia, Alabama, Florida and Mississippi, and growers support the PLC program. The structure of the program, a marketing assistance loan, reference price, and the current payment limit structure, allow not just growers, but also the industry to provide jobs and some level of economic stability to rural communities. Clearly, peanut growers are facing economic challenges as discussed previously. These challenges are not a result of the PLC structure, but it is important that the Committee periodically evaluate, as you are today, the costs of production that growers are facing and determine if the specifics

of these programs are keeping pace with the changing economics growers are experiencing.

Our industry partners, shellers and buying points, agree that the PLC program works for peanuts. Since the 2002 Farm Bill, the forfeiture rate for peanuts has been very low. In 2020, the rate was, for example, 0.166%.

We do have a number of growers, in specific regions, that have produced peanuts for years but do not have access to the PLC program because of a lack of base acres. We know that this issue is not specific to peanuts. We hope the Committee will work with commodity organizations to assist these producers.

The USPF supports maintaining crop insurance, but peanut growers have not seen the benefits, when compared to costs, as many other crops. Our state grower organizations have asked researchers to review the role of crop insurance for peanut producers. While crop insurance is considered the primary risk management tool for producers to recover from natural disasters and volatile market fluctuations, preliminary research indicates that the reliability of crop insurance as a safety net varies for many peanut producers when total operating costs for the farm are considered. In addition, peanut farmers do not have access to a futures market as other commodities. For our farm, we do not utilize crop insurance at a high level. The costs are too high for the coverage you receive on irrigated peanuts.

With regard to accessibility of U.S. Department of Agriculture programs, we support the continued web based program availability. As USDA offices are consolidated and staffing needs are an issue, it is important that farmers have access to programs online and that this accessibility is as straightforward as possible.

In conclusion, the Federation believes the 2018 Farm Bill PLC program for peanuts has been effective for farm families and the peanut industry. We do believe that the Committee should review the specifics of the 2018 Farm Bill in light of the unprecedented costs of production farmers are facing in the future. While some may argue that costs will recede to their previous levels once these recent events have subsided, my experience is that these increased costs do not return to their original level.

Thank you for allowing me to participate today.

The CHAIRMAN. Thank you, and thank all of you for your very outstanding testimonies.

And at this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us to get as many questions in as possible. Again, please keep your microphones muted until you are recognized in order to minimize background noise.

And now, I recognize myself for 5 minutes.

Ladies and gentlemen, my first question is asked because of this very disturbing and terrible, and quite honestly, evil activity that Russia is conducting in Ukraine, and the impact that it is having or could have on our agriculture industry. Our nation has the leading agriculture industry in the world, often referred to as the Bread Basket of the World. The Good Lord has blessed us in this country to be that leader.

But my concern is this. Rising inflation has had a substantial impact on both the prices of our commodities, as well as the input costs that farmers are facing. Things like fertilizer, several of you have mentioned that, and I believe that the Russia/Ukraine conflict will definitely exacerbate these conditions because Ukraine is a major exporter of raw materials, and a disruption in these exports will surely raise prices globally. And when input prices rise and support program prices remain the same, it is our farmers who will have to carry that cost.

And so, with that said, let me ask and start with you, Ms. James, and maybe others of you who may want to jump in here. Do you think that our commodity support programs like the Price Loss

Coverage Program which sets reference prices for commodities should be more responsive to economic conditions?

Ms. JAMES. Well, yes, sir, I do. I believe that your statement about inflation is a very important one, especially at this time. I believe that the inflation rate has grown about two percent a year for the past 10 years, but then we are at seven percent in this one last year. So, that is a considerable increase, although our reference prices have remained the same as you have stated.

The CHAIRMAN. We will come back to that, but I also want to call on Ms. Jaclyn Ford with the National Cotton Council.

Ms. Ford, thank you for your enlightening testimony. Can you talk about decisions that you expect cotton producers to make this year in terms of participation in ARC and PLC, as well as STAX and supplemental crop insurance products that are available for producers? There are some crop insurance products that are available only if they do not participate in ARC, and so, I realize that the dynamic effects that producer decision, it has a dynamic effect on their decisions. Can you shed some light on how these decisions are made?

Ms. FORD. Yes, sir. Our family this year will be participating in STAX rather than PLC, and we will be doing that at a lower level. It will be at a cost of about \$10 per acre. We just got sign-ups done this week, but cost is a determinant. Our input costs are so much more, so your cost per acre participating in the crop insurance programs will determine participation costs. So, if we can make that more affordable for the producers as far as participating, I think that would be a good thing.

But our cost per acre this year has gone up for cotton probably around 30 or 40 percent, so we are looking at an input cost of somewhere between probably \$900 to \$1,100 per acre right now since the Ukraine war, and right now cotton is trading at \$1.10, \$1.20. I haven't looked at it this morning. It was up a little bit, so right now we are at about a break even point at a 2 bale average. So yes, we certainly need some more support.

The CHAIRMAN. Well thank you for that, and Committee Members, we can all do without a lot of things, but we definitely cannot do without food, and it is our nation that provides that supply.

With that, Ranking Member, I will turn to you.

Mr. THOMPSON. Mr. Chairman, thank you very much, and thanks to each and every one of our witnesses today and your organizations that you are affiliated with for what you do for agriculture. Mr. Chairman, I appreciate your line of questioning and the responses. It is not so much, at this point, we can have record high commodity prices we are getting, but with inflation, it is the margin that matters. That is something we need to take into consideration.

Lately, there has been a lot of conversation surrounding agriculture and climate change, and these are conversations that I welcome as American agriculture has a great story to tell. And we got to get better at telling our story. But often, I hear questions about climate framed in a manner that asks how can we change the safety net or crop insurance to be more climate friendly? And I think that is looking at the problem completely the wrong way. Rather, we should be asking ourselves what can we do to make climate pol-

icy farmer friendly? American producers are the most efficient in the world. And if the goal is to reduce global greenhouse gas emissions, then the smartest thing we can do from a climate standpoint is, quite frankly, to have American farmers, ranchers, and foresters produce more and export it overseas. And the farm safety net is critical to helping our farmers manage risk year after year.

Now, for anyone who wants to jump in, can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint? I welcome anyone that wants to jump on that.

Dr. JOHANSSON. Well, thank you for that question, Ranking Member Thompson.

I had the privilege of chairing the Federal Crop Insurance Corporation Board of Directors previously when I was at USDA, and I do think that crop insurance needs to focus on providing risk management to farmers. The program obviously needs to be actuarially-sound based on principles of insurance. USDA can certainly work to incentivize producers to reduce or sequester greenhouse gases, but that is best addressed through conservation programs. And at least, that is by and large how USDA has proceeded thus far, with one exception maybe, the crop insurance discounts for planting cover crops.

But generally when it comes to the commodity title or crop insurance programs, USDA has properly stuck to the mission of those programs, and we certainly know that the increase in productivity in U.S. agriculture across all of our crops and the levels of efficiency seen on our farms have significantly reduced emissions per unit of output over time.

As I mentioned earlier, obviously the sugar program is critical to keeping U.S. sugar production viable for our growers. We have seen excessive subsidies provided by other countries to their sugar sector, which effectively guarantees surpluses are dumped on the global market. Moreover, the production in most of those countries does not meet the labor and environmental standards we have in the U.S.

So, weakening sugar policy and outsourcing more of our sugar production to heavily subsidized global sugar markets would undercut our supply chains, weaken national security, hurt the environment, and cost us family farms here in the U.S.

Thanks.

Mr. THOMPSON. Thank you.

Mr. Edgington, I saw you were going for your microphone.

Mr. EDGINGTON. Yes. So, from the National Corn Growers perspective, I listened to your question and I think about it in a couple different ways.

We have been this way for quite a while, the crop insurance is number one. It is our number one best risk management tool, and we need to continue with that. It is a vital piece. We are rolling out another—we have worked with RMA to do another one coming this year called PACE, which looks at split-nitrogen application, and if you can't get it on, is there a crop insurance piece to that? And there will be.

But we have also got—and we rolled it out last summer—our corn sustainability policies where we know by 2030 that we can improve things on land use efficiency, water quality, all of these over—there are four or five products up to 10, 15 percent, and maybe some of them beyond that. But that is a piece about conservation that we are working on, and it is about efficiencies and quality, and all of the dynamics that we do on a day-to-day basis.

We have corn all over the United States, and to talk about climate and risk management tools in the same package and has to be done this way, does not fit well with corn. It is tough to do the same thing in southern Texas as it is in northern Minnesota or in the State of Washington *versus* Maine, let alone central Iowa. And so, it is an area that we want to keep separate from the fact that risk management is *risk management*, conservation is *conservation*, and we are working very hard in both areas to improve and become more efficient as crop producers.

Mr. THOMPSON. Very good. I don't have much time left. Just an invitation. I would love to have future communications if you have thoughts that you could respond and provide those on that particular question, I think that would be very, very helpful as we work towards this next farm bill. Also, together we can tell the great story of American agriculture.

So, thank you so much, Mr. Chairman.

The CHAIRMAN. Thank you.

The gentleman from California, Mr. Costa, who is also the Chairman of the Subcommittee on Livestock and Foreign Agriculture, is recognized now for 5 minutes.

Mr. COSTA. Well, thank you very much, Mr. Chairman, for holding this important hearing as we begin to set this table for the reauthorization of next year's farm bill. I think it will be the fourth farm bill reauthorization that I have had the privilege to work on. And let me also commend you for your opening comments remembering and reflecting upon a life well lived in his service to our country, our colleague, Jim Hagedorn, a Member of my Subcommittee that we worked on together. Our thoughts and prayers are certainly with his family.

I say this time and time again as a farmer, a third generation. Food is a national security issue, and I think everyone on this Committee agrees that our responsibility is to ensure that American agriculture remains strong and vibrant, that Americans realize that incredible productive, nutritious food that they consume every night at their dinner table is a result of hard work by farmers, ranchers, dairymen and -women, and farmworkers. It is a partnership, and so we are very interested in your comments today about how we reset the stage. Obviously, the focus is Title I today. Obviously, there are other titles in the reauthorization of the farm bill that we are going to be clearly listening carefully to your recommendations in terms of modifications and changes.

Let me ask a specific question with our witness, Ms. Ford, on the National Cotton Council, and then I want to have a general question that you folks might want to think about with relationship to the lessons that we have learned in the last 2 years as a result of this pandemic, horrific pandemic in which over 900,000 Americans have lost their lives, in terms of the supply chain, and how we have

turned our very delicate and complicated food supply chain with four percent of the nation upside down, and how we address that as we move forward.

Ms. Ford, when we talk about cotton was added on Title I farm programs, you talked about the ARC, the Agriculture Risk Coverage and the Price Loss Programs that have worked for producers of seed cotton as compared to how upland was previously treated in Title I programs. Do you care to elaborate any further?

Ms. FORD. Well, this year with the prices being higher, I don't think a payment would not kick in, but it has worked in the past and it is more dependent on price than yield. And we use crop insurance for yield protection, but the PLCs work very well in the past for price protection.

Mr. COSTA. Well, and that is a good segue. I mean, I have crop insurance and farming, as we all know, is risky enough given the challenges we face. And as I told a previous President one time, I said, "Farmers are risk takers," and so, what lessons do you think we should be focused on? Crop insurance obviously is a vital part of our safety net, but what we ought to be thinking about in reauthorization next year's farm bill?

Ms. FORD. I think we need to be thinking about margins as well with the input costs. I think we have to look at margins and what the crops are costing us to produce, and not—

Mr. COSTA. The comment that I made previously, I said farmers are price takers, not price makers. Now, I have been involved in California for years, the leading agriculture state in the nation. You all nod your heads when I say farmers are price takers, not price makers, because you know what that means.

But how do we look forward in terms of not just the safety net of the insurance program and how we might improve it, but what other—I mean, we have the inflationary impacts that we are all dealing with, of course, and I am working very heavily on a bipartisan basis on this supply chain issue that we hope will relieve some of those inflationary pressures. But the fact is, is that American agriculture is challenged. Anyone care to opine?

Mr. DOYLE. I think it is important for us as farmers. We invest in creating demand for our crop, whatever it is. Farmer investment, we have check-offs that help do that. But, as a governing body, you give us the tools that we need to make us less risky. Our lenders that a lot of times young, new farmers don't have opportunities, don't have backing or assets, PLC, ARC, those give those lenders some type of assurance that, "Hey, we can finance this young grower and he could be less risky."

Mr. COSTA. My time has expired, but thank you, Mr. Chairman, and we will continue this conversation.

The CHAIRMAN. The gentleman from Georgia, Mr. Austin Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman.

Mr. Edgington, I am going to come to you in just a second, but I want to go to what Ms. Ford and Ms. Rogers put in their testimony, because I want to talk to you about the letter that the National Corn Growers Association wrote to a company called Mosaic.

Ms. Ford and Ms. Rogers, in your testimonies that we have heard today here, you both mentioned increases in the cost of production. Ms. Ford, you referenced that most producers are expect-

ing 25 to 40 percent increases in inputs due to higher fertilizer and other costs. Fertilizer is the number one issue I hear back home.

Ms. Rogers, you note in your annual study on the peanut cost of production from the Center for Rural Prosperity and Innovation at Abraham Baldwin Agricultural College a significant spike in the cost of production for peanuts, a 22 percent increase in the cost to produce a ton of peanuts.

Now, Mr. Edgington, when we want to get down to the heart of things back home, sometimes we say it is time to shuck the corn. Your association wrote a letter to Mosaic because Mosaic had requested additional tariffs be placed on products that would compete with them. Is that correct?

Mr. EDGINGTON. That is correct. We have been in correspondence with Mosaic about their tariff application with the International Trade Commission. That is correct.

Mr. AUSTIN SCOTT of Georgia. I want to read you something. This is from this company's annual report to shareholders, and if I am not mistaken, they control about 80 percent of some of the markets, is that correct, inside of the United States?

Mr. EDGINGTON. They are currently at about that level on the finished product, yes.

Mr. AUSTIN SCOTT of Georgia. A monopoly. Full year revenues up 42 percent. Stronger pricing more than offset volumes. Gross margin up 200 percent. Adjusted earnings before income tax, a fiscal year record, up 129 percent. And I think that what Americans need to realize is the monopolization of the inputs in our food supply to our farmers is what is leading to the majority of the discussion right here. The input costs are going up faster than the markets can absorb them, and it is leading to a tremendous amount of food price increases.

Now, they requested the tariffs be put in place in February of 2021. Do those record profits sound to you like they would be coming from a company that actually needed protections from competition?

Mr. EDGINGTON. You mind if I don't answer that part of your question, but I would like to address part of the whole issue.

Mr. AUSTIN SCOTT of Georgia. Yes, sir.

Mr. EDGINGTON. Because we have been—I have been more involved in fertilizer than I thought I would maybe have to be, other than on my farm in this process. And one of the things we have learned in the process is they do not look at this table as their customer. They are selling to the CHS's and Growmark's of the world. That is their distributing network, and so, our pushback on Mosaic or CF Industries on nitrogen fertilizer has been a surprise to them, because we have never pushed back before because of the process and the engagements we have had.

Mosaic has had tremendous profits. Now, they have reasons that they tell us as to why they were competing against foreign countries subsidizing their fertilizer, and that is what they did. They represent about 55 percent of the phosphate rock inside of the United States, but they represent 80 percent of the DAP that we are applying to our fields. And so, when you have that type of control over the majority of the market, there becomes lots of discussion around the profits that they are making.

Mr. AUSTIN SCOTT of Georgia. If I may, this control is not limited to fertilizer, though. We are seeing increased monopolization, whether it be seed or any other type of input cost, and then what you see in some cases is like communist China where they stepped in and they bought Syngenta. And so, Mr. Chairman, we have a lot of work to do in making sure not only that foreign countries don't own our ag input supply, but that not any individual company inside America controls too much of our ag inputs. And if we could get that right, we would have significant competition in the input market and we would have more fair pricing to our farmers.

I am down to 8 seconds. With that, Mr. Chairman, I will yield.

The CHAIRMAN. Thank you.

And now, the gentlewoman from Ohio, Ms. Brown, is recognized for 5 minutes. Ms. Brown, you may be muted. Un-mute yourself.

Ms. BROWN. Thank you for that. I apologize. Chairman Scott, can you hear me now?

The CHAIRMAN. Yes, I can.

Ms. BROWN. Okay, good.

The CHAIRMAN. Go right ahead.

Ms. BROWN. All right, thank you and Ranking Member Thompson for holding this hearing today, and thank you all to the panelists for being here and offering your feedback on these important farm bill programs.

The business of farming is risky, and it is important to have smart safety net programs in place for when the unthinkable happens. It is also important for us to ensure that these programs are accessible to all farmers.

So, my question is the USDA has made several modernization efforts to make information and applying for these Title I programs more efficient. Mr. Coleman, can you talk about your producers' experience with using USDA's online tools and program application systems?

Mr. COLEMAN. Sure, I would be happy to talk a little bit about that.

The FSA offices have implemented programs where you can get a lot of the information and do it online, but it does get real complicated. These programs kind of overlap. I am very involved with EQIP and NAP and a lot of the programs there, and so sometimes it gets kind of confusing. That is probably the reason why I made the statement about being able to go into the office and talk to these people in person, and the staffing—have the staff in the building for them to work personally with a person, especially with me doing as many different crops as I do. It gets very complicated.

But the tools are there. The tools are there, and they are working. It is pretty complicated.

Ms. BROWN. Thank you for that.

USDA data has shown time and time again that Black farmers receive only a fraction of the farm subsidies that White farmers do. So, my question is most recently they released data showing that nearly all the funds provided to the farmers to offset impacts of COVID-19 went to White farmers.

Mr. Doyle and Ms. Berg, what are your organizations doing to support Black farmers and producers when it comes to Title I programs, and what could Congress do to address these disparities?

Mr. DOYLE. Thank you for the question. From our organization's standpoint, we have a new strategic plan in place. We reevaluated our policy and we have included diversity within our membership, encouraging membership as we are a membership and election type of board. We have brought in speakers on diversity, educating our membership just to let them know to be aware of that. We encourage youth. That is one way, minority colleges with the MANRRS program. We recently had them come in and speak to our board, and opportunities exist there. I am in the Mississippi River Delta and it is—farmers, we are—there are few of us. It is challenging sometimes just to get volunteers on our own board, regardless of their ethnicity.

So, just continue education including diversity. And Mr. Bridgeforth here is in the room, and I have actually been in an educational communication team with his brother, a farmer from northern Alabama, and Kyle and his family have done great things and we continue to reach out to families like his and others in Arkansas to make us aware of what we need to be doing in improving our association, representing all farmers within the United States.

Ms. BERG. At the National Association of Wheat Growers, I will be the second woman President ever in the Association's history. So, we have definitely been moving forward trying to get more minorities or anybody—we embrace them in our industry and for our association. So, we do look forward to working with anybody who would like to walk through the door with regard to minorities or anybody at all. We embrace it.

Ms. BROWN. Okay. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. Thank you.

The gentleman from Arkansas, Mr. Crawford, is recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman. I appreciate that. Thank you so much.

Ms. JAMES, I want to ask you a quick question first.

In your testimony, you noted that rice's current \$14 per hundredweight reference price was built off costs of production, but that was back in 2012. So, that is 10 years ago. I don't want to try and lock you in on what you think an appropriate number is today, given the fact that things are changing so fast in the ag economy, but I do want to ask you, quite straightforwardly, does \$14 per hundredweight reference price represent an adequate safety net for rice producers today, based on recent costs of production that you are seeing?

Ms. JAMES. Well, the easy answer is no, and unfortunately, our market prices are just above there, so we are kind of in a really tenuous situation right in rice. And as you know, there are only about 3 million acres of rice in our country. So, if rice farmers are not planting rice and producing rice, we stand to start seeing our infrastructure begin to erode and our mills and dryers not be profitable. Our American end-users who are buyers of domestic rice will then have to turn elsewhere. Food security is definitely an issue. So, keeping our rice farmers in business is very important, not only to the rice industry, but to American consumers.

Mr. CRAWFORD. Thank you. I appreciate that.

I appreciate the perspective of all of our producer representatives here today, because I think from the outside looking in, I have had this conversation with many of your colleagues and many farmers: historic prices. Prices and margins are two different things, so for people who don't play a role in ag policy but ultimately benefit from it, I think we need to get a little bit of perspective here because inflation hits everybody, it is certainly hitting production costs on the farm, and that is hitting you and your bottom line.

So, I think it is important that the American people recognize that if you are just looking at prices, you are not getting the full picture of what it takes to put food on the shelves, and that is exacerbated by supply chain issues that we are seeing, and then of course, as has been mentioned numerous times throughout this hearing thus far, what is taking place in Ukraine right in front of our eyes in real time and how that is impacting particularly, I would think, wheat is maybe the most volatile and vulnerable in this scenario. But I think all of you and your producers that you represent are vulnerable to what is taking place around the world, and I think one of the things that we can do to be more proactive in this equation is to turn back on our domestic energy production, and make us energy independent. Not only can we address our own needs, this addresses potentially the fertilizer issue that has come up—and I would like to associate myself with the comments of Mr. Austin Scott. But this also addresses our ability to be a net exporter, and actually help Europe and Ukraine in a more material way.

So, I hope that your producer groups are conveying that message as well. We certainly are here.

Let me shift gears and direct a question to Mr. Doyle. The Soy Belt, if you will, I guess, is largely associated with states like Iowa, Illinois, Missouri, Nebraska, and others. But Arkansas is actually home to considerable soybean production, and of course, that is where you live and where I live. I just kind of wanted to get you to provide a little bit of perspective on the soy growing region throughout the United States and kind of where some of the most active areas are.

Mr. DOYLE. So, yes, we are—if you could picture North Dakota down to Texas, over to Florida, and up to New York and back again, with the exception of West Virginia, that is where the 30 primary soybean growing areas are. Within that, you have about 65 percent that is shipped through the Gulf of Mexico down the Mississippi River. You have about 20, 25 percent that travels by rail from the northern states to the Pacific Northwest and are offloaded on the West Coast. And then you have some in Virginia nearby, and the Saint Lawrence Seaway is now being looked at as an alternative route for shipping due to the container shortage. So, it is about 3.1 million acres in Arkansas. I believe we are number nine.

Mr. CRAWFORD. It is interesting, and on the FFA seal, corn is represented there as universal, and that may be true, and all respect to our corn growers, but I would think soybeans are probably almost universal as well. Wouldn't you?

Mr. DOYLE. So, yes. We are shipping soybeans all over the world. It was primarily feedstock. Now the oil market is driving the price, and it is a great thing.

Mr. CRAWFORD. Excellent. I appreciate you being here.

Thank you, and I yield back.

The CHAIRMAN. The gentlewoman from New Hampshire, Ms. Kuster, is recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman, and thank you so much to our panel. I am excited to continue these discussions tracking the implementation of significant bipartisan wins in the 2018 Farm Bill, and also looking for ways to continue to sustain our farmers and foresters as we look ahead to the farm bill of 2023.

As we look at the commodity title, I did want to note how important dairy production programs are to my district. In 2018, I was proud to work with colleagues on both sides of the aisle to retool what is now the Dairy Margin Coverage Program. Dairy farmers had long been struggling with high feed costs and low milk prices that threatened the profit margins and survival of the many small family-run dairy farms in my district and across New England. That is especially true in our region where uniquely high transport costs for feeds were not factored into the Dairy Margin Coverage Program at that time. The DMC Program has made a tremendous difference in ensuring farmers can access reliable margin coverage and choose between options to ensure that they are securing the best coverage to fit their needs.

Despite this win, New England dairies continue to face significant challenges to their long-term viability. Producers are still struggling with the dramatic shift in the cheese market that have thrown off the Federal Milk Marketing Orders and undermined the price of other dairy products. Once again, the New England region is uniquely strained by this situation, and as the USDA continues to work on administrative upgrades to the DMC Program, small New England dairies remain under pressure to compete against large scale dairy operations in other parts of the country.

I believe there is much more we can do in the next farm bill to shore up our family dairy operations, and I hope future hearings in the commodity space will cover this topic.

But to shift gears, I am also interested in ensuring that all our producers, particularly small operations with limited time and resources can easily access USDA online tools and program applications. USDA grant and loan programs and insurance and price support programs are absolutely critical, but we in Congress need to enact policy that ensures that all producers have a realistically fair chance to participate.

Mr. Doyle, you briefly touched upon this point in your testimony. Could you talk about your producers' experience using USDA online tools and application systems, and what other steps would you urge Congress to take in the farm bill to ensure that small producers have as much easy access as possible?

Mr. DOYLE. So, thank you.

I guess COVID really put a lot of us back in our homes and our computers. That is where we work best from. Anything that we can do over the internet through the website on a calculator or sign up for a program without having to go to town to an office with the

restrictions in place, I think that is going to make us more efficient.

We also are concerned about cybersecurity. We know any time we put our information over the web that it is susceptible, so we want to make sure that all of the information is protected, but streamlining applications or data insertion, I think that is a great thing. Modernization of the system, FSA offices have often complained that they don't communicate well at the state level, county level, Federal level, so just making them all on the same system would make it easier, make it more efficient with less redundancy.

Ms. KUSTER. Great, thank you.

I have a little bit of time left if any of the other witnesses have any comment on the online applications and tools?

Ms. JAMES. I might just add that training and education back down to the county offices that can be administered with these farmers would be something good that we need to be sure and contribute, and rural internet is obviously an issue in most of our areas, so access is very important and having all of that in place. It takes time and training also, so that would be what I might add to the conversation.

Ms. KUSTER. Great, thank you so much. And we do understand the challenges of rural internet. That is a big issue in my district, and we are working on that. We have significant funding in the bipartisan infrastructure bill that has already gone through, and signed into law, and more to come.

Thank you, Mr. Chairman, and I yield back.

The CHAIRMAN. Thank you.

The gentlelady from Minnesota, Mrs. Fischbach, is recognized for 5 minutes.

Mrs. FISCHBACH. Well, thank you very much, Mr. Chairman. Usually I don't get to go this quickly so I am very happy today.

I just wanted to ask Dr. Johansson. You mentioned in your testimony the foreign market distortions as they relate to sugar production around the world, and as you know, I have large sugar production in my district. And when I talk to critics of the sugar program, they seem to fail to realize that weakening the program will put producers in my district and across the country at a competitive disadvantage around the world, simply because of the government distortions. Would the sugar program be needed if it weren't for these government distortions around the world?

Dr. JOHANSSON. First of all, that is a great question. Thanks so much for asking it, and yes, I had an opportunity just to get up to your district and see some sugarbeet farms this past summer. Of course, they were under a lot of duress from the drought that was happening up there. I think it underscores the importance of the sugar program. As you mentioned, there is a great deal of foreign market subsidization of their sugar sectors. Unfortunately, that often results in overproduction in those countries, and that surplus sugar is then just dumped on the world market, driving down those prices.

So, our producers are extremely efficient here in the United States. We produce nearly 70 percent of the sugar domestically that we consume here. We do that while meeting very high labor and environmental standards. It is just not the case that other for-

eign countries are doing the same in all cases, and certainly on a level playing field. I know some of your colleagues have, and you have, supported legislation that effectively says if other countries are willing to discontinue their over-subsidization of their sugar sectors, that we would also take a look at our programs.

So, with that, I would just say yes, our producers from both the cane side and the beet side are extremely efficient, but as I pointed out in my testimony, our program effectively is administered at zero cost. But we just can't compete with foreign governments subsidizing their producers to such a degree that is going on. We just saw a recent case come out of the WTO noting the extreme support that India is providing its sugar sector and we have seen the results of that with all that sugar effectively dumped on the world market. Thanks a lot.

Mrs. FISCHBACH. Well, thank you, and just building on that, you mentioned you were able to come to my district and see some of the disasters that they were facing, that the beet farmers were facing last year. And, you were the Chief Economist at the USDA when the WHIP+ program was put together that rescued growers in my state as well as other states when natural disasters threatened to drive many out of business. Can you expand a little bit and talk about the WHIP+, why it is so essential for our growers and how the producers took care of the consumers then?

Dr. JOHANSSON. Yes, of course. We would say producers would prefer to have a good harvest and market their product as opposed to relying on government programs. But in cases such as we saw with the WHIP+ Program back in 2018 and 2019, we had just such a severe hit to the sugarbeet industry with the freeze that went on up there, that untimely freeze that froze a lot of those beets in the ground. And we saw recently just this year Hurricane Ida slamming into Louisiana.

So, I would just say that the WHIP+ Program has been effective. Our producers have utilized that program when it has been there, and they have been eligible for those loses. Of course, as I noted, the 2022 freeze down in Florida is not authorized for WHIP+ at this time, but ultimately, that program or if the Committee looks towards WHIP—working on the WHIP Program to make it maybe a standing disaster program or something like it in the next farm bill, in a way that doesn't interfere with crop insurance. Of course, that—as everybody here on the panel has noted—is really underlying the safety net for a lot of their operations. So, we would certainly be receptive to working with the Committee on that. And again, I thank you for all your support, certainly, in getting that program up this year, and certainly for future disasters that just fall outside of the regular crop insurance safety net sort of regime. Having something like WHIP+ has been very effective for our producers.

Mrs. FISCHBACH. Well, I thank you very much and I appreciate your answers. I would just like to thank the Chairman for holding this hearing today, and with that, I yield back.

The CHAIRMAN. Thank you.

And now the gentleman from Illinois, Mr. Rush, is recognized for 5 minutes. Mr. Rush.

Mr. RUSH. Thank you, Mr. Chairman for this extraordinary hearing, and I want to thank all the witnesses for their participation.

Mr. Chairman, I have spoken before in this Committee about how my grandfather, who was a farmer in southwest Georgia, and indeed, I was born on his farm. And my grandfather, like too many Black farmers over the last 100 years or so, ultimately lost our farm. And I am concerned that not much has changed, Mr. Chairman, for Black farmers over the last decades. According to a review of USDA data, nearly all of the funds provided to farmers to offset the current impacts of the pandemic COVID-19 went to White farmers.

To any of these extraordinary witnesses, what policy would you recommend to the Committee to rectify both the historic and also the current discrimination that is too often faced by farmers of color, and specifically, would you include increased transparency of the very subsidies that are so vital to America's farmers and to Black farmers in your recommendation? Any witness?

The CHAIRMAN. Mr. Rush is asking any witness to respond to the discrepancy in the receiving of financial assistance for our Black farmers. Would any of you care to respond to that?

Well, let me comment on that, if I may.

Mr. RUSH. Mr. Chairman?

The CHAIRMAN. Yes.

Mr. RUSH. I need some response from the witnesses. Are they prepared to respond, or are they not prepared to respond?

Dr. Johansson, are you prepared to respond or are you not prepared to respond?

Mr. Doyle, are you prepared to respond?

Mr. DOYLE. Okay, absolutely.

I think it is about opportunity and communication. We have an open door if—I have spoken with—we have reached out to Black Farmers Association. We were invited to come to Georgia and speak at an event this past summer. I think COVID disallowed that. But no, we would welcome any comment or input from minority grower associations, absolutely. We only speak to the issues that our farmers bring to us, the most important things, and absolutely, I would put minority—Arkansas had—

Mr. RUSH. I only have a few minutes.

Ms. Berg, would you respond or are you prepared to respond to my question, or are you unprepared? Yes or no?

The CHAIRMAN. I think, Ms. Berg, he is referring to you.

Ms. BERG. Could you clarify the question for me, please?

Mr. RUSH. Okay. Let me just—

Ms. BERG. I can't hear him very well.

The CHAIRMAN. I think that what he is asking, Ms. Berg, if you could share with us what efforts you all are making in order to assist in the efforts to lift up our Black farmers more emphatically, because our Black farmers, by every financial economic indicator, are way behind because of past and present racial discrimination.

And so, what Mr. Rush is asking is what are you specifically, and other panelists, doing to address this? Are there any plans or any activities that any of you have to assist us in this situation to rectify the situation financially that is impacting our Black farmers?

Ms. BERG. So, one of the things that we do in our wheat industry, we represent 20 states across the country. We are always looking for new states to come on board to be part of our membership and be part of the decision-making process that we do for the wheat industry.

The other one is we reach out to USDA and they have quite a few programs out there that, whether it is beginning farmers, minority farmers, and so hopefully we support those programs to help improve grower education.

The CHAIRMAN. Right.

Mr. RUSH. Ms. Berg—

The CHAIRMAN. Mr.—

Mr. RUSH. Ms. Berg, being Black is not a state, all right, so this is not a state-by-state issue. Being Black is not a state. It is a condition, it is a reality, it is racial description. But it is certainly not a state.

The CHAIRMAN. Mr. Rush, what we are going to do, each panelist can be able to provide a written statement to you on this—

Mr. RUSH. Please.

The CHAIRMAN.—and I appreciate your inquiry on a very important issue, and all of our witnesses may respond in writing if you have specific things to address Mr. Rush's concern.

And now, I recognize the gentleman from California, Mr. LaMalfa, for 5 minutes.

Mr. LAMALFA. Thank you, Mr. Chairman.

First up front, I want to thank you for your moving tribute and prayer for our good friend, Mr. Hagedorn. He was a really good man and his loss hurts around here a lot. Good man from the first time I met him in our building there, so I appreciate everybody's kindness towards his memory and for his wife Jennifer and family.

The CHAIRMAN. Yes.

Mr. LAMALFA. So, with that, I want to just launch right in here. I have been a lot of places today, so I want to get with Jennifer James here from USA Rice. She had earlier testimony about PLC, the price loss coverage, and also to the other program, Agriculture Risk Coverage, can actually be a little better, a little more flexible when worked with other commodities.

And so, would you like a little more time to expand on how the flexibility to switch between the two programs is helpful?

Ms. JAMES. Well, in Arkansas, I have elected the PLC during the entire farm bill, and I am not as familiar with the California rice growing and their choices in the farm bill, but I can speak to the PLC and its importance definitely in the mid-South rice growing region. It has allowed many rice farmers to stay in business during this time, as our prices have been very depressed, and we are going into an area where the input costs are extremely high. My friends in California are probably experiencing some of the highest in the rice industry at this time, so we really cannot stress enough that the safety net and these reference prices, this is our safety net. The crop insurance program is important to us in certain instances, but the safety net, the PLC Program is vital.

Mr. LAMALFA. So, as we are seeing incredibly higher input costs, I mean, it looks like fertilizer for my co-op at home is up at least

80 percent, and we try to get our fuel tanks topped off at the tune of at least 50 percent more in cost from a year ago.

So, what you are saying is increasing the reference price is going to be extremely helpful towards getting through this next phase for rice, and I imagine the other commodities, too, right?

Ms. JAMES. Yes, sir, that would be correct. And we are working to try and figure out the data behind all that.

Mr. LAMALFA. Okay. So, is that something that will be pretty forthcoming, the data on that, so it can be implemented in our discussions?

Ms. JAMES. I am sure the rice industry will be working on that going forward, yes.

Mr. LAMALFA. Okay, thank you.

Jaclyn Ford with cotton. An issue for rising input costs affecting cotton as well, I guess that is somewhere across the whole range, some were reaching 25 to 40 percent when you blend fertilizer, fuel, and other inputs in there for—and cotton as well. And maybe that is low. You can direct me on that, too. What do you think this Agriculture Committee can be thinking about and incorporating into these farm bill discussions in just input costs, and what kind of reality are we going to have to have in the farm bill to better reflect, going forward, the issues we face?

Ms. FORD. I think just taking margins into consideration, increased reference prices are good, but also with the increase, we just never know what war and what the COVID pandemic brought our input costs up. So, I think considering margins when you are making those decisions for us.

Mr. LAMALFA. One of the things we are driving for immediately is we feel our energy costs can be brought back into line somewhat if the United States is producing its own energy and not relying on Middle East or high-cost energy, high-cost electricity, and all that.

Ms. FORD. Yes.

Mr. LAMALFA. My home State of California, electricity is going to continue to go through the roof as generation is taken offline. We had two nuclear power plants not that many years ago. We are going to have zero soon. Hydroelectric dams are under threat of being taken out. I am not sure where these input costs on energy are going to be able to come into line with that kind of policy. So, I appreciate that.

Now, Nicole Berg from wheat growers. I think this doesn't just apply to wheat payments, in your experience, it sounds like it has taken a year and a half after a crop is harvested for wheat payments to make it to the grower. So, that lag can obviously be really tough for cash flow and making payments. And even farmers on the edge might see that they might be going out of business waiting for that payment. Please, what do you have to say about that, to fix it?

Ms. BERG. Yes, during the WHIP+ appropriations, it is in the appropriations and we are now working on the disaster for 2020 and 2021, and we are now in 2022. And USDA hasn't really even finished rulemaking yet. So, we are hoping that with more expedience in rolling out these programs through USDA, it would help us farmers, help us in that time of need during that disaster and not just 2 years later and people are going out of business.

Mr. LAMALFA. Yes, unbelievable. Well, hopefully with most of this COVID nonsense behind us, we will be sharpening these issues up a little.

The CHAIRMAN. Thank—

Mr. LAMALFA. Mr. Chairman, I thank you.

The CHAIRMAN. Yes, thank you.

The gentlewoman from Illinois, Mrs. Bustos, who is Chair of the Subcommittee on General Farm Commodities and Risk Management, is recognized now for 5 minutes.

Mrs. BUSTOS. Thank you very much, Mr. Chairman.

Let me jump right into this. The 2018 Farm Bill requires the use of crop insurance yield data as the first source of data in the ARC Program. So, my questions are to Mr. Doyle and to Mr. Edgington. And if there is anybody else who wants to chime in, please feel free. But for the two of you specifically, has the use of crop insurance yield data improved how ARC has functioned? Mr. Doyle, we can start with you.

Mr. DOYLE. Yes, absolutely I think it has. It is more accurate data. I believe averages, as you know, farm yields from high to low across all types and fertility levels, so that crop insurance tied back to an FSA number is definitely more accurate, in my opinion.

Mrs. BUSTOS. Thank you, Mr. Doyle.

Mr. Edgington, if you could answer?

Mr. EDGINGTON. Yes, I totally agree with Mr. Doyle and we have made a lot of strides in the crop insurance world talking to the Farm Service Agency offices and how this all works for the farmers as they produce yields and provide the information to the various resources that need it. And so, we are definitely making strides. I think it is an area that we can continue to improve, though, because technology is helping us in that area in a lot of ways.

Mrs. BUSTOS. Okay, very good. Anybody else want to chime in on that question?

All right, if not, let me move on to my next question. Again, this will be for Mr. Doyle and Mr. Edgington for starters, anyway.

USDA has undertaken efforts to streamline the acreage reporting process for producers who participate in the Title I commodity programs and Federal crop insurance. Has this streamlining initiative worked, and has the reporting process been simplified for producers? Mr. Doyle, you first, please.

Mr. DOYLE. So, I think COVID has put us in a challenging year for the last couple of years, so we haven't had a lot of face-to-face conversations in the FSA office. Anything that makes reporting easier, more accurate, less redundancy I think will help us enter the programs that we so need, more efficiently and effectively, so I would say the verdict is still out for us, but I applaud the improvements to reporting.

Mr. EDGINGTON. Yes, and I agree with him on that. One of the areas that I think we have been challenged on—and COVID has been trying to maybe show us some things to work on—is the age grouping that we have with farmers and how they are comfortable in reporting. There is a generation just a little bit older than Brad and I that—I mean, there are days that I am not very comfortable with the computer, but I certainly do better than the generation that is thinking about retiring. And so, they are struggling, wheth-

er it is with their crop insurance agent or with the FSA office. Them not being able to go into the offices has been a real hindrance. They have worked their way through it. Our offices, at least in my area, have been very flexible in trying to help people, whether we have done things online or other ways.

But we are making strides, and it is—we love technology right up until we have to use it to give reports, it seems like. And so, we will get there and we are getting better, but I think there is always room for a little bit of improvement.

Mrs. BUSTOS. Okay. I am going to try to squeeze in one more question, and this will be for the panel, so whoever wants to jump in. It is a broad question.

I know the perspectives on ARC and PLC over the past couple of years have varied depending on the commodity. So, as this Committee continues our oversight work and looks ahead to the next farm bill, what are the metrics that we all should use when we evaluate the effectiveness of our existing programs? And maybe we will have one of the other people start first, and then anybody else who would like to chime in?

Mr. DOYLE. I think we definitely need to address reference price, because it has been mentioned several times here, but it is also important to remember that we don't want reference price to dictate the planted acres. We want to use it as the safety net, but we don't want it to drive or change our decisions from year to year. We want to use it as a tool.

Mrs. BUSTOS. Thank you.

Dr. JOHANSSON. Yes, that is a great question, Congresswoman Bustos. I would say, at least from the sugar perspective, certainly looking at loan rates and how closely aligned they are with our costs of production would be another metric to look at.

Mrs. BUSTOS. Thank you.

Ms. BERG. Madam Congresswoman, I think one of the things in the wheat industry we would like to do, we work on such thin margins, and we don't necessarily want to make a bunch of money, but we want to at least try to break even on these safety net programs and try to keep our family farms in business. So, I guess I would look at definitely the bottom line of how much do we make or how much don't we make, and how we plan for our risk management process. In my area, we have 6" of rainfall a year. Last year, I didn't harvest $\frac{1}{3}$ of my farm, and so, I had to utilize the safety net of crop insurance and it was there, and I would have to say it has kept the family farm in business.

The CHAIRMAN. Thank you. The gentleman from Indiana, Mr. Baird, is recognized for 5 minutes.

Mrs. BUSTOS. My time has expired.

Mr. BAIRD. Thank you, Mr. Chairman, and I too would like to start off by expressing my loss for my friend Mr. Hagedorn from Minnesota. His insight and his wisdom really contributed to this Committee in his home State of Minnesota, so I just want you to know I do miss him. Aside from that, Mr. Chairman and Ranking Member, I really appreciate having this hearing. I appreciate us getting started on the farm bill, and I appreciate all the witnesses sharing your insight with us here today.

Well, the one thing I want to start off with is—and maybe all of you can respond to this, but, Mr. Doyle, I keep hearing in my area, Indiana, that they feel the safety nets almost have to fall too low before they actually kick in and really give any kind of a safety net. And so, as we look at ARC, and the PLC, and otherwise relatively successful programs, do you feel that the reference prices have adequately kept up with the market trends, and the input costs, and your overall break even cost for production? And, if not, how do you feel we, as a Committee, should look at those reference prices, and how should they be evaluated?

Mr. DOYLE. Thank you for the question. I think Purdue University has a break even cost around \$11.07 for soybeans per bushel, and the current reference price is \$8.40. As has been mentioned here several times today about the input costs, we, as farmers, make most of our decisions the fall prior to planning. We make a budget, as we need to, but a lot has changed since then, so our profitability is at risk now, and raising that reference price to a certain level, absolutely we need to do that. What that level is, I believe we are not ready to quite agree on yet. We have a lot of economists and experts who will work on that, and we would be glad to present that at a later date.

Mr. BAIRD. Super. I really appreciate you mentioning my alma mater too, Purdue.

Mr. DOYLE. American Soybean Association was founded 101 years ago on the Fouts Farm in Indiana.

Mr. BAIRD. Super. Thank you. Anyone else care to comment about the reference prices?

Mr. EDGINGTON. So, the corn growers are just kind of getting started in their whole process, and we are really grassroots. I mean, we start down at the county level, and it goes to state, and next week, at Commodity Classic, there will be a lot of discussion around a lot of this, but we have also done surveys and questions, because there are regional differences, even with—in corn production.

Mr. BAIRD. Yes.

Mr. EDGINGTON. It is an area that is still under study for us, because you ask a really tough question of what should the price be. If we had a stable market every year that it is—whatever this is, that is an easier discussion than the volatility that we live in, both on the input side and on the products. So it is a very challenging discussion, and we will definitely be taking some time to analyze where we should be at.

Mr. BAIRD. I appreciate that very much. I have a minute and 51 seconds, so I have three more. If any one of you three want to comment, I would appreciate it.

Ms. JAMES. I would be happy to chime in. For the rice industry, I think I have mentioned it several times that the reference price is not working for us. And I know we are looking forward, but currently, the 2021 PLC is going to be about $\frac{1}{3}$ of the 2020, and for the 2022 crop we are about to plant, it appears we will have no PLC, but the market is just slightly above there, so we are in a very tenuous area, trying to make those planting decisions going forward, and so it is very important to the rice industry.

Mr. BAIRD. Thank you. We have a minute and 8 seconds.

Ms. FORD. On behalf of the cotton industry, I can tell you that we are very similar to Mr. Edgington. We have people meeting regionally, because cotton is huge too, and cotton in Texas is different than cotton in Georgia, and cotton in California is different than cotton in Georgia, so we are listening to all of our different sectors, and getting everybody's input in all of that. It will be the end of the year, probably, before we have all of those ideas, and interest organizations combined to get our recommendations.

Mr. BAIRD. Thank you. Any others?

Dr. JOHANSSON. Congressman, we are also—both from the cane side and the beet side, we are also looking towards talking to all of our members, and finding out what are the most salient recommendations to provide to the Committee, so we are also at the same process at this point in time. But certainly everybody, as has mentioned today, and certainly as you have highlighted, are watching these cost productions, and inflationary trends towards our input costs with a great deal of concern.

The CHAIRMAN. Thank you. The gentlewoman from Washington, Ms. Schrier, is recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman, and welcome to all of our witnesses. First, I want to thank Ms. Berg for testifying today from my home State of Washington. It is wonderful to see you again, and I so appreciate you sharing your expertise with all of us. I was going to focus on the wheat industry today, and so I have a couple questions for you. Let me just set the stage by saying that Washington State produces close to half of the nation's soft white wheat, which is very special, and approximately 90 percent of that is exported.

In your testimony, you noted that the wheat market has been like a roller coaster lately over the last few years, with severe weather events, trade disagreements, the pandemic, supply chain issues disrupting normal operations, even having China decide that they are going to grow their own wheat, and not have any imports some years. I have been hearing from growers in my district about the challenges of getting their crops overseas due to supply chain disruptions, mostly caused by exploitative practices of foreign-owned shipping companies, and that mainly affects hay and wheat. In recent months, I have been hearing the opposite side of this, about supply chain disruptions in the other direction raising the costs of inputs as a result of similar processes.

So, Ms. Berg, I just thought I would ask in a general sense, in light of the ongoing drought in the Pacific Northwest, higher input costs, the supply chain issues, I wanted to just ask generally how Title I farm bill programs are working, and if they are not working well, what are you hearing most from the farmers in your area?

Ms. BERG. Well, thank you, Congresswoman, and I want to thank you for all your hard work with regard to containers and shipping issues, because I know you have been a champion for our state, working on these issues for us farmers. I guess what I am hearing in the state is—with regard to USDA programs is we are definitely in a change of staffing at USDA, with regard to people are retiring. We have new people coming on board, and so, with these retirements, I think that there needs to be—definitely training for quality assurances in administering these programs.

And then I do look forward to the day we can go back into the offices and actually meet with folks. Over—the online has worked. Some farmers are grumbling because they—I mean, they are farmers. We don't want to be behind a computer. We want to go into the office and have somebody help facilitate us signing up for programs. And so that is kind of what I hear on the country side.

You addressed my volatility issue that the wheat industry has. I think it needs to be brought out that $\frac{1}{3}$ of the wheat production comes from—in the whole world comes from Ukraine and Russia, so we look like we are going to have definite volatility. Last week we were up limit, and then we are down limit, so I definitely see this as a huge volatility issue for our industry, with regard to price.

Ms. SCHRIER. Thank you for commenting on both of those issues. First, I will tell you that it feels like we are really close to being able to do things in person. We are here in this Committee room, not in masks, in this hopefully long period of being able to feel safe, and we feel that same angst. None of us like to be behind computers all the time. I was going to ask, since you touched on Ukraine and Russia, you are looking at this as uncertainty and volatility. Is there any benefit for exporters from the United States to be able to help alleviate—and fill these gaps, alleviate hunger around the world?

Ms. BERG. I hope there is. I hope this becomes an opportunity for American farmers, and American wheat farmers, with regard to a little bit of disruption with regard to supply and demand kind of concepts as we move forward. But the wheat industry also—we don't want to see people in war and so we don't necessarily want them to have a hardship either for their country and their region.

Ms. SCHRIER. Right. And this would be specifically filling temporary gaps.

Ms. BERG. Yes.

Ms. SCHRIER. Thank you, and thank you for those comments. We agree. As we look ahead to the farm bill, are there some ways specifically that we can sustain some necessary changes for you? In addition to that gap, you talked about a year and a half to 2 years of getting funding reimbursed. Are there other ways that we can help?

Ms. BERG. I think streamlining. I know that it was discussed earlier today. Streamlining the process would help farmers. Also in education and outreach to farmers of when is the signup. I think we could do better in promoting and working with—maybe it is the wheat growers—helping promote the message of get in and sign up. I think that that would be an important—

The CHAIRMAN. The witness could continue with a written response to her. Thank you very much. And now the gentleman from Iowa, Mr. Feenstra, is recognized for 5 minutes.

[The information referred to is located on p. 154.]

Mr. FEENSTRA. Well, thank you, Chairman Scott and Ranking Member Thompson. My district is the top ethanol producing district in the entire nation. Biofuels are a low-cost, low-carbon complement for other fuel sources, and it can be net carbon negative in the next several years. Biofuels are good for the environment, they are good for our farmers, and they are good for our consumers. We have all seen how Russia chose to needlessly attack Ukraine,

and the consequences of this will be significant to our agriculture community, and even the farm bill. Today the U.S. imports 206,000 barrels of crude oil from Russia every single day. This must stop. We must become energy independent, and biofuels are ready to fill that gap both domestically and overseas.

Mr. Edgington, thank you for being here from our great State of Iowa. It is a great pleasure to see you. I appreciate your testimony. You mention in your written remarks that 5.3 billion bushels of corn was used for ethanol in 2021, and there is more capacity to increase fuel production beyond that. To what extent can the ethanol energy increase energy independence, and how can the farm bill partner with the industry's goal to provide this opportunity where we can be energy independent through biofuels?

Mr. EDGINGTON. Representative Feenstra, thank you for that question. Ethanol is a fantastic product, and it does two things, it provides energy, and it cleans the environment. Greenhouse gas reductions are, the latest studies are coming out, over 50 percent reduction compared to traditional fuels, and we just keep getting better. And so it kind of covers two things. Energy independence, we immediately have more ethanol that is available, sitting in tanks that could go into cars and vehicles today and tomorrow. E15, we lost that on a year-round basis on what is a very interesting wording situation. We could get that back, at least on a temporary basis. That would definitely put more fuel into the supply that is domestic, that is here already.

We, along with our friends on the diesel side of renewables, have a great product, and we have more capacity. More plants are being built. Plants are able to expand. And we currently use a little over 5 billion bushels of corn for ethanol production, but we are putting almost \$1½ billion back into the livestock feed as actually a higher quality product. So it is really a great situation that we have with corn, and the ability, with ethanol, to simply help let the United States be more energy independent on its own.

Mr. FEENSTRA. I agree 100 percent. Mr. Doyle, sort of the same question with biodiesel, right? I mean, we have this great opportunity, and do you see anything that we need to look at to be proactive in the farm bill to address this, that we can be energy independent?

Mr. DOYLE. So soybean oil, as you mentioned, biofuel—actually 66 percent reduction in greenhouse gases. What once was a byproduct is now driving the price of soybeans. So any support to our refineries within the U.S. to encourage any kind of tax credits would be very beneficial.

Mr. FEENSTRA. Yes. I agree. I mean, I just think this is something the farm bill needs to look at to get us not reliant on 206,000 barrels a day of Russian oil. Got another question. I used to be a crop agent, and I know I had a lot of anxiety when the last farm bill came around, when it came to crop insurance. It seemed like it worked out okay. I know there are a lot of bumps in the road yet. Mr. Edgington and Mr. Doyle, we talked about a lot of the protections that are out there already, but do you see any nuances that we need to make crop insurance better, to make it easier for the farmer, whether it be at the FSA office, or in general, the policies that are currently out there?

Mr. EDGINGTON. So, one of the things I think that we have the opportunity is simply to expand what we can work with under the side of crop insurance, and that is what the PACE Program is about that has come out, and it is all about supplemental nitrogen, or split-apply nitrogen, which is kind of a two-win situation, because you are doing—be more efficient with your nitrogen as you apply it. The challenge you have—and I do this 100 percent on our farm, we split-apply all of our nitrogen—is—if the month of June in Iowa is really, really wet, you could be caught short, and corn is very nitrogen dependent. So the idea of the insurance, and it is being rolled out in 11 states, test counties, is that—if a weather event causes economic harm because you couldn't finish nitrogen, this could be covered through that. So that is one of the pieces.

Mr. FEENSTRA. Yes. I assume the same for soybeans.

Mr. DOYLE. Yes, 90 percent coverage for soybeans.

Mr. FEENSTRA. Yes.

Mr. DOYLE. Very important.

Mr. FEENSTRA. Yes. Sounds good. Thank you so much, and I yield back.

The CHAIRMAN. Thank you. The gentleman from Georgia, Mr. Bishop, is recognized for 5 minutes.

Mr. BISHOP. Thank you very much, Mr. Chairman and Ranking Member, for holding this hearing, and thank you to our witnesses for attending. And let me offer my apologies to Ms. Rogers for the technical difficulties in my introduction, but I certainly want to welcome you and Ms. Ford to this Committee.

Ms. Rogers, in your testimony you mentioned that there are a number of growers in specific regions that have produced peanuts for years, but don't have access to the PLC Program because of a lack of base acres. We know that base acres will help young and beginning farmers of covered crop commodities. How important is base acre enrollment to the industry, particularly to young and beginning farmers, and how can our Committee be helpful in addressing this issue? And what are your thoughts on the voluntary update of base acres?

Ms. ROGERS. We are looking into that matter, definitely. We have a number of growers that would benefit from an update of base acres, but there are some other options—that as well, and we have our economists looking into that, looking into the different options, and the cost of those options in the ways that we can help those growers, but not be detrimental to the growers, because this affects all growers, and lots of commodities in lots of the U.S., as you know. So we are hoping that in the future we can work with the Committee to come up with a solution to address this base issue.

Mr. BISHOP. Thank you. Mr. LaMalfa touched on this issue, but one of my priorities on the Committee of Appropriations is options for a permanent solution to disaster relief. Thought it continues to be elusive, there are improvements that really can be made, and, of course, the stopgap measures, like *ad hoc* legislation, as has been indicated creates delays, so we have to find a way to expedite the process.

You talked about the need for either a permanent disaster program, or other policy options to address disaster conditions, Ms. Ford. Can you talk about what disaster aid could look like, and

how Congress could be helpful in expediting, in the processing of that relief? And, Mr. Coleman, could you weigh in also on what permanent disaster relief would look like for specialty crop producers? Ms. Ford?

Ms. FORD. Yes. I am not really prepared to answer that specifically but I will get with the Council and get you an answer to that.

[The information referred to is located on p. 154.]

Mr. BISHOP. Okay. Mr. Coleman?

Mr. COLEMAN. I am not really prepared either. The one thing that I will say about the crop insurance is what we are finding with these specialty crops is our proven yields, if you have a real marginal year, the assistance, or the packages from the FSA and the crop insurance don't match up, and you end up with no insurance at all. And so that is a concern for our growers with these specialty crops. We need to find a way to make those numbers work better so if we do have just right below—or just borderline a disaster, we can still qualify for payments.

Mr. BISHOP. Okay. Thank you. You guys have come, and we depend upon you, because you are where the rubber meets the road. And, as we move into the new farm bill, we want to help forge solutions to these problems. And if you could really, really give some thought to it, and talk with others in your industries to help us so that we can craft in the new farm bill possibly some policy solutions that will address these concerns, because they are very serious, and I know that you probably don't have fully reasoned solutions at this point.

But as we move forward, help us so we can try to work it out, because we want to have policies in place that work for everybody—specialty crops, and for all of our farmers that will really continue to help us to produce the highest quality, and the safest, and most abundant, and economic agriculture anywhere. So thank you all for your testimony, but help us as we go forward with the farm bill in crafting a solution. So thank you so much for your coming, and sharing with us, and we look forward to hearing from you going forward.

Mr. COLEMAN. Thank you.

The CHAIRMAN. The gentleman from Georgia, Mr. Allen, is recognized for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman, I thank you for holding this important hearing. Obviously the commodity industry is very complex, and I have had a competing hearing today, but I have tried to check in, and—trying to learn more about, is there any way to make this process simpler? I mean, we talk about people who don't qualify because they don't have the acreage, or something like that. I mean, I don't quite understand those things.

But one thing that I am hearing back home a lot is that commodity prices are up, corn, cotton, soybeans, wheat, but input costs are rising as well, which is a real problem. For commodities that have not seen price increases, there is not additional revenue to offset the higher input costs, then barring a significant increase in yield, net farm income could be lower in 2022. Will this lead to calls for Congress to design some sort of a program that responds to these production cost increases? And I would ask each of you to respond to that question, starting with Ms. James.

Ms. JAMES. Certainly, and crafting what that might look like, I certainly don't know today, but I can tell you that with these higher input costs, and the price of rice that has not elevated, the rice industry—the rice farmers look at losing about \$500 million in this next crop year, so it is a very disturbing and important issue that we must continue to discuss.

Mr. ALLEN. How are you going to overcome that?

Ms. JAMES. Well, from a farmer standpoint, the unfortunate answer would be not to plant rice, and plant another crop, and that is not good long-term for our industry.

Mr. ALLEN. Yes. Ms. Ford?

Ms. FORD. Yes, the PLC Program has worked well for us in the past. This year people are going to be utilizing STAX more, but we are concerned with input costs rising, and even with cotton at over \$1 today, we are at a break-even point, which is really sad, because normally we are really, really excited about a dollar cotton. So input costs now—fertilizer is 120 percent from what it was last year. Some chemicals are double. Fuel is up 40 percent, so our input costs are up significantly, so definitely we need to re-evaluate the reference price, and what we need to do.

Mr. EDGINGTON. As I said earlier, that is a tough question. When you do these farm bills about every 5 years, and you try to look at averages and lengths, and have we moved into a different price parameter on input costs long-term. That is really tough to forecast like that, and we have to use the USDA and other economists to help us with that, and we are going to be looking into all of that as we think about this.

It is probably against the nature of most farmers to want to say that they are going to use some USDA program to help them out every single year. That is not their style. Most of the time it is leave me alone. Let me produce what I am doing, and leave me alone. So that always comes into the discussions we have, but we are a ways away from having that—

Mr. ALLEN. Well, see, yes, we want to leave you alone, but the problem is this war on fossil fuels has caused the input prices to do this. And this Administration's war on fossil fuel is the problem, and that is an event outside of your control. And that is why I asked this question. Yes, Ms. Berg.

Ms. BERG. Thank you, Mr. Congressman. Input costs—just to give you an example, glyphosate, Roundup, you used to be able to purchase it for \$15, and now we are hearing prices quoted as \$82. So that kind of gives you a perspective of increases in these input costs. Farmers are survivors. We will try to survive through this dark time. A lot of us did some pre-purchasing, did fertilizer spreading last fall, and hopefully it doesn't catch up to us too much with these rising costs, and putting family farms out of business.

Mr. ALLEN. I know, but it is so unnecessary, because if we would return to the previous Administration's energy policy, we wouldn't be seeing the cost of a barrel of oil doing this. I mean—go ahead, sir.

Mr. DOYLE. So, yes, not only would the price—has the price increased, a lot of it is uncertainty for the supply. We might not even have the crop protection products to finish this crop out. If we

could bring manufacturing back to the U.S., that would be critical for our longevity in this industry.

Mr. ALLEN. Yes, and we have to bring all essential manufacturing back to this country. Mr. Chairman, I am out of time, and I yield back. Thank you, sir.

The CHAIRMAN. The gentleman from California, Mr. Carbajal, is now recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman. Santa Barbara County, in my district, was historically home to sugarbeet production, and California continues to be a sugar producing state. I am a strong supporter of our current sugar policy, and I am looking forward to discussion on how to maintain and strengthen it in the upcoming farm bill. Dr. Johansson, U.S. sugar policy has allowed American sugar producers to invest in on-farm and factory improvement to become even more efficient and more sustainable. Per acre yields for sugarbeet and sugarcane have both sharply increased over the past 20 years. Can you explain how the current U.S. sugar program has helped producers invest in their operation?

Dr. JOHANSSON. Congressman, that is a great question, thanks for asking. Sugar program, as you have mentioned, has been effective in helping our producers improve efficiencies, increase in productivity on their fields as well. As you have mentioned, over the past 20 years or so, we have seen production increase by about 16 percent for both sugarcane and sugarbeet production in the U.S., all while farming 11 percent fewer acres, and that is just a testament to the general ingenuity on the part of our producers. We have heard about a lot of that today here on the Committee. The American farmer is the most productive, and most efficient at responding to challenges, and we are seeing that play out on our sugarbeet and sugarcane farms across the country.

The current policy, as I mentioned earlier, is extremely important, even though it comes at no cost to the taxpayer, and it has operated a zero cost for the last—for 17 of the last 18 years, and, of course, forecast to cost zero dollars going forward for the next 10 years by USDA. It is extremely important because of the issue that we see in the global sugar market being so distorted by foreign country over-subsidization of their sectors, and the dumping of that sugar on the global market, which drives down costs—the price of the global sugar—global sugar prices to below the cost of producing that sugar.

And, of course that is something that would effectively drive our producers out of production, if that program wasn't supported by the Committee, and we look forward to, certainly, your continued support on the Committee, and looking at strengthening that safety net as part of the other commodities as well, looking at trying to align our supports, whether that be loan rate, or the other programs that have been talked about today better with cost of production and input costs.

Mr. CARBAJAL. Thank you, Dr. Johnson—Johansson. Sorry for screwing up your name there, I apologize. With the COVID-19 pandemic impacting our supply chain, and disrupting so many sectors of our economy and agriculture industry, can you share with me how these challenges have impacted the domestic sugar industry?

Dr. JOHANSSON. That is another great question, thanks for asking. Of course, COVID-19 has—the pandemic has affected all producers in all their markets, both here in the United States, and certainly we have seen abroad, and, of course, the conflict that we are seeing between Russia and Ukraine is obviously going to be putting a lot of energy markets, fertilizer markets, and commodity markets in turmoil. Over the past couple years, certainly, our sugarcane and sugarbeet producers have been cognizant of this issue, and have put in place safety measures at all of our mills, refineries, processing facilities, to safeguard all of our employees, and we have done a very good job of that.

Certainly we have been concerned with labor in general. It is a big issue for us, as it is for a lot of other commodities that are represented here, and we are continually trying to both provide safe working conditions for all of our employees, but also secure labor, whether that is through the guestworker programs, or other labor sources here in the United States. Of course, the labor market is extremely tight right now.

We certainly would support, and look towards Congress to working on the issue of improving labor supply. But ultimately, with the pandemic, yes, hopefully, as has been mentioned, we are coming out of that, returning to more normal conditions, would look forward to hopefully joining you next time in person, and would be able to provide additional responses in writing later.

[The information referred to is located on p. 152.]

Mr. CARBAJAL. Thank you, Dr. Johansson. I am out of time. I yield back.

The CHAIRMAN. Thank you.

The gentleman from South Dakota, Mr. Johnson, is recognized for 5 minutes.

Mr. JOHNSON. Thank you, Mr. Chairman. I want to dive a little deeper into the line of questioning that Mr. Bishop had. And I know, as we talk about *ad hoc* disaster relief, or maybe moving toward a more permanent program, we think about the interplay with crop insurance. That is obviously most clear. But I guess I want to start with Mr. Doyle. Some of the other witnesses didn't have strongly held opinions on Mr. Bishop's question, but I want to give you an opportunity, sir. As we think about disaster relief, are there Title I interactions that we should be thinking about *vis-à-vis* the next farm bill? Your thoughts?

Mr. DOYLE. So I think we need to see how it is designed. It would depend on how it is designed, and what its purpose is. We, as soybean farmers, rely heavily on crop insurance. Ninety percent of soybean producers partake in crop insurance, so that is the number one vital tool. As I mentioned earlier, ARC and PLC have been used very little over the last few years, but I think we are always open to some sort of protection beyond what is the norm, so we would be in support of a program. When disaster comes up, we appreciate the ability of this House Agriculture Committee, and our government, to come in, step in, and support us when needed, because many of those disasters are out of our control. We never plan for them, and they can devastate the family farm operation in one single crop year.

Mr. JOHNSON. So, Mr. Doyle, does American Soybean have a policy on whether you prefer *ad hoc* disaster relief, or maybe a new permanent program? A new standing program, rather?

Mr. DOYLE. Not really. I mean, we go to the farm bill. That is our go-to. We would—as conditions or instances would come up, we would—yes, we would definitely seek support. But, as of right now, we are pretty happy with what the farm bill produces, other than the ask for change in reference price, as we requested. Things like that protect us enough, along with crop insurance.

Mr. JOHNSON. Mr. Edgington, how about for corn? Do you all have a strongly held opinion on *ad hoc versus* standing disaster relief as we look toward the next farm bill? And are there interactions between Title I programs we should keep in mind if we were going to make any change to disaster relief?

Mr. EDGINGTON. So, the history has been that we have been more in the *ad hoc* camp, and—partially because there has been—and I have been farming for close to 40 years, and there were long stretches that we didn't much need disaster programs. And then Mother Nature runs a cycle, and it is like, well, we have to have something almost every year somewhere in the county. But, the *ad hoc* seems to kind of work for that. Obviously there are relationships between ARC, PLC, crop insurance, and WHIP, and then you can move over into some of the other programs.

But we have a pretty solid safety net program for most commodities in the current farm bill, and Mother Nature is still our biggest wildcard, will probably always be our biggest wildcard. So, to write a program that is permanent, based on what Mother Nature is going to do is really a challenge when we don't know what she is going to do.

Mr. JOHNSON. So for both Mr. Doyle, Mr. Edgington, we have talked reference price, reference price today, and I get it, clearly that is going to have to be a serious focus of the Committee's work here over the course of the next year or so. Are there other things with regard to ARC and PLC that we need to be mindful of as we roll into the farm bill?

Mr. DOYLE. I think, just to mention base acres, a lot of the young producers only have 10 or 20 percent of their farm base acres, so the opportunity for them is almost non-existent. So any—

Mr. JOHNSON. And I am sorry, Mr. Doyle, I should have included base acres in a topic that we have pretty well—

Mr. DOYLE. Yes, sir.

Mr. JOHNSON.—fleshed out, or are in the process of fleshing out. So, other than those two things, is there are a third—and maybe those—one and two are so big we don't need a third target, but I wanted to give you an opportunity.

Mr. EDGINGTON. Well, you might have the opportunity to deal with yields, and what things are based off of on that, because our yields, and I think everybody up here has mentioned it, we continue to improve with genetics, and opportunities that we get, and our costs go up because of that, and usually there is an association. And so, as we look at maybe increasing the base yield to go with the base acres that are there, or back and forth, it becomes an area that also maybe should be looked at.

The CHAIRMAN. Thank you very much. The gentleman's time has expired. The gentlewoman from Minnesota, Ms. Craig, is recognized for 5 minutes.

Ms. CRAIG. Thank you so much, Mr. Chairman and Ranking Member, for having this hearing, first and foremost, today on Title I programs. Corn and soybean farmers in Minnesota's 2nd Congressional District rely on these programs for stability, and I am really grateful to the witnesses today for sharing their input in how the tweaks made in the 2018 Farm Bill have played out. As the conversations for the next farm bill ramp up, I am curious to learn more about how Title I programs like ARC and PLC have worked for family farmers during the instability of the past few years. I recognize that some of that was covered by my colleague Dusty Johnson, but maybe we will go into just a little bit more here.

With that in mind, I will turn to President Edgington for my first question. Mr. President, as you know, corn growers on family farms in Minnesota's 2nd District provide food for people across the country and the world. They also provide the key input for ethanol, which grows markets in Minnesota, and helps to de-carbonize our transportation sector. That is why I am pushing every opportunity to ensure that the year-round sales of E15, whether it is through my Year-Round Fuel Choice Act (H.R. 4410), or another legislative route. That is less of a farm bill conversation, of course, but I mention it here because biofuels are such a critical part of our collective effort to support renewable fuels.

When it comes to the upcoming farm bill, I am hoping you can provide a little bit more perspective on any additional flexibilities that NCGA thinks might be impactful for family farmers moving forward. Are there any additional tweaks, like the ARC and PLC election flexibility change in the 2018 Farm Bill, that might make a difference?

Mr. EDGINGTON. Representative Craig, thank you for that, and thank you for your support of ethanol, and all the things that you have done for us on that. As I mentioned earlier, we conducted a study, it is over 900 people that responded, and we are working through that data. We will answer some of those questions that you have asked, and we will have more of that information this summer as we move forward, and how to maybe fine-tune, or how to adjust some of the current farm bill programs as they reflect on corn growers. I think we will have a really interesting discussion next week in New Orleans around some tweaks. We always do at our policy sessions. And then we meet again in July right here in Washington, D.C. So we will be bringing some of those things that you are asking for, but at this point, we are still working through the process.

Ms. CRAIG. Well, thank you. We look forward to getting an update, and, obviously, are very interested in your suggestions. I want to turn to President Doyle next. President Doyle, thank you so much for your comments and focus on the role that the ARC and PLC reference price for soybeans is playing in decision-making for bean growers. The fact that the last time a PLC payment was triggered for soybeans was 2005 indicates a lack of responsiveness in the program, especially when some soybean farmers experienced negative margins for their crops during the 2018 and 2019 trade

wars. With that in mind, can you speak to what ASA thinks might make sense for a reasonable reference price?

Mr. DOYLE. It is, soybean prices are driven by supply and demand, and right now the prices are good, driven by demand. The safety net, PLC or ARC, it is a safety net. It is what we go to when times are bad, and I would have to say times are pretty decent right now, and good for soybeans. We have high demand. But to give you an exact reference price, I believe I am not qualified for that, but we will deep dive into that this year.

As I mentioned earlier, Purdue set a break even price around \$11. Somewhere near that may be where we need to be. We have sufficient data coming. We will continue to have talks with our state affiliates, and we need all of that data to come in, along with buyers, and see what long-term demand and supply will be, and hopefully we can shed some light on what would be a more fair and safe reference price for soybeans.

Ms. CRAIG. Thank you so much, Mr. Doyle. Let me just ask real quick, any other farm bill updates you would like the Committee to consider?

Mr. DOYLE. I think for soybeans Minnesota's one of the strongest on crush. Any support of oil and Renewable Fuel Standard would be beneficial to our industry.

Ms. CRAIG. Awesome. With that, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. The gentlelady from Louisiana, Ms. Letlow, is now recognized for 5 minutes.

Ms. LETLOW. Thank you, Chairman Scott and Ranking Member Thompson, for holding this very important hearing to review the key commodity support programs authorized by the farm bill. And I just have to say, I love seeing so many women in agriculture witnesses. And, as many of you know, agriculture is the backbone of my district, and is one of the largest economic forces for the area. From rice, to cotton, to soybeans, to sugar, all of which are represented here today, my district has been blessed with the fertile soil to grow just about anything. In fact, according to the *USDA Census of Agriculture*, my district alone accounts for 49 percent of total agriculture sales in the state. It is the hardworking farmers, ranchers, and forestland owners throughout my district that I am proud to represent on this Committee, and drafting the next farm bill needs to remain at the forefront of our vital work, going forward.

Ms. James, in your testimony you mentioned a study I requested of Texas A&M University's Agricultural and Food Policy Center to determine the economic impact of higher fertilizer prices on its representative farms. I am truly appreciative on AFPC's hard work to complete this analysis, but I am concerned by the findings which show steeply increasing input costs across the board for commodities, and particularly rice, farms experiencing the highest fertilizer cost increase per acre.

Ms. James, could you please speak to how this tremendous increase in input costs are affecting you, and are you struggling to find certain inputs to be able to successfully plant a crop this year? And then, second, while we all understand that traditional farm bill programs discussed today aren't designed to react to these unprecedented input economic challenges, how could we look to the

next farm bill to help alleviate these unpredictable production challenges in the future?

Ms. JAMES. Well, thank you, and thank you for your question. Of course, the study that you referenced, actually, the average per acre increase in the rice industry was \$174.20, and I will stress that that is the average, so there are many producers who are going to experience a much higher cost per acre this season. This equals over \$500 million increase in the rice industry would be spent to produce this crop, so, yes, we are struggling. We are trying to make planting decisions.

On my particular farm, I will be planting less rice acres this year than we normally do. We have gone through our budgets, and have made adjustments in line items that we can. We are trying to choose less expensive rice varieties that will still yield as well. We are modifying our pre-plant fertilizer applications, and just trying to make good decisions so that we can still grow rice and support our industry. We are concerned about the inputs. One input in particular is the nitrogen. Nitrogen fertilizer timing for rice is extremely important for the yield benefits, and so we are concerned that we may not have that availability at the proper time for the plant to do its best job.

Looking forward to the next farm bill, as I have mentioned, the crop insurance products that we have in rice are not as effective for us. We are able to grow rice in a controlled environment, and, therefore, most years have a good yield. Therefore, something in the revenue department is always important for us to be sure and protect our revenue. As we referenced earlier in the Committee, the PLC for rice is extremely important, and the fact that the market is just above that is very disappointing right now.

Ms. LETLOW. Well, thank you so much for your testimony and this insight. Mr. Chairman, I yield back.

The CHAIRMAN. All right. Thank you very much. Members, before we move to our next questioner, I have just a brief announcement. One of our witnesses, Ms. Ulibarri, has a family emergency, and has to leave. Any questions for her can be asked for the record to receive a response in writing. Thank you for that. And now the gentlewoman from Iowa, Mrs. Axne, is recognized for 5 minutes.

Mrs. AXNE. Thank you, Chairman Scott, and thank you to our witnesses for being here today. I appreciate your testimony, and look forward to continuing to work with you all as we review the 2018 Farm Bill, and look ahead to 2023, something I have been very much looking forward to in my role. I especially want to welcome Mr. Edgington. Chris, it is always good to have an Iowan testifying on this Committee, so welcome, and thank you for the hard work that you do for our community, and Iowa, and on behalf of Iowa farmers. I am very appreciative.

As you know, last year prices and production were strong in Iowa, and they look positive for the future, but farmers have experienced significant volatility and uncertainty over the last few years due to the demand destruction caused by the trade war, and, of course, by the pandemic. So farmers were able to survive those challenges due to strong farm safety provided through crop insurance, Title I programs, and recent *ad hoc* programs, so it is imperative that we look at all these, and support these farm safety net

programs, and improve them where necessary, so I have a couple questions along this line.

Mr. Edgington, as you noted in your testimony, farmers now have the opportunity to decide between ARC and PLC each year, rather than making a multi-year decision. Do you believe that that change to annually, as opposed to multi-year, has helped benefit our farmers?

Mr. EDGINGTON. I do think that is a good choice, because of the volatility, and I am a case in point. I have actually played in all of them. I have done ARC-County, ARC-Individual, and PLC, and there are definitely people that have gone back—from PLC back to ARC-County this year. And part of the reason we were doing some of the back and forth was dependent upon what you wanted to do with crop insurance, if you wanted to look at the supplemental programs of ECO or SCO, which there was about 10 million acres in last year's crop that people signed up for. So I do believe in that flexibility.

Mrs. AXNE. Okay. Well, thank you for that. And next question along these lines is what do you and other producers consider when deciding between ARC and PLC, and do you believe that there is enough information out there, and easily available, for you to make a good decision, an informed one? I am trying to get at—it sounds like you have taken different opportunities, dependent on what your needs are. How easy is it for our other farmers to get this information so that they can do the same?

Mr. EDGINGTON. Well, there is probably always room for improvement on ease of availability, but it is a challenge. The programs are big, and familiarity helps, and that is why, actually, I really hope that we continue with that in the next farm bill, because people are finally getting comfortable about exactly what these programs are, and how they work for them individually. There are online tools that help. The university extension officers were very useful when these programs were originally rolled out. They, along with the FSA offices, worked together, especially in Iowa, I assume the other states were similar, as people tried to work through those programs. But there are big decisions, and the challenge oftentimes is you are forecasting the future, when you do those, and so you take your best experienced decision, and move forward with that.

Mrs. AXNE. Okay. So is there anything that you think we should be looking at adding? Any push marketing out to farmers? Anything that we can be in front of them with this on a regular basis? You mentioned that the ISU extension was really helpful at the beginning of the program. Is there anything that you think we should be doing ongoing to make sure farmers are aware?

Mr. EDGINGTON. One of the things, I think it was mentioned earlier, is maybe a reminder. Farmers are busy. They are doing their day jobs. And, yes, signing up for government programs is part of our day job, but it is something that slides through the cracks quite often. I have seen that happen in our operation, where you have to make a decision, and it is like, wait a minute, it is already that time? How did we get here? And, you really haven't had time to think about it.

So maybe we need to go back—and it doesn't—I wouldn't say it is an every year thing, but maybe it is an every other year, during the winter have a discussion about the programs on a more open forum, coming from either extension or FSA, to say, "Hey, guys, let us sit down and go through these again, run the formulas, because everybody has talked about these are pretty complex, and farming is not getting smaller."

Mrs. AXNE. Well, thank you for that. I very much appreciate that, and hopefully we will reach out to you and maybe get some thoughts on that from my team so we can put that into place. I couldn't agree with you more. I really appreciate your time today. I have other questions, but my time is coming near to an end here, so I will thank you so much, and I yield back.

The CHAIRMAN. Thank you. The gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. Well, thank you, Mr. Chairman, and thank you to all of our witnesses for appearing before the Committee today. Going into farm bill season, this is extraordinarily exciting, even though I know it doesn't seem like that after 3 hours, but very important nonetheless, so I will jump right in. Dr. Johansson, I know that Florida farmers, including our sugarcane farmers, are assessing the damage from the January freeze, and they will share details of the damage as the harvest continues for the next few months. Please let us know, when possible, what disaster aid language might be necessary for Florida farmers to recover from the unexpected losses.

Now, today I want to focus on a bill that I sponsored that pledges to end our sugar policy only when other countries end their sugar policies. You all may know it as Zero For Zero (H. Con. Res. 43). The sugar industry supports this Zero For Zero legislation, and I would like you to briefly explain to my colleagues why, as an industry expert.

Dr. JOHANSSON. Well, thank you for that question, Congresswoman Cammack. As you point out, over 100 countries produce sugar, and their governments are deeply involved in these industries, providing either high subsidies, tariffs, or non-tariff trade barriers to protect them. Billions of dollars go into their industries each year, which allows them to dump their surpluses below their own cost of production on the world market, which directly threatens U.S. farm families.

There is nothing fair about global sugar markets. I will just point out, as an example, the WTO recently found India guilty for subsidizing sugar production by more than \$14 billion a year, paying export subsidies to dump their surpluses on the world market. The U.S. sugar policy is a response to that high and rising foreign subsidies, which are a core cause of predatory trade practices in the global market. The vast majority of these producers are higher cost and less sustainable than U.S. producers. Our sugar policy is a comprehensive response to these unfair trade practices, and if they stop these practices, as you point out, and let our farmers compete in a fair, competitive marketplace, we would not need a program.

We applaud you, Congresswoman, for leading the charge through your Zero For Zero legislation to expose those subsidies and trade practices that threaten our sugar industry, and actually press to

have those problems addressed on a multi-lateral basis in the appropriate venue. Thank you for the questions.

Mrs. CAMMACK. Thank you. And when you put it like that, I just don't know how any of my colleagues would argue against the Zero For Zero legislation, so thank you for that. And, just so we are very clear, have you seen any evidence of foreign nations cutting back on their sugar subsidy programs, yes or no?

Dr. JOHANSSON. That would be no, and, in fact, the other direction.

Mrs. CAMMACK. Perfect. Thank you. I am going to now move to another issue that is near and dear to some of my producers' hearts, and that is the issue of peanuts and base acreage. So, Ms. Rogers, I appreciate your testimony, particularly your highlighting of the fact that not all producers of peanuts have access to the PLC Program due to lack of base acres. My district, my state, has a particularly unique situation in this regard.

As you know, many peanut producers in Florida have faced challenges with the current base acreage arrangements. Given the changing economics growers are experiencing, particularly the rising costs of inputs, do you think that taking a look at a potential voluntary update to base acres across commodities could have a positive impact on the bottom line for producers, including those peanut producers currently without access to the PLC?

Ms. ROGERS. Thank you, Congresswoman. We are definitely looking at that. Our peanut leaders, they have been meeting with many growers in Florida to talk with them about the issues, and how it could be addressed, and definitely updating base is an option. We are looking at that, plus many other options as well. We have our economists looking at it, and coming up with a cost that would be to update the base, and the cost of other options as well. And we sure hope that we can work with your team, and this Committee, to come up with an option that would work for those growers, as well as the rest of the growers.

Mrs. CAMMACK. Thank you. And do you believe that, if we were to move forward with a base update, that would incentivize and encourage young farmers to enter the industry?

Ms. ROGERS. I think that is possible. We definitely need to do what we can to help farmers, and whatever we come up with, whatever option we come up with, to be able to help the ones without base, will definitely help the young farmers.

Mrs. CAMMACK. Excellent. Well, I appreciate your commentary, and thank you again to all our witnesses before the Committee today. With that, Mr. Chairman, I yield back the remainder of my time.

The CHAIRMAN. Thank you. The gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations, is now recognized for 5 minutes.

Mrs. HAYES. Thank you, Mr. Chairman, and thank you for having this very important hearing. Title I subsidies, along with non-farm bill assistance programs, are a critical economic safety net for the farmers in my district that can access them. Between 1995 and 2020, three farms in my district received commodity payments totaling \$4.1 million. Compared with some of the other regions rep-

resented on this Committee, that is pennies. And while these programs are based on acreage, it is still concerning to me that our smallest farms, those that have the tightest profit margins and least assets to fall back on, may be benefitting less than large corporate farms, and the largest family farms. That disparity is even more concerning when you consider the increased input process we have seen over the past year. Many of your testimonies mentioned these concerns, and the negative impact they are having across the agricultural sector. That strain is multiplied tenfold for a small family farm.

The largest Title I payments to farms in my district were Agricultural Risk Coverage payments for corn. So, Mr. Edgington, as President of the National Corn Growers' Association, can you provide some insight on how those payments function for the smallest farmers?

Mr. EDGINGTON. So, it is a function of the process, and acres, and yield, so you have a formula that is designed, and it is based off of acres and yield. And, yes, there are fluctuations, there is no question, from large farms to small farms. And, unfortunately, I don't know a real good way around that. If you speak with Secretary Vilsack, he will talk about what percentage of us farmers actually get a living based off of only crop production, and it is not very many.

And while people say that large family farms are a challenge, I live in part of a large family farm, and when you break it out on an individual basis, we are not that many acres per producer inside of our operation. And so it is always something to be looked at, but it is—currently it is a function of base—of acres and yield.

Mrs. HAYES. Do you think that it is equitable between small family farmers, like those in my district, and some of the larger corn producers?

Mr. EDGINGTON. So, in your question about equitable, are you saying on a per acre basis, or in the total dollars going to the operation? Because, if you take two operations, and one has 150 acres of corn, and one has 1,000 acres of corn, but their base acres and their yield are the same, on a per acre basis, they will be very equivalent. On an overall operation, there will be a difference. So it is a challenge as to how you look at it, and what area you are after.

Mrs. HAYES. Got it. Thank you. In your testimony you talked about how the USDA should continue to find more ways to reduce the reporting burden on producers. Can you elaborate on the burden felt by producers being required to visit the FSA office, and how might that burden be decreased?

Mr. EDGINGTON. Well, one of the ways we talked about was how you handle crop insurance, and reporting to the RMA, as well as reporting to the FSA. In a lot of cases it is a dual process, and there should be a way to streamline that. Now, personally, I am fully in favor of using the USDA acres, because they are the most accurate out there. If you use farmer technology numbers, there is some variance. RMA, in my area, at least, uses FSA numbers, because they know that is the most accurate. But there should be a way that it could be a one stop—either I am going to go visit the FSA office, and RMA gets those numbers, or I am going to go visit

my RMA agent, if he is closer, and FSA gets those numbers. I think there is an area we could get some efficiency improvements.

Mrs. HAYES. Thank you. I think we have heard the same thing across multiple programs. And last, for whomever on the panel would like to weigh in, I have heard a lot from people in my district regarding input prices and the increased cost of fertilizer. While this is very concerning in the immediate term, there may be other conservation practices that could mitigate the need for fertilizer long-term. Specifically, planting cover crops may also improve the nutrients in soils that are available for crop production, potentially reducing farmers' dependence on chemical fertilizers. From your perspective, did higher fertilizer prices lead farmers to plant more acres with cover crops over this last winter?

Mr. DOYLE. Absolutely, I believe so. It was a driving force, especially for soybean farmers. Very beneficial to plant cover crops, and we certainly encourage that.

Mrs. HAYES. Thank you. Thank you for your time, and your thoughtful answers. Mr. Chairman, that is all I have. I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is recognized for 5 minutes.

Ms. ADAMS. Thank you, Mr. Chairman. Thank you to the Ranking Member as well for hosting the hearing today, and to all the witnesses, thank you for being here. The commodity support programs discussed today primarily assist basic commodities, such as corn, rice, and cotton. However, socially disadvantaged and minority farmers tend to produce fruits, vegetables, and raise livestock. Therefore, socially disadvantaged and minority farmers are not able to take advantage of the bulk of funding and support programs. Improving access for all agriculture stakeholders to the assistance programs that fall under commodity support programs is a priority for me, and I look forward to working with my colleagues on this issue as we move forward on the farm bill.

So, Ms. Ford, in your testimony you mentioned the need for market loan programs to be automated. So have any of your members, especially socially disadvantaged farmers and ranchers expressed challenges in accessing the technology, or navigating the application process, for commodity support programs?

Ms. FORD. We are advocating that everybody use more technology, and right now we are working with the National Black Growers' Council currently on just more involvement, and more minority—and involvement overall.

Ms. ADAMS. So have you had any one of those express the concerns that I have just mentioned? Ms. Ford?

Ms. FORD. Yes, ma'am. The program automation has been a problem because of government shutdowns due to COVID.

Ms. ADAMS. Okay. So what have you asked USDA to do to better support the socially disadvantaged and minority growers? Have you had a conversation with them about it?

Ms. FORD. I have not personally, but that is something that the National Cotton Council is working on, is more outreach and more communication.

Ms. ADAMS. Okay. All right. Mr. Edgington, a condition for eligibility for Marketing Assistance Loans rests on the ability to store

commodities, a current problem due to supply chain issues caused by the COVID-19 pandemic. So have your members expressed any concerns regarding the eligibility or capacity to store their product?

Mr. EDGINGTON. Storing corn is maybe a little different than others because we work in such a large volume, and our infrastructure for corn has been pretty solid. You have a local co-op network system, you have a regional delivery system, or you have on-farm storage. There always can be challenges, and, obviously, the supply challenge that I hear about is maybe not from the loan side, and the USDA, but from the supply side, is can I get the materials to build a new storage bin to hold the crop?

And so we definitely have supply chain challenges inside the corn industry, as I think everybody at the table would say, and so we are hoping that we can get back to a new normal on supply chain, but nobody knows what that is.

Ms. ADAMS. Okay. Mr. Johansson—I mean Dr. Johansson, according to a review of USDA data, the top ten percent of farm subsidy recipients receive almost 80 percent of all farm subsidies. While the largest ten percent have received, on average, more than \$560,000, the bottom 80 percent received an average of about \$8,000. So, considering these economic disparities, do you support reasonable payment limits and means testing for farm subsidies?

Dr. JOHANSSON. Congresswoman, that is a great question. I think I had pointed out here earlier, between 10 to 15 percent of farms produce about 90 percent of the food marketed here in the U.S. That means there are a lot of other operations out there that are also engaging in crop production and livestock production. They are just at a smaller scale. So that explains one component of that distribution of payments that you just mentioned.

Obviously, means testing and payment limits are firmly in control of the Committee you are on there. I know that Congress has looked at this issue many times over the past, and has convened various committees, some of which include, for example, the office I used to work in. At the Office of the Chief Economist, I think we have seen some reports coming out from those efforts. I would imagine that this would be something that you all look at with the new farm bill upcoming.

Ms. ADAMS. Thank you, sir. Mr. Chairman, I am out of time. I yield back.

The CHAIRMAN. Thank you. Thank you very much. And now the gentleman from Florida, Mr. Lawson, you are recognized for 5 minutes.

Mr. LAWSON. Thank you, Chairman Scott and Ranking Member Thompson, for holding this hearing. It is a very important hearing, as we deal with a new farm bill. And I want to welcome, as most of them have welcomed, all the participants that we have in the hearing today. My statement, which I want some clarity on, is the 2018 Farm Bill, included increased loan rates for most covered commodities, including sugar loan rates at around one percent a pound. Dr. Johansson, you mentioned in your testimony that the increase did not keep up with inflation or the rising cost of production of sugar. What should be done to the sugar loan rate to make them more effective to sugar producers, and why should this be a priority?

Dr. JOHANSSON. Congressman, that is a great question. I think, as everybody on this panel has talked about, cost of production, input costs are rising quite a bit, certainly since this—I guess since last April, since last May, when we saw inflation really taking off, and that is been affecting all commodity production. Sugarcane and sugarbeet certainly have been feeling that as well, and, of course, in the 2 months we have seen this conflict in Ukraine also pushing up prices for a lot of our inputs. Same time, I just want to point out that we have lost a lot of crop protection tools and inputs as well for managing pests on our operations.

So I guess I would say that, yes, we did see in the last farm bill some fairly modest changes to the raw cane loan rate, as well as the refined beet rate. Certainly, I know our producers and our members are looking at providing recommendations to the Committee as we go forward, and we are still in the process of pulling those lists together, and certainly we will be providing that as we get closer into this year. As you have continued discussions, we would be happy to follow up with those.

But I think what I had mentioned in my testimony was that it is clear that the loan rate is not matching current cost production. Current input costs have been going up. I think that would be something that folks would echo here. Of course, sugar doesn't participate in ARC/PLC, so we have had a lot of discussion about that as well, talking about reference prices. It is much the same with respect to reference prices in current costs in the operation. So, again, thanks for the question, and certainly we will be looking forward to putting forward our recommendations a little bit further into the summer here as we continue to meet and develop what those might be.

Mr. LAWSON. Thank you very much, Dr. Johansson. As a Congressional Member of Florida, I know how important it is for disaster assistance to quickly and effectively be distributed to farmers and producers. The question here for all witnesses, for your commodities, what would a permanent disaster assistance program look like, and how should it work in conjunction with the current authorized Title I program?

Dr. JOHANSSON. Well, let me just say real fast, and I will let my other panelists from other commodities chime in, this is a question that we have talked a little bit about today, and certainly one thing that everybody is interested in seeing is if there are additional standing disaster program developments in the next farm bill, that they be ones that are consistent with crop insurance that maybe also encourage additional coverage potentially, as well as looking at some commodities that may not be as well served by the current crop insurance products. Some commodities, maybe specialty crops, certainly sugarcane and sugarbeet, would like to see some additional improvements in some of those products available to us at a more reasonable price. But I will see if other panelists want to add to that.

The CHAIRMAN. Anyone?

Mr. LAWSON. Mr. Chairman, I guess no one else wants to respond, and with that, my time is running out. I yield back.

The CHAIRMAN. Thank you, Mr. Lawson. And, ladies and gentlemen, this brings our hearing to a close, and I can't thank you

enough, our Committee can't thank you enough. Your wisdom, your guidance, your testimonies, have been just extraordinary, and very helpful to us. The input you have shared with us today is so critical to our Committee's effort to oversee this farm bill. We are in the 2018, and as we prepare for the next farm bill, 2023, and we want to thank you for that.

Farmers across our nation now are experiencing—they have experienced so much, and we must respond, and make sure that our farmers, our producers, have all of the means necessary to do the critical job that we are calling upon them to do. Our food supply is critical not only to us, but the entire world. And as we look at, and as we examine the impact that this Russian evil business is doing in Ukraine, it impacts us drastically, and we have to resolve our nation, our leadership, the leadership of the European Union, and all over this world we have to raise a loud voice and stop Russia from doing, and continuing, this evil work, killing women and children indiscriminately. It is enough to break our hearts. But we have to understand the role that we have in providing the food supply most critical. There is no nation on Earth that has this weight on the shoulders of their farmers as we do, because we have the world's greatest and most impactful agriculture system.

And so we want to thank you so very much again, and over the coming weeks and months I look forward to continuing to engage with you, and all of our stakeholders, on the options we should look at for our next farm bill. But you have shared with us what works and what does not work. We are on a journey here, and it is an exciting one, but it is also one where the world is indeed depending upon our agriculture system to be strong. And we are committed to doing that, and you all have helped us greatly today. And from the bottom of my heart, and the hearts of those of us on this Committee, we thank you for taking time out of your busy schedules to share with us your valuable testimony.

And now, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions posed by a Member. And now this hearing of the Committee on Agriculture is adjourned.

[Whereupon, at 1:30 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. AUSTIN SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

December 16, 2021

Dear Mosaic Company,

We write to express our concern with your company's trade practices. As the second-largest phosphate fertilizer producer in the world, Mosaic has almost single-handedly erected an insurmountable tariff barrier to keep its top competitors in Morocco and Russia out of the U.S. phosphate market.

Mosaic's corporate affairs spokesperson recently told Brownfield Ag News that the company is trying to keep prices rational. Saying, "Prices are set essentially by the global supply and demand picture . . . we don't dictate prices."

Yet, thanks to Mosaic's petition, only 15% of phosphorous imports now come into the U.S. without tariffs. And experts say that using Commerce and ITC to manipulate the supply curve does indeed dictate price to farmers.

According to farm economist Bob Young's estimate, "the economic impact of applying countervailing duties of between 30% and 70% on phosphate imports would equate to roughly \$480 to \$640 million in added fertilizer bills on U.S. farmers."

You'll agree that Mosaic now has a much healthier balance sheet than it did in 2017-18, when you and J.R. Simplot began pursuing the CVD case. You'll also concede that you did not anticipate China's phosphate export ban, the COVID-19 black swan event, rising natural gas prices, a historic supply chain disaster and Hurricane Ida.

Mosaic's posture to date has been a masterpiece of irresponsible corporate social responsibility. But it now has an elegant way to reverse course given these exceptional circumstances.

We ask that you voluntarily withdraw your countervailing duties and allow critical supply back into the U.S. at a time of inadequate supplies and soaring phosphate prices.

Precedent exists for reaching a voluntary settlement. For instance, in August 2019 the U.S. tomato industry resolved its anti-dumping dispute with Mexico voluntarily rather than escalate tensions and further disadvantage producers on both sides of the border.

We look forward to your swift action to withdraw the CVDs. In the meantime, please be advised that we will relentlessly pursue a resolution on this issue.

Sincerely,

CHARLES RING, *President*,
Texas Corn Producers Association

JAY SCHUTTE, *Board President*,

SUPPLEMENTARY MATERIAL SUBMITTED BY ROBERT JOHANSSON, PH.D., DIRECTOR OF
ECONOMICS AND POLICY ANALYSIS, AMERICAN SUGAR ALLIANCE

Insert

Mr. CARBAJAL. Thank you, Dr. Johnson—Johansson. Sorry for screwing up your name there, I apologize. With the COVID-19 pandemic impacting our supply chain, and disrupting so many sectors of our economy and agriculture indus-

try, can you share with me how these challenges have impacted the domestic sugar industry?

Dr. JOHANSSON. That is another great question, thanks for asking. Of course, COVID-19 has—the pandemic has affected all producers in all their markets, both here in the United States, and certainly we have seen abroad, and, of course, the conflict that we are seeing between Russia and Ukraine is obviously going to be putting a lot of energy markets, fertilizer markets, and commodity markets in turmoil. Over the past couple years, certainly, our sugarcane and sugarbeet producers have been cognizant of this issue, and have put in place safety measures at all of our mills, refineries, processing facilities, to safeguard all of our employees, and we have done a very good job of that.

Certainly we have been concerned with labor in general. It is a big issue for us, as it is for a lot of other commodities that are represented here, and we are continually trying to both provide safe working conditions for all of our employees, but also secure labor, whether that is through the guestworker programs, or other labor sources here in the United States. Of course, the labor market is extremely tight right now.

We certainly would support, and look towards Congress to working on the issue of improving labor supply. But ultimately, with the pandemic, yes, hopefully, as has been mentioned, we are coming out of that, returning to more normal conditions, would look forward to hopefully joining you next time in person, and would be able to provide additional responses in writing later.

Thank you for your excellent question, Congressman Carbajal. I will add to my response from the hearing.

As we noted in our June 2021 response to USDA's request for information (<https://www.regulations.gov/comment/AMS-TM-21-0034-0437>):* “. . . The structure of the domestic sugar industry in the United States was resilient in meeting the joint challenges of adverse weather in 2019, which lowered domestic sugar stocks, and the COVID-19 pandemic in 2020, which shocked consumer demands in multiple ways. The U.S. sugar supply chain is deliberately configured to withstand such shocks, which are all too common for agricultural commodities . . .” In that request, Secretary Vilsack highlighted that food and agricultural commodities, such as sugar, are ‘critical and essential goods for national and economic security.’ Sugar is an essential ingredient in food manufacturing.¹ Without reliable supplies of sugar, it is likely that several food manufacturers would have had to idle operations in 2020, resulting in lost jobs and shortages of staple goods at grocery stores at a time when consumers needed those more than ever, due to the closure of most food service establishments. In short, U.S. sugar policy helped ensure a resilient U.S. food supply chain during the pandemic.

By way of background, beet sugar is produced in 11 states, primarily in the north, because cold winter temperatures permit beets to be stored outside with minimal loss of their sucrose content. Beet sugar primarily serves the interior of the country. This source of sugar is located near major food manufacturers, who have facilities close to other agriculture raw materials. Sugarbeet production in California is in the Imperial Valley and they harvest just enough each day in the spring and summer to feed the factory. That factory is incredibly important to California because it is a reliable local supplier to meet the needs of millions of people throughout California as well as the Southwestern U.S. Sugarcane is grown in three states, processed into raw sugar, and then refined at eight coastal refineries like C&H in Crockett in the Bay Area. Cane sugar primarily serves the heavily populated coastal regions of the country.

We also experienced disruptions in demand during the COVID-19 pandemic that are now beginning to return to pre-pandemic consumption patterns. During the 2020 pandemic, consumer hoarding behavior was observed at the retail grocery stores and supermarkets as essential food and consumer goods supplies were overwhelmed by spiking demands. Ingredients for baking and cooking (sugar, flour, oils, etc.) were top food items in demand as retail food service shuttered overnight. To meet those challenges and to provide sufficient supplies to food manufacturers, during March–May 2020 the domestic sugar industry put an equivalent of an *additional* 50 million 4 lb bags on grocery shelves in record time to meet consumer needs and provide a calming effect of a resilient supply chain.

* **Editor's note:** the referenced comment letter is retained in Committee file.

¹A reported 74 percent of consumer-packaged foods contain caloric sweeteners (Ng, S.W., M.M. Sliming, and B.M. Popkin. 2013. “Use of Caloric and non-caloric sweeteners in U.S. consumer packaged foods,” *Journal of the Academy of Nutrition and Dietetics*, Vol. 112(11): 1828–1834.

Editor's note: the referenced article is retained in Committee file.

As the economic disruption from the pandemic begins to dissipate, there remain significant bottlenecks in the supply chain for inputs as well as for deliveries. Those bottlenecks are raising prices not just for sugar imports, but also for inputs needed to grow our crops, and are adding to the costs of our just-in-time delivery system for providing adequate supplies of sugar to our customers throughout the marketing year.

SUPPLEMENTARY MATERIAL SUBMITTED BY NICOLE BERG, VICE PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS

Insert

Ms. SCHRIER. Thank you, and thank you for those comments. We agree. As we look ahead to the farm bill, are there some ways specifically that we can sustain some necessary changes for you? In addition to that gap, you talked about a year and a half to 2 years of getting funding reimbursed. Are there other ways that we can help?

Ms. BERG. I think streamlining. I know that it was discussed earlier today. Streamlining the process would help farmers. Also in education and outreach to farmers of when is the signup. I think we could do better in promoting and working with—maybe it is the wheat growers—helping promote the message of get in and sign up. I think that that would be an important—

The CHAIRMAN. The witness could continue with a written response to her.

Thank you for allowing me the opportunity to further discuss this topic. Streamlining the process would definitely help farmers. Staffing levels in USDA offices throughout the country have been understaffed dating back to pre-pandemic times. We applaud the USDA for working diligently to fill these positions and understand they are working as hard as possible under hiring authority to fill them. However, we believe that Congress should take a serious look at the incentives that USDA can provide and the process through which potential employees must go through to fill the positions. Further, promotion and messaging on sign-up dates and deadlines is extremely important. Farmers have some of the busiest schedules and many deadlines unfortunately come and go with some farmers not remembering or being unable to take the time to make the trip to the USDA office to complete paperwork. The Committee and USDA should seriously consider how to be more innovative in their messaging and customer service in delivery and sign-up of programs. Last, these programs can sometimes be confusing and time-consuming to figure out what decisions and programs are the best for their operations. We encourage the investment into models and technical assistance to help farmers make the best decisions. Land Grant institutions and their extension services are extremely important in this aspect. We encourage greater collaboration between Federal agencies and these extension services to provide as much support and technical services as possible to help farmers utilize the valuable safety net tools that this Committee has already provided.

SUPPLEMENTARY MATERIAL SUBMITTED BY JACLYN D. FORD, DELEGATE, NATIONAL COTTON COUNCIL

Insert

Mr. BISHOP. . . .

You talked about the need for either a permanent disaster program, or other policy options to address disaster conditions, Ms. Ford. Can you talk about what disaster aid could look like, and how Congress could be helpful in expediting, in the processing of that relief? And, Mr. Coleman, could you weigh in also on what permanent disaster relief would look like for specialty crop producers? Ms. Ford?

Ms. FORD. Yes. I am not really prepared to answer that specifically but I will get with the Council and get you an answer to that.

The need for *ad hoc* disaster assistance for crop and livestock producers has become apparent in recent years due to significant natural disasters and major weather events ranging from hurricanes to massive, long-term drought. These events create crop losses on a scale and magnitude that crop insurance in its current form is not solely equipped to manage. Therefore, we believe there is a need for the Committee, in the upcoming farm bill development, to evaluate either including a permanent or standing assistance program and/or fund that would allow USDA to

quickly and efficiently respond when major natural disasters cause crop and live-stock losses in the future. One of the major drawbacks with the recent *ad hoc* assistance is the significant delay from the time loss to the time of producers receiving assistance. In some cases, this timeframe has approached 2 years, which is extremely difficult for a producer and their lender to withstand financially. We recognize there are a lot of unanswered questions about how to structure and fund such a program for USDA to utilize and there is the issue of finding necessary budget resources for this purpose. Related to this topic of disaster assistance, we also believe the Committee should evaluate existing crop insurance policies and options and consider if additional resources could be invested in existing or new policies and/or endorsements that would allow producers to affordably protect a greater share of their risk with insurance, thereby minimizing their exposure to loss in times of a major natural disaster.

SUBMITTED STATEMENT BY MARCELA GARCIA, PRESIDENT AND CHIEF EXECUTIVE
OFFICER, U.S. RICE PRODUCERS ASSOCIATION

The U.S. Rice Producers Association represents rice producers in Arkansas, California, Louisiana, Mississippi, Missouri, and Texas. It is the only national rice producers' organization comprised by producers, elected by producers, and representing producers in all six rice-producing states.

Title I has been essential for our rice producers. Eighty-five percent of rice consumed in the United States is grown in our six member states. Recent market conditions have not favored our farmers and the Title I programs, particularly the Price Loss Coverage (PLC) program, provide security to our producers to ensure they can continue to operate. Around 99% of short and long grain rice and close to $\frac{3}{4}$ of Temperate Japonica are enrolled in the PLC program. This program is essential to our producers, but we urge the Committee to modernize/update it to reflect current conditions and protect the American rice industry going forward.

While other agricultural commodity producers have seen recent surges in price, rice producers have not been so fortunate. Of all the PLC programs, rice is the only one of the major grains that is receiving a PLC payment for the 2021 crop indicating it is the one not enjoying higher prices. Rice prices have only increased by 8% since 2020, whereas others have seen increases of over 50%. This slight increase in price has resulted in a decrease in the amount of PLC benefits available to our producers relative to previous years, with the payment rate per pound for rice expected to be $\frac{1}{3}$ lower than last year. The value of American rice production has fallen from \$3.2 billion to \$2.9 billion from 2020 to 2021 and as the challenges our farmers face will only continue to grow, strengthening the safety net provided by the PLC program will be essential to preserving American rice production.

Rice producers have also been impacted by the surge in production costs, both for inputs and labor. Our rice producers have seen a sharper increase in the cost of fertilizer than other commodity producers and this gap is widening. As prices for rice are only increasing at a moderate rate, our producers will need additional support to remain in operation.

Title I allows our producers to compete in an often-unfair global market. Of all the major rice exporting countries, only the U.S. does not enjoy developing country status and we are subject to lower prices because of the farm subsidies that developing countries are using to subsidize their farmers while keeping prices depressed. As other countries over-subsidize their rice production, American rice producers are disadvantaged. We cannot control what these other countries do, so we must continue providing stability to our farmers so they can compete in the international market. The safety net provided through Title I gives assurance to our producers that they can compete and ensures the United States remains relevant in the international market.

As the Committee considers the 2023 Farm Bill, we urge Members to update these safety net programs to better reflect the economic conditions our rice farmers face. These programs are critical to our producers' operations and much has changed in the past year, let alone 5 years. As the challenges and uncertainty facing our producers rise, it is critical our farmers know they have sufficient support to continue operations. We thank you for considering our testimony.

SUBMITTED QUESTIONS

Response from S. Brad Doyle, President, American Soybean Association

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. We appreciate the Administration and Congress' ongoing efforts to better understand needs and improve accessibility of programs across USDA. We are fully supportive of and respect the self-examination process in which USDA is readily participating. Members of USDA's Equity Commission and Subcommittee on Agriculture are undertaking a thorough and thoughtful review as they develop recommendations on policies, programs, and actions needed to address racial equity issues and broader systemic equity issues at USDA.

Encouraging diversity and eliminating systemic issues that facilitate discrimination are important tenets of ASA's new strategic plan, and our organizational policy and procedures. We all have a responsibility and a role to play in eliminating racial injustice. These changes start from within, and examples of how ASA is effecting positive change are:

- ASA has introduced interactive curriculum to its programs—both board of director and staff training, and our leadership tracks—on, for example, the topics of unconscious bias, privilege, and having thoughtful, impactful conversations on race, inclusion and diversity.
- ASA's new 5 year Strategic Plan implemented this fiscal year includes measurable objectives and action items to guide us as we aim to be more inclusive.
- Our leadership programs and communicators programs provide avenues for training and reaching diverse audiences in agriculture in a positive way.

Perpetuating environments that do not support all people is not what modern agriculture represents. We are cutting edge in biotechnology, production practices, and so much more. We have demonstrated that we can be on the front end of change, and we strive to be better at understanding what issues exist in agriculture so that we can be forward thinking and consider the best potential solutions. We look forward to working with Congress and the Administration to improve equity and accessibility.

Question Submitted by Hon. Cheri Bustos, a Representative in Congress from Illinois

Question. Mr. Doyle and Mr. Edgington—In both of your testimonies, you mention the importance of base acres for growers who would like to participate in commodity programs. I have personally heard stories of farmers who have purchased land that was not previously enrolled in USDA programs. Thus, they were not permitted to enroll that new land in Title I commodity programs. What suggestions do you have on how we can look to potentially expand base acres in situations like these in a responsible and efficient manner?

Answer. As my testimony highlighted, there is a significant disparity in soybean planted acres compared to base acres. The inability to access a meaningful safety net by soybean producers is a serious concern. Our farm bill survey results showed that 84% of respondents would like the option to update base acres.

In addition to the scenario you have shared, others are outlined in my testimony. This includes a young, beginning farmer who has only 10% of base acres on his or her farm; a farmer who has implemented conservation practices which enable cultivation of acreage without base; small farmers who have transitioned out of tobacco production and into new crops eligible for base acres; farmers who have exited the dairy business and moved into production of other crops eligible for base; and farmers who have lost cropland to residential or industrial development and have sought other areas to cultivate. There likely are more scenarios that exist in farm country that justify a producer option to update base acres, on which Agriculture Risk Coverage (ARC) and Price Loss Coverage (PLC) benefits are made.

Our organization looks forward to working with you to develop a solution, both to the base acre disparity and the current insufficient reference price for soybeans, that can be adopted in the next farm bill and implemented by USDA to strengthen the safety net for soybean farmers.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. The farm safety net is critically important. Without the farm safety net provided by crop insurance and Title I, lenders would not have the confidence to extend credit to farmers each year—and farmers would not have the resources to produce food, fuel, feed, and fiber. Such a scenario would impact domestic food production, as well as have a ripple effect throughout rural economies. We are unfortunately witnessing the challenges to food production and food security unfold in Eastern Europe.

In addition to the United States, the leading producers of soybeans are Brazil, Argentina, India, and China. The U.S. Soybean Export Council (USSEC), which is the export arm of the U.S. soybean industry, has shared that over the last decade many export partners show preference to U.S. soy because of our sustainable production practices, environmental protections, and regulatory approaches relative to other suppliers. Many of these production practices were initiated in the U.S. during the Dust Bowl. The subsequent support provided for conserving sensitive areas and technical and financial support for transitioning to a variety of conservation practices through Title II and private investment have helped put the U.S. in this position. We continue to strive for improvement.

Response from Robert Johansson, Ph.D., Director of Economics and Policy Analysis, American Sugar Alliance

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. On behalf of America's sugar producers, I would like to thank Congressman Rush for raising the important issue of racial diversity in agriculture and the disparity experienced by farmers and ranchers of color. All of America's farmers and ranchers, including historically underserved farmers and ranchers, are critical to a diverse and robust food supply. The American Sugar Alliance is dedicated to serving all of America's sugar farmers, including producers of color. As an industry, and through our partnerships with organizations such as the Food and Agriculture Climate Alliance (FACA), we support initiatives to engage and enroll historically underserved farmers, ranchers, and forest owners in USDA programs.

On our farms here in America, we are grateful for the many multi-generational farm families growing sugar crops. Those include Black, Indigenous and Hispanic farmers. America's strong farm and trade policies support those sugar farmers and ensure that they can stay in business to pass along the family farm to the next generation, continuing their farming legacy.^{1*}

At our processing facilities, investing in our people is a priority and a key part of our mission to produce sugar sustainably. America's sugar companies have invested in training and scholarship programs to encourage a skilled and diverse workforce. Even then, we still need more workers on the farm, in the factories and transporting our crops to the mills and factories and sugar to our customers.

We continue to look for and implement outreach programs to attract a diverse workforce for these unfilled needs. Companies have also sought to use their reach and influence to make a difference in our communities and neighborhoods. Many of our companies serve their neighbors through charitable food donations, support for community organizations and schools, and volunteer opportunities. Those efforts not only help our neighbors but allows the community an opportunity to learn what we do, and hopefully attract applicants that would not have previously considered a career in agriculture.

America's sugar industry welcomes and celebrates farmers and workers from diverse backgrounds. Across the country, from very rural areas to some of the largest

¹ See for example, <https://agclimatealliance.com/2021/11/01/comments-on-usdas-csaf-partnership-initiative/>.[†]

*Footnotes annotated with † are retained in Committee file.

cities, our industry provides good jobs with good wages and benefits, and real opportunities for growth. Many of our farms and processing facilities are in areas where jobs and economic growth are very limited. Weakening sugar policy would outsource good-paying jobs as well as sugar farms overseas to foreign countries who often exploit their workers and farmers.

As Congress deliberates the next farm bill, we encourage Congress to maintain a strong U.S. sugar policy to provide farmers and workers with necessary stability and allow our industry to continue investing in initiatives that yield a more diverse workforce. We also encourage Congress to work alongside the U.S. Department of Agriculture to ensure that all farm bill programs are available and accessible to all farmers.

Questions Submitted by Hon. Ann M. Kuster, a Representative in Congress from New Hampshire

Question 1. Dr. Johansson, are there any short-term steps your industry would find agreeable to alleviate the tightness in the current sugar market? More specifically, would you oppose measures such as:

- a. Relaxing artificial calendar restrictions to permit routine late and early entry of sugar under quota;
- b. Eliminating the requirement for the October 1st TRQ to be set at minimum; or
- c. Directing USDA to work with USTR to regularize the reallocation of import quota shares among countries, recognizing that many countries with U.S. quotas no longer even produce sugar

Is it the position of the American Sugar Alliance that these measures would jeopardize the American sugar industry?

Answer. Thank you for your questions, Congresswoman Kuster.

First, we would not characterize the current market as “tight,” the current projection of stocks-to-use for the 2021/22 crop year is 13.6 percent, which is due to the requirements built into the Antidumping and Countervailing Duty Suspension Agreements with Mexico that were necessary to prevent illegal dumping of sugar on America’s sugar market. And while we all have seen first-hand the impacts of rising inflation on our farms, companies, and households, it should be pointed out that the cost of sugar has barely risen over the past year.

Second, we would oppose those three measures for several reasons: they would reintroduce uncertainty in program management; possibly depress market prices, making it harder for our industry to invest in maintaining a just-in-time delivery supply chain; and potentially threaten the ability of some farmers to remain in business.

For background purposes, recall that all outside investors have exited the sugar industry. Beet farmers mortgaged their farms to buy sugar companies to avoid further closures. Half of the revenue from sugar sales go to investing in and maintaining a resilient supply chain for sugar, such as building processing and storage facilities to hold inventory for our customers. The farmer gets whatever is left to invest in his or her farm operation and to purchase inputs for the next season. Given the inflated cost of inputs in 2021 and 2022, increasing interest rates, and flat sugar prices, some of our growers are struggling to cover their costs.

In conclusion, the current sugar program provides safe, reliable, and sustainably produced sugar to corporate customers as well as to the American consumer directly in the grocery store. Consumers prefer American-made sugar and the price on the store shelf has remained relatively constant in nominal terms over the past 10 years at about 70¢ per pound (and is actually falling in real terms). And USDA has been administering the sugar program, as directed by Congress, at zero-cost to taxpayers for 17 of the past 18 years and is expected to do so for the next 10 years, according to USDA. The one exception is when Mexico was found to have illegally dumped sugar onto the U.S. market at below Mexico’s cost of production.

Given the global supply chain uncertainties we have and are experiencing as a result of [COVID], international conflicts, shipping disruptions and climate change, Congress should be looking to strengthen the safety net for our American farmers, not weaken it.

Question 2. Dr. Johansson, the American Sugar Alliance states that it supports removing sugar subsidies entirely (or “zeroing them out”) only once every single country with sugar subsidies does the same. We all know that’s unlikely to happen any time soon. In the meantime, are there any changes your organization could support to make Federal sugar policy more transparent, fair and equitable for all stake-

holders involved? Can you point to any area where you think they may be room for good-faith compromise?

Answer. Thank you for your question, Congresswoman Kuster.

I would argue that Federal sugar policy is as transparent and, in many cases, more transparent than it is for other commodities in the farm bill. And I would also argue that it is fair and equitable for all stakeholders involved. Indeed, many in our industry who are struggling to afford current crop inputs or even find them at a reasonable cost, or the many farmers and factory workers who used to produce sugar in Hawaii, would argue that current policy is not fair and equitable for sugarcane and sugarbeet family farmers.

Your question about compromises related to the Zero-for-Zero concept for global sugar subsidies and distortionary practices indicates skepticism that other countries will ever stop utilizing self-sufficiency schemes that rely on government treasuries to subsidize production and dump excess production onto the world market. I believe that other countries are less likely to stop over-subsidization and dumping behavior if the United States first unilaterally removes protections.

We tried to partially dismantle U.S. sugar policy earlier and it was a disastrous failure and cost our farmers billions of dollars. Under the original NAFTA, Mexico methodically increased subsidies to boost its production acres to take advantage of growing access to the U.S. market. In 2013 Mexico had a bumper crop and illegally dumped that surplus sugar on the U.S. market at prices below its cost of production, a clear violation of U.S. trade laws. As a result, prices in the U.S. crashed and producers forfeited sugar because they were unable to repay their loans with interest, despite being among the most efficient and sustainable sugar producers in the world. The lost revenue devastated our farmers and was key in driving Hawaiian production out of business only to benefit Mexico. That illegal trade practice was resolved through the Antidumping and Countervailing Duty process administered by the Department of Commerce. However, the example remains as a stark reminder of what happens when we allow surplus, dump market sugar to flood the U.S. market at predatory, anti-competitive prices.

As another example, I would point to the recent finding by the WTO that the Government of India has been over-subsidizing its sugar sector and then subsidizing the export of its surplus sugar. Of course, the Government of India claims that the WTO findings were erroneous and unacceptable. It is clear from this example that governments around the world will continue to utilize subsidies or other supports to benefit their sugar sectors, furthering sugar being the most volatile and distorted commodity market in the world. U.S. sugar farmers are among the most efficient and sustainable sugar producers in the world and can compete on a level playing field, but not against billions in subsidies and other hidden supports supplied by foreign governments.

Therefore, to complement the bipartisan Zero-for-Zero approach to eliminating sugar subsidies globally, the American Sugar Alliance recently released a policy statement outlining four recommendations to improve the effectiveness of the WTO. WTO reforms will make dismantling unfair trade practices and subsidies an attainable goal, laying the foundation for a less distorted and more predictable global market. We would also encourage other countries to improve their labor and environmental practices so that their sugar sectors can meet similar standards as those in the United States, Australia, and the European Union.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. On behalf of America's sugarcane and sugarbeet family farmers, I would like to thank Ranking Member Thompson for highlighting the importance of the safety net for farmers in general and how critical that safety net is for maintaining domestic food production and supporting national security. The main safety net for sugar producers is the Title I sugar program.

A key component of the sugar program is access to sugar loans. The Department of Agriculture provides processors of domestically grown sugarcane and domestic processors of sugarbeets interim financing through access to loans to at statutory loan-rate levels. The seasonal nature of sugarbeet and sugarcane crops requires sugar producers to store massive amounts of sugar until the market demands it. As our farmers produce and harvest their cane and beet, and as our processors and refineries use that feedstock to produce sugar for sale, those sugar loans are necessary to ensure farm and factory operations can continue even though the sugar is marketed throughout the year. This allows sugar to be stored after harvest when mar-

ket prices are typically low and sold later for just-in-time delivery to food manufacturers and retail consumers, when market prices are generally more favorable.

Loans are taken for a maximum term of 9 months and must be liquidated along with interest charges by the end of the fiscal year in which the loan was made. Unlike most other commodity programs, the sugar program makes loans to processors and not directly to producers. The reason is that sugarcane and sugarbeets, being bulky and very perishable, must be processed into sugar before they can be traded and stored.²

The loans are non-recourse, meaning that when a loan matures, USDA must accept sugar pledged as collateral as payment in full including interest, in lieu of a cash repayment of the loan, at the discretion of the processor. However, that has only happened in 1 year over the past 18 years, and because loans are repaid with interest, the sugar program cost to taxpayers was zero dollars for the other 17 years.

The one year we did see costs was when Mexico illegally dumped surplus sugar on the U.S. market at below its cost of production causing an artificially depressed price and forfeiture of sugar to the government. That cost our farmers billions of dollars in revenue and contributed to the loss of our Hawaiian sugar farmers, mills, and refineries. The subsidy/dumping problem was resolved in 2017 when the industry brought and won trade cases.

While vitally important to our industry, the loan rates for raw cane sugar and refined beet sugar have not kept up with inflation. As we see costs of production rising for all categories of inputs according to the USDA, the level of protection provided by those loans has declined in real terms.

Over that same time period, we have seen American sugar farmers increase production in the United States by 16 percent while land used for sugar production has fallen by 11 percent. Improvements in seed genetics, field machinery, and efficiencies in sugar processing facilities and refineries have all contributed to those improvements, which have helped our family farmers meet some of the strictest environmental and labor standards in the world. We know that many countries not only overly subsidize their sugar sectors, but they also do not adhere to the same standards that our producers do here in the United States.

Response from Nicole Berg, Vice President, National Association of Wheat Growers

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. Thank you, Congressman Rush, for allowing the National Association of Wheat Growers (NAWG) to continue this dialogue. NAWG's mission is to unite wheat farmers to promote policy efforts that create an environment that is conducive to the success of wheat farming in the United States. Our grower-led organization works to achieve that through advancing wheat through advocacy, alliances, and innovation. Since assuming the role of NAWG President on March 10, 2022, NAWG passed a resolution where we will be engaged and work collaboratively with organizations that seek to guarantee all farmers and ranchers are treated fairly and equally in farm programs and by Federal agencies regardless of race, color, gender, sexual orientation, age, national origin or ancestry, physical or mental disability, or veteran status. It is incumbent upon legislators and the executive branch to advance and implement public policies are accessible to all farmers. As we look towards re-authorizing the farm bill in 2023, I have begun outreach to other trade associations across the industry, including organizations that work to encourage the participation of historically disadvantaged farmers. It is important we as an industry work hand in hand to eliminate racial injustice and discrimination in our institutions. We also look forward to working with Congressman Rush and other Members of the House Agriculture Committee to ensure more transparency and equality in farm programs and the Federal agencies that implement them.

NAWG applauds the USDA and the work of this Committee for their work in establishing the Equity Commission and Subcommittee on Agriculture and appre-

² See <https://www.ers.usda.gov/topics/crops/sugar-sweeteners/policy/>.

ciates the work USDA is conducting through thorough reviews of their policies and programs. We look forward to working with the partners in this Commission to advance the equity of all our farmers.

Further, NAWG advocates for farm programs that will help all wheat farmers. U.S. wheat farmers produce the best, highest quality wheat in the entire world, and our minority farmers play a massive role in accomplishing that. We feel that tightening the farm safety net to allow fewer farms to fall through is the best way to ensure that our minority farmers are able to pass their farms into posterity. Policies that allow farms to be passed onto next generations of farmers affordably, allow our farmers to remain in business through down economic years and natural disasters, and help mitigate risk in one of the riskiest businesses in the economy, will help keep minority farmers on their land. We are committed to ensuring these programs are equitably implemented and leave no farmer behind and look forward to working with Members of this Committee to make that happen.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. Thank you, Ranking Member Thompson, for allowing the National Association of Wheat Growers (NAWG) the opportunity to discuss this vitally important topic. The farming safety net is vital in not only keeping farmers employed on their farms that have often times been in the family for multiple generations, but in ensuring that the United States has the most secure, safe, and affordable food supply. Never before have humans been able to produce this much food, using these few resources, on this little land. The safety net allows our farmers to engage their entrepreneurial spirit, take risks, try different practices, and ultimately create the best, most innovative food. This safe, secure, and affordable food supply comes with a significant amount of risk and cost. Input costs have risen dramatically since the start of COVID-19, while world events and drought over the last twelve months have created unprecedented market volatility. Without the safety net provided by the farm bill, many farmers would have been forced to exit the industry, putting the food supply at risk.

Russia and China are currently the two largest single country wheat producers in the world, according to the most recent *World Agricultural Supply and Demand Estimates* (WASDE) report from the USDA. These countries are not beholden to the same conservation or climate standards as U.S. farmers are, nor do they produce the high-quality wheat that U.S. farmers do. As this Committee discusses conservation and climate programs, it is important to understand that hindering the U.S. wheat farmer's ability to produce their products, which have long been grown under climate-smart practices that leave the ground in better condition to ensure their posterity are able to continue to produce, will allow our competitors to capitalize on our decreases in production. This will only hurt the environment and climate.

Response from Chris Edgington, President, National Corn Growers Association

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. Thank you for the question and opportunity to continue the conversation on this important topic. The National Corn Growers Association (NCGA) has adopted the mission to “sustainably feed and fuel a growing world” with the vision “to create and increase opportunities for corn growers.”

NCGA understands and recognizes that minority producers, including farmers of color, have faced discrimination, injustices, and barriers that other corn growers have not and do not encounter. Unfortunately, we understand these challenges continue today throughout agriculture and within the U.S. Department of Agriculture (USDA) programs and policies.

We are supportive of USDA's establishment of the Equity Commission and Subcommittee on Agriculture and recognize that the Commission was first authorized and funded by Congress. We appreciate the leadership of Dr. Jewel Bronaugh, Dep-

uty Secretary of Agriculture, and the external stakeholders who are conducting a thorough review of USDA policies and programs.

We look forward to the results and recommendations from this diverse group of agriculture leaders on how USDA and the programs the Department administers can advance equity and remove barriers to underserved communities.

As a grassroots membership organization, NCGA is committed to cultivating a diverse membership, workforce, and a culture of inclusivity and belonging. NCGA and our affiliated state associations and check-off organizations work together to help protect and advance corn growers' interests. Membership is to open all individuals without regard to race, color, religion, sex, national origin, age, disability, veteran status, marital status, sexual orientation, or gender identity.

Our focus is on creating competitive market demand, promoting increased sustainable production, and strengthening customer and consumer trust. These efforts are intended to advance the profitability and prosperity of all corn growers across the country. However, we acknowledge that we have a responsibility and a role to play in eliminating racial injustice in our industry. We look forward to working with the Committee and Congress so that agriculture programs better represent and address the needs of all farmers and communities.

Question Submitted by Hon. Cheri Bustos, a Representative in Congress from Illinois

Question. Mr. Doyle and Mr. Edgington—In both of your testimonies, you mention the importance of base acres for growers who would like to participate in commodity programs. I have personally heard stories of farmers who have purchased land that was not previously enrolled in USDA programs. Thus, they were not permitted to enroll that new land in Title I commodity programs. What suggestions do you have on how we can look to potentially expand base acres in situations like these in a responsible and efficient manner?

Answer. Ahead of the 2018 Farm Bill, delegates for the National Corn Growers Association (NCGA) adopted broad policy that supports the update of base acres and yields for commodity programs when applicable. While NCGA does not currently have national policy that provides specific recommendations for changes to base acres, we also hear from growers who are in similar circumstances without access to the commodity Agriculture Risk Coverage (ARC) and Price Loss Coverage (PLC) programs due to a lack of base acres.

NCGA grower led action teams and state associations, are continuing to study the issue, explore potential changes, and evaluate the pros and cons of changes, as part of our policy development process. Policy options under review and consideration range from a voluntary base acre update, base acre reallocation, to a mandatory base acre update. Each policy would have highly individualized impacts on producers at a farm-to-farm level as well as national budgetary scoring and baseline implications for program crops. We look forward to working with the Committee as NCGA develops more formal policy priorities ahead of the next farm bill.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. The National Corn Growers Association (NCGA) and our members are very mindful of the need to balance a dependable domestic food and energy supply, long-term farmer profitability, and environmental stewardship. We appreciate the Committee's consideration of our views regarding USDA commodity programs and the need for producers to have access to effective risk management tools, including Federal crop insurance.

The producer safety net programs, authorized and updated through farm bills, help growers proactively manage their risks and respond to multiple challenges impacting farmers and the agriculture industry. NCGA continues to focus on accessible and defensible tools geared towards revenue, which factors in both yield and price risks that growers may face throughout the growing and market seasons.

NCGA formed a Corn Sustainability Advisory Group in 2019 to proactively drive the U.S. corn sustainability story and ensure continued demand for the crop. In June 2021, NCGA solidified corn farmers' commitment to environmental, economic, and social sustainability with the release of U.S. Corn Sustainability Goals and the first *U.S. Corn Sustainability Report*. The report documents a long history of continuous improvement by U.S. corn farmers and the goals set targets for further progress over the next decade.

The United States is the largest producer of corn globally, followed by China, Brazil, Argentina, and Ukraine. In terms of exporting markets, the U.S. remains

competitive with other corn exporting countries and will continue innovate and implement technology and practices that make U.S. corn production efficient and environmentally and economically sustainable.

Response from Jaelyn D. Ford, Delegate, National Cotton Council

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. Thank you for this question and for the opportunity to provide some input on this important issue. The National Cotton Council (NCC) recognizes that minority producers have and continue to face discrimination and barriers in agriculture and in working with USDA to access programs.

Membership in the National Cotton Council is open to all U.S. cotton producers and individuals operating across the other six segments of industry we represent. We are a grassroots membership organization, with a diverse workforce, and a culture of inclusivity. NCC and our state producer interest organizations along with other national industry interest organizations work together for the benefit of all the individuals in the U.S. cotton industry without regard to race, color, religion, sex, national origin, age, disability, veteran status, marital status, sexual orientation, or gender identity.

More recently, NCC has been communicating with the National Black Growers Council and has participated in a number of their regional field days and their most recent annual meeting last fall. As part of the industry's commitment to sustainability, through the U.S. Cotton Trust Protocol, we are planning and conducting specific outreach to the minority producer community to assist them in enrollment to the Protocol, which is intended to help cotton producers better market and promote their cotton to our customers and consumers.

We plan to continue our outreach and engagement with the National Black Growers Council as their membership includes a number of cotton producers, some of whom are also members of NCC. And we have been exploring what other projects and activities with our agribusiness partners we can initiate and undertake to do more outreach and engagement with the underserved community. In addition, we look forward to working with the Committee going forward to help ensure that agriculture programs and policies are available and effective for all farmers.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. For cotton, the farm bill safety net that includes strong price protection in Title I along with crop insurance, and the marketing loan program are the key components critical to our industry, the financial viability of our producers, and the basis for marketing the U.S. cotton crop. U.S. cotton must compete in a highly competitive global market with a majority of U.S. cotton exported to textile producing countries. The U.S. is the third largest producer of cotton behind India and China, and the U.S. is the largest exporter of cotton, followed by Brazil.

In terms of conservation practices adopted by cotton producers and actions to address climate change, the U.S. cotton producer is leading the world in terms of a shrinking environmental footprint. This success is being highlighted and validated by the industry's sustainability platform, the U.S. Cotton Trust Protocol. While other countries such as Brazil are trying to position their producers and cotton production as meeting strong sustainability standards and metrics, their progress does not match the position of the U.S. where our growers are continuing to implement practices to make continued improvements in water efficiency, soil health, energy efficiency, and greenhouse gas emissions.

Response from Verity Ulibarri, Member, Farm Bill Advisory Committee, National Sorghum Producers

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. Representative Rush, I thank you for this important question. I would like to note that during the hearing, because I was participating remotely, I was unable to clearly hear the question as it was asked at the time, but I am happy to provide a response to you now understanding its full context.

As a female farmer and rancher of Hispanic descent, I have seen behavior that is at the root of your concern. However, I can also say I have not allowed it to diminish my hopes, and I also would say it has not, in fact, diminished my prospects for success. I believe through hard work, honest dealings and “sticktoitvity”, there are no cultural constraints that cannot be overcome. This is among the great blessings of living and working in the United States of America. With that said, agriculture is a tough business with no guarantee of success.

While I believe there are a number of programs and policies that exist to help address some of the systemic issues expressed, and I personally know historically underserved individuals who have benefitted from those programs, I also believe examination of how we can continue to improve and create a more inclusive industry that supports all people who want to be a part of modern agriculture is necessary.

National Sorghum Producers has worked hard to ensure our leadership represents all sorghum farmers. We support our sister organization with the Leadership Sorghum program, established almost 10 years ago, and it has served as a tool to identify and recruit leaders who represent diverse ethnicities, races, genders, ages, growing regions and practices.

We are also proud of the level of diversity represented in STEM careers in the sorghum industry. We invest in students as up-and-coming researchers, farmers and young professionals through efforts conducted by National Sorghum Producers and the Sorghum Foundation, and we remain engaged with these research professionals at private and public entities as they are critical contributors to the success of sorghum farmers and the agriculture industry.

On behalf of the National Sorghum Producers, I thank you for your passion and leadership, and we look forward to working with Congress further to examine and update future policies that ensure working in agriculture is a meaningful and fulfilling way to live, for all people who want to be a part of it.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. As we look at the situation in Ukraine and Russia right now, I think we are all reminded of the importance of a strong domestic safety net and maintaining our U.S. food supply. This is a key priority for my farm and for National Sorghum Producers as we evaluate the farm bill and components under Title I, in addition to crop insurance. It’s imperative we safeguard both these program titles for our national security and the economic viability of U.S. farmers and ranchers.

The U.S. leads the world in sorghum production and exports. From an export standpoint, Brazil is the fastest growing competitor, but as we look at acres in our country side-by-side to those in Brazil, U.S. sorghum farmers employ conservation tillage methods on 74 percent of all sorghum acres, whereas Brazil is destroying one of the world’s largest carbon sinks. Nigeria, Ethiopia, Sudan, and Mexico follow the U.S. in total acres, but production and efficiency to that of the U.S. sorghum farmer is unmatched. Sorghum’s natural characteristics help it protect and build soil health by retaining moisture and nutrients. It’s a water-smart, climate resilient crop, and it conserves our precious natural resources, adapting to both heat and drought, making it a reliable and responsible option for U.S. farmers and consumers alike.

Response from Clark Coleman; on Behalf of National Sunflower Association, National Barley Growers Association, U.S. Canola Association, and USA Dry Pea and Lentil Council

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. I do not have the answer to combating historic discrimination faced by black and brown farmers. This is an issue that goes beyond any specific crop or organization. There are significant barriers to entry for farming and those are certainly greater for minorities. The organizations that represent the crops that I grow need more participation and resources and do not have the luxury of excluding anyone.

Discrimination and prejudice absolutely should not be tolerated in any government program, any organization, or any individual. USDA employees at all levels, from the county offices to the top leadership, must ensure that programs are inclusive, accessible to all, and administered equally for all. USDA recently launched its equity action plan that seeks to increase access to Federal programs and improve relationships with minority groups and Tribal nations. I look forward to the recommendations expected later this year and next year and welcome suggestions for ways that I and the organizations that represent me can be proactive in promoting and supporting greater diversity and inclusiveness in agriculture.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. The experiences of the past few years certainly demonstrate the importance of the farm safety net and maintaining domestic food production. The COVID pandemic and supply chain disruptions, and now the war in Ukraine, reinforce how vital domestic food production is to our national and economic security. I would add that part of maintaining domestic food production is ensuring that we have reliable sources of fuel, fertilizer, chemicals and inputs necessary to produce our food.

On top of the pandemic and supply chain disruptions, in 2021 much of the country experienced significant natural disasters, including hurricanes in the Southeast, wildfires in the West and historic drought in the northern tier and Northwest. Without the safety net provided by Title I farm programs and crop insurance, many farms would simply not be able to survive. Conservation programs also play an important role as we must conserve our natural resources and ensure healthy soils and clean water in order to maintain abundant domestic food production.

For sunflowers, the major global producers are Ukraine and Russia. The Russian invasion and war in Ukraine has significantly impacted supply and prices. Sunflower production in the U.S. has been declining for the past 2 decades and the private-sector breeding research and investment has migrated to Europe and South America where sunflower production is increasing. Only one private company develops and tests a full product line in North America. The hybrid choices available to farmers this year and into the future will be hybrids adapted to other continents. Even prior to the war in Ukraine the National Sunflower Association was developing a request to establish a domestic research initiative with the USDA Agricultural Research Service (ARS) in the 2023 Farm Bill. We urge your consideration and support for this proposal.

For the other crops I grow, the global leaders in barley production include Australia, France, Ukraine, and Russia. Canola and rapeseed are produced largely in Canada, Europe, Russia, and Ukraine. While I do not know how each of those countries stack up from a climate and conservation standpoint, I believe U.S. farmers must continue to strive for improved efficiencies that will enable us to produce more on the same amount of land and with greater fuel and fertilizer efficiency. This will be necessary to feed the growing global population as well as conserving natural resources and mitigating environmental impacts.

Thank you again for the opportunity to participate in this hearing.

CLARK COLEMAN.

Response from Jennifer James, Member, Board of Directors, USA Rice

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

Answer. We appreciate and recognize the importance of this topic and thank you for the question. USA Rice supports diversity and inclusion in our industry.

The organization staff have all participated in diversity and inclusion training.

As a partner with the U.S. Department of Agriculture on a number of programs, USA Rice adheres to and takes seriously its equal opportunity and non-discriminatory statement: "USA Rice is an equal opportunity provider and employer. USA Rice does not discriminate based on race, color, national origin, religion, sex, gender identity, sexual orientation, disability, age, marital/family status or political beliefs."

USA Rice did not oppose U.S. Department of Agriculture loan relief and flexibilities for historically underserved producers.

USA Rice supports the efforts of the U.S. Department of Agriculture's Equity Commission, which was authorized and funded by Congress, and looks forward to the recommendations offered to break down the barriers experienced by minority farmers, including farmers of color.

We recognize that discrimination has occurred with various programs offered by the U.S. Department of Agriculture, and it is our hope that the commission provides insights and actionable items to ensure that discrimination does not occur.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

Answer. Thank you for this very important question.

The U.S. rice industry contributes more than \$34 billion to the U.S. economy annually and provides jobs for more than 125,000 individuals. There are over 5,500 rice farmers that grow rice across an average 2.8 million acres, and the industry produces 20 billion pounds of rice annually. Half of the rice produced in the U.S. is exported overseas to more than 120 countries. Approximately 80 percent of rice consumed in the U.S. is produced and processed domestically.

The Price Loss Coverage (PLC) program has been a simple and predictable safety net for rice farmers, and it functions as intended by providing assistance during times of declined prices that are beyond the control of a farmer.

PLC has supported rice producers in low price environments in the past, but the program has recently only provided some assistance to U.S. rice farmers as we compete with heavily subsidized and protected foreign producers of rice, such as China, India, and Thailand. These bad trade actors continue to distort markets around the world, dumping rice which results in many disadvantages for U.S. rice farmers. Unfortunately, the support from PLC has not kept pace with the level of support that foreign rice producers enjoy, and it isn't equipped to respond to a rapid increase in input costs or rising inflation.

PLC reference prices were developed using cost of production data from 2012. Rice farmers are facing input costs that are much higher than they were in 2012. The current PLC price for 2021 is projected to be around \$14/cwt, which is the current reference price. This means rice producers are at break-even prices according to 2012 cost of production.

Rice farmers are facing both stagnant commodity prices and disproportionately higher input costs. This combination is creating a severe financial squeeze that threatens the continued viability of U.S. rice farms. Rice prices have not kept pace with other major crops whose prices are much higher than they were in 2020. Similarly, the rise in input costs hit rice farmers disproportionately harder than other commodities.

A February 2022 study from Texas A&M University's Agricultural and Food Policy Center (AFPC) indicates rice farmers will realize more than \$500 million in losses this year. As a result, rice producers are in a worst-case scenario when looking at likely no support from PLC and the current cost of production.

China, India, and others are blatantly ignoring their World Trade Organization commitments and admit to highly subsidizing their producers while dumping rice on the global market. This further undercuts U.S. producers and threatens the viability of our industry.

India, the world's largest rice exporter, controls nearly ½ of the global rice trade. In 2020 and 2021, rice was the only staple food to not see significant world price increases because of India's record production and dumping of stocks on the world market. In 2021, India made up 40 percent of world rice trade. In 2010, India made up eight percent.

Additionally, Thailand and Vietnam, the second and third largest exporters, are also in excess of their commitments. According to the U.S. International Trade Commission, rice is the most protected and subsidized commodity traded globally. Last month, India announced it would subsidize fertilizer for its producers of rice, wheat, and sugar in excess of \$20 billion. This is in addition to agricultural subsidies already in place in India where rice producers' production costs are subsidized at upwards of 80 percent.

Without improvements to the PLC program in the next farm bill and needed action against India and others by our government at the WTO, rice farmers stand to lose. Current forecast production is an indicator. U.S. rice acres will decline to the lowest levels since 2017 according to USDA's March 2022 *Prospective Plantings Report*, however, as an industry, we feel this forecast was a high estimate and our acreage will be lower. As a result, production will be lower. Even though the 2021 crop was small and 2022 is forecast down again, prices have remained steady. Fundamentally, our market isn't reacting as it should be due to the actions of these bad trade actors.

U.S. rice farmers have been smart about the climate for decades and blazed a trail in conservation and sustainability initiatives. USA Rice is an effective collaborator when it comes to sustainability efforts given our history with the Rice Stewardship Partnership, a long-term partnership with Ducks Unlimited and the Natural Resources Conservation Service, established in 2013.

USA Rice strongly supports voluntary, incentive-based and cost share conservation programs, such as EQIP, CSP, and RCPP. Working lands programs not only address resource concerns, but they also increase productivity and sustainability by making cropland more diverse and efficient.

All segments of the U.S. rice industry are invested in sustainable production and milling practices because it is personal—rice farmers often live on the land they work, and rice mills are important economic drivers in their communities. Together they provide tens of thousands of jobs and inject billions of dollars into the economy—all while standing on a strong record of environmental stewardship.

Every day the U.S. rice industry strives to meet the demands of growing populations while increasing resource efficiencies at every level of the supply chain. The rice community is invested in using sustainable production and processing practices because it is personal. We provide for our families, serve our communities, protect wildlife habitats, and create jobs. Our stewardship is deliberate, ensuring a healthy, safe food supply, while improving the environment, and contributing to the local economy.

The climate advancements and environmental stewardship by rice farmers here in the United States is second to none. The U.S. rice industry has decreased greenhouse gas emissions by 41 percent since 1980, while also decreasing energy and water use and soil loss, and increasing land use efficiency.

Response from Meredith McNair Rogers; on Behalf of U.S. Peanut Federation*

Question Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question. During the hearing, I asked what I thought was a straightforward question: *what policies would our expert panel made up of commodity group witnesses recommend to rectify both the historic and current discrimination too often faced by farmers of color?* And yet, I was faced by defending silence.

So I would like to ask again for the record, *for all witnesses*, what specific policies would you recommend to combat the historic and current discrimination too often faced by Black and Brown farmers in your respective industries?

*There was no response from the witness by the time this hearing was published.

Question Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question. Can you talk about the importance of the safety net and maintaining domestic food production, and for your commodity, what other countries are major producers, and how do they stack up from a conservation and a climate standpoint?

A 2022 REVIEW OF THE FARM BILL
(RURAL DEVELOPMENT)

TUESDAY, MARCH 8, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMODITY EXCHANGES, ENERGY, AND
CREDIT,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Antonio Delgado [Chairman of the Subcommittee] presiding.

Members present: Representatives Delgado, Plaskett, Axne, Craig, Kuster, Spanberger, Pingree, Schrier, Fischbach, Austin Scott of Georgia, LaMalfa, Balderson, Cloud, Feenstra, Cammack, Thompson (*ex officio*), and Mann.

Staff present: Lyron Blum-Evitts, Emily German, Chu-Yuan Hwang, Paul Balzano, Caleb Crosswhite, Patricia Straughn, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. ANGIE CRAIG, A
REPRESENTATIVE IN CONGRESS FROM MINNESOTA**

Ms. CRAIG [presiding.] This hearing of the Subcommittee on Commodity Exchanges, Energy, and Credit entitled, *A 2022 Review of the Farm Bill: Rural Development*, will come to order.

Welcome, and thank you for joining today's hearing. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today. After brief opening remarks, Members will receive testimony from our witness today, and then the hearing will be open to questions.

Today's hearing with USDA's Under Secretary for Rural Development, Xochitl Torres Small, is an important opportunity for Members of this Subcommittee to evaluate the effectiveness of Rural Development programs and the implementation of the 2018 Farm Bill.

First of all, I would like to welcome Under Secretary Torres Small back to the Agriculture Committee. I think I speak for all of my colleagues when I say your presence on this Committee is missed, but we are grateful for your continued public service in your new role.

One of my goals for today's hearing is to highlight the strength of rural communities across America, and to dig deeper in rural communities like those in Minnesota's 2nd Congressional District,

so that we can take advantage of opportunities that Congress has provided in the 2018 Farm Bill, and subsequent legislation.

One aspect of today's discussion and an integral part of the work of the Rural Development team at USDA is that Americans should be able to choose where they want to live without having to make concessions on access to fast and reliable broadband internet, clean water, and affordable healthcare. Additionally, we must work to ensure that those diverse communities have the tools to thrive in a 21st century economy.

Part of achieving that goal is to strengthen the reliance of local supply chains so that they can better support the distribution of commodities in a diverse economy where residents have access to tools that will support their learning and success. Another part of that goal is continuing to invest in renewable energy found across rural America.

Ultimately, rural America knows best how to invest in their communities.

In this Subcommittee, over the past year we have heard from rural stakeholders and residents about the problems they encounter and the resources they need most. Under Secretary Torres Small, thank you for accepting our invitation to speak before us today as we conduct important oversight work in preparation for the 2023 Farm Bill. I value that experience and insight you bring, and I look forward to hearing your testimony.

[The prepared statement of Mr. Delgado follows:]

PREPARED STATEMENT OF HON. ANTONIO DELGADO, A REPRESENTATIVE IN CONGRESS
FROM NEW YORK

Today's hearing with USDA's Under Secretary for Rural Development, Xochitl Torres Small, is an important opportunity for Members of this Subcommittee to evaluate the effectiveness of Rural Development programs and the implementation of the 2018 Farm Bill.

First of all, I'd like to welcome Under Secretary Torres Small back to the Agriculture Committee. I think I speak for all of my colleagues when I say your presence on the Committee is missed, but we are grateful for your continued public service in your new role.

My district is the eighth most rural district in the country and my constituents know first-hand just how much resilience and ingenuity there is in rural communities. One of my goals for today's hearing is to bring some of those strengths to light and dig deeper on how rural communities like the ones I and many others on this Committee represent.

One aspect of today's discussion, and an integral part of the work of the Rural Development team at USDA, is that Americans should be able to choose where they want to live without having to make concessions on access to clean water, affordable health care, or fast and affordable broadband internet.

Additionally, it is important that our rural communities have the tools to thrive in a 21st century economy. We must work together to help strengthen local supply chains and ensure efficient distribution of commodities.

Ultimately, rural America knows best how to invest in their communities. In this Subcommittee over the past year, we have heard from rural stakeholders and residents about the problems they face and the resources they need most.

Under Secretary Torres Small, thank you for accepting our invitation to speak before us today as we conduct important oversight work in preparation for the 2023 Farm Bill. I value the experience and insight you bring, and I look forward to hearing your testimony.

I would now like to welcome the distinguished Ranking Member from Minnesota, Ms. Fischbach, for any opening remarks she would like to give.

Ms. CRAIG. I now would now like to welcome the distinguished Ranking Member, the gentlewoman from Minnesota, Mrs. Fischbach, for any opening remarks that she would like to give.

**OPENING STATEMENT OF HON. MICHELLE FISCHBACH, A
REPRESENTATIVE IN CONGRESS FROM MINNESOTA**

Mrs. FISCHBACH. Thank you, Madam Chair. I appreciate the opportunity, and thank you, Under Secretary, for being here today. We appreciate it, and I would like just to begin by remembering Jim Hagedorn. Jim was passionate about his work on the Agriculture Committee and serving the people of southern Minnesota. Our districts are very similar, and so, I was fortunate to work with him on issues critical to our constituents, like promoting ethanol, expanding broadband access, improving livestock supply chains.

I also want to thank the Majority for starting these hearings for the next farm bill. I am very excited to start this process. Each of us want to make this bill as strong as we can to serve our constituents, and as Ranking Member Thompson has said, collaboration at the committee level is necessary to make that happen.

Holding hearings like this one will help us all better understand what worked and what didn't work from the last farm bill, so the reauthorization accurately addresses the needs of our rural communities.

Through the 2018 Farm Bill, this Committee made important improvements to USDA Rural Development programs to meet the health, communications, infrastructure, and economic development needs of rural Minnesota. We provided new and expanded authorities to help address the opioid crisis and the loss of rural health facilities, expand access to clean water and high-speed internet service, rebuild essential community facilities, strengthen rural employers and employees, and promote regional economic development. These pieces are critical components for building what I call strong rural communities.

I am anxious to hear about the Department's work implementing these programs and what additional resources or authorities are needed to enhance the Rural Development toolkit. I am particularly interested in hearing how deployment of rural broadband is going, and the role the USDA plays.

Last summer, we worked together to craft a bipartisan broadband bill, blending ideas from Ranking Member Thompson's Broadband for Rural America Act (H.R. 3369) with proposals from Chairman Scott and Chairman Delgado to develop the Broadband Internet Connections for Rural America Act (H.R. 4374). This legislation passed our Committee unanimously in a clear display of just how important robust broadband connectivity is to our Committee and the Americans we represent. This Committee believes that USDA should have the outsized role in the development of broadband infrastructure in rural Minnesota—excuse me. That was a Freudian slip, I think—in rural America. I hope to hear more from the Under Secretary about how we can strengthen USDA's role in this important mission area.

And again, thank you so much for being here. I really appreciate it, and I am looking forward to the hearing.

Thank you.

Ms. CRAIG. Thank you so much.

I would now like to recognize Ranking Member Thompson for any opening comments he would like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Madam Chair, thank you very much. Thank you to you and the Ranking Member for this hearing.

Let me first echo Mrs. Fischbach's statements, one regarding Jim Hagedorn, and some of us will be attending the funeral, a celebration of his life later today. His presence certainly is going to be missed in these halls and on this Committee.

I would also echo the Ranking Member's statements and thank the chair for calling this hearing on the rural development title of the farm bill. I am honored to welcome Under Secretary Torres Small back to the Committee, I am thrilled to see her. What a blessing to see an Agriculture Committee alumni in the Rural Development Office, someone who truly understands rural America and the challenges our constituents face. It is great to see you back in the Committee room, Under Secretary.

I recently read a very staggering statistic that I would like to share with you all. According to the Federal Communication Commission's 2021 broadband report, more than 500,000 Pennsylvanians are without access to broadband connectivity. In fact, Pennsylvanians living in rural areas are 11 percent less likely than their urban and suburban counterparts to have internet service at home.

Now, this very statement is proof for the ongoing digital divide. In the 2018 Farm Bill, we as a Committee enacted provisions tackling rural and regional broadband development and deployment issues across the nation, while prioritizing resources to the most remote and least connected residents who are also often the most expensive to connect. Now we must continue to look for ways to bring rural America into the 21st century, and I know this is an issue that you are passionate about, Under Secretary.

Agriculture Committee Republicans are ready and eager to work with you on improvements to the Rural Development mission area, but we cannot do that without willing partnership and proactive engagement from you and the rest of the Department of Agriculture. Our partnership falters when the Department acts unilaterally and ignores the concerns of Members of this Committee, or fails just to engage the Committee in the development of the work that they are doing, and only seeks our counsel or input when new authority or funding is needed. Now, we share the responsibility for governing and addressing the needs of rural America, and we can only meet that obligation if we work together.

Historically, I am very proud of the fact that the House Agriculture Committee is one of the most—I would say the most—bipartisan committees in Congress. Our dais is reigned with an impressive dedicated group of Members who are committed to rural America, just like everyone at USDA is. I hold out hope that we can develop a fruitful, consistent partnership with USDA that best serves our rural communities. You might be surprised about what we can accomplish when we work together.

I thank you for doing this, and I look forward to today's oversight conversation.

Thank you, Madam Chair, and I yield back.

Ms. CRAIG. Thank you so much, Ranking Member.

The chair would request that other Members submit their opening statements for the record so our witness may begin her testimony, and to ensure that there is ample time for questions.

I would like to again welcome our witness today, USDA's Under Secretary for Rural Development, Xochitl Torres Small. We will now proceed to hearing your testimony. You will have 5 minutes. The timer should be visible to you and will count down to 0, at which point, your time has expired.

Under Secretary Torres Small, please begin when you are ready.

STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Ms. TORRES SMALL. Thank you, Chair Craig, thank you, Ranking Member Fischbach, thank you Ranking Member Thompson, thank you all Members of the Subcommittee for the chance to come before you today and discuss the state of the United States Department of Agriculture's Rural Development mission area. I also deeply appreciate your comments about Congressman Hagedorn, a former colleague of mine.

Last week, I was in the Black Belt, and I saw firsthand the wastewater crisis that Americans there have been experiencing for decades. When you don't have good wastewater, you may also be drinking dirty water, because of contaminated wells. Rural Development has been working on this for some time, and specifically trying to get folks to sign up for drinking water systems so that we can continue the operations and maintenance necessary to do that work.

So, that means getting people to sign up for these systems, getting them to trust a government that has, all too often, let them down. And so, one Rural Development employee decided to go door-to-door in rural Alabama talking with constituents, trying to get them to sign up for this program. And one woman almost threw him out. She said, "I have been drinking this water from this well my entire life. The government hasn't helped me yet. Why should I think that they will help me now?" He he sat down with her and convinced her to let him test her water, and when the test results came back, the person testing asked if the sample had come from a septic tank because there was that much bacteria in the water. She now has clean water. She signed up for the service and that is a success story. But it also shows how much time it can take with just one person to rebuild that trust.

And so, I want to thank you for the time that you put in to listening to and representing your constituents, to the thoughtful investments that you make in Rural Development so that we can continue to do this work together. I recognize that call to service, and I am deeply grateful to get to work with you.

I am also proud that President Biden and Secretary Vilsack have laid out a clear vision for agriculture and rural America. Building Back Better from COVID-19, expanding options for more and bet-

ter markets for farmers and ranchers, helping us all survive extreme weather, and build resiliency through climate-smart tools, and reaching people in places that have been historically underserved, advancing racial justice, equity, and opportunity. Because rural America has incredible potential, but it cannot be fully realized without reliable infrastructure that looks like broadband, but it also looks like hospitals, schools, community centers, water and wastewater services, housing, sustainable energy, all of which are critical for quality of life, as well as for growth and resiliency.

Your work as Representatives means you are clear-eyed on the challenges that we will face in turning these investments into infrastructure on the ground. I know I am in a rural community when I am in a room full of people who care deeply about their home, but not one of them is a grant writer. Which means that we are going to have to take a hard look at how we deliver our programs equitably. We are going to have to recognize that we haven't always done a good job of giving people a fair chance at success, and it means we are going to be working hard to reduce barriers into the future.

We are the only agency in the Federal Government with a specifically rural mission, and one of the keys to our success is the staff's commitment to that mission. Our team lives and breathes it. That is why when offices are understaffed or decades-old technology systems take extra time that could allow them to instead otherwise be used to reach people in rural places, it can take a toll on them. It can wear down staff morale, reduce quality of customer service, and could erode hard-won relationships with rural partners.

We are going to need to keep those relationships strong to take on the challenges of the future, like supporting innovations in our food system and partnering with farmers and ranchers, investing in energy efficiency, renewable energy systems, and higher blend biofuels infrastructure, and being there to help people across rural America turn their vision for their home and their kids into a reality in the places that they love.

Amidst the tremendous challenges of our time, I see hope and opportunity in rural America. I see businesses eager to build new markets, farmers forging climate-smart solutions, and people who have been left behind open to building new relationships. If we take our cue from them, I am confident we will do our job right.

Thank you, and I look forward to answering your questions today.

[The prepared statement of Ms. Torres Small follows:]

PREPARED STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Mr. Chairman, Ranking Member, and Members of the Committee, thank you for the opportunity to come before you today to discuss the state of the United States Department of Agriculture's Rural Development (RD) mission area. As each of you know well, rural America is exceptional. It contains remarkable economic potential, constant ingenuity, and impressive diversity. The Biden-Harris Administration and the U.S. Department of Agriculture are making once-in-a-generation investments in rural America and specifically rural infrastructure that have the potential to transform communities and lives. However, rural and Tribal areas also face complex challenges that require a different kind of investment—an investment in deep and trusted partnerships. This is where the Federal Government has so much opportunity

before it. From experience, we have seen the tools that can best support rural communities: from flexible programs, technical assistance that make our programs easier to access, and customer-centered technology and staffing. Today I am excited to share both where I am proud of Rural Development's work to be a partner on the ground, and some of the opportunities for improvement where USDA is eager to work with Congress to address. Together, I believe we can—and we must—modernize Rural Development so it can effectively deliver on its mission of building inclusive rural prosperity.

Rural America puts food on our tables, powers the nation, and includes the rich values, traditions, and diversity that make our country what it is today. In 2021 the United States set a new record in agricultural exports and production levels with an 18 percent increase over the previous year.¹ This growth bolsters the economy as a whole and also sustains many rural communities with jobs both on and off the farm. Today, 30% of rural counties have diversified economies and are not reliant on any one industry for a large portion of its employment. This incredible diversity across local rural economies showcases the uniqueness of every rural community. And while many rural communities are thriving, many others are still struggling to keep people in the places they call home. Between 2010 and 2020, urban areas grew by 8.8 percent, while rural populations declined by 0.6 percent. That decline grew by nearly tenfold in areas of persistent poverty, where populations dropped by almost six percent.² Across the country we know that water systems are degrading, housing units are crumbling, and unreliable or nonexistent broadband service severely undercuts the ability to participate in a global economy. These challenges are only exacerbated in areas where there are deep economic, geographic, and racial disparities.

Often rural assets—from food to energy to natural resources—are taken from their place of origin and moved elsewhere to create jobs or opportunities away from the rural communities where they were originally produced. Urban areas may rely on rural ones for raw input and commodities, but rural communities are not seeing enough of these benefits in a meaningful way. Something must change or we risk losing rural life as we know it. The costs of failing rural America are high for all of us. Just a few of the top sectors in rural America—agriculture, energy production, and natural resource extraction—account for more than \$440 billion in exports annually.³ The United States will be less competitive on a global scale if we fail to leverage the economic power of rural America.

Despite the challenges, the solutions are there in the experiences, stories, ideas, and dreams of rural people if you listen carefully. Farmers, rural business, local government officials, schools, hospitals, and community leaders—often time volunteers—find creative solutions to old problems through partnerships, regional expertise, and savvy every day. Amidst the tremendous challenges of our time, I see hope and opportunity in rural America. I see businesses eager to access new markets, farmers seeking climate-smart solutions to extreme weather, and underserved communities with a firm understanding of their assets who are seeking trusted partners to tackle systemic issues. I see the opportunity for Rural Development to work with each rural community to support their vision to make their home a place with good jobs, safe homes, and thriving opportunity for generations to come. If we take our cues from the communities and people who are our customers, I am confident we will do our jobs right.

Creating More and Better Markets

USDA is adapting America's food system with a greater focus on more resilient local and regional food production, building new markets and streams of income for producers and businesses, and supporting the infrastructure that underpins rural communities. The infrastructure investments Congress and the Biden-Harris Administration are providing to rural communities via the American Rescue Plan and the Bipartisan Infrastructure Law as well as annual appropriations measures can be transformational for rural America if complemented by new market opportunities and capacity building efforts to help communities best leverage these programs to forge their own future.

In December, Rural Development launched a program to make more than \$1 billion in loan guarantees available to help businesses in the food supply chain process their products and get them to market. The new Food Supply Chain Guaranteed

¹ <https://www.usda.gov/media/press-releases/2022/02/08/american-agricultural-exports-shattered-records-2021>.

² <https://www.ers.usda.gov/webdocs/publications/102576/eib-230.pdf?v=2961.8>.

³ https://www.usitc.gov/research_and_analysis/tradeshifts/2020/trade_by_industry_sectors.htm.

Loan Program will help meat and poultry processors and other food businesses that are active in the middle of the food supply chain: manufacturing, storage, transportation, and distribution. Rural Development announced new investments to significantly increase the sales and use of higher blends of bioethanol and biodiesel through expansion of the infrastructure for renewable fuels derived from U.S. agricultural products and will complement existing funding with an additional \$100 million in grants in the coming months. Additionally, Rural Development has made \$700 million available through the Biofuel Producer Program to provide support to producers who experienced market losses due to the COVID-19 pandemic. These investments will give consumers more options for clean energy at the pump, while also creating new market opportunities.

Rural Development is also working to expand access to new markets by expanding access to broadband across rural America. Broadband is make or break for rural America, impacting small towns, communities and Tribal nations alike—linking rural hospitals to critical telehealth care, connecting businesses to international markets, and giving our students the tools, they need to learn remotely.

Rural Development, in close coordination with other Federal partners, is working to close the digital divide in rural America, to meet the goal of Biden-Harris Administration to connect all Americans to reliable, affordable high-speed internet, and to ensure that the opportunities provided by high-speed internet services are available to all. In the first two rounds of funding, Rural Development's ReConnect program has provided more than \$1.5 billion to 181 projects to increase broadband service. These projects will serve nearly 300,000 households nationwide. Part of the success of ReConnect can be attributed to its deep investment in technical assistance and administrative support for technology and staffing, which broadens the reach of the program to include the least connected communities.

In addition, tomorrow Rural Development will close its largest ever application window for the third round of ReConnect program funding, which will provide more than \$1 billion in broadband funding to rural communities. In the next few months, we will open the fourth ReConnect program application window as part of distributing an historic \$2 billion in broadband funding provided by the bipartisan Infrastructure Investment and Jobs Act for broadband programs operated by Rural Development. These investments are momentous and make significant strides toward closing the digital divide and ensuring that all rural Americans can participate in the global economy.

As we support investment in more and better markets, we are also working to help communities recover from COVID-19. We have expanded access to COVID-19 vaccines, testing, and supplies, while strengthening rural health care providers, including through the \$500 million that the American Rescue Plan provided for USDA's Community Facilities to create the Emergency Rural Health Care Grant Program. Thriving markets require a safe place to live, and Rural Development looks forward to supporting this objective.

Climate Resiliency

At Rural Development, we know rural communities are on the frontlines of severe weather and drought that threatens their safety, health, and livelihoods. Utilities, small businesses, and cooperatives all play critical roles in rural communities and will be best positioned to help increase rural energy efficiency and transitions to clean power. By investing in climate-smart and resilient infrastructure, rural leaders are taking charge with the appropriate Federal support and flexibility to foster their success.

Since January 2021, Rural Development invested \$687 million through the Rural Energy for America Program (REAP) to help rural businesses purchase and install energy efficiency upgrades and renewable energy systems and has the flexibility to fund a variety of projects from constructing greenhouses to large-scale solar panel projects, all which play a significant role in tackling the climate crisis. In that same period, Rural Development projects greenhouse gas emission savings of 1.4 million metric tons of Carbon Dioxide annually for the life of these projects. Rural Development invested more than \$47 million in grants across 31 states to add almost a billion gallons of higher blends fuels to the market through the Higher Blends Infrastructure Investment Program. The Rural Utilities Service invested \$241 million in renewable and energy storage loans, including 13 solar projects totaling \$199.8 million. Rural Development is also celebrating the 10th Anniversary of the BioPreferred certification and labeling program by adding more than 270 new companies to bring the total to 3,200 companies from 47 different countries. The biobased products energy supports 4.6 million American jobs, contributed \$470 billion value added to the U.S. economy, and generates 2.79 jobs in other sectors of the economy for every biobased job.

These programs demonstrate remarkable success in the fight against climate change while also helping cut energy costs and increase efficiency for producers and rural businesses. Rural residents know what works for them, and they know what tools they need to adapt to changing circumstances and build a more resilient future.

Advancing Racial Equity

At Rural Development, we acknowledge we have not done enough to provide all producers, small businesses, families, and communities an equal chance of success and prosperity. Rural counties make up 86 percent of persistent poverty counties and roughly half of Black and Native American rural residents live in economically distressed areas.⁴ These divides are systemic, and RD is committed to working intentionally to reduce disparities between rural and urban communities and within rural communities by reducing barriers to accessing RD programs and services for underserved rural communities.

USDA recently announced and held the first meeting of an Equity Commission, which is charged with evaluating USDA programs and services and recommending how we can reduce hurdles to accessing them. Rural Development is eager to support the work of the Equity Commission and looking forward to the Department's plans to launch an additional Subcommittee focused on rural community and economic development. This Subcommittee will directly inform Rural Development's work and help us aim to achieve more equitable outcomes.

In the meantime, Rural Development is looking for creative ways to provide capital to communities that historically have not had these resources and knows that investments in our boots-on-the-ground staff to help communities navigate not only Rural Development resources but those across the Federal family that can help meet their needs is crucial to reducing barriers. Additionally, other ways to make programs easier to access like the current round of ReConnect funding which is currently allows Tribes and Socially Vulnerable Communities to apply for grant funds that do not require matching funds. Access to information, the ability to participate in a global economy, and digital learning opportunities are vital to helping dismantle barriers for these rural communities.

Opportunities for Improvement

Rural Development provides community infrastructure, builds rural housing, and supports small businesses and entrepreneurship across rural America. One of the strengths of Rural Development is that unlike many other Federal agencies, we have a presence in the communities we serve through our state and area offices. With over 4,600 "boots-on-the-ground," Rural Development identifies and provides rural assistance that reflects the needs of local communities. Congress recognizes this special relationship and has entrusted Rural Development to invest in rural communities by increasing program levels each year. We are grateful to Congress for its trust in our highly effective stewardship of the funding and authorities they have entrusted to us.

Rural Development has a wide range of tools and authorities, but there are ways that these programs and authorities are dated, cumbersome and can make it so that working with Rural Development is harder for communities than it should be. From providing technical assistance to helping communities employ proven development strategies and finance methods, Rural Development could be an even better partner to rural and Tribal communities. To that end, I am eager to work with Congress to ensure that Rural Development is a modern, customer-oriented organization with the programs, tools, flexibility and skills that ensures Rural Development can meet communities where they are and offer the full scope of expertise and support rural communities' need today.

Rural Development's core programs and authorities are incredible and impactful. But our programs are rooted in the title V of the Rural Housing Act of 1949, the Rural Electrification Act of 1936, and the Consolidated Farm and Rural Development Act. While Rural Development programs are often adjusted or updated, rarely are they considered holistically and with a comprehensive view of what it will take to keep wealth created in rural places in rural and Tribal communities and what these communities need to thrive and prosper. The 2023 Farm Bill presents an opportunity to take that wider view and ensure Rural Development is the transformational partner rural and Tribal communities need today.

Conclusion

In my time leading this agency, I have had the opportunity to travel across the country and meet with many of the people we serve. I have visited states in every region of the country—in many of your districts meeting with the people you represent. I have been able to hear their concerns and their optimism about the future. I too am optimistic about the future and look ahead to continuing to fight for rural communities, and the farmers, ranchers, businesses, and families who sustain them.

Rural Development is poised to meet and expand our commitment rural America, and with some additional tools in our toolbox that empower our staff to work hand-in-hand with rural communities to better access more flexible programs Rural Development could truly deliver best-in-class service and seize this moment to re-imagine and rebuild an economy that invests in the people who make this country run. I look forward to working with this Committee to support this mission.

Ms. CRAIG. Thank you so much.

At this time, Members will be recognized for questions in order of seniority, alternating between the Majority and Minority Members. You will be recognized for 5 minutes in order to allow us to get to as many questions as possible. Please keep your microphones muted until you are recognized in order to minimize background noise.

I would like to start by recognizing myself for 5 minutes.

First, on strengthening local and regional supply chains, I would love to address local and regional meat processing as a key part of resilient rural economies. Madam Under Secretary, you mentioned the \$1 billion investment that USDA is making, via a Food Supply Chain Guaranteed Loan Program, made possible by the American Rescue Plan (Pub. L. 117–2) funds. That is in addition to \$500 million for meat and poultry processing announced in July of 2021.

How will USDA ensure that these programs help existing processing facilities scale up their operations via staffing and infrastructure investments, and how does USDA see these programs as complementary and not overlapping?

Ms. TORRES SMALL. Thank you so much, Chair Craig.

This is a crucial issue. Of course, for farmers and ranchers who, in the midst of COVID–19, were trying to find some place to process their product and had no options. They had people who wanted their beef, but were going to have wait a year before there was a chance, there was room in the slaughterhouse. So, we are trying to address this on the ground by expanding options and building out the middle to make that investment.

So, right now we have the Food Supply Chain Guaranteed Loan Program that has helped identify potential projects as well as lenders who might be eager to work with us on this issue. We have also announced MPPEP (Meat and Poultry Processing Expansion Program), which is really building that out, identifying middle market projects that are very close to completion, how can we support that last step of investment to get them online and operating, expanding the number of hooks available. And we are also eager to take on new projects, identifying where there are others that are more in the formation piece and how we can work with local lenders to potentially support additional projects in the future.

So, I look forward to working with you on that, and certainly I want to recognize that what we are looking at now is how we expand the existing services so that people have options, so that farmers have options as do people in the supermarket.

Ms. CRAIG. Perfect.

Well, listen, let's turn to rural healthcare. We could talk about this for hours, but the Emergency Rural Healthcare Grants in the American Rescue Plan provided the Rural Housing Service Community Facilities Program up to \$500 million to eligible applicants to expand access to COVID-19 testing and vaccines, telehealth services, food assistance, and the long-term sustainability of rural healthcare.

Has the program been successful? Did any of the changes made to the existing CF Program prove successful enough to potentially warrant incorporation into permanently authorized CF programs?

Ms. TORRES SMALL. Chair Craig, it is crucial that we respond to the challenges both experienced in the midst of COVID-19 when it comes to healthcare, but also that rural America is facing as a whole when it comes to healthcare. When we see increasing numbers of rural hospitals closing, when we see challenges in workforce, and also, just people being able to get care close to home. We were able to, with Community Facilities, set up two programs to those ARPA funds, \$300 million on tract 1 and then \$150 million in tract 2. Tract 1 was immediately responding to COVID. Tract 2 is looking into the future and building resiliency. And we were impressed with applications on both fronts. In tract 2, there certainly was more demand than we expected. So, we are eager to continue to get out those awards, and certainly willing to provide technical assistance if it is a program you continue to be interested in.

Ms. CRAIG. I want to end my questioning here on rural broadband. Can you share background on USDA's approach to the next round of ReConnect funding? What will the Department prioritize? How will it ensure that all entities, including local providers, have access to those funds?

Ms. TORRES SMALL. I was in Lewis, Iowa, the other day and the Mayor there remembers the exact spot on the hill that he used to have to go to make a cell phone call. A few months later, Rural Development brought in some fiber. The cell phone company put up a tower right next to it, and now he can call from his phone anywhere in Lewis. He also can operate his business from home. Those are the kinds of impacts we want to make. Our ReConnect round 3 is targeted at reaching those places that no one has dared to go before. It is going to take ingenuity. It is going to take working with new communities, whether it is laying ground on the sea floor to reach an island off the coast, or whether it is reaching Alaskan Native villages that you can't reach even by road.

So, we have a lot of work to do, but we are seeing a lot of interest. And we want to thank this Committee for their foresight in investing in broadband for so long, for decades, that is allowing us to take advantage of this moment.

Ms. CRAIG. Thank you so much, Under Secretary Torres Small. It is an honor to have you here.

That concludes my 5 minutes, so I know recognize the gentlewoman from Minnesota, Ranking Member Fischbach, for 5 minutes.

Mrs. FISCHBACH. Thank you very much, the Chair from Minnesota. It is a Minnesota morning.

Thank you again, Under Secretary for being here. I just want to maybe expand a little bit on the broadband issue. I mentioned the

bipartisan bill that we passed in my opening remarks, and that provided a drastic increase for resources available to USDA Rural Development for broadband deployment in contrast to the just three percent of broadband funds allocated under the American Rescue Plan Act of 2021, Infrastructure Investment and Jobs Act (Pub. L. 117–58), and the proposed Build Back Better was for broadband programs under the USDA’s purview.

And so, I am just kind of wondering, the 2018 Farm Bill authorized a very similar program named Middle Mile Infrastructure Program to finance these types of projects, but this program has yet to be appropriated for funding. Do you believe that Rural Development would be better prepared to finance these projects and handle these projects for rural areas?

Ms. TORRES SMALL. Well, I just thank you so much for your focus on broadband, and in your remarks as well as Ranking Member Thompson’s remarks, the focus on partnerships that are crucial to get broadband done, whether it is on a local community scale, whether it is in Congress, whether it is between agencies. And because of the Agriculture Committee’s investment in broadband for a long time, we have the skills that have allowed us to stand up the programs that have been established for us very quickly.

Now, in terms of what the program looks like, we will certainly follow Congress’s lead and do what you instruct us to do, and we are really eager to provide technical assistance on any questions you might have as you do that. But thank you for having such a bipartisan approach to it.

Mrs. FISCHBACH. Thank you very much, and maybe switching a little bit, switching gears.

You mentioned funding availability for biofuels infrastructure and assistance related to pandemic losses, and I am grateful for that. Minnesota’s 7th Congressional District is one of the top producers of biofuels in the country, and it is in many cases the main employer or source of economic activity in the town in which they operate.

What are your thoughts regarding biofuels, not just as a source of low-carbon fuels, but as an economic generator in these rural communities, especially as we consider USDA’s authorities and programs in the farm bill?

Ms. TORRES SMALL. I was in Minnesota this past winter, and I was just struck by the pride of the farmers and the community for being part of this solution when it comes to taking on climate change. Also, the pride of the local market that it has created. I talked to someone who was both a local elected official and a banker who saw the impact it was having on their town. He is also a father who was hopeful that his daughter will be able to stay in their hometown because of the new job opportunities that are available.

I think that really speaks to exactly what you are talking about. I am proud that USDA has invested \$700 million in terms of providing support for those farmers and the experiences they had in the midst of COVID–19, and then another \$100 million to build up that infrastructure that is crucial to delivering that climate-smart fuel close to home.

Mrs. FISCHBACH. Thank you very much, Under Secretary, and I yield back.

Ms. CRAIG. The Ranking Member yields back.

I now recognize the gentlewoman from Iowa, Mrs. Axne, for 5 minutes.

Mrs. AXNE. Thank you, Madam Chair, and thank you, Under Secretary Torres Small, for joining us today. I very much appreciate seeing you, as usual.

Listen, I just want to touch base on a few things, but first, thank you so much for your visit last November to my district where we announced a significant Rural Energy for America Program to help Elite Octane's ethanol plant in Atlantic, Iowa, be even more energy efficient. So, thank you so much for your approach to energy efficiency in looking at our states for that.

After touring the plant, we had a great roundtable discussion with farmers and stakeholders on the benefits of biofuels, and how it provides a cleaner alternative to fossil fuels and is a significant driver of economic opportunity in Iowa. At the end of the day, supporting rural communities is one of my top priorities in Congress, and so, I have been laser focused on making sure that these issues, including rural broadband, which, of course, USDA plays a key role in, is where I would like to direct my first question.

So, I appreciate the efforts of the USDA to ensure forward looking speed standards in the latest round of ReConnect funding. Given the record \$65 billion investment in broadband in the bipartisan infrastructure bill, as well as funds from the American Rescue Plan invested in broadband deployment across the country, which includes \$200 million in Iowa, and then, of course, I am very familiar with a lot of funding we have in Iowa at the state level as well. I am wondering, how is the USDA working to coordinate broadband efforts across multiple levels of government to make sure that these best practices are shared and we use the money effectively and efficiently. As something we have been talking about in Iowa, quite honestly, for a long, long time, I am glad we are going to get this done, but I want to make sure that we get the biggest bang for our buck, and I am hoping you can shed a light on how that coordination will work.

Ms. TORRES SMALL. That is such an important question, Congresswoman Axne, and what we are seeing in our conversations so far is just the importance of making sure that there are partnerships when it comes to broadband. It is about coordination, but even more importantly, it is about truly partnering with our Federal agencies on the ground.

And Rural Development has a lot to bring to that partnership. We have the long tenured experience in broadband because of the foresight of this Committee. We have the new option to include grants in those applications, as well as to waive some of the matching requirements that we are able to do in this most recent round. We also have expertise working in some communities that we can really bring to the table, whether it is working with NTIA on some of the assistance when it comes to Indian Country, whether it is getting that on the ground detail, the granularity that we require for our projects, which is house-by-house, to then supply information as we work towards better maps.

So, Rural Development has a lot to bring to the table when it comes to coordination, and we are doing that robustly. Whether it is weekly meetings at the White House, whether it is staff level communication about the timing of announcements, or making sure that we are keeping an eye on places where announcements have been made, for example, in RDOF and FCC, making sure that we will be then communicating with the states as they receive their money from NTIA.

So, there is a lot of work to be done. There are a lot of people who have different expertise that they are bringing to the table, and Rural Development is very proud to be part of that.

Mrs. AXNE. Thank you so much for that, and listen, if there is anything that you want to communicate to us Members as you move this forward, I very much appreciate it because to me, getting this done is so important. Iowa falls bottom of the barrel when it comes to connectivity, so thank you for that.

Now, I want to move on to housing. Of course, USDA supports housing in rural areas. While in the future, I hope to see more investment in these programs to alleviate housing shortages that are, quite honestly, holding back rural communities over the long-term, I am just curious right now about the process and support for residents who are already there in existing housing supported by USDA. In Iowa, unfortunately, I have heard of reports of mismanagement, lack of maintenance, and some other illegal actions by Truverse, which is a property management company that receives USDA support.

So, can you describe the rights renters in USDA properties have as far as in terms of upkeep of the property, as well as oversight that the USDA does, and if the USDA needs additional resources or abilities to fulfill and support the protection that those renters need?

Ms. TORRES SMALL. Congresswoman Axne, thank you for your focus on this. It is a crucial issue. Rural Development operates a large number of housing. So, you often think of HUD when you think of housing. We have about $\frac{1}{3}$ of the same stock in rural communities specifically, which is crucial.

To get to your point, we are committed to making sure that tenants living in places that have received USDA loans do have the support that they need. We have been responsive in terms of making sure that there are new ways to issue a complaint, for example, and we have been working with Iowa Finance Authority to address some of those concerns. I really appreciate your role in raising these issues, and look forward to continuing to work with you and your team to make sure that we are addressing these concerns, because it is crucially important as we think about housing in rural America. It is one of the key building blocks to make sure that people have a good life, and we work hard to make sure that people living in those facilities only pay 30 percent of their income for housing through some of the subsidized assistance that is available through Congress. So, we will work to continue to do that.

Mrs. AXNE. Thank you. I yield back.

The CHAIRMAN [presiding.] Thank you. I also want to thank Congresswoman Craig for filling in, I appreciate that. And I now will recognize Ranking Member Thompson for 5 minutes.

Mr. THOMPSON. Thank you, Mr. Chairman. Madam Under Secretary, I want to thank you for your recent response to our letter regarding the substantial changes to the ReConnect Program. And one of the questions I had was how you decided to advantage non-profit applicants over for-profit applicants, since that so clearly broke with the long-standing operation and precedence of the program. And unfortunately, I was puzzled and somewhat unsatisfied with your response, as it seemed to point to a priority within an unrelated and much older provision in the Rural Electrification Act to justify the Department's current actions in implementing ReConnect. I think if you had talked with us before making this drastic change, we would have been happy to clarify that Congress has always wanted to encourage as many options for rural residents as possible, and doesn't believe that any type of broadband provider was more deserving of assistance than another.

I think, actually, that is why USDA—we are always very proud—has been more effective at bridging the digital divide, than—quite frankly, some of the other agencies within the Federal Government. So, I hope we are not falling into some of the bad habits that have made some of these other agencies less than effective at bridging the digital divide.

In my opening statement, I noted that we want to work with you to address the needs of rural communities, but are frustrated at the many times that we have been excluded—this was one issue in Rural Development, but there have been others in other parts of USDA recently, from major policy changes until the—really excluded until the very last moment. ReConnect round 3 is just one of those examples. I would just ask that, just request that you please talk with us. We want to work with you before you embark on major policy changes. These changes have consequences, and in the future, and particularly as you undertake ReConnect round 4, can you assure me that you will talk to us about any major programmatic and policy changes, before they get set in stone?

Ms. TORRES SMALL. Ranking Member Thompson, I deeply appreciate your focus on broadband and how we can deliver it as appropriately as possible. Thank you for your very detailed letter addressing some of your concerns, and we look forward to continuing to work with you.

It is certainly, as we take on this next step, which are going to be some of the hardest projects, we are looking to bring in as many potential partners as possible, and to that point of coordination, one of the pieces that we see as one of our strengths is relationships with rural electric co-ops that potentially we can help bring to the table.

And so, in setting up this small percentage of voluntary points as a way to try to get more people to be at the table solving problems, we are hopeful that this will just create more options for communities that may not necessarily otherwise have folks who are looking to serve their area.

Mr. THOMPSON. On the broadband area, obviously there was discussions previously about the great bipartisan work that this Committee did. Last summer with Chairman Scott, we worked on a bipartisan bill, passed unanimously. It really bridged, if not all, most of the digital divide, would have created a circuit rider program

like we see with rural water. We have done that for broadband. It would have provided a competitive grant program for mapping. And unfortunately, we cannot get the Democratic leadership—and this is a frustration I share with Chairman Scott. We have worked on this hand-in-hand, actually, to try to get Democratic leadership in the House to bring it to the table.

So, I would just ask—and I know Chairman Scott would appreciate this as well—any help that you and USDA could do to influence the Democratic leadership in the House to bring this very strong bipartisan bill to the table would be greatly appreciated. I know rural America would benefit from it. What was passed in the infrastructure bill, \$2 billion to USDA. With inflationary costs, it is not going to go very far. We need to bridge the digital divide in rural America to give rural Americans access to what they need to have today. If we would have taken the same disjointed approach back in the 1930s to electricity, I think some of our communities—probably the community I live in—would still be in the dark. But, I would appreciate that.

I would also, just real quickly on the meat processing assistance, I support the notion of diversifying and enhancing processing capacity. I think that is an approach I certainly appreciate.

Any brief comments on the level of interest that you have seen in the Food Supply Chain Guaranteed Loan Program, and the projected timing of awards, or the types of projects that may be coming forward?

Ms. TORRES SMALL. It has been a great opportunity to extend conversations with new lenders who might be interested in supporting expanding the food supply chain, and specifically in meat marketing. And so, we are working on that, recognizing that with a guaranteed program, our partners are the lenders, who are then working to build those projects. So, as we work to educate about that program, we are also working to make sure that they are aware of the additional opportunities that will be out there in the future, and it has provided a chance for us to work more in an area that allows farmers and ranchers to build local markets, and diversify their work.

Mr. THOMPSON. Very good. Thank you. Thank you, Mr. Chairman.

**OPENING STATEMENT OF HON. ANTONIO DELGADO, A
REPRESENTATIVE IN CONGRESS FROM NEW YORK**

The CHAIRMAN Thank you. I will now recognize myself for 5 minutes.

First, let me just say it is good to see you, Under Secretary. I appreciate you taking the time to be here today before the Committee, and I am looking forward to being able to talk a bit more here about rural economic development and the program initiatives that we think we can build upon moving forward.

Let me say, it is important to understand as someone that represents the eighth most rural Congressional district in the country that figuring out how to have robust regional rural economic development resources is of utmost priority for me. As we recover from COVID-19, rural communities need access to targeted resources. That is why I introduced the Rebuild Rural America Act of 2021

(H.R. 2361), which delivers resources directly to counties, towns, and villages to address issues like food insecurity, high unemployment, or a lack of rural broadband. The key components of the program being that it provides non-competitive, multi-year and flexible funding to support the growth of our local rural economies. It would remove, also, bureaucratic hurdles and ensure the USDA staff are available for technical assistance, capacity building, and oversight.

Could you please talk to me about existing rural economic development programs, specifically the Stronger Economies Together, and the Strategic Economic Community Development Program? What are some characteristics of these two programs that have been effective, and how can we build upon the resources that have been provided by these programs to ensure Rural Development staff and rural communities are working together to develop plans for rural economic growth and can access funding to support these plans?

Ms. TORRES SMALL. I so appreciate—Chairman Delgado—thank you so much for the chance to be here, and I deeply appreciate your comment about how we can make sure that Rural Development staff is on the ground and working together with the communities, because those really are the two sides of the same coin in terms of the partnerships that we have to forge to address this.

And so, as we look at your legislation and recognizing there were similar related proposals in the Build Back Better legislation, that focus was on building that community capacity. One of the great ironies of the approach that we have seen is that so often, money goes to cities through CDBG grants, that goes directly there. But for rural communities, they have to compete for those funds. And so, certainly recognizing your effort to address that and to support community capacity.

The other side of the work is making sure that we have Rural Development folks on the ground, like the person I spoke about in my opening statement, making sure that there are experts in the community. So, not just in the projects and the programs and the loans and the grants and all of the requirements for the application, but also in knowing the people on the ground, and that is the other side of the coin. We need both of those in order to reach places that we haven't been able to reach before.

The CHAIRMAN. And just to make sure I understand, those two pieces that you have highlighted in terms of community capacity and folks on the ground, when you think about the two programs I mentioned, the Stronger Economies Together and the Strategic Economic Community Development Program, are those key components of those two programs, or are there other types of aspects? Could you speak specifically to those two programs?

Ms. TORRES SMALL. Sure. So, something we are continuing to work with your office on, identifying what are the benefits and how do we take them into the future? And as we look at the farm bill, as we provide technical assistance for you, I think it will be about pulling out what works in those programs and how we take that into the future.

The CHAIRMAN. Yes. Just one little follow-up here. Can you commit to working with us to identify opportunities to support com-

prehensive regional development planning efforts, and ensure we are providing rural communities with technical assistance and access to flexible use funding?

Ms. TORRES SMALL. I can.

The CHAIRMAN. Excellent. Well, we will certainly continue to work with you on that as you move forward, and again, thank you very much for your time and testimony today.

And with that, I will now recognize Representative LaMalfa for 5 minutes.

Mr. LAMALFA. Hi. Am I on?

Ms. TORRES SMALL. Hi.

The CHAIRMAN. Yes, you are on.

Mr. LAMALFA. Okay, good. Thank you. It is hard to hear here. Thank you. I appreciate it, Mr. Chairman, and Under Secretary, good to see you—or should I just say, Xochitl, it is great to see you, ma'am. It is awesome. It is great to have you in this position here, so I appreciate you.

Let me launch into a couple things here. The issue that GT, I mean, Ranking Member Thompson touched upon it a minute ago, but I want to take it a little further.

ReConnect round 3, what we are finding is that the groups that are availing themselves to the funding—I am not doing very good right now. Anyway. They are trying to access this program, right, generally has been with municipal or nonprofit, but we are finding is that—I have some very small companies up in my district as well that do happen to be private companies. They don't fit the other categories, so I guess with the points system, the preference points is they are left out because they don't score as many points on the scale. But the policy of USDA is supposed to not really discriminate against them in that sense because they are the only game in town in these very rural areas too that we are talking about. So, can we take a further look at that and see that the points system—that that scale does not harm them just because they might happen to be privately held companies?

Ms. TORRES SMALL. Congressman LaMalfa, I really appreciate your efforts to make sure that we are reaching every community, and communities that have been unserved or underserved, making sure that we have the right partners at the table.

Mr. LAMALFA. Thank you.

Ms. TORRES SMALL. When it comes to the voluntary points system, we were thinking very intentionally about how we bring new partners to the table, but also recognizing that there are a lot of different ways we want people to distinguish their projects. So, whether that is making sure that you are reaching vulnerable communities, socially vulnerable communities, the most rural, least dense places, that is another way to receive priority points. The places with the lowest connection, under 25/3, for example, is another way to get everyone at the table and to distinguish your application.

So, the cooperative or local government piece is 15 points out of a total 150 points that allow you to distinguish your applications. There are lots of ways to build a great application, and we are eager to work with folks on the ground in California to make sure that they are finding those ways to do that.

Mr. LAMALFA. Is it possible, then, to have it looked at as if they are the game in town, we are talking extremely rural areas between mountain ranges and such. The points scale, there isn't a way for these barely connected areas to have any other way to do it. So, I guess, is it possible to put aside that part, because that is it. It is either they are in or they are out. You know what I am saying?

Ms. TORRES SMALL. So, there is \$1.15 billion available in this round. There will be another \$2 billion available, a little bit less than that, thanks to the bipartisan infrastructure law, and so, we expect that we will be working with different partners depending on who is, like you said, on the ground in those areas and we are eager to work with them as we continue to distribute these funds.

Mr. LAMALFA. Sorry, I'm [inaudible].

On one other point here, too, is that the opioid crisis in rural areas has been a tremendous issue, but it has been kind of put aside by COVID. And so, what we are looking at is that in these rural areas, it still needs to be addressed, as always, and we realize that. But what can you tell me about the focus of USDA in rural issues with the opioid, picking that back up after the tremendous issues with COVID waning here, but still the opioid problem we have? What are we looking at there? How can we emphasize more of that work?

Ms. TORRES SMALL. Congressman LaMalfa, thank you so much for asking that question. It is absolutely true that we have to continue to take on the challenges of the opioid crisis, and you are right to put it in the context of COVID-19. In the midst of COVID-19, we saw deaths related to opioid overdoses increase in a way even beyond what we had seen before. And so, as we are coming out of this crisis as CF, the Community Facilities Grant Program and Loan and Guaranteed Loan Program has shifted from standing up these new programs to address COVID-19. We are also eager to work to continue to identify projects and opportunities to deal with the opioid crisis.

Mr. LAMALFA. Thank you, I appreciate it. Good to see you.

I will yield back my time.

The CHAIRMAN. Thank you.

I now recognize Representative Kuster for 5 minutes.

Ms. KUSTER. Thank you so much, Chairman Delgado, and I have to say, I could not ask for a better bipartisan transition, Mr. LaMalfa. As the chair of our bipartisan Addiction and Mental Health Taskforce, I very much look forward to working with you to transition from the post-COVID era to renew our attention to addiction in rural America.

I want to give a warm welcome to our good friend Under Secretary Torres Small. Welcome back to the Agriculture Committee. It was such a treat to have you in New Hampshire last December and to show you the key role that USDA Rural Utilities Service loan programs play in the growth of the solar energy infrastructure in the Granite State.

And as you saw during your visit, USDA Rural Development programs across the board have a tremendous impact in my state with broadband, water, energy, housing, and beyond. We look forward to the reauthorization of the farm bill in 2023. It is a great oppor-

tunity to take stock of how we continue to strengthen our farms and our rural communities.

And with that in mind, I want to begin by asking about the Value-Added Producer Grants. In 2020, I led bipartisan legislation to temporarily waive the matching fund requirement for participation in this program in light of financial challenges related to COVID-19. Ultimately, we were able to secure a significant reduction for the matching requirement. I believe this value-added program will only grow in demand as small family farmers and producers seek to diversify their products and make connections with local consumers. This is a win/win for both ends of the food supply chain.

Madam Under Secretary, could you comment on the impact you have seen this program have as we emerge from the pandemic, and are there steps that we can take to ensure that small farmers can continue to participate in this program?

Ms. TORRES SMALL. Congresswoman Kuster, thank you so much for your work on the Value-Added Producer Grant. It is one of the most popular things that we do, which is helping farmers and ranchers take a product and find ways to infuse more value into that product. Often, it also means opening up more and better markets, which as we have seen in the midst of COVID, is exceptionally crucial for our food supply chain resiliency.

I have seen on the ground how farmers are working to get more greens to local grocery stores because of Value-Added Producer Grants. I have seen that that connection that I think we can talk about more in terms of connecting rural communities to urban communities, and how we are truly feeding America. So, I think there is this great opportunity for Value-Added Producer Grants. I have also heard them talked about in the context of meat processing, whether it is cold storage, whether it is making sure we are using all of the byproducts available, to create value out of that. So, I think it is one of the most popular programs, and I certainly appreciate your interest in it, and I am happy to provide technical assistance as you look at that further.

Ms. KUSTER. Well, it is so important to boost the rural economy and particularly with the rising energy costs, it just seems a complete waste of consumer dollars to be trucking our food halfway across the country, when it could be grown in the community right where people live.

Switching gears, I want to return to the topic of the day, rural broadband. As you know, we are excited that several communities in New Hampshire received a loan for broadband build-out through the ReConnect pilot program last year, but as millions of Americans still don't have reliable broadband access, including 13 percent of New Hampshire farmers, I am concerned to hear that broadband funding has sometimes been used to overbuild existing broadband networks instead of bringing the benefits of broadband to areas with no service. Would you agree that the priority for broadband funding in programs at the USDA should be on areas currently without any broadband, and if so, what steps are you taking to make sure that the ReConnect funds prioritize those communities with no broadband?

Ms. TORRES SMALL. So, one of the steps that we have taken when it comes to making sure that we are reaching places that are unserved right now is included in that priority system, priority points. The largest number of priority points available for serving unserved areas, which is defined as *less than 25/3*. So, we see an incredible opportunity to reach those places, and frankly, Rural Development has been one of the most successful in terms of reaching those places because of our experience working in rural communities.

I am also really glad that you brought up farmers and access on farms as one of the challenges. I was in Virginia earlier—actually, late last year, and a farmer came up to me and he said thank you so much for increasing the required build-out speed to 100 up, 100 down. I want to expand my work in precision ag. I want to be a contributor when it comes to using climate-smart technology, and it is going to take having that connectivity to make that happen. So, that is another way that we are working to both reach the unserved places now in terms of those priority points, and then also to make sure that rural communities aren't stuck in a slow lane, because this isn't just about now. It is about how do we make sure that these are great, thriving rural communities into the future.

Ms. KUSTER. Excellent. Well, my time is up. I am going to submit for the record my final question on the Healthy Food Financing Initiative, which has been really helpful for immigrant and refugee farmers in New Hampshire.

But I yield back, Mr. Chairman, and thank you again for having the Under Secretary. I think she is an outstanding member of the new Administration. Thanks so much.

The CHAIRMAN. Thank you.

Now I would like to recognize Representative Cammack for 5 minutes.

Mrs. CAMMACK. Thank you to the Under Secretary for your presence here today. I appreciate your testimony, as well as my colleagues and your questions. This is an incredibly important issue. I think COVID highlighted precisely the need for high-speed reliable affordable internet across America, and certainly in rural America, be it for telehealth, for commerce, or for education.

I represent a largely rural district in north central, northeast Florida, and we have children who do their homework in a Hardee's parking lot. We have government entities that cannot open their doors because of restrictions from the Federal Government and can only serve via telehealth or a telework model. But because of the lack of internet connectivity, we are not able to take advantage of those resources. So, my constituents are in kind of a Catch-22.

So, I know that I am not alone in this. Constituents across America are in this. But I have a real concern about overbuilding, and the relationship between USDA and FCC. So, if you look at the FCC's current definition of *unserved*, that is an area that is lacking speeds of 25/3 megabits per second. Now, the definition also describes communities throughout my own district where even minimal broadband service is unavailable, leaving entire communities behind.

Secretary Vilsack recently announced that USDA would fund projects capable of serving 100/20 megabits, including areas that were already receiving funds from the FCC's Rural Digital Opportunity Fund, the RDOF auction, to serve areas at speeds of 25/3.

Now, I am concerned that we have multiple providers in the same area that are going to use federally subsidized overbuilding to deploy broadband, which really doesn't make economic sense. It is not good use of taxpayer funds. So, how are we going to prevent overbuilding in these areas while still leaving areas that aren't touched by the RDOF auctions and by the ReConnect Program? How are we going to address this?

Ms. TORRES SMALL. Congresswoman, thank you so much for your advocacy for the rural communities and the people that you serve, especially when it comes to people who do not have good reliable internet right now. It is a priority of USDA Rural Development to make sure that we are reaching those unserved communities. We have the same definition of 25 up, 3 down as *unserved*, making sure that we are reaching your constituents. And that is why the—in the priority points we have identified 50 points out of 150 are specifically for that unserved population of 25 up, 3 down. Additionally, if they are a very sparse population, if they are really rural, that is another set of priority points.

So, we know how crucial it is to be able to prioritize those projects, and we know how crucial it is to make sure that rural communities aren't stuck in the slow lane for the rest of time, right? This is an investment not just for now, but also into the future. So, making sure that we have a backbone that will be able to compete on the speeds that we see is crucial, because we certainly saw in the midst of COVID with your kids who are sitting in the Hardee's parking lot that 25 up, 3 down isn't enough for them to be able to listen to their teacher and learn from home. And so, we want to make sure we are building out to where it is enough for them to compete on the global marketplace.

Mrs. CAMMACK. So, in the time I have remaining, I just want to do a quick follow-up on that.

So, under the RDOF—and I know this is more the FCC side—it prohibits these entities, these Census tracts, these municipalities, once they have been auctioned off to participate in other programs, but so many of these areas would fall or qualify for USDA. Are there conversations ongoing with FCC and your office about how we can navigate this? Because under that FCC guidance, there is 10 years to deploy the service. We can't afford to wait 10 years.

Ms. TORRES SMALL. So, there absolutely are conversations ongoing about how we coordinate between RDOF and ReConnect Programs. We are considering projects at a very granular level. What does this look like on the ground? And that is something that in this round, we started to do. So, we are looking very specifically at how an application would impact current RDOF places, and making sure that we recognize building out is going to take construction time and beyond, and making sure that whatever decisions we make, they are in coordination across the Federal Government.

Mrs. CAMMACK. Excellent.

Thank you, and I yield back.

The CHAIRMAN. Thank you.

I now recognize Representative Feenstra for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Delgado and Ranking Member Fischbach.

Under Secretary Torres Small, my district is extremely rural and the lack of broadband connectivity is a huge issue for my constituents, like we have heard a lot of others talking about. Rural Development oversees the ReConnect Program, which most recently received \$2 billion through the Infrastructure Investments and Jobs Act. This money is in addition to the over \$1 billion the ReConnect Program has already been appropriated in 2019.

I am wondering, are you coordinating with the FCC, and do you intend to utilize their maps when distributing these new broadband funds? If not, why not?

Ms. TORRES SMALL. Thank you so much, Congressman, and really for your focus when it comes to good reliable internet, it is crucial and it is crucial that, a theme of this conversation is about partnerships. It is about what can we all bring to the table to solve this problem? And what I have seen is that that takes partnerships on the ground, and it takes partnerships in the Federal Government.

And so, we have been working hard to make sure that we are bringing our best to the table, and that is our long-tenured experience working in rural communities, working with different kinds of potential providers. Our experience in Indian Country that we have been able to use with NTIA, for example, as they do some of that outreach, and also, our experience of very granular applications.

Mr. FEENSTRA. So, are you planning to use the maps? Will you be using the maps or not?

Ms. TORRES SMALL. So, we are supporting better maps through our granular assessment of applications. So, we are legally required to look further than the maps currently look when it comes to identifying places served. We have a robust process where you—if there is a question about whether or not there is service, the person who is claiming that they are providing that service will have to respond and demonstrate that service, and then that information goes back to NTIA and FCC as they continue to build out their maps.

So it is, certainly, one aspect of an application that we look at, but we go deeper and then we communicate that information back to the FCC and NTIA.

Mr. FEENSTRA. Okay. So, my question is I have a lot of rural telcos in Iowa, and obviously, they want to participate. They want to be part of the ReConnect Program, and obviously, they rely on the maps and the maps are very important, simply because if somebody horns in on their area, all of a sudden the local telcos are X'ed out. They don't have a chance. So, how do we move forward with this concern?

Ms. TORRES SMALL. That is a really good point, that there are telecom providers that are relying on the maps that are out there. I would say there are also people who are in those areas where it says they are covered and they are not, and we want to make sure that they have access to good reliable internet. So, the maps give us a chance to look at an area, and then identify what truly is served and not, and identify projects based on that. That is a legal

requirement from the Rural Development side, but I am happy to coordinate with you and your team further as you identify potential challenges.

Mr. FEENSTRA. Yes, this is, to me, a really big topic because what we have seen in Iowa is you have a big national company or somebody that says, "Hey, we are going to come in and provide you with broadband," and it really doesn't happen or it doesn't have the upload/download speeds. Whereas our rural telecommunications that have invested a lot of dollars into rural areas are not getting a chance, and this really concerns me. All I want is the best broadband possible for all these districts, and I sometimes think that we are down this path of one size fits all, and I am here to say, can we work together on this?

Ms. TORRES SMALL. I think we can absolutely work together. Rural Development lives and breathes the motto one size doesn't fit all. That is why we have regional folks who are reviewing the applications who know the partners on the ground. That is why we do look beyond the maps and look at the specific people and whether or not they actually have service, and that is why we have built this set of priority points so the people can cobble together different types of projects that answer the specific challenge on the ground, like the constituents in Iowa that you represent.

Mr. FEENSTRA. Well, thank you so much.

I got just a little bit of time left. Under Secretary, the USDA's BioPreferred Program has proven to spur economic growth and job creation. Through its creation in the 2002 Farm Bill, and the expansion in the 2014 Farm Bill, how has this program achieved its mission to develop and expand biobased products? Again, this is very big for Iowa and I would like to know, what recommendations do you have for the BioPreferred Program?

Ms. TORRES SMALL. Yes. Biobased products are definitely exciting. It is where you take what could have otherwise been a byproduct and turn it into a product itself. Just a small fact, we used biobased utensils at my wedding, so we certainly know that it is an opportunity for the future.

The biobased BioPreferred Program that you are talking about helps identify to the Federal Government and to purchasers that there are these products out there. It can also support those markets, and we look forward to working with you more to make sure that we are giving you the information you need to get this done.

[The information referred to is located on p. 205.]

Mr. FEENSTRA. Thank you so much for your comments, and I yield back.

The CHAIRMAN. Thank you.

I now recognize Representative Balderson for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman.

Madam Under Secretary, thank you for being here today. It is good to see you.

One of my concerns with these Federal dollars, and specifically, with the ReConnect Program, is overbuilding. As you are probably aware, the IIJA redefined *eligible service areas* for the ReConnect Program from 90 percent of households underserved to 50 percent. Other IIJA broadband programs, such as those administered by the NTIA, have an 80 percent underserved threshold.

My first question has two parts. Would you support raising the unserved threshold from 50 percent to at least 80 percent in order to be in line with the IIJA programs?

Ms. TORRES SMALL. Thank you so much, Congressman Balderson. It is wonderful to see you, too. We will certainly do what Congress tells us to do, and we have shown our ability to do that with the different instructions based on the different amounts that have been allocated to ReConnect through CARES and then through other Acts, and then we will continue to adapt to that.

One of the things that we have seen is that often, companies are trying to cobble together projects that will pencil out, and so, that means reaching unserved people, but sometimes in places that are also surrounded by a little bit more coverage. And so, it will be interesting to see with the bipartisan infrastructure law how that impacts the type of projects that are presented. And we are happy to work with you to provide information in the future about that.

Mr. BALDERSON. All right, thank you very much.

And how does the USDA plan to avoid overbuilding the other federally qualified projects when the USDA is operating under different standards than the NTIA?

Ms. TORRES SMALL. I mentioned earlier just the impact that building to 100 up, 100 down can have for farmers when they want to be part of the solution when it comes to precision ag, especially with increased droughts that we are seeing, for example. And so, recognizing that we want to make sure we are building to the needs of the future, not the past, and with COVID-19, we certainly saw that 25 up, 3 down is the past.

And so, we are committed to prioritizing those places that don't have that service now, but also recognizing we need to look at what it is going to take to have a vibrant rural community in the future.

Mr. BALDERSON. Okay, thank you very much.

My next question is, and I agree with your statement that broadband is a make-or-break issue for rural America. To that end, when USDA makes an award under its ReConnect Program or issues some other funding support to expand broadband, what steps does the Department take after the fact to measure that the promised service is being delivered?

Ms. TORRES SMALL. That is a really great question, and we will follow up with more details on it as we continue to make new awards when it comes to ReConnect and the current investments now. But part of the Rural Development's special sauce and its expertise is people on the ground, it is the GFRs who know those providers, and so, we are available when there are concerns. People who are expressing, "Hey, they say we are being served but we are not really," and being able to verify whether or not that claimed service is truly existing.

[The information referred to is located on p. 206.]

Mr. BALDERSON. Okay, thank you. I look forward to that.

My last question is: broadband availability is critical in rural America, not just at home and in school, but also in the field as our farmers adapt precision agriculture solutions. Unfortunately, most broadband performance data is focused either on buildings that have fixed connections, or on roads where wireless connectivity can be mapped through drive testing. But with this

enhanced focus on precision agriculture, we are missing a key element. Would you consider partnering with broadband measurement companies to collect better data about wireless broadband availability over arable lands?

Ms. TORRES SMALL. We absolutely need to use tools to find out—have more precise identification of where broadband exists and where it doesn't, and that is especially true when it comes to Rural Development that has to have more specific information for its awards. So, we would certainly love to follow up with your team about the research that you are talking about, and recognize that we also have a pretty—a catch-all system in terms of identifying what places are claimed to be covered, then verifying that they are covered, requiring the company that is claiming that to show that, and then if necessary, testing on the ground. But we would love to see if there are other ways to address that.

The CHAIRMAN. Thank you, and I recognize Representative Schrier for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman, and welcome, Under Secretary Torres Small. It is wonderful to see you, and I want to thank you for taking the time to visit my district a few weeks ago. We loved having you there.

Today, I would like to focus on how USDA Rural Development programs can help the development of a strong wood products industry, and specifically, I would like to focus on one pending application to the Business & Industry Loan Guarantees Program that is crucial to my home State of Washington. So, I would love for you to give full consideration to the X-Caliber Rural lending applications to the USDA's B&I Program for the construction and development of projects to create the Darrington Wood Innovation Center, which will actually house three separate entities. Together, they will enable the Darrington Wood Innovation Center to develop a mass timber production facility and serve as a truly one-of-a-kind hub for innovation in wood product manufacturing. So, this will bring high quality jobs back to a rural area in need of investment and economic revitalization. The center represents a new model, really, for the future of the nation's wood product industry by focusing on cross-laminated timber, which encourages long-term forest management, that improves forest health, reduced wildfire risk, all while sequestering carbon, creating family-wage jobs, and providing materials that will lower the cost of housing.

And for the past 5 years, the Town of Darrington in collaboration with private industry and nonprofits and other community stakeholders has really pioneered the development of this new rural industrial manufacturing complex. This effort has already attracted \$6 million in grants from the Economic Development Administration, and \$2 million in grants and loans from Washington State, with more state funding likely on the way.

So, it has broad support and this first phase involves the construction of a cross-laminated timber plant, modular fabrication facility, and remanufacturing sawmill and kiln facility. These projects are seeking bids now, and they are ready to go as soon as possible. So, this is a priority in Washington State, and is fully in line with the purpose of the B&I Program, and I strongly support the application and hope you to give it strong consideration.

As you know, Madam Under Secretary, communities in my district and throughout Washington State are at extreme wildfire risk, and approximately 3 million acres of forestland is in need of restoration and resiliency. So, developing this strong wood products industry represents a unique opportunity to create wages, revitalize a community, make our forests healthier and resilient, reduce housing prices, and increase carbon sequestration long-term.

I was wondering, Under Secretary Torres Small, just how you think about USDA's Rural Development programs and how they might be able to support the development of the wood products industry in Washington State and around the country?

Ms. TORRES SMALL. Congresswoman Schrier, thank you so much for your work for Washington State, for your support in finding innovative solutions like when it comes to wood products. We certainly are aware of just how much support this one project has across the board, and I know that my team has been in close communication with your team about that. We certainly recognize that level of support and appreciate your passion for your community.

We do have some statutory requirements that we have to evaluate when it comes to the B&I Program. When it is one project, if there are co-borrowers, you can't borrow more than—I think it is \$20 million. So, certainly we will continue to keep in close contact with you and your team about how this may or may not impact this project.

Ms. SCHRIER. Thank you very much. I really appreciate your attention to it, and calling that to my attention so I can address it on our end.

I want to thank you for being here, congratulate you on your position, and I yield back.

The CHAIRMAN. Thank you.

I now recognize Congresswoman Plaskett for 5 minutes.

Ms. PLASKETT. Thank you very much, Mr. Chairman. Thank you for this hearing. I am especially glad to see Under Secretary Torres Small with us. We know the tremendous work that she did as one of our colleagues, and we know that she is going to bring that same energy and dedication to the role that she has now.

Under Secretary, one of the areas, of course, as you can imagine, that is important to me is disaster aid, living in an area that is tremendously impacted by climate change. Are there any Rural Development components to disaster aid after a rural area has experienced disaster, and is there anything Congress should consider in this regard?

Ms. TORRES SMALL. Congresswoman Plaskett, thank you so much for your work in the Virgin Islands and for the country, especially when it comes to disasters and extreme weather, which we are seeing increasingly.

So, since I have been on the job since October, any time there is a disaster, I get an email late that night identifying what the issue is, identifying how extensive the damage is, and what the region is. And then every morning, there is an update in terms of what is happening to our offices on the ground, because that is often—we have over 450 offices across the country, and so, identifying that our employees on the ground—the properties, so that the loans that we have given for both single-family and the people liv-

ing in apartments, multi-family, and any impact on those properties, and then the area in general, because there are resources that can be brought to bear for folks even if they are not currently borrowing within Rural Development.

We are coordinating closely with FEMA to make sure that they have the information about available units, either single-family or multi-family housing near the area if they need access to places to live within that, and then we are also communicating with our borrowers, because if they have a loan payment, they are going to be, on top of everything else that they are worried about at that moment, they want to know what is going to happen in terms of the expectations for those loan payments.

So, those are some—we also, I will just say, work closely with FEMA to make sure FEMA is taking the lead. It is important to have that lead agency, but also coordinate carefully with them in terms of the resources we have to bear.

Ms. PLASKETT. And is there anything that you believe that we as Congress should do to support you, particularly when it comes to speeding up and making sure that coordination takes place immediately after a disaster so that that aid can get right to individuals where they need it?

Ms. TORRES SMALL. I really appreciate your focus on this issue, and I am happy to provide any technical assistance in terms of specific challenges that you are seeing on the ground. I think that is maybe the way we can be best responsive to finding the best solution to support your constituents.

Ms. PLASKETT. Thank you.

The USDA has provided a variety of assistance and grant programs to U.S. Territories, almost all of which are considered rural areas. But my colleagues and I believe that there can be improvement in the area of energy assistance, renewable energy adoption, energy efficiency, and energy grid resiliency. The viability and sustainability of energy in the Virgin Islands and Puerto Rico is of the utmost importance for the well-being of our rural communities. Energy costs on our islands are higher than anywhere else in the country, and our geographic location leaves us vulnerable to climate change, but also provides opportunities for adoption of innovative energy resources.

Congressman Ted Lieu and I introduced the Renewable Energy for Puerto Rico and the U.S. Virgin Islands Act, H.R. 2791, to create a small, new assistance program within the Agriculture Department which grants may be awarded to nonprofits to facilitate renewable energy development, energy efficiency, smart grids, micro grids, *et cetera*. Can you provide any perspective on the soundness of a small new funding stream for USDA to support renewable energy development and energy efficiency and resiliency in U.S. Territories with our unique energy needs?

Ms. TORRES SMALL. First, it just warms my hear that your Virgin Islands, as they address the challenges of climate change, also want to be part of the solution. We are eager to provide technical assistance on your specific legislation, and recognize that it is crucial to be providing support on the ground for developing those solutions and climate-smart tools.

Ms. PLASKETT. Thank you very much for your support, and I yield back.

The CHAIRMAN. Thank you.

I now recognize Representative Scott from Georgia for 5 minutes.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman, and Madam Under Secretary, it is nice to see you. I am sorry that I am seeing you through Zoom, but I was in 2118, which is a committee room that I know you spent a lot of time in as a Member of the Armed Services Committee. So, I hope you are well, and look forward to seeing you in person.

I have a couple quick questions that deal with the middle mile with regard to broadband access. The 2018 Farm Bill provided the Department with the authority to finance the middle mile infrastructure projects. To date, my understanding is that no funds have been appropriated for middle mile projects. Could you speak to the importance of middle mile connectivity for rural communities, and what is the Department doing to advocate within the Administration to put these resources in the middle mile to support rural America?

Ms. TORRES SMALL. Congressman Scott, it is wonderful to see you even virtually, and I deeply appreciate your question about how do we get the backbone of infrastructure across rural America so that we are certainly reaching that last mile, the last homes, but also recognizing that as part of that, building that middle mile connectivity is crucial. And it is certainly something that through the Agriculture Committee, Rural Development has been working on for decades to address.

I am happy to provide any technical assistance in terms of specific questions you might have in terms of the impact of the previous investments that we have made as you evaluate and work with your colleagues in Congress about future investments.

Mr. AUSTIN SCOTT of Georgia. Thank you, Madam, and I think kind of the frustration for everybody is how slow it has been to actually get the resources to the people to implement the technology that is needed in rural America.

We also have a request for the Department to provide a comprehensive report on all of the broadband related activities financed by the Department in the preceding fiscal year. The Fiscal Year 2020 report was released at the end of January of 2022, is my understanding. That is about a year and a half after the close, and certainly you, being a Member of Congress, you understand the frustration with not having the facts that we need to make the decisions that we make. So, any help going forward with making sure that those reports are done in a more timely manner would be appreciated. And any idea when we can actually see the 2021 report come out?

Ms. TORRES SMALL. I want to make sure we get you the best information possible, so I will make sure our team follows up with you in terms of that.

[The information referred to is located on p. 206.]

Mr. AUSTIN SCOTT of Georgia. Okay. Well, we very much look forward to working with you. We want to see our rural utility services have the ability to put broadband in and deliver broadband, and obviously, what technology is right in one part of the county

might not be right in another part of the county. So, I certainly look forward to working with you on the flexibility with our service providers, and how they can best deliver that.

But I appreciate your work, I appreciate you personally, and I look forward to seeing you and working with you to resolve these issues for rural America. Thank you, Madam Under Secretary.

Ms. TORRES SMALL. Thank you, Congressman Scott.

The CHAIRMAN. Thank you.

I now recognize Congresswoman Pingree for 5 minutes.

Ms. PINGREE. Thank you very much, Mr. Chairman. Thank you for having this hearing. I am pleased to be here, and welcome, Madam Under Secretary. We are so happy to have you in that position, and it is just wonderful to hear your knowledge and enthusiasm. It all comes through in answering everyone's questions. We look forward to having you come visit us in Maine sometime, and I have a few questions for you today.

So, I will just jump right in. I really appreciate that so many people have asked broadband questions, so you clearly know how important it is to everyone on this Committee. We have some issues in Maine related to ReConnect, and I feel like I have been bringing this up for a while, but we are the model of the communities that you are talking about when you mention the town in Iowa where you have to go to a separate, you have to go up a hill somewhere to get cell phone service. That is pretty much everywhere in Maine. So, we are a very rural state and we have had a lot of issues in getting connected, and we know how critically important it is.

But a lot of them are struggling, the very small projects. These are projects of \$1 million or less, but the program requirements are so burdensome they are still struggling to move forward 2 years later. We compare that to the broadband projects funded by the state-allocated CARES Act funding. They are completing their builds in 8 to 12 months. So, can you talk to me a little bit about any flexibility you can provide to existing ReConnect awardees who are struggling? Is there support that Rural Development could provide to existing ReConnect awardees to help them navigate the program requirements? We really want to see them up and running.

Ms. TORRES SMALL. Thank you so much, Congresswoman Pingree, for working with your constituents and applicants as we try to address this challenge. We certainly want to be responsive to their needs and look forward to following up with you specifically on the challenges you are facing. Because when it comes to Rural Development, one of our strengths, and frankly, one of the biggest needs in serving rural communities is something I mentioned in my opening statement. You don't necessarily have a grant writer. That lack of capacity to be able to do the follow up on this work, you don't have someone who is paid specifically to make sure that this million dollar project is—you are crossing all the T's and dotting all the I's. And thankfully with the bipartisan infrastructure law, when it comes to ReConnect, there was a specific amount of money that was set aside for technical assistance, and I look forward to working with you as that program gets developed to identify potential ways to be that resource for communities as they are going through this.

We also have the GFR's in regions across the country that have experience both from the application stage with these specific projects, and certainly will bring that as an opportunity for support, and then where we have seen some time that it is taking to get these projects off the ground, sometimes with environmental review, for example, we have implemented a focused tiger team to try to address some of those challenges and speed along the process with some of the consultations that were necessary that, frankly, slowed down a little bit in the midst of COVID.

So, we are eager to work with you specifically on the project, because it is often a very specific issue that is being faced, but that is why that technical assistance is so crucial so that we can respond to those specific needs.

Ms. PINGREE. Great. Well, we will definitely follow up with those grantees that are still dealing with difficult situations.

Another quick question on the Value-Added Producer Grant and the food safety implementation. In the 2018 Farm Bill, I worked to include dedicated funding to help producers upgrade their practices and equipment to improve food safety through this program. So, we are already talking about the 2023 Farm Bill, but this change has still not been implemented. I know USDA held a listening session about this in the fall, but I want to just get an update about when implementation of this food safety financial assistance through the Value-Added Producers Grant might be available?

Ms. TORRES SMALL. Thank you so much, Congresswoman. I will make sure that my team is following up with you on that. We certainly have been implementing a lot of new programs in the midst of COVID to respond to some of the most urgent needs. That has created a capacity challenge, and I want to make sure we are giving you the best information about the promulgation timing for the Value-Added Producer Grant and the food safety piece that you worked so hard on.

Ms. PINGREE. Great. That is such a burdensome cost for many small- to medium-sized farmers. It would be great to make sure they get that assistance.

Last, I just have 30 seconds so I will be quick about this. I am a little concerned about in the Meat and Poultry Processing Expansion Program, \$150 million investment for projects up to \$25 million. This is probably just going to be a statement to you, but I am worried about that being used for larger scale projects, and we all know it has been brought up by other Members how important it is to expand our existing capacity with small- to medium-sized processors. So, I am going to have to take your answer, get it later, but I am just emphasizing that point. We want to make sure that \$150 million doesn't get eaten up in a few big projects. We really want it spread out.

Ms. TORRES SMALL. Thank you. We look forward to following up on the record.

Ms. PINGREE. Great. I yield back. Thank you very much. Good to see you.

The CHAIRMAN. Thank you.

I now recognize Congresswoman Spanberger for 5 minutes.

Ms. SPANBERGER. Thank you, Chairman Delgado, for holding this important hearing. It is so exciting to be here today with our friend

and former colleague and Under Secretary for Rural Development, especially as we are starting to plan for the 2023 Farm Bill.

Certainly, over the last couple years, we have seen significant challenges facing our communities at large, but in particular our rural communities with the unprecedented and unique challenges that we faced because of COVID and the associated economic hurdles. So, these challenges in rural communities, as you well know, have ranged from broadband infrastructure challenges to supply chain bottlenecks that really have ravaged critical industries like meat and poultry. And in response to these challenges, USDA's Office of Rural Development and Congress have collaborated to offer really critical assistance and solutions through funds from the American Rescue Plan, we have seen new programs that have been launched to address food supply chain concerns, improve access to broadband and telehealth, and to make our critical industries whole.

So, to follow up slightly on Congresswoman Pingree's question as well, I was so proud to host you in my district with Under Secretary Moffitt to discuss USDA's announcement of the Food Supply Chain Guaranteed Loan Program to help expand meat and poultry processing capacities using funds from the American Rescue Plan. I am very excited that that program is, in part, based on the Butcher Block Act (H.R. 4140), which I co-led alongside Dusty Johnson. And as you saw during that visit to my district, there are so many small processors in communities like mine who are ready to answer the call and help reduce bottlenecks in our meat supply chain, but need that bit of support.

So, could you give an update on this program, how it pertains to the funds that have been directed for meat and poultry processing, and how many awards have gone out so far?

Ms. TORRES SMALL. Congresswoman Spanberger, thank you so much for that question and for your advocacy for meat processors and for agriculture across the board. I really appreciated the change to get to Gordonsville, Virginia, and to meet ranchers and meat processors who were trying to answer that call in the midst of COVID. People were wanting meat, and they couldn't get it processed in time. So, they were trying to find all sorts of creative ways to make that work, and everything down to the county zoning made it hard. And so, all of those things they have to navigate is something we are certainly looking at.

So, you mentioned the Food Supply Guaranteed Loan Program, which I think is a crucial opportunity to work with local lenders on projects, but sometimes for the smaller ones, they may need more technical assistance. And that is why Under Secretary Moffitt was there. They had a program that awarded \$32 million for 167 meat and poultry slaughter and processing facilities to invest in that interstate commerce, and there will be another round with \$22 million. So, we are certainly looking at some of that assistance, technical assistance as well.

And then when it comes to MPPEP and making sure that we are building out the middle when it comes to meat processing. The first focus is kind of that last mile, that last little piece to get a project over the edge to expand options, but as we move into the future, also trying to identify other projects that are kind of more at the

beginning of their work, and how they can work with local lenders to receive support at the beginning stages of their work to take it to fruition. And that certainly could include independent processors and the smaller scale processors as well.

Ms. SPANBERGER. And certainly, as we work towards the 2023 Farm Bill, I think we will want to work in concert with your office to determine how it is that we should consider extending some of the funding especially for these new loans, what we can learn from the implementation thus far, and working together with you and Under Secretary Moffitt certainly how we can ensure that we are doing right by our small producers and in so many cases, would-be meat processors.

In your written testimony, you mentioned investments made through the Rural Energy for America Program, the REAP Program. I have been a very strong supporter of REAP, and have multiple pieces of legislation kind of focused on this program. Notably, this program and the bill that I sponsored would dramatically increase funding for the REAP Program, expand eligibility, and create a fund for underutilized technologies, including biodigesters or biofuel-related infrastructures.

And so, as we are seeing insecurity and instability related to Putin's horrific invasion of Ukraine and we are seeing the increase of cost of natural gas and gasoline, I think this speaks now more than ever that funding to support REAP is vital. It gives producers a bit of independence and certainly reduces their dependence on foreign energy and allows them to lower energy costs.

My time is up, but I will follow up with questions for the record to see what your thoughts may be on how this incredibly important program really can give some independence to our rural communities and our farmers.

Thank you for being here. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, and that concludes the question-and-answer period today.

The work of Rural Development is vital to ensure that our rural communities have the resources they need to become resilient and to serve the members of their communities. As a former Member of the House Agriculture Committee, Under Secretary Torres Small understands the importance of the policy decisions made by this Committee, and it was certainly great to hear directly from you today about Rural Development's work and relevant policies in the 2018 Farm Bill. I want to thank you, Under Secretary, and with that, we will adjourn.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witness to any question posed by a Member. This hearing on the Subcommittee on Commodity Exchanges, Energy, and Credit is adjourned.

[Whereupon, at 11:31 a.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. GLENN THOMPSON, A REPRESENTATIVE IN CONGRESS
FROM PENNSYLVANIA

December 22, 2021

Hon. THOMAS J. "TOM" VILSACK,
Secretary,
U.S. Department of Agriculture,
Washington, D.C.;

Hon. XOCHITL TORRES SMALL,
Under Secretary of Agriculture for Rural
Development,
U.S. Department of Agriculture,
Washington, D.C.

Secretary Vilsack and Under Secretary Torres Small:

Throughout the COVID–19 pandemic, Americans have relied on their high-speed broadband connections more than ever to work, educate their children, access health care, and connect with loved ones. Unfortunately, these benefits remain out of reach for millions of Americans, particularly those living in rural and remote areas, who continue to lack access to broadband connections.

Through the Coronavirus Aid, Relief, and Economic Security (CARES) Act,¹ the Consolidated Appropriations Act of 2021 (the Act),² the American Rescue Plan Act (ARPA),³ and the Infrastructure Investment and Jobs Act,⁴ Congress provided billions of dollars for programs across Federal agencies to bridge broadband connectivity gaps.

The U.S. Department of Agriculture (USDA) is one of the agencies charged by Congress with administering broadband funding under the COVID–19 recovery packages. USDA's ReConnect Program received over \$2.6 billion to fund grants and loans for broadband deployment in rural areas.

We are concerned that key policy decisions on how to distribute the \$1.15 billion in the third round of the ReConnect Program will result in duplicative and inefficient use of taxpayer dollars. Unfortunately, USDA is planning to provide funding for communities that are served with internet speeds of greater than 25/3 Mbps, which could leave those in rural America still lacking such service further behind and exacerbate the digital divide. We urge you to focus funding for unserved communities that lack access to any broadband connection rather than toward duplicative or upgraded service for those communities which already have internet service of 25/3 Mbps.

Meeting the needs of these unserved communities first before addressing the needs of better served communities is essential to closing the digital divide. To help identify these communities, the Federal Communications Commission (FCC) is in the process of implementing the Broadband DATA Act, which will provide granular data on broadband service across the United States. We encourage USDA and every Federal agency to utilize this data as it becomes available to assist in identifying unserved communities and streamlining the application process.

We also believe that forward-looking broadband service standards must be balanced by a technologically neutral approach. USDA must ensure that unserved communities gain broadband access as expeditiously and cost effectively as possible, while securing investments in broadband systems that will provide sufficient service far into the future.

As Republican leaders of the Committees on Agriculture, Appropriations, Energy and Commerce, and Oversight and Government Reform, we are focused on ensuring that the enormous Federal investments in broadband are spent as efficiently as possible and targeted to those unserved communities that need it most. It is our responsibility to ensure that USDA's rural broadband activities are effectively managed and coordinated across the Federal Government.

To gain a better understanding of how the substantial changes made to the ReConnect Round 3 application were developed, we request responses to the following questions, no later than January 14, 2022:

1. Rounds 1 and 2 of ReConnect defined *sufficient access to broadband* as internet speeds of greater than 10/1 Mbps. Similarly, the 2018 Farm Bill established 25/3 Mbps as the minimum broadband speed threshold. Yet, in Round 3 of ReConnect *sufficient access to broadband* is redefined as internet speeds of greater than 100/20 Mbps, a significant increase over both the previous ReConnect rounds and recent legislative history.

¹P.L. 116–136 at 138 Stat. 281 *et seq.*

²P.L. 116–260.

³P.L. 117–2.

⁴P.L. 117–58.

What specific data and analysis did you and your staff rely on to determine that *sufficient access to broadband* should be defined as internet speeds of greater than 100/20 Mbps?

2. The radical shift in the definition of *sufficient access to broadband* shift will have the effect of significantly expanding the areas of eligibility under the program, including encompassing potentially any area with service speeds of less than 100/20 Mbps.

Please provide a map of what new areas have been made eligible under ReConnect Round 3 as compared to the areas eligible under ReConnect Round 1 and 2, and areas eligible under the requirements in the 2018 Farm Bill.

Under each map, how many additional communities will be competing for USDA's limited program resources compared to the previously eligible communities?

3. ReConnect Round 3 requires that funded projects be technically capable of provide symmetrical internet speeds of 100/100 Mbps. Please describe what currently available technologies are capable of meeting these requirements in rural communities. How could this requirement exclude common broadband technologies utilized in rural communities?

What specific data and analysis did you and your staff rely on to determine that symmetrical broadband speeds were a necessary requirement to meet the needs of rural Americans?

4. Historically, USDA broadband programs have treated all potential broadband providers equally, and not advantaged or disadvantaged any type of provider. Yet, the rules for ReConnect Round 3 provide a clear preference for certain types of providers.

What specific data and analysis did you and your staff consider to justify this break from longstanding historical practice?

To gain a better understanding of your efforts to administer these funds, we request your response to the following questions no later than January 14, 2022:

1. What steps are you taking to coordinate USDA's broadband funding investments, including the recently announced third round of ReConnect funding, with those led by other Federal agencies, including the FCC, the Department of the Treasury, the Department of Commerce, and the Department of Education?
2. How will you ensure that USDA does not invest in broadband projects that will compete with or undermine broadband projects funded by other agencies?
3. What is the Department's justification for not prioritizing funding for unserved areas before upgrading networks in areas that already have service?
4. What steps are you taking to avoid subsidized overbuilding of privately-owned networks, which has been shown to discourage broadband investment and exacerbate the digital divide?
5. How are you working to ensure that different technologies and types of providers are leveraged, so that the most remote areas get served expeditiously and cost-effectively?
6. What specific steps are you taking to track and report to the FCC and the National Telecommunications and Information Administration the locations where USDA is funding broadband projects, pursuant to section 904(b)(2) of Division FF of the Consolidated Appropriations Act of 2021?⁵

In addition, we request that you provide a detailed accounting of any CARES Act and Consolidated Appropriations Act of 2021 funds that you have awarded or allocated to support broadband connectivity. Specifically, we request the following information no later than January 14, 2022:

7. A list of all funding awards that have been awarded or allocated to support broadband connectivity and the amount of each award.
8. For each award that will be used to fund broadband deployment or build-out:
 - a. The geographic area and/or location(s) that the project will cover and the level of service (bandwidth and latency, if available) that will be provided to the covered area and/or location(s);
 - b. Whether an existing provider already offers broadband service in the covered geographic area and/or location(s); and

⁵Pub. L. No. 116-260, 134 Stat. 1182 (December 27, 2020).

- c. Whether funds have been awarded through other Federal programs (such as the FCC's Universal Service Fund, Emergency Connectivity Fund, or COVID-19 Telehealth Program; the Department of the Treasury's Coronavirus Relief Fund, Coronavirus State and Local Fiscal Recovery Fund, or Capital Projects Fund; the Department of Education's Education Stabilization Fund; and the Department of Commerce's Broadband Infrastructure Program, Tribal Broadband Connectivity Program, or Connecting Minority Communities Pilot Program) to provide broadband service to the covered geographic area and/or location(s).

Thank you for your attention, and we look forward to your timely responses. If you have any questions, please contact Kate O'Connor at (202) 225-3641, Lamar Echols at (202) 225-5074, or Paul Balzano at (202) 225-0317.

Sincerely,

Hon. CATHY McMORRIS RODGERS
Ranking Member
Committee on Energy and Commerce

Hon. JAMES COMER
Ranking Member
Committee on Oversight and Reform

Acting Director, Office of Management and Budget

SUPPLEMENTARY MATERIAL SUBMITTED BY HON. XOCHITL TORRES SMALL, UNDER
SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE

Insert 1

Mr. FEENSTRA. . . .

I got just a little bit of time left. Under Secretary, the USDA's BioPreferred Program has proven to spur economic growth and job creation. Through its creation in the 2002 Farm Bill, and the expansion in the 2014 Farm Bill, how has this program achieved its mission to develop and expand biobased products? Again, this is very big for Iowa and I would like to know, what recommendations do you have for the BioPreferred Program?

Ms. TORRES SMALL. Yes. Biobased products are definitely exciting. It is where you take what could have otherwise been a byproduct and turn it into a product itself. Just a small fact, we used biobased utensils at my wedding, so we certainly know that it is an opportunity for the future.

The biobased BioPreferred Program that you are talking about helps identify to the Federal Government and to purchasers that there are these products out there. It can also support those markets, and we look forward to working with you more to make sure that we are giving you the information you need to get this done.

I concur that the BioPreferred® Program offers an opportunity to de-carbonize the nation's everyday consumer biobased products, drive the nation's biobased economic growth, create jobs, promote sustainable production of consumer biobased products, and create opportunities for climate-smart practices.

The 2018 Farm Bill has reassigned delivery of this program to Rural Development and specifically to the Rural Business—Cooperative Service. Rural Development reports that the program currently has over 20,000 products registered in the BioPreferred® Program Catalog, supports over 6,000 USDA Certified Biobased Products,

has participating businesses from 49 countries, and has 3,342 companies participating overall. This year we will celebrate the 20 year anniversary of the Biobased Markets Program which follows our recognition of the 10 year anniversary of the BioPreferred® label in 2021. In calendar year 2021, 976 applications were certified which represents the greatest number of labels awarded in a single year.

At present, there are no requirements for Federal agencies to report their biobased product purchasing data, so year-to-year biobased product spending results are unknown. As examples, there are no requirements to report spending related to supply contracts or direct purchasing via purchase cards, fleet cards, or catalog purchases. However, there are requirements for Federal service and construction contractors to report their biobased product purchasing via the System for Award Management. In FY 2021, Federal service and construction contractors reported in excess of 76 million dollars in biobased product purchasing.

Rural Development would like to see increased reporting of biobased product procurement across the Federal Government and our team has been proactive in affecting change since taking over this program. Despite challenges with documenting and reporting biobased product procurement, we continue working toward solutions.

- The USDA BioPreferred Program has taken steps to meet its goal of increasing biobased product purchasing. These steps include:
- Reviewing current service and construction solicitations to ensure biobased product purchasing and reporting requirements are included. If the solicitation is non-compliant, the Contracting Officer receives a communication requesting an amendment to correct the error.
- Posting a new web-based training program for Contracting Officers which will be available on the USDA BioPreferred® Program website.
- Conducting outreach with events such as GSA SmartPay for purchase card managers, the Federal Environmental Symposium, and the Agricultural Outlook Forum.
- Launching a newsletter directed to Federal Government employees called BioBuzzGov which focuses on information for procurement and sustainability professionals in the Federal Government.

Insert 2

Mr. BALDERSON. . . .

My next question is, and I agree with your statement that broadband is a make-or-break issue for rural America. To that end, when USDA makes an award under its ReConnect Program or issues some other funding support to expand broadband, what steps does the Department take after the fact to measure that the promised service is being delivered?

Ms. TORRES SMALL. That is a really great question, and we will follow up with more details on it as we continue to make new awards when it comes to ReConnect and the current investments now. But part of the Rural Development's special sauce and its expertise is people on the ground, it is the GFRs who know those providers, and so, we are available when there are concerns. People who are expressing, "Hey, they say we are being served but we are not really," and being able to verify whether or not that claimed service is truly existing.

Once an award is approved, USDA takes a multifaceted approach to monitor the progress of the construction. Award funds are only advanced for specific projects that have been approved for funding. Our national office staff monitors the progress of the advances and ensures that the construction is in conformance with the approved application. In addition, USDA has general field representative (GFR) located in each region throughout the country that visits the project and inspects construction that is being completed. Awardees are also required to submit reports that proved the geo-coded locations of all premises served and submit a final report when all construction has been completed. The GFR will then conduct field visits to make sure that the premises are getting served.

Insert 3

Mr. AUSTIN SCOTT of Georgia. . . .

We also have a request for the Department to provide a comprehensive report on all of the broadband related activities financed by the Department in the preceding fiscal year. The Fiscal Year 2020 report was released at the end of January of 2022, is my understanding. That is about a year and a half after the close, and certainly you, being a Member of Congress, you understand the frustration with not having the facts that we need to make the decisions that

we make. So, any help going forward with making sure that those reports are done in a more timely manner would be appreciated. And any idea when we can actually see the 2021 report come out?

Ms. TORRES SMALL. I want to make sure we get you the best information possible, so I will make sure our team follows up with you in terms of that.

This report will be finalized in coming months, and we are happy to share it with it you.

SUBMITTED LETTER BY HON. JIM MATHESON, CHIEF EXECUTIVE OFFICER, NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION

March 7, 2022

Hon. ANTONIO DELGADO,
Chairman,
Subcommittee on Commodity Exchanges,
Energy, and Credit,
House Committee on Agriculture,
Washington, D.C.;

Hon. MICHELLE FISCHBACH,
Ranking Minority Member,
Subcommittee on Commodity Exchanges,
Energy, and Credit,
House Committee on Agriculture,
Washington, D.C.

Dear Chairman Delgado and Ranking Member Fischbach,

On behalf of National Rural Electric Cooperative Association's over 900 members, I write to express our interest in and appreciation for your upcoming hearing to review United States Department of Agriculture (USDA) Rural Development programs authorized in the 2018 Farm Bill. We applaud your leadership and look forward to working with you as you write the next farm bill.

As key stakeholders and participants in USDA Rural Development programs, member-owned, not-for-profit electric cooperatives utilize many of these programs to serve the poorest, most rural parts of our country. We see ourselves as electric utilities that are more than just poles and wires companies. USDA Rural Development programs below are just a few of the tools our members use to serve rural communities and help elevate rural America.

- ***RUS Electric Loan Program***—Low-cost loans from the RUS electric loan program are essential to helping co-ops meet the challenge of building high-cost electric infrastructure in hard to serve, rural areas.
- ***Broadband***—Electric co-ops are making important strides to bridge the digital divide through broadband deployment. In fact, more than 200 electric cooperatives are now, in some shape or form, in the broadband business. We pride ourselves in being good stewards of the financing Congress has made available and see ourselves particularly well-positioned to provide broadband services to consumers in unserved areas of the country.
- ***Rural Energy Savings Program (RESP)***—RESP offers low-cost financing to electric cooperatives for cost-effective, energy-efficiency retrofit projects at customers' homes.
- ***Rural Energy for America Program (REAP)***—REAP provides grants and loans to develop renewable energy systems and implement energy efficiency measures.
- ***Rural Economic Development Loan and Grant (REDLG)***—Under the REDLG program, proceeds to the Federal Government from Rural Utilities Service (RUS) loans are used to finance economic development projects in rural communities. Electric cooperatives partner with community stakeholders on REDLG projects to construct essential infrastructure, renovate hospitals, build libraries, and expand businesses, among other things.

Thank you again for your consideration of these critical programs and your service on behalf of the communities that they serve. Please feel free to reach out to me or anyone on my staff if we can be of assistance.

Sincerely,

CEO, NRECA.

SUBMITTED QUESTIONS

Response from Hon. Xochitl Torres Small, Under Secretary for Rural Development, U.S. Department of Agriculture

Question Submitted by Hon. Ann M. Kuster, a Representative in Congress from New Hampshire

Question. Madame Under Secretary, I wanted to ask you about The Healthy Food Financing Initiative, which provides grants to increase the availability of affordable, healthy food in underserved communities, including in rural America.

In 2019 and 2020, over \$4 million in small, targeted grants were awarded nationwide through HFFI—including to the Fresh Start Farms Food Hub, a collective of immigrant and refugee farmers in New Hampshire.

Can you talk more about the impact this program has on the rural economy and food access? Also, the statute also allows HFFI to provide loans to increase the affordable, healthy food in underserved communities. Can you explain why there have not been any loans made under this program?

Answer. Thank you for your question. During the first 2 years of the Targeted Small Grants Program (TSGP), HFFI funding provided \$4.4 million in grants to 30 recipients in 23 states. As a result of this assistance, we saw the following impacts:

- Over 460 Permanent jobs were created or saved;
- Approximately 182,750 square feet of space was created or renovated to sell, store or distribute food;
- Fifty percent of the funding served very low income areas;
- Ten percent of the recipients were owned or controlled by Native people; and
- Fifty-three percent of the recipients were owned or controlled by People of Color.

We expect these impacts to increase as HFFI is near awarding funds through a third round of funding for the TSGP.

In addition to the TSGP, we recently expanded the types of assistance that can be utilized through HFFI. Our National Fund Manager is currently finalizing two new programs that are expected to be offered in 2022. The first is a capacity-building grant program that will provide financial assistance to Partnerships to develop their own versions of HFFI in their local areas. Partnerships are regional, state, or local public-private partnerships that are organized to improve access to fresh, healthy foods and provide financial and technical assistance to eligible projects. Examples of activities we expect to fund include hiring a project coordinator, surveying local communities, providing one-on-one guidance to local retailers and food enterprises, assessing data to develop financial products like loans, grants, and tax credits, and identifying a local lender to set up a revolving fund.

The second program is a credit enhancement program. This program will again award grants to Partnerships via a qualified lender. These grants must be used for credit enhancement activities, such as establishing a revolving loan fund, implementing flexible credit requirements for lending eligible projects, and establishing a loan loss reserve.

Both of these new programs will continue to support priorities that were established through the TSGP. That is, priority will be given to projects that meet one or more of the following:

- Create or retain quality jobs for low-income residents in the community.
- Support regional food systems and locally-grown food;
- Are accessible by public transit;
- Involve women- or minority-owned businesses;
- Receive funding from other sources;
- Are located in or serve a rural area;
- Are located in very-low-income communities.

2018 Farm Bill authorized HFFI at \$125 million over 5 years and to date, the highest annual appropriation that the program has received is \$5 million.

Question Submitted by Hon. Angie Craig, a Representative in Congress from Minnesota

Question. Under Secretary Torres Small, thank you for considering the following question, which I was not able to ask during the hearing on March 8, 2022, but which I hope you may still be able to address.

We continue to see a decline in the health of rural communities. There is a tremendous need for investment in healthcare, childcare, fire and police stations as well as other essential community facilities across rural America. In my district, Compeer Farm Credit has joined with local banks, credit unions and USDA to finance these projects. However, the Farm Credit Administration process presents challenges for Farm Credit institutions to provide investment financing to rural hospitals, clinics, childcare and nursing care facilities.

Can you discuss programs or specific topics like rural health care where adequate access to financing has posed a barrier to rural areas? What can USDA do to work with FCA to create more opportunities for Farm Credit to work collaboratively with other lenders to finance these essential facilities?

Answer. USDA Rural Development (RD) serves an important role in providing direct access to capital for rural communities in every sector. In the healthcare sector, rural areas face challenges accessing care for many reasons including hospital and healthcare facility closures, workforce shortages, and limited telehealth opportunities due to lack of broadband. Over the last 10 years, RD has invested approximately 10% of its commercial dollars, almost \$9 billion, in the care section. RD also supports care services by supporting workforce development through planning, infrastructure and equipment financing, employer engagement, and education training. Additionally, RD's investment in rural healthcare projects and their associated infrastructure like broadband or public safety, can pave the way for further investment from other entities such as private lenders or local governments. As in the example described in the question, Farm Credit institutions can be a valuable partner for banks or credit unions as they seek to finance important rural health related projects. Farm Credit institutions can also serve as a holder for all or part of RD guaranteed loans for health-related projects under the OneRD Guaranteed Program. RD works with lenders across the country under the OneRD program and can connect interested parties or project proponents to approved lenders as requested.

A 2022 REVIEW OF THE FARM BILL
(THE ROLE OF USDA PROGRAMS IN ADDRESSING CLIMATE
CHANGE)

WEDNESDAY, MARCH 16, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, Costa, McGovern, Adams, Spanberger, Hayes, Delgado, Brown, Rush, Pingree, Kuster, Bustos, Plaskett, O'Halleran, Carbajal, Lawson, Craig, Axne, Schrier, Panetta, Bishop, Thompson, Austin Scott of Georgia, Crawford, DesJarlais, LaMalfa, Davis, Allen, Kelly, Bacon, Johnson, Baird, Jacobs, Balderson, Cloud, Mann, Feenstra, Miller, Moore, Cammack, Fischbach, and Letlow.

Staff present: Paul Babbitt, Lyron Blum-Evitts, Chu-Yuan Hwang, Kelcy Schanuman, Ashley Smith, Josh Maxwell, Patricia Straughn, Jennifer Tiller, and Dana Sandman.

OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA

The CHAIRMAN. The Committee will now come to order. I want to welcome everyone, and thank you for joining today's hearing entitled, *A 2022 Review of the Farm Bill: The Role of USDA Programs in Addressing Climate Change*. After brief opening remarks, Members will receive testimony from our very distinguished witnesses today, and then the hearing will be open for questions.

I want to welcome everyone to a very important hearing today. As many of you may recall, at our first hearing in my tenure as Chairman of this Committee, we discussed the role that farmers, ranchers, and foresters have in addressing climate change, as well as the impacts that climate change will have on them and their local communities in rural areas. Today's hearing will focus on how our 2018 Farm Bill supports voluntary USDA programs that can help improve the profitability of our agriculture operations, and mitigate climate change at the same time. This is very important.

And ladies and gentlemen, there is no industry, there is no entity that relies on their existence from climate and weather than agriculture. So, that is why we and agriculture must be at the front of the point of the spear when it comes to addressing climate change. And our rural communities are already facing inadequate

infrastructure and natural disasters. Just look at the fires in the western part of our nation that will grow in frequency and impact which further affects their ability to provide reliable, affordable, electric service and clean drinking water, things that other sections of the country take for granted. Our rural communities are in the crosshairs of this.

I am also for allowing farming to remain a viable way of life. That is important here. Family farming is the “hardbed” of our agriculture system, and I am pleased that we have a young farmer here today who can speak to her experience utilizing such programs through USDA.

Our aim is to also provide rural small businesses and towns with the tools to undertake efforts to address climate change impacts or increase their own energy efficiency, which helps their bottom lines and their budgets, and increase their farm’s profitability.

And as we are all seeing right now, increasing energy efficiency and producing more renewable energy right here at home should continue to be a goal to ensure that we do not have to rely on other countries for our own energy needs. We are blessed in our own country to have the necessary energy sources without depending on other nations.

Today’s panel of witnesses brings a wide breadth of experience from the role of the Federal Government in program development and funding, all the way to how farmers are utilizing and implementing these programs. I have said time and time again that we want agriculture to be at the tip of the spear. That is what we want to accomplish today. It is agriculture that must lead this nation’s efforts in climate change.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Welcome to another important hearing in our ongoing work to review the 2018 Farm Bill.

As many of you will recall, our first hearing in my tenure as Chairman of this Committee discussed the role that farmers, ranchers, and foresters have in addressing climate change, as well as the impacts climate change will have on them and their local communities.

Today’s hearing will focus on how the 2018 Farm Bill supports voluntary USDA programs that can help improve the profitability of our agriculture operations and mitigate climate change at the same time.

Agriculture occupies a unique position in this conversation with the potential to have a great impact through innovation on both reducing emissions and sequestering greenhouse gases.

Our rural communities are already facing inadequate infrastructure, and natural disasters that will grow in frequency and impact will further affect their ability to provide affordable, reliable electric service and clean drinking water.

In 2021, the annual global surface temperature was 1.51° Fahrenheit above the average in the last century. Additionally, 61 percent of the landmass of the contiguous 48 states experienced moderate or worse drought.

Make no mistake, climate change poses a threat to our rural communities, and to the production of food, fuel, and fiber. We must support our producers and rural communities in addressing this growing challenge.

I want to ensure that our farm bill programs support producers, particularly historically underserved and beginning farmers, who want to innovate and adopt practices that conserve resources and address climate change, while also allowing farming to remain a viable way of life. I am pleased that we have a young farmer here today who can speak to her experiences utilizing such programs through USDA.

Our aim is to also provide rural small businesses and towns with the tools to undertake efforts to address climate change impacts or increase their energy efficiency—which helps their bottom lines and budgets.

And as we're all seeing right now, increasing energy efficiency, and producing more renewable energy here at home should continue to be a goal to ensure that we don't have to rely on other countries for our energy needs.

Today's panel of witnesses brings a wide breadth of experience, from the role of the Federal Government in program development and funding, all the way to how farmers are utilizing and implementing those programs.

I have said time and time again that we want agriculture to be at the tip of the spear in our efforts to address climate change, and today's hearing is going to further sharpen that point as we continue our work on the farm bill.

I now recognize my friend and the Ranking Member of the Full Committee, 'GT' Thompson, for any opening remarks he may have.

The CHAIRMAN. With that, I will now turn it over to our Ranking Member for his opening statement.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, thank you, Chairman Scott, and thank you to our panelists for testifying today, it's greatly appreciated. I am excited about the panel that sits before us.

Recently, *The New York Times* wrote a series of stories and produced several videos denigrating rural Americans for providing this country with the safest, most abundant, and most affordable food supply in the history of the world. Let's set the record straight. U.S. agriculture accounts for less than ten percent of greenhouse gas emissions according to the Environmental Protection Agency. Over the last 70 years, U.S. agriculture has tripled food and fiber production, while usage of land, energy, fertilizer, and other inputs have remained steady.

Now, I believe farmers are climate champions, but there is more to be done. In fact, nearly a year ago, several of my Republican colleagues on this Committee introduced a suite of climate friendly and farmer-focused bills. So, if you have commonsense solutions, I am here to work with you. But I will not fundamentally upend our commodity, conservation, and crop insurance programs to appease Washington think tanks. I will reject complicating our programs and making climate the focus of every title of the upcoming farm bill reauthorization.

Now, we must ensure agriculture production remains viable in rural America to keep production from increasing in areas of the world with lower environmental standards, worse labor conditions, and fewer food safety considerations. And that is why a robust safety net is critical to keeping farms and production here, while lowering overall global greenhouse gas emissions.

Now, I would be remiss not to mention the tone deafness of this hearing, as our country and our farmers face enormous and immediate challenges, including higher food prices, record inflation, input costs, the tax on our energy independence, which, by the way, could lead us to a greater supply of domestic produced fertilizer, and dependable labor, which has been a theme long before COVID.

Now, these are the issues I hear about as I travel the country, and these are the issues we should be addressing. Our producers need action, not half-baked pilots and arbitrary mandates. Now, I

hope at the end of the day we recognize that our voluntary, locally-led, incentive-based conservation system is working as intended, and that we must not undermine its continued success in supporting the environment and producers.

Agriculture is science. It is technology. Let me back up and say American agriculture is science. It is technology. It is innovation. The demands of a 21st century farm economy and the economically viable climate solutions depend on tools and policies that continue to unleash and increase U.S. productivity.

Once again, thank you to our panelists that are here. I am looking forward to your testimony and the opportunity to be able to hear the exchange between our Members and yourselves.

Mr. Chairman, I yield back my time.

The CHAIRMAN. Thank you, Ranking Member.

The chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony, and to ensure that there is ample time for questions.

Our first witness today is the Honorable Charles Conner, who is the President and CEO of the National Council of Farmer Cooperatives, on behalf of the Food and Agriculture Climate Alliance.

Our next witness today is Ms. Kristin Weeks Duncanson, who is the owner and partner of Duncanson Growers, and she is testifying today on behalf of the AGree Economic and Environmental Risk Coalition.

Our third witness is our former Senate colleague, Senator Heidi Heitkamp from the great State of North Dakota. She is the Co-Chair of the Bipartisan Policy Center's Farm and Forest Carbon Solutions Task Force.

Our fourth witness today is Ms. Shakera Raygoza. Let me repeat that, please. Ms. Shakera Raygoza, who is an owner and operator of Terra Preta Farm, and she is testifying today on behalf of the National Young Farmers Coalition.

To introduce our fifth witness today, I am pleased now to yield to our colleague from California, Mr. Panetta.

Mr. PANETTA. Thank you, Mr. Chairman. It is my absolute honor to introduce Dr. Glenda Humiston as a witness in today's hearing on the role of USDA programs in addressing climate change.

Now, as a representative for the Central Coast of California, I am well aware not only of the benefits of our agriculture to our community and our country, but also the many, many challenges faced by that number one industry in the number one agricultural state in the nation, California. Unfortunately, as we will hear today, one of the growing challenges, especially in my state, is the everchanging landscape due to the climate crisis.

Fortunately, we have people like Dr. Humiston, who has dedicated her career to supporting agricultural sustainability by working to ensure that people thrive, our planet is healthy, and there is prosperity for all. As the current Vice President, Agriculture and Natural Resources for the University of California, Dr. Humiston advances those goals with innovative answers to local issues by leading a staff of over 1,500 people at 11 institutes and nine research and extension centers in California. She came into that position in 2015 with more than 25 years of experience working on public policy development and program implementation to support

sustainability. That includes her service as President Clinton's Deputy Under Secretary for Natural Resources and Environment at the USDA, and being appointed by President Obama as the California State Director at the USDA Rural Development Division.

Dr. Humiston is California born and Colorado raised where she grew up on a cattle ranch and was an active member of 4-H, so I have no doubt that her experience working with cows to U.S. Congress Members and for mechanization to the sequestration of carbon, and everything in between has allowed Dr. Humiston to be able to provide this Committee with insightful information for us to use as we provide solutions in the 2023 Farm Bill for the effects of climate change on agriculture.

Mr. Chairman, I thank you for this important hearing, and I thank you, Dr. Humiston, not just for your invaluable testimony today, but also for your interminable work to ensure a fruitful future for our agriculture not just in California, but all across our country.

I yield back, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Panetta.

And now, our sixth and final witness today is Dr. Joe Outlaw, who is the Co-Director of the Agriculture and Food Policy Center, Department of Agricultural Economics at Texas A&M University.

I am so pleased to have such a distinguished panel of witnesses before us today. Thank you so much for being with us. You will each have 5 minutes, and the timer should be visible to you and will count down to 0, at which time, your time will be expired.

And now, let us begin with you, Mr. Conner. Please begin when you are ready.

**STATEMENT OF HON. CHARLES F. CONNER, PRESIDENT AND
CHIEF EXECUTIVE OFFICER, NATIONAL
COUNCIL OF FARMER COOPERATIVES; CO-CHAIR, FOOD &
AGRICULTURE CLIMATE ALLIANCE, WASHINGTON, D.C.**

Mr. CONNER. Thank you, Chairman Scott.

Chairman Scott, Ranking Member Thompson, and Members of Committee, thank you for holding today's hearing and inviting me to testify on the role of the USDA programs in addressing climate change in the next farm bill. I am Chuck Conner, President and CEO of the National Council of Farmer Cooperatives, and a founding Co-Chair of the Food and Agriculture Climate Alliance, which I am testifying on behalf of today.

Formed 2 years ago, FACA breaks down the barriers that have existed between farm organizations and environmental groups on the issue of climate and gives producers a seat at the table in climate discussions. Today, with a steering committee of 24 groups and a broader membership of over 80 organizations, FACA truly represents the food, agriculture, and forestry value chain from field to fork.

As the Committee begins work on the next farm bill, we recommend that the process align with FACA's guiding principles. We believe that policies should be voluntary, and market- and incentive-based. That they should advance science-based solutions and outcomes, and that they should promote resiliency and help rural economies better adapt to climate change.

With these principles in mind, FACA has developed a robust set of policy recommendations that should be considered while writing the next farm bill. I would like to highlight just a few key examples. For a more comprehensive list, I refer the Committee Members to my written testimony.

First, we believe that USDA's Natural Resources Conservation Service must be bolstered to effectively meet and address climate change. FACA recommends a 10 to 20 percent increase in funding for NRCS programs to be dedicated for new and existing greenhouse gas reductions, adaptation, and soil health efforts. We also support setting aside one percent of total mandatory funding from the new baseline for technical assistance to ensure producers receive critical on the ground support.

Second, FACA recognizes that climate-smart agriculture requires reliable broadband. Without such a connection, many of the tools required to implement and measure best practices are simply out of reach of producers. We applaud Congress's efforts on broadband thus far; however, the need is great across the countryside, and many, many gaps remain. FACA hopes that this continues to be an area of focus in the farm bill process.

Third, FACA has several recommendations on energy efficiency that could be included in the next farm bill. For example, the Rural Energy for America Program, or REAP, helps producers and rural small businesses install renewable energy systems and improve energy efficiency. Since this program is oversubscribed, we urge the Committee to increase funding to meet demand. In addition, expanding REAP's eligible entities to include farmer co-ops would facilitate wider adoption of renewable energy technology, such as anaerobic digesters.

FACA also supports programs already underway at USDA to address climate change. I would like to give special mention to USDA's newly launched Partnerships for Climate-Smart Commodities. FACA is especially pleased to see the program structured consistent with our recommendations for climate pilot projects.

FACA's original policy recommendations were developed in 2020. They were not written with a farm bill in mind. In addition, the membership of FACA has grown considerably, both in numbers and diversity since that time. Because of this, FACA will soon start a process to update our own priorities for the upcoming farm bill to build upon the scope of our original recommendations. We look forward to working very, very closely with this Committee in this process.

Finally, as the farm bill process begins, I believe it is critical that any efforts to address climate must provide access for all producers and rural communities, and address the historic inequalities that have been seen in many Federal farm programs.

In conclusion, FACA believes that the next farm bill must be written to address climate policy. Responding to consumer demands, private-sector commitments to reduce emissions and grow green energy will only continue in the years ahead. The potential for added costs to be pushed down to producers makes it imperative that the next farm bill provide the tools to help producers remain profitable. With the right public policy, what could be an

unsustainable cost we believe can be turned into something that will boost farm income and help rural communities.

Mr. Chairman, again, thank you for holding this hearing today, and I look forward to responding to questions at the appropriate time.

[The prepared statement of Mr. Conner follows:]

PREPARED STATEMENT OF HON. CHARLES F. CONNER, PRESIDENT AND CHIEF EXECUTIVE OFFICER, NATIONAL COUNCIL OF FARMER COOPERATIVES; CO-CHAIR, FOOD & AGRICULTURE CLIMATE ALLIANCE, WASHINGTON, D.C.

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for holding today's hearing and inviting me to testify on the role of U.S. Department of Agriculture (USDA) programs in addressing climate change in the next farm bill. I am Chuck Conner, President and CEO of the National Council of Farmer Cooperatives (NCFC), and a founding co-chair of the Food and Agriculture Climate Alliance (FACA), which I am testifying on behalf of today.

The nation's food, agriculture, and forestry industries are uniquely positioned and ready to contribute to our country's broader effort of reducing industry impacts on the climate. Farmer-owned cooperatives, which represent a wide spectrum of agricultural production, are already leaning into voluntary climate initiatives that are pro-producer and pro-environment. We are actively seeking ways to engage while ensuring producers can generate revenue from adopting climate-smart practices rather than have costs pushed down on them. That is why NCFC has come together with an array of industry groups that may not always reach consensus when it comes to agriculture policy but agree that we must have a seat at the table to inform the development of policies to help producers do their part.

As we examine the many ways our industry can positively impact a changing climate, it is important to keep in mind that one size does not fit all when it comes to public policies and effective practices on the ground. What works for a dairy producer in the Northeast likely will not work for grain farmers in the Midwest, specialty crop growers out West or forest owners in the South. Climate policy as it relates to agriculture and forestry production must be voluntary, incentive-based and enable producers to remain profitable. The next farm bill provides the opportunity for this Committee to climatize existing programs to generate revenue for farmers while mitigating climate risk.

About FACA

Over 2 years ago, NCFC, along with the American Farm Bureau Federation, Environmental Defense Fund and National Farmers Union, came together to collaborate and establish a set of principles for developing climate policy priorities that the food and agriculture sector could broadly support. These principles include supporting voluntary, market- and incentive-based policies; advancing science-based outcomes; and promoting resiliency and helping rural economies better adapt to climate change. These policies were created with an overarching goal to do no harm, meaning FACA policies would be thoughtfully crafted, informed by broader potential consequences and tradeoffs, and account for inequities.

FACA is committed to working with the Federal Government, and within our own memberships and networks, to support current and future farmers, ranchers, and forest owners of all genders, races, creeds, religions, sexual orientations, and backgrounds. When it comes to implementing farm bill and other agency programs, USDA should commit to having a broad, diverse and inclusive stakeholder group actively participate in the policy decision making process. USDA programs and incentives should be structured inclusively and designed to equitably distribute benefits and burdens of climate and agriculture policies.

Paramount to success, the Alliance also has an underlying focus on the critical need for broadband access in rural America. Without a strong, reliable internet connection, farmers cannot obtain current information, utilize precision agricultural practices, record, track and analyze real-time data or meaningfully document progress on their farms. These capabilities are necessary to validate, verify and account for the outcomes of climate-smart practices.

With this foundation, FACA welcomed four additional founding members including, The Nature Conservancy, National Alliance of Forest Owners, National Association of State Departments of Agriculture, and FMI—The Food Industry Association. The group went on to develop more than 40 policy recommendations in six areas of focus: soil health; livestock and dairy; forests and wood products; energy; re-

search; and food loss, food waste and consumer engagement. There are several proposals highlighted below and included within FACA's recommendations that, if adopted, would provide opportunities for the food and agriculture sector to build stronger partnerships around climate-smart production strategies.

Since the release of FACA's foundational policy recommendations in November 2020, the Alliance has worked diligently to grow support for the Alliance. Today, FACA consists of 24 steering committee members and a growing list of more than 80 supporting state and national NGOs and trade associations that guide our efforts to advocate and implement our policy priorities.

A full list of FACA's policy recommendations and supporting members can be found at www.agclimatealliance.com.

FACA's Ongoing Outreach

Since November 2020, our outreach and collaborative efforts have taken a whole of government approach. FACA representatives have met with various Administration officials ranging from the U.S. Department of Agriculture's (USDA) Secretary of Agriculture Tom Vilsack, the Undersecretary for Farm Production and Conservation (FPAC), and the senior climate teams from the Office of the Secretary (OSEC), the Natural Resources Conservation Service (NRCS), and the Office of the Chief Economist (OCE), as well as the Senior Advisor for Agriculture at the Environmental Protection Agency (EPA), and the Program Associate Director (PAD) for Climate, Energy, Environment and Science at Office of Management and Budget (OMB). We appreciate this Administration's willingness to work with our alliance and take a voluntary, market- and incentive-based approach to new initiatives that have been introduced to promote climate-smart agriculture and forestry practices.

USDA has already taken innovative approaches toward supporting producers in adopting and maintaining climate-smart practices. For example, allowing feed additives to be eligible for Conservation Innovation Grants (CIG) to help producers and their partners better understand the impact various feed additives have on an animal's overall nutrition and on the environment. FACA identifies feed additives as a promising tool to address enteric emissions in ruminant livestock to reduce methane emissions resulting from enteric fermentation. However, regulatory roadblocks have added years onto the process of making these additives widely available to producers. This lag in approval is also impacting research and development investments in emissions reducing feed additives in the United States. Streamlining the approval process and facilitating more research and development in this field is just one important way USDA can help producers contribute to reduced GHG emissions and climate resiliency on the farm.

Earlier this year, NRCS launched a new Cover Crop Initiative through the Environmental Quality Incentives Program (EQIP) to deliver \$38 million to 11 states to help agricultural producers plant cover crops. Additionally, USDA's Risk Management Agency (RMA) introduced the Pandemic Cover Crop Program (PCCP) to help reduce producers' crop insurance premiums while maintaining cover crop systems.

Members of FACA weighed-in multiple times with Administration officials during the development of USDA's newly launched Partnerships for Climate-Smart Commodities (PCSC), urging the Department to first take an analytical approach through pilot project funding to better understand barriers to adopting climate-smart practices and reliable methods for measurement and verification. FACA strongly supports USDA's newly launched PCSC program and we are pleased to see the program structured in a manner consistent with FACA's recommendations. USDA's Notice of Funding Opportunity will allow participants to form partnerships to help producers overcome barriers and be competitive in private markets.

Members of FACA's steering committee also met with countless Members of Congress and their staff on both sides of the aisle to offer briefings on the group's principles and policy recommendations and discuss specific priorities such as appropriations requests and support for legislation. For example, FACA supports the *Agriculture Environmental Stewardship Act*, a bill that provides an important tool to incentivize investments in climate-smart technologies such as nutrient recovery and biogas systems that have multiple benefits to the environment and rural communities.

Additionally, the *Growing Climate Solutions Act*, introduced in the House by Representatives Abigail Spanberger (D-VA) and Don Bacon (R-NE) and supported by a growing bipartisan list of more than 70 cosponsors, would serve as a foundation for setting standards and certification criteria to help foster the growth of private-sector carbon markets. The companion bill was led by Senators Debbie Stabenow (D-MI) and Mike Braun (R-IN) and passed by the Senate last year with an unprecedented show of bipartisan support in a vote of 92-8. If farmers are to be part of solving climate challenges, they need to rely on proven science, accurate data, and

standardization to help get there—this bill does not offer the entire solution, but an important step in that direction. We appreciate Members of this Committee engaging with each other on this momentous piece of legislation.

These are just two examples of legislation that embody FACA's core principles of supporting bipartisan, voluntary, and incentive-based policies that promote resilience to help rural economies better adapt to climate change.

FACA Recommendations for USDA

Although FACA has not yet fully outlined a set of farm bill priorities, there are several areas within FACA's original policy recommendations worth examining as you prepare for the next farm bill.

For example, FACA encourages USDA to make a stronger commitment to agricultural and forestry research to help provide farmers, ranchers, and forest owners with the tools they need to adapt, mitigate, and become more resilient to climate change. These recommendations include directing USDA's ARS to develop protocols for climate research trials to establish consistent standards for measurement and verification and provide more in GHG emission outcomes. NRCS also requires adequate funding to expand the number of soil sampling reference sites and formally codify USDA's Climate Hubs. In order for farmers to play an active role to meaningfully move the needle on climate mitigation, producers will first require reliable data that is field and practice-generated over time.

Additionally, climate advantageous inputs will continue to be an important tool for producers to enable conservation practices like tillage management and use of cover crops. FACA supports continued innovation and maximizing climate benefits through a strong, science-based risk/benefit regulatory system. Access to safe and effective risk management tools is critical for growers to participate in these conservation practices and meet climate and sustainability goals.

FACA highlights in its policy priorities how improved pasture and grazing management has the potential to play a substantial role in terrestrial carbon sequestration. More needs to be done to develop protocols and to deploy prescribed pasture and grazing practices to reduce emissions. NRCS should identify regions and practices with the greatest potential for carbon sequestration and methane emissions reduction, and should support research, development, and widespread use of decision-support tools for climate and land stewardship outcomes.

There are several areas within FACA's recommendations related to energy efficiency that could be addressed by USDA. For example, the Rural Energy for America Program (REAP) is an important funding source for producers and rural small businesses needing assistance to install renewable energy systems or make energy efficiency improvements on their operations. However, REAP is an oversubscribed program and in critical need of additional funding to meet demand. Expanding REAP's eligible entities to include farmer co-ops would also facilitate wider adoption of renewable energy technology such as anaerobic digesters which are highly effective tools in reducing, destroying and converting methane and nitrous oxide emissions from livestock manure and other waste. FACA also recommends USDA conduct a study of on-farm energy initiatives to examine the status of on-farm efficiency adoption, rural renewable energy production and biofuels deployment. The study should also identify barriers and opportunities to increase on-farm energy initiatives and scale renewable fuels production.

In recent years, this Committee has held hearings on food waste. As you may recall, food waste accounts for eight percent of all global greenhouse gas emissions and is an important factor when examining how the food and agriculture sector can reduce its climate impact. More can be done to provide education through USDA's Food and Nutrition Services initiative, Team Nutrition, to highlight food waste prevention and reduction in information geared toward teachers and students. The National School Lunch Program operates in nearly 100,000 public and nonprofit schools and residential childcare institutions, providing lunches to nearly 30 million children every day. Opportunities to educate through Team Nutrition more fully could result in behavioral changes that lead to less food waste. Furthermore, more information about preventing food waste in USDA's Foods in Schools product information sheets is a low-cost way to ensure participants in USDA nutrition programs receive storage information that could prevent food loss and waste and increase the effectiveness of these nutrition programs. We have been successful in achieving this priority through the FY22 appropriations process but look forward to identifying other meaningful ways for USDA to partner with FDA and EPA on food loss mitigation and food waste strategies to prevent wasted inputs, energy, and methane emissions in landfills.

These are just a handful of FACA recommendations directed toward USDA that could be considered as part of the upcoming farm bill deliberations.

2023 Farm Bill Outlook

Members of FACA will begin in earnest later this month to examine and develop priorities for the upcoming 2023 Farm Bill and will likely start by exploring ways to improve and/or expand current programs. With 16 new members joining the steering committee since FACA's original policy priorities were released in 2020, it is reasonable to assume that the scope of the Alliance's policy priorities for the farm bill will expand. However, FACA's founding principles and original policy recommendations will guide any new policy priorities agreed upon by the Alliance and those priorities will continue to be adopted through the process of unanimous consent.

Regardless of the specific farm bill priorities FACA ultimately agrees to, we believe that the next farm bill must address climate policy as it impacts American agriculture and forestry. Private sector commitments to reduce greenhouse gas emissions and grow green supply chains will continue to increase in the years ahead. The potential for added costs to be pushed down to producers makes it imperative that the next farm bill provide the necessary tools to help producers remain profitable for years to come. With the right public policy, what could be an unsustainable cost can be turned into something that will boost farm income and rural economies. This is even more crucial given the rising costs of inputs caused by inflation and growing geopolitical uncertainty. Necessary for success and wide-spread adoption will be support from both sides of the aisle.

As the Administration and Congress take these steps, FACA believes it is critical that these programs provide equitable access for all producers and rural communities and address the historic inequalities that we have seen in many Federal farm programs. Further, as USDA begins efforts to receive input from producers and landowners on their work to reduce climate impacts, the Department should be proactive in promoting a diversity of representation on advisory committees and similar bodies to ensure programs work for all of agriculture.

The timing is right for all industries, including agriculture, to come together and find solutions that will sustain production agriculture and forestry practices in our country, while preserving the ability for producers to be profitable and to pass along their way of life for generations to come. State Departments of Agriculture, environmental NGOs, agricultural lenders, and producer groups are well-positioned to be trusted resources and partners for farmers, ranchers, and forest owners in what is often referred to as the "Wild West" of carbon markets and ecosystem services. We believe Congress and the USDA have important roles to play to provide a foundation for private market participation and to support the viability of our nation's agriculture and forestry producers through voluntary, market- and incentive-based policies and the passage of the 2023 Farm Bill.

FACA looks forward to working with Members of this Committee and other policy makers as we finalize our priorities for the 2023 Farm Bill and work together to support America's farmers, ranchers, and forest owners in a future focused on climate.

About the National Council of Farmer Cooperatives

Since 1929, NCFC has been the voice of America's farmer cooperatives. NCFC values farmer ownership and control in the production and distribution chain, the economic viability of farmers and the businesses they own, and vibrant rural communities. We have an extremely diverse membership, which we view as one of our sources of strength—our members span the country, supply nearly every agricultural input imaginable, provide credit and related financial services (including export financing), and market a wide range of commodities and value-added products.

American agriculture is a modern-day success story. America's farmers produce the world's safest, most abundant food supply for consumers at prices far lower than the world average. Cooperatives differ from other businesses because they are member-owned and are operated for the shared benefit of their members.

Farmer cooperatives enhance competition in the agricultural marketplace by acting as bargaining agents for their members' products, providing market intelligence and pricing information, providing competitively priced farming supplies and vertically integrating their members' production and processing. There are nearly 2,000 farmer cooperatives across the U.S. and earnings from their activities (known as patronage) are returned to their farmer-members, helping improve their members' income from the marketplace.

The CHAIRMAN. And thank you, Mr. Conner, for your excellent remarks and testimony.

And now, Ms. Duncanson, please begin when you are ready.

STATEMENT OF KRISTIN WEEKS DUNCANSON, OWNER AND PARTNER, DUNCANSON GROWERS; MEMBER, AGREE ECONOMIC AND ENVIRONMENTAL RISK COALITION, MAPLETON, MN

Ms. DUNCANSON. Thank you very much. Good morning to everyone. I am Kristin Weeks Duncanson, representing the AGree Coalition. I would like to thank Chairman Scott, Ranking Member Thompson, and all the Members of the Committee for an opportunity to testify today. As part of my testimony, I will also be submitting some documents from the coalition with my official statement.

My husband, Pat, and I own Highland Family Farms in Mapleton, Minnesota. We grow soybeans, corn, small grains, and raise hogs. We practice conservation on our acres. We are transitioning some acres to organic production, and are even considering how we can grow saplings on some marginal lands to help supply reforestation efforts in the northern part of our state.

I am also a member of the AGree Coalition, a group that builds consensus around ideas that will make agriculture more resilient, profitable, and sustainable. As a businessowner and farmer, better information is the foundation of how I manage risk from disruptions to our operation due to pandemics, wars, or climate change.

This Committee has repeatedly asked how do we convince farmers to adopt conservation practices? The answer is simple. It is better data—data that is up-to-date, accessible, and can be analyzed to show the costs and benefits of conservation practices. USDA and private-sector companies both collect an enormous amount of data from farmers. USDA has the opportunity to use our data to advance widespread adoption of conservation. AGree's farmer-centric approach is grounded in the understanding that farmers must see how conservation practices benefit farm profitability in order to bring adoption up to scale.

USDA must link and analyze data across mission areas and make this data available to qualified, trusted, academic institutions and researchers so that they can show that it works. It is easy to get bogged down in the concerns about data privacy or who gets access. I answered those criticisms by pointing out that USDA for years has shared confidential data with land-grant universities under strict guidelines. Processes to protect privacy, including requirements that all the published reports only use aggregated non-identifiable data already exist. Researchers who break a contract and reveal personal data face jail time.

I recently jotted down all the data that we report to USDA for farm programs, conservation programs, and for crop insurance, plus the data I report to my insurance agent and the data report to my lender, and to the Minnesota Pollution Control Agency. All that data or most of it is integrated on our John Deere platform. It is helpful to us, certainly, and it is also helpful to them. They are going to use that data to sell me more products and services.

However, not all farmers participate in this private-sector data revolution. It is the role of USDA and Congress to make sure that the new insights coming from analyzing big data are available to all farmers.

One example of how USDA could better use the data is to improve the connections between conservation and crop insurance. Cover crops, crop rotation, and rotational grazing make crop and rangeland more resilient to drought, bring more water holding capacity from deluges we are increasingly seeing, and save money for farmers through reduced pesticides.

Yet these practices are peripheral to crop insurance and are recognized after many years of adoption, as we change our APH. This can be 10, 20, or 30 years, depending upon how many crops you are growing.

You see the problem. Farmers use conservation and they become less risky and more resilient. That probability of loss decreases as their conservation increases, but that is only recognized through crop insurance as an APH that takes decades to establish.

Let me be abundantly clear. We support the Federal Crop Insurance Program and the reliability it offers to farmers. We also support that crop insurance could recognize or perhaps even incentivize farmers to adopt conservation to reduce risk to an uncertain future. Agriculture is going to change dramatically over the next span of the next farm bill. Let's plan for that future.

Thank you again for this opportunity. I only wish I could be there in person, but it is a beautiful day here in Minnesota, and we are getting ready to plant.

[The prepared statement of Ms. Duncanson follows:]

PREPARED STATEMENT OF KRISTIN WEEKS DUNCANSON, OWNER AND PARTNER, DUNCANSON GROWERS; MEMBER, AGREE ECONOMIC AND ENVIRONMENTAL RISK COALITION, MAPLETON, MN

Framing the Conversation

Good morning. I am Kristin Weeks Duncanson, representing the AGree Coalition. I'd like to thank Chairman Scott, Ranking Member Thompson, and all the Members of this Committee for the opportunity to testify today.

As part of my statement, I will be submitting several documents from the work of the AGree Coalition for the record (see *Appendix*).

I was 19 years old and an intern for a Senator from Minnesota when I worked on my first farm bill. Since then, I have been engaged in farm bills as a Senate staffer, commodity group leader, but most importantly, as a farmer from southern Minnesota.

My husband Pat and I own Highland Family Farms in Mapleton, Minnesota. We grow soybeans, corn, small grains, and raise hogs. On our farm, we are trying to become more resilient, and we are always planning for the future. Practicing conservation is how we manage the increasing risks to our farm from extreme weather.

We practice conservation on all our acres, we are transitioning some acres to organic production, and we are thinking about how we can grow saplings on marginal lands to supply reforestation efforts. We work towards economic, environmental, and community sustainability with every decision we make in our operation.

I am also a member of the AGree Coalition, a group housed at Meridian Institute, that builds consensus around ideas that will make agriculture more resilient, profitable, and sustainable. Today's hearing is timely as the Committee turns to how the next farm bill will help farmers—and our whole food system—reduce risk and address a changing climate.

As a business owner and farmer, better information is the foundation of how I manage risks from disruptions to my operation due to pandemics, wars, or climate change. I am always thinking about how I can get more information about the things I can't control, but that affect my farm.

This Committee has repeatedly asked, "How do we convince more farmers to adopt conservation practices?" The simple answer is better data. Data that is up to date, accessible, and can be analyzed to show the costs and benefits of conservation practices.

The AGree Coalition sees agricultural data as central to programs throughout the farm bill. USDA and private-sector companies both collect an enormous amount of data from farmers. *USDA has an opportunity to use our data to advance widespread adoption of conservation. AGree's farmer-centric approach is grounded in the understanding that farmers must see how conservation practices benefit farm profitability in order to bring adoption to scale.*

As programs are developed by both government and the private-sector to incentivize new adoption of climate-smart practices, many farmers and policymakers are also asking how the contributions of “early adopters,” the early innovators of these practices, will be recognized and rewarded. The most sustainable way to both maintain and expand climate-smart agricultural practices is to build the business case for conservation adoption through new data collection and research by USDA. Building the evidence base for the connection between conservation practices and risk can help us embed incentives for the adoption and maintenance of climate-smart agricultural practices throughout markets, finance systems, regulatory processes, and crop insurance programs.

USDA must link and analyze data across mission areas; create incentives for farmers to submit additional data they want to report about their farming practices; and make this data available to qualified, trusted academic institutions and researchers so they can show us what works.

It's easy to get bogged down in concerns about data privacy or who gets access. I answer those criticisms by pointing out that USDA has, for years, shared confidential data with land-grant universities. Processes to protect privacy—including requirements that all published reports use only aggregated, non-identifiable data—already exist. Researchers who break a contract and reveal personal data face jail time.

When you ask farmers, “Should your data be combined with other farm data to help you understand what conservation practices will work on your farm, helping you to reduce your risk and become more profitable?”, the answer is yes. Most farmers are just fine with sharing most data that they already are reporting. But USDA is woefully behind when it comes to managing data or having the ability to analyze what they do collect from farmers about the outcomes of conservation.

I recently jotted down all the data I report to USDA—for the farm program, for conservation programs, for crop insurance, plus data I report to my crop insurance agent, the data I report to my lender and to the Minnesota Pollution Control Agency. All that data is already integrated on the John Deere platform. It's helpful to me, certainly. And it's also helpful to them. They're going to use it to sell me more stuff.

However, not all farmers are participating in this private-sector data revolution. It is the role of USDA and Congress to make sure that the new insights coming from analyzing big data are available to all kinds of farmers.

The promise of big data is only fulfilled if we use it for the benefit of farmers. It does none of us any good to be siloed at USDA like it is now, with the private-sector investing and marketing for only a few crops, to only the most tech savvy farmers they select.

One example of how USDA can use data to improve tools for farmers is by using data to improve the connections between conservation and Federal crop insurance. Cover crops, no-till, crop rotations, rotational grazing, and other conservation practices make crop and rangeland more resilient to drought, bring more water-holding capacity for the deluges we increasingly see, and save farmers money through reduced pesticide applications. Yet these practices are peripheral to the crop insurance program, and only recognized many years after adoption when a 10 year APH (Actual Production History, the 10 year average of a farmer's yields) fully incorporates that less-risky system. Or after 20 years, for a farmer growing two crops. Or 30, for the farmers growing three.

You see the problem: farmers that use conservation become less risky and more resilient. Their probability of loss *decreases*. But that is only recognized in crop insurance through an APH that takes *decades* to establish. Hence, many farmers are talking about improvements.

Let me be clear—we support the Federal Crop Insurance Program and the reliability it offers to farmers. We also support that crop insurance should recognize and even incentivize farmers to adopt conservation to reduce risk and resilience on the way to an uncertain future.

Agriculture is going to change dramatically over the span of the next farm bill. By the time we get to 2028—when the bill you are about to write will expire—this country and farmers like me who grow our food are going to be different. Those who purchase our products will be different. Let's plan for the future, rather than ad-

addressing the needs of the past. Thank you for this chance to share my vision for the next 5 years.

The Case for Next Generation Crop Insurance

June 2021

Foreword

Federal crop insurance is a key risk management strategy for the majority of commodity crop producers. Since 2015, the AGree Economic and Environmental Risk (E2) Coalition has sought to better understand the risk reduction benefits of agricultural conservation practices and how these benefits are accounted for in the Federal Crop Insurance Program (FCIP). This paper summarizes important insights from the Coalition's work on Federal crop insurance and conservation.

In sharing what we have learned, AGree hopes to inform current policy debates in a way that drives broader adoption of agricultural conservation practices and strengthens the FCIP by improving understanding of how conservation practices reduce risk and improve farmers' economic outcomes, enhance environmental performance, sequester carbon and support working lands resilience.

Farmers' investments in practices that improve soil health have the potential to increase resilience to severe weather events, reduce environmental impacts, and increase productivity over time. Yet, while conservation practices have the potential to impact both producer profitability and the environment, more work must be done to fully understand how conservation practices reduce risk and how to best reflect those risk-reduction benefits in crop insurance and conservation policy, data innovation efforts and rating models.

AGree's work is intended to support and inform the work of the Risk Management Agency—as well as other USDA agencies such as the Farm Services Administration (FSA) and Natural Resources Conservation Service (NRCS)—to promote climate-smart agriculture through Federal crop insurance and other programs.

We hope you find this paper to be a useful resource.

Executive Summary

Federal crop insurance, a major component of the Federal farm “safety net,” is a central component of risk management for the vast majority of commodity crop producers. Since 2015, the *AGree Economic and Environmental Risk Coalition*¹ (AGree E2 Coalition) has sought to better understand the risk reduction benefits of agricultural conservation practices and how these benefits are accounted for in the Federal Crop Insurance Program (FCIP). The AGree E2 Coalition grew from the foundational work of AGree, an initiative designed to elevate food and agriculture

¹<https://foodandagpolicy.org/>.

as a national priority. We are housed within *Meridian Institute*,² a mission-driven nonprofit consultancy that builds understanding, guides collaboration and drives action to address our world's complex challenges.

This paper summarizes important takeaways to date from the E2 Coalition's work on Federal crop insurance and conservation. In sharing what we have learned, AGree hopes to inform current policy debates in a way that drives broader adoption of agricultural conservation practices and strengthens the FCIP by better understanding how conservation practices reduce risk and improve farmers' economic outcomes, enhance environmental performance, sequester carbon, and support working lands resilience.

The agriculture sector is uniquely impacted by weather. Building landscape resilience is vital to protecting agricultural yield and farmers' livelihoods today and into the future. At the same time, agriculture is a significant contributor to greenhouse gas emissions, while having the capacity to serve as a carbon sink.

A growing body of evidence—including work supported by AGree—shows that farmers who use conservation practices, such as cover cropping, conservation tillage, diversified crop rotation, and management-intensive rotational grazing, reduce yield risk, which, in turn, could result in fewer insurance claims. Research shows that conservation practices can improve water quality and soil health by increasing soil organic matter, and, relatedly, healthier soils reduce risk, especially in very dry or wet conditions, as well as sequester carbon.

The Risk Management Agency (RMA), an agency within the United States Department of Agriculture (USDA), implements the FCIP and has begun to look at how conservation practice implementation can reduce risk. AGree's work is intended to support and inform the work the Agency has begun to understand the effects of conservation practice adoption on yield variability, which is a measure of risk used by RMA. This effort will require using robust data analysis to determine the impact of weather, conservation practices, soil type and other variables on yield risk. Further, policy alignment between agencies—including RMA, Farm Services Administration (FSA), and Natural Resources Conservation Service (NRCS)—that serve producers is needed to ensure that program design and implementation work together to facilitate climate-smart agriculture while reducing administrative barriers and challenges for farmers seeking to adopt and expand the use of agricultural conservation practices.

Through our work over the last several years, we have identified the following key areas where policy improvements can support RMA and drive next generation crop insurance for the benefit of farmers, the environment and taxpayers now and into the future.

- **Data Innovation:** Modernize data collection, interoperability, storage and sharing while protecting producer privacy.
- **Crop Insurance and Conservation Policy:** Improve crop insurance and conservation policies so that they work better for farmers and reduce risk while adopting new policies that encourage adoption of conservation practices that reduce risk.
- **FCIP Rating Model:** Enable research that helps strengthen the FCIP risk rating model by addressing knowledge gaps, and utilize data to assess and improve on-the-ground outcomes.

Introduction

Federal crop insurance is a key risk management strategy for the majority of commodity crop producers. The three largest commodity crops—corn, soy and wheat—are overwhelmingly insured under the Federal Crop Insurance Program (FCIP), with over 90% of corn and soy acres and over 85% wheat acres enrolled (*Congressional Research Service*,³ 2021). These insured acres equate to an enormous landmass of over 195 million acres (Farm Bureau, 2018). Crop insurance is one of the largest expenditures under the farm bill, representing about 37% of the total farm portion of the farm bill¹ or around \$10 billion per year (*Congressional Budget Office*,⁴ 2018).

Every year, farmers have weather-related losses, but in some years, such as in 2012 or 2019, years that saw substantial drought and flooding respectively, the safety net is relied on expansively, with billions paid in insurance claims (Rippey, 2015;

²<https://merid.org/>.

³<https://fas.org/sgp/crs/misc/R46686.pdf>.

¹The "farm" (or producer-focused) portion of the farm bill excludes the Supplemental Nutrition and Assistance Program.

⁴<https://www.cbo.gov/publication/54880>.

Schnepf,⁵ 2020). For example, 2019 saw record “prevent plant indemnities” with \$4.2 billion paid to farmers who were not able to plant because of very wet conditions (Schnepf, 2020). Given the high enrollment and significant Federal subsidization,^[iii] crop insurance has the potential to drive broader adoption of agricultural conservation practices that reduce risk and provide a host of economic and ecological co-benefits including, for example, sequestering carbon and improving water quality.

Reducing agricultural risk and building landscape resilience are essential as the impact of climate change accelerates (SARE,⁶ 2018). As the atmosphere warms, severe weather events are increasing in frequency and climate changes are occurring. The Midwest, where the majority of commodity crops are produced, is generally becoming wetter in the spring, while the summers are becoming drier and hotter, as is much of the Western Plains. The *Fourth National Climate Assessment*⁷ (2018) has summarized climate-related challenges in the Midwest as follows:

Increases in warm-season absolute humidity and precipitation have eroded soils, created favorable conditions for pests and pathogens and degraded the quality of stored grain. Projected changes in precipitation, coupled with a rise in extreme temperatures before mid-century, will reduce Midwest agricultural productivity to 1980 levels without major technological advances.

Mounting scientific evidence shows that conservation practice implementation reduces crop yield risk during times of drought, heavy precipitation and flooding. Additionally, conservation practices provide multiple environmental benefits, including improved water quality and soil moisture management, carbon sequestration, and habitat (U.S. Farmers and Ranchers Alliance Ecosystem Services Science Advisory Council,⁸ 2019). These co-benefits may also create new funding streams for farmers as carbon and water quality markets come online.

To help inform work under way by U.S. Department of Agriculture (USDA), as well as, broader policy efforts to improve farm policy, this paper provides AGree’s synthesis on the following issues:

- *The risk-reducing effect of conservation practices;*
- *Barriers to conservation practice adoption by producers in the FCIP; and*
- *Critical need for improved agriculture data collection, utilization and policy alignment among USDA agencies that serve farmers.*

The Risk Management Case for Conservation Practices

A growing body of research shows that conservation practices are an effective risk reduction strategy. As noted above, the 2019 planting spring season was the wettest on record in many areas (USDA,⁹ 2019). As a result, farmers submitted over \$4 billion in insurance claims for nearly 20 million acres where wet conditions prevented farmers from planting a cash crop within the time required by insurance, a circumstance known as prevent plant or prevented planting (Congressional Research Service,¹⁰ 2020).

A recent National Cover Crop Survey (Survey) found that 78.6% of the respondents reported wet planting conditions that delayed planting, but that 78% of farmers who planted cover crops did not have prevent plant claims (2019–2020 National Cover Crop Survey¹¹). In addition, the Survey found promising results for “planting green,” the practice of seeding a cash crop directly into a living cover crop and allowing both to grow for a period. Despite saturating spring rains, 54.3% of respondents reported they were able to plant cash crops sooner in green-planted fields than in fields where cover crops were terminated early or were not present (2019–2020 National Cover Crop Survey). Many producers also reported other benefits, with 70.5%

respondents reporting that the planting green improved weed control when compared with their other fields (2019–2020 National Cover Crop Survey).

The Conservation and Crop Insurance Research Pilot,¹² a collaboration between AGrEE, researchers at the University of Illinois, and USDA, will shed further light on the impact of cover crops on risk management during wet years. Under the pilot project, researchers are looking at USDA data and other information for six states—Indiana, Illinois, Iowa, Missouri, Minnesota, and South Dakota—to better understand how the use of cover crops and no-till affected corn and soybean planting dates in the extremely wet spring of 2019, whether planting occurred at all (prevent plant crop insurance claim declared), and what impact the conservation practice(s) had on 2019 yields. Results of this data analysis effort should be available by early 2022.

At the other end of the weather spectrum, soil organic material (SOM), of which soil organic carbon is the main component (Lal, 2016), has been found to protect yields during drought conditions. Higher levels of SOM improves water retention, thereby mitigating against the impact of drought. Further, SOM is important to overall soil health and carbon sequestration, which is key to the growth of terrestrial carbon sequestration markets (*reThink Soil: A Roadmap for U.S. Soil Health, The Nature Conservancy*,¹³ 2016). Cover cropping, no-till, and conservation tillage increase soil organic matter (Chambers, *et al.*, 2016; Poeplau and Don, 2015; Yu,¹⁴ *et al.*, 2020).

Consistent with the benefits associated with SOM and its relationship with cover cropping and tillage, a recent U.S. study on maize (corn), concluded that soil organic matter protects yields and lowers crop insurance payouts (Kane, *et al.*, 2021). Further, using long term evidence, Bowles, *et al.*, found that using *crop rotation diversification* across North America increased maize yield in all weather conditions, including drought (Bowles, 2020). Introducing advanced grazing management systems, such as management intensive grazing, into cropping systems has also been shown to improve soil health and, relatedly, increase soil organic material (*Wallace Center*,¹⁵ 2018).

Policy Impediments to Conservation Practice Adoption

Although the use of cover crops has increased over the last decade, only a small percentage of cropland acres—about 3.9% of all U.S. cropland—is planted in cover crops (2017 Agriculture Census¹⁶). While important changes were made in the 2018 Farm Bill related to cover crops and crop insurance eligibility, policy impediments—both actual and perceived—hinder conservation practice adoption by farmers who participate in the FCIP. These *challenges persist*¹⁷ despite RMA's recent changes to cover cropping guidelines intended to make it easier for producers to adopt the practice. Policy barriers fall into three main categories:

1. *Policies that prevent or make adoption of conservation practices challenging;*
2. *Lack of information regarding the compatibility of conservation practices with FCIP; and*
3. *Lack of incentives to implement conservation practices in the first place.*

For historical context and as an illustrative example, prior to the 2018 Farm Bill, farmers faced the danger that an indemnity claim would be denied if they did not either adhere to USDA guidelines regarding cover crop termination or receive advanced approval for deviations. This policy discouraged many producers from planting cover crops. To address this barrier, the 2018 Farm Bill included language that provided cover crops were to be considered good farming practices (GFP) so that termination deviations would be treated similarly to other farm management decisions.^[iii] In response, RMA removed the advanced approval requirement, re-issued slightly modified termination “guidelines” to clarify termination options for cover crops, and provided that cover cropping, including termination issues, could also use the good farming practices process if necessary. This shift in policy is important for

^[iii] Section 11107, The Agriculture Improvement Act of 2018 (2018 Farm Bill), P.L. No. 115-334.

reducing impediments to adoption. The guidance document, however, requires ongoing refinement and expansion by the Natural Resources Conservation Service (NRCS) so that the termination guidance can be used by innovative farmers without the need to go through the GFP process.

Despite this change, however, over a quarter of farmers in a recent survey expressed the belief that crop insurance is a barrier to cover crops, and 34.7% did not know whether or not crop insurance is a barrier (Fleckenstein, *et al.*, 2020).

This lack of knowledge indicates the need for RMA and NRCS to take an *affirmative and coordinated* outreach and education role to enhance awareness and understanding of the multiple benefits of cover crops.

Moreover, crop insurance coverage concerns continue for other conservation practices that are endorsed by NRCS, but where RMA must determine that implementation does not impact historic yield or maturation. This challenge of FCIP keeping up with conservation innovations that reduce risk is an impediment to broader adoption of conservation practices, as well as improved economic and environmental outcomes for producers. Fortunately, the secretary of the USDA has the authority to address this misalignment by improving the coordination between agriculture agencies in policy development and program delivery, strategies that are also necessary to attain the Administration's ambitious climate goals.

The third challenge is the lack of incentives to *adopt* risk-reducing conservation practices. The reasons why farmers choose not to implement conservation practices are multifactorial, but economic concerns are often an important factor in their decision-making (2019–2020 National Cover Crop Survey). To partly address this concern, recently *Illinois*,¹⁸ *Iowa*¹⁹ and *Indiana*²⁰ partnered with RMA to provide a \$5 per acre crop insurance premium discount for eligible farmers enrolled in FCIP who implement cover crops. Farmer demand for this modest incentive out-paced available funding.

Recently, RMA built on the overwhelming success of these state programs through the Pandemic Cover Crop Program (PCCP), a new initiative which offers a \$5 per acre premium discount for the 2021 crop year. To be truly effective, any incentive needs to be ongoing and available on an annual basis so that it encourages greater adoption and not only rewards past practice. The incentive should be extended to farmers enrolled in Whole Farm Revenue Protection, so the program is inclusive of diversified operations, including specialty crops. Additional funding for RMA to incorporate cover crop reporting into the Acreage Crop Reporting Streamlining Initiative (ACRSI) would also make cover crop reporting easier in the future. Finally, as the PCCP is implemented, we encourage USDA to capture and publish the results of this incentive to further demonstrate our understanding about the risk-reduction benefits of cover crops and ensure that Federal crop insurance policies acknowledge the connection between conservation, soil health and agricultural risk.

RMA's initiative to support cover crops in the current crop year is a positive step, but more must be done to accelerate the adoption of cover crops and other conservation practices. As we discuss further below, despite growing evidence that conservation practices reduce risks, the risk rating model used by RMA may not adequately recognize the risk reduction benefits of soil type, conservation practice adoption and other variables.

Assess the FCIP Rating Model

In order to more accurately and fairly assess risk, research is needed to help assess and, as needed, strengthen the FCIP risk rating model by addressing knowledge gaps and utilizing data to improve on-the-ground outcomes. In particular, the FCIP rating model should evolve—as supported by research—to consider the risk reduction benefits of conservation practices in the context of increased climate risk. Currently, RMA relies primarily on average historical yields (Actual Production History or APH) and loss costs to determine baseline insurable yield levels and risk rates but does not consider soil health improvements from conservation practice use. In particular, there is a lag between when soil health improvements will affect yield variability and performance in reality *versus* when they will be reflected in the RMA risk assessment (actuarial data). In the case of APH, it could take years for the soil health improvements to be fully reflected. In the case of rates, since loss experience—the amount of loss an insured farm experiences—of producers using conserva-

¹⁸ <https://www2.illinois.gov/sites/agr/Plants/CoverCrops/Pages/default.aspx>.

¹⁹ <https://www.cleanwateriowa.org/cropinsurancediscount>.

²⁰ <https://www.in.gov/isda/divisions/soil-conservation/cover-crop-premium-discount-program/>.

tion practices are pooled with loss experience in fields not using conservation practices, rates may be biased against conservation practice use relative to conventional practices.

A watershed 2017 study published in the *American Journal of Agricultural Economics* by Woodard and Verteramo-Chiu²¹ explored the feasibility of using soil data when determining crop insurance guarantees and rates. The researchers used high-resolution data sets for soil type, one indicator of soil quality and carbon sequestration potential, and overlaid other data regarding soil health attributes such as available water storage and soil organic carbon. The study found that estimating risk using available soil data sets is feasible. Further, the researchers found statistically and economically significant differences in premium pricing between RMA's risk ratings and the risk ratings calculated when incorporating soil data. In particular, RMA's ratings generally underpriced insurance premiums for low quality fields and overpriced high-quality fields, an artifact of pooling dissimilar risks in RMA's rating.

Other contemporary research confirms the risk reduction benefits of healthy soils. Following Woodard and Verteramo-Chiu (2017), Kane, *et al.* (2021) analyzed county data from 2000 to 2016 related to corn yield, drought and crop insurance claims. The data analysis showed that "counties with higher soil organic matter are associated with greater yields, lower yield losses, and lower rates of crop insurance payouts under drought," corroborating earlier work. Another recent study analyzed long term yield data sets for maize in the United States and Canada and found that diverse crop rotations increased yield *across all growing conditions* by 28% (Bowles, *et al.*, 2020). As severe weather becomes more commonplace and temperatures rise, the information from such studies likewise becomes increasingly more important to gather and apply.

Ongoing research will further enhance our understanding about the role of soil health and conservation practices in risk reduction.

In addition to the Conservation and Crop Insurance Research Pilot discussed above, research is underway through RMA's 508(h) process, which provides an avenue for third parties to propose new insurance products that could be beneficial to producers to determine how and in what combination ("stacked") conservation practices reduce risk. These 508(h) projects, if approved by the Federal Crop Insurance Corporation (FCIC) Board, could provide information for new insurance rating methodologies that explicitly consider conservation practices. The Conservation and Crop Insurance Research Pilot is an example of why the ability of third parties, such as companies, NGOs and others, to develop plans of insurance through the 508(h) process must be maintained and protected.

Harness the Power of Agriculture Data

Essential to improving the farm safety net to meet today's challenges is agriculture data.

Agribusiness has long understood the value of data in driving improved outcomes on the farm. For years now, companies like John Deere and The Climate Corporation have been collecting and using big data sets to analyze and improve productivity at the field level. USDA has a growing awareness of the need to modernize its approach to data collection and is taking affirmative steps to address multiple data silos, data gaps and a lack of data interoperability in order to improve its program implementation and to support extramural research. Consequently, supporting these efforts across agencies by addressing legal and policy gaps is essential to fully modernize USDA's approach to data collection and utilization.

AGree has been working with diverse stakeholders to help address *USDA's data collection and utilization issues*.²² For example, the 2018 Farm Bill included language at section 12618 that required the USDA to assess and report to Congress its current conservation datasets, and the effects of conservation practices on farm and ranch productivity. USDA's report to Congress inventoried major data sets but also described the limited authority to facilitate extramural research into the impacts of conservation practices on productivity.^[iv]

Since the passage of the 2018 Farm Bill, USDA has made inroads in addressing agriculture data shortcomings, but administrative barriers and legal gaps remain that stand in the way of harnessing the power of modern data analysis to improve programmatic outcomes. The good news is that these issues are solvable. For example, Senators Klobuchar and Thune supported the aforementioned agricultural data

²¹ <https://onlinelibrary.wiley.com/doi/abs/10.1093/ajae/aaw099>.

²² https://foodandagpolicy.org/wp-content/uploads/sites/4/2019/09/2018-July-Ag-Data_Improving-Productivity-while-Protecting-Privacy.pdf.

[iv] Report on file with Meridian Institute.

language in the 2018 Farm Bill that helped provide the impetus to USDA's current data efforts, including the *Crop Insurance and Conservation Practice Research Pilot*.²³ Currently, climate and other bills being considered by Congress, as well as a commitment at the USDA to optimize its programs and authorities to provide climate solutions and better serve farmers, provide a rare opportunity to address these administrative and legal issues. Adopting industry standard data infrastructure, security protocols and user permissions to protect security and confidentiality of producer data while automating and standardizing data collection, storage and sharing are key to moving the USDA's programs forward in a way that better serves farmers and accelerates climate-smart agriculture.

The Road Ahead

Given the challenges of climate change and other pressures on farmers, there is an urgent need to innovate our approach to the farm safety net.

A convergence of diverse, bipartisan stakeholders around the interrelationship between crop insurance, conservation and climate is providing a unique opening to do so. From these efforts, we have identified three, interrelated components for creating, implementing and continuously improving next generation risk management.

- **Data Innovation:** Modernize data collection, interoperability, storage, and sharing while protecting producer privacy.
- **Crop Insurance and Conservation Policy:** Improve crop insurance and conservation policy so that they work better for farmers and reduce risk while adopting new policies that encourage adoption of conservation practices that reduce risk.
- **FCIP Rating Model:** Enable research that helps strengthen the FCIP risk rating model by addressing knowledge gaps, and utilize data to assess and improve on-the-ground outcomes.

By harnessing the power of agricultural data, growing our knowledge about what conservation practices work and where and applying this knowledge to USDA programs, we can improve risk management, generate a host of co-benefits and provide a better value for farmers and taxpayers.

CFAD members participated as individuals, not as official representatives of their organization.

Foreword

The Climate, Food, and Agriculture Dialogue (CFAD) is a group of climate, food, and agriculture interests advocating for ambitious and durable Federal policy solutions on food systems and climate change. The Dialogue’s long-term goal is to enact Federal climate policy in line with our *guiding principles*.^[i]

This paper provides insight and recommendations on the challenges facing “early innovators.” Early innovators are our leaders in conservation agriculture. They have tested and developed climate-smart practices, demonstrated the benefits, and paved the way for others to follow. Unfortunately, early innovators can be excluded from public and private conservation programs, which target incentives toward farmers who are new to the conservation space.

As public and private investments in climate-smart agriculture increase, we risk excluding the very leaders who blazed the trail for the expansion of climate-smart agriculture. Our goal should be to develop an agricultural system that encourages maintenance of existing climate-smart practices, continued innovation, and broader adoption of climate-smart practices by producers who have not yet been persuaded to adopt them. The recommendations within this paper were developed with that goal in mind.

We hope you find it to be a useful resource.

The AGree Climate, Food, and Agriculture Dialogue (CFAD)

Introduction

*Expanding climate-smart agriculture is a central tenet of the Biden Administration’s whole-of-government approach to address climate change, stimulate economic growth, and support agricultural productivity.*¹

At the 26th United Nations Climate Change Conference of the Parties (COP 26), President Biden launched the *Agriculture Innovation Mission for Climate*^[ii] in partnership with the United Arab Emirates, 31 other countries, and 48 NGOs, to mobilize \$8 billion in investments in climate-smart agriculture over the next year.

Pursuant to that goal, U.S. Secretary of Agriculture Tom Vilsack highlighted USDA’s Climate-Smart Agriculture and Forestry Partnership Initiative as a key strategy for advancing climate-smart agriculture, saying:

“We’re positioning U.S. farmers, ranchers, and forest landowners as leaders in addressing climate change, while at the same time creating new market opportunities for them through pilot projects that invest in science, monitoring, and verification to measure the benefits of climate-smart production practices. Unlocking these markets will be key to tapping into the incentives needed to adopt climate-smart practices on the ground.”²

As programs are developed by both government and the private-sector to address climate change by incentivizing adoption of climate-smart practices, many farmers and policymakers are asking how the contributions of the “early innovators” of these practices will be recognized and rewarded.

Early innovators are our leaders in conservation agriculture—they have tested and developed new climate-smart practices, proved their efficacy and long-term profitability, and paved the way for others to follow. Although early innovators shoul-

^[i] <https://climatefoodag.org/guiding-principles/>.

¹ USDA is in the process of developing an official definition of “climate-smart agriculture.” In this paper, we use the term to refer to integrated agricultural practices that maintain or increase productivity, enhance resilience, and reduce emissions (avoiding emissions or potentially removing them from the atmosphere) on U.S. working lands.

^[ii] <https://www.usda.gov/media/press-releases/2021/11/02/launching-agriculture-innovation-mission-climate>.

² United States Department of Agriculture. [Press Release 0239.21]. (2021, November). *USDA Underscores Commitment to Climate Action at COP26* | USDA (<https://www.usda.gov/media/press-releases/2021/11/05/usda-underscores-commitment-climate-action-cop26>).

dered the risk and, in many cases, the cost of establishing climate-smart agricultural practices, newcomers to climate-smart agriculture are now better positioned to participate in programs looking for new carbon sequestration and emissions reductions (“additionality”). This puts the early innovators at a financial disadvantage to other producers, who have more room for improvement and will be able to stack greater income from ecosystem service payments. Early innovators should not be financially penalized going forward because they chose to take action sooner than others.

There is also concern that the challenge early innovators face in generating additional emissions reductions could create a moral hazard—the financial incentive to revert to conventional management to become eligible for private carbon markets. These concerns beg the question: **How do we create a system that ensures farmers who have transitioned to climate-smart agricultural practices will maintain practices over the long-term, while continuing to improve and innovate?**

The purpose of this paper is to outline a framework for understanding the early innovator issue and share CFAD’s consensus recommendations.

Issue Assessment

Over the fall of 2021, CFAD convened panel discussions composed of private-sector, government, and NGO experts to better understand the issue and develop a set of consensus policy recommendations. Based on these discussions, our assessment of the early innovator issue is as follows:

- **There is no single, agreed-upon definition of what makes producers “early innovators,”** which complicates discussions about how their contributions should be considered and recognized. “Early innovators” are generally referred to as producers who have implemented some number of conservation practices, and it is inferred that these practices likely have been in place for a significant amount of time (*i.e.*, longer than just a few years). The reality is that the early innovator community is not a monolith—it includes crop and livestock producers who have implemented climate-smart practices on the entirety of their farm for decades, as well as those who have periodically implemented selected practices on just a portion of their operation for shorter durations. Furthermore, many producers who have adopted one or more conservation practice will still be eligible for carbon market programs if they agree to expand or add new practices. **Policy discussions should recognize that early innovators face varying degrees of difficulty in benefiting from carbon market programs**—including small- and medium-sized, diversified, and BIPOC producers—depending on the breadth and duration of their conservation actions, the size of their operations, and geography and soil type.
- **We do not have a comprehensive assessment of how many early innovators exist and consequently do not understand the magnitude of the risk of losing their established conservation progress.** Estimates point to a relatively low number of farmers who would be entirely excluded from carbon markets. Data from the National Agricultural Statistics Service’s (NASS) 2017 Agricultural Census estimates that conversion to no-tillage systems has slowed in recent years, only expanding from 96.5 million acres to 104.5 million acres between 2012 and 2017. Increase in cover crop acreage has been more significant over that period; however, the total extent of cover crop adoption remained relatively low at only about 15 million acres in 2017.³ NASS also reports that there are 5.5 million acres in organic production as of 2019.⁴ These numbers can be interpreted either as a minor issue in the grand scheme of the climate crisis or as millions of acres of U.S. farmland potentially at risk of losing conservation practices due to perverse incentives.
- **Early innovators are an important group of producers—they represent conservation innovation, leadership, hard work, and risk-taking.** They have created conservation benefits that need to be recognized and maintained. Moreover, agricultural communities look to early innovators before investing in climate-smart and other conservation practices. Seeing unequal compensation

³National Agricultural Statistics Service. 2017. CENSUS OF AGRICULTURE Vol. 1, *Chapter 1: U.S. National Level Data (Table 47: Land Use Practices by Size of Farm: 2012 and 2017)*. Retrieved from [st99_1_0047_0047.pdf \(usda.gov\)](https://www.nass.usda.gov/Publications/AgCensus/2017/Full_Report/Volume_1,_Chapter_1_US/st99_1_0047_0047.pdf) (https://www.nass.usda.gov/Publications/AgCensus/2017/Full_Report/Volume_1,_Chapter_1_US/st99_1_0047_0047.pdf).

⁴National Agricultural Statistics Service. 2020. 2017 CENSUS OF AGRICULTURE Vol. 3, *Special Studies, Part 4: 2019 Organic Survey*. Retrieved from https://www.nass.usda.gov/Publications/AgCensus/2017/Online_Resources/Organics/index.php.

for the same practices could alienate conservation leaders and disincentivize the teaching, promotion, and adoption of innovative, new climate-smart agricultural practices. **Our goal should be to develop an agricultural system that encourages maintenance of existing climate-smart practices, continued innovation by conservation leaders, and the adoption of climate-smart practices by producers who have not yet been persuaded to adopt them.**

Recommendations

A range of incentives have been proposed to reward early innovators for past actions, including one-off, lump-sum payments and amending USDA conservation programs to reward conservation maintenance. However, CFAD proposes that the most sustainable and influential way to maintain and expand climate-smart agricultural practices is to build the business case for conservation adoption. This can be done by embedding incentives for the adoption and maintenance of climate-smart agricultural practices throughout agricultural markets, finance systems, regulatory processes, and insurance programs. These strategies will benefit both early innovators and those new to climate-smart agricultural practices.

Our recommendations for creating this system include the following:

1. **The USDA Economic Research Service should conduct a literature review of existing research to understand the economics around producer motivations for implementing and maintaining climate-smart practices.** Research should answer the following questions, which can offer important lessons for current USDA efforts to promote conservation adoption:
 - How many early adopters exist and how many acres of U.S. farmland are currently in conservation practices? How many of them are unlikely to qualify for private carbon market contracts?
 - What are early innovators' motivations for implementing conservation practices and the current business case for practice maintenance? Many early innovators have been supported in their efforts by USDA conservation program funding and technical assistance. Once those programs have run their course, what is the bottom-line benefit to the producers to maintain their efforts?
 - How likely are early innovators to “undo” their current soil health practices to qualify for carbon market payments? Does the promise of a carbon market payment outweigh the soil health and other financial benefits of continued conservation?
 - How many early innovators have already received government payments for implementing climate-smart practices? Potential compensation of early innovators should take into account if they already received some sort of incentive based on other ecosystem benefits—*e.g.*, soil erosion, water quality, habitat, *etc.*
 - In emerging markets where producers are able to stack payments for product with payments for ecosystem services, what is the extent of the financial disadvantage this creates for early innovators?
 - What has caused the stagnation of climate-smart practice adoption nationally?
2. **The Federal Crop Insurance Program (FCIP) should recognize the risk-reducing benefits of conservation practices.** Expanding the good farming practices accepted by the FCIP to include NRCS-approved “good farming practices” that are proven to reduce risk is one cost-effective approach. Lowering the cost of crop insurance premiums for producers with a record of using climate-smart practices that reduce agricultural risk is another. There is actuarial evidence that certain conservation practices such as cover crops, reduced tillage, and crop rotation are effective risk-reducing strategies that include substantial climate benefits; these benefits should be recognized through crop insurance premiums.⁵ For example, a new crop insurance endorsement for corn farmers called the *Post-Application Coverage*

⁵The Case for Next Generation Crop Insurance (https://foodandagpolicy.org/wp-content/uploads/sites/4/2021/06/AGree_SynthesisCropInsurancePaper.pdf), a white paper published by the AGree Economic and Environmental Risk (E2) Coalition, summarizes important takeaways to date from work done by the E2 Coalition's work on Federal crop insurance and conservation.

Endorsement (PACE)^[iii] provides supplemental coverage for farmers who split-apply nitrogen, a practice that supports the nitrogen needs of corn at specific times in the crop's growth cycle. This endorsement incentivizes the efficient use of fertilizer and promotes cost savings for producers and has important environmental benefits by reducing nitrogen release into water and air. Private-sector opportunities to capture environmental and risk-reducing benefits by paying for insurance products such as PACE should also be explored.

3. **Agricultural lenders should recognize the economic benefits of conservation practice adoption, including improved soil health and reduced agricultural risk, when offering loan terms to producers.** A growing body of evidence is demonstrating that, over the long term, conservation practices can reduce farmer costs and risk, increase asset value of farming operations, increase yield resilience, and diversify farm income streams—producing benefits for both farmers and their financial partners. These benefits should be quantified and incorporated into financial products offered to farmers who adopt climate-smart agricultural practices.⁶
4. **USDA should continue to explore the development of climate-smart commodity markets that reward early innovators through new market mechanisms. Supporting markets that preference agricultural commodities produced using practices that reduce greenhouse gas emissions or sequester carbon would strengthen the business case for climate-smart agriculture.** This is a place where early innovators have a significant head start given their years of experience and can capitalize on their technical expertise. In addition, USDA should use existing authorities to develop infrastructure (*e.g.*, drying technologies, composting systems, seeds stocks, *etc.*) that supports the implementation of new practices, commodities, and livestock and cropping systems.
5. **Ecosystem markets that allow producers to generate both carbon credits and other ecosystem services credits from the same project should be explored to create stacked incentives to expand and maintain existing conservation practices.** When it comes to ecosystem services, the whole is greater than its parts—stacking payments is a way to recognize the greater value that more intact ecosystems provide. Such markets may allow early innovators to generate income from the full range of ecosystem services they create as well as increase the market incentives for conservation overall by providing multiple income streams. As ecosystem services markets take shape, it is critical they are inclusive of small- and medium-scale, diversified, and BIPOC producers.
6. **Food and beverage companies should consider how early innovators can be included in supply chain sustainability programs** to reduce scope 3 emissions.⁷ As companies work to reduce emissions and meet climate commitments, they should ensure early innovators are eligible for any incentives and programs to expand adoption of climate-smart practices.
7. **USDA and Congress should systematically work to expand and improve existing conservation programs, drawing on CFAD's recommendations for investing in working lands conservation.**^[iv] This includes making changes to expand enrollment, strengthen our network of technical assistance providers, and increase the accessibility of NRCS offices and resources to all producers. Adjusting programs to be more outcomes-based and reward producers based on the conservation benefits they have generated can also help maximize program impact. However, USDA should continue to

^[iii]<https://pacecropinsurance.com/>.

⁶The Environmental Defense Fund has released numerous studies and reports identifying how farmers and financial partners can quantify the financial benefits of conservation practices and incorporate that value into policies, products, and decision-making. These resources can be found *here* (<https://www.edf.org/ecosystems/how-conservation-delivers-value-farm-and-beyond>).

⁷Companies can assess and report their greenhouse gas emissions across three different “scopes” using the Greenhouse Gas Protocol. Scope 1 refers to greenhouse gas emissions from an organization's directly owned and controlled resources. Scope 2 refers to indirect emissions from the energy an organization purchases from a utility provider. Scope 3 includes indirect emissions from a company's supply chain—for example, the production of wheat or the transport of corn purchased by a food company. Carbon offsets can be applied to mitigate an organization's scope 1 and 2 emissions, while carbon insets can be applied to mitigate scope 3 activities. While protocols for measuring scope 1 and scope 2 are outlined in the Greenhouse Gas Protocol, protocols for measuring scope 3 emissions have not yet been finalized.

^[iv]<https://climatefoodag.org/investing-in-working-lands-conservation/>.

build on recent investments to develop measuring, reporting, and verification tools that accurately quantify the ecosystem services of more diversified systems. This is critical to ensure that highly diversified systems are accurately rewarded for the complex ecosystem services they provide.

8. **USDA should offer technical assistance to states that wish to create programs that give producers who adopt or have adopted climate-smart agricultural practices regulatory certainty on compliance with environmental safeguard policies** (e.g., Clean Water Act requirements, Endangered Species Act).⁸ Such programs benefit early innovators by providing regulatory certainty in exchange for the adoption and maintenance of climate-smart practices.

Conclusion

The primary goals of our national agriculture-climate policy should be to maintain the progress that early innovators have achieved by using climate-smart agricultural practices while actively engaging new growers in adopting and expanding use of these practices.

While carbon markets offer one pathway to reward innovators of climate-smart practices, there are many other tools, even in the face of limited resources, that can be utilized to recognize and reward the work of agriculture's conservation leaders. The added value and profitability of climate-smart operations should be systemically rewarded through reduced crop insurance rates, increased land values, climate-smart commodity markets, ecosystem service markets, as well as preferential treatment from USDA programs and regulatory agencies.⁹

We need to use a variety of tools and applications to reward climate-smart agriculture—no single tool will work for all producers and production systems. **Only by constructing an agricultural system that consistently rewards conservation adoption will we be successful in expanding climate-smart agriculture at the magnitude required to help mitigate climate change.**

Recommendations for Investing in Working Lands Conservation

About CFAD

AGree's *Climate, Food, and Agriculture Dialogue* ^[i] brings together a diverse group of farmers, ranchers, and foresters; environmental NGOs; supply chain companies; and former government officials. CFAD members have divergent views of the issues and opportunities facing U.S. agriculture, but we share a common view that **climate change demands ambitious and durable Federal policy solutions that are commensurate with the urgency and scale of the problem.** We see U.S. food and agriculture system as a crucial source of solutions to address climate change and the degradation of nature, which includes our land and water resources. These solutions must provide transparency and promote affordability while distributing costs and benefits in such a way that promotes equity and value to land managers. The scientific consensus that the climate is changing at an increasingly rapid pace is incontrovertible. The timeframe for taking meaningful action to avoid catastrophic impacts is running short. Our guiding principles for Federal policy on climate change and food systems can be viewed *here* ^[ii].

Exponentially increasing regenerative farming practices on American agricultural land represents an incredible opportunity to generate benefits for the environment, agricultural producers, and society at large. America's

⁸For example, the Minnesota Agricultural Water Quality Certification Program (MAWQCP) is a statewide program in Minnesota designed to recognize and reward agricultural stewards of water quality. Farmers and landowners who treat risks to water quality are certified under the program and deemed in compliance with any new water quality laws or rules for 10 years. Certification gives farmers greater certainty about regulatory standards and assures the public that Minnesota's farmers are doing their part to protect and improve water quality.

⁹We want to see climate action across U.S. working lands and would note a caution that USDA could inadvertently create additional issues by paying for practices without producers being enrolled in markets. Past practices aren't eligible for credit generation so if producers take on new practices that could generate credits, they need to be enrolled to get market credit for those outcomes.

^[i]<http://www.climatefoodag.org/>.

^[ii]<https://climatefoodag.org/guiding-principles/>.

working lands represent 40% of the nation's acreage.¹ Responsible, increased investments in working lands conservation and regenerative agriculture are critical to help the Biden Administration reach its goal of negative emission farming and engaging 30% of the nation's land and water in conservation,² as well as to reaching a growing number of climate commitments made by farm groups and food companies. A responsible balance between working and idle land conservation is the common-sense approach to reduce greenhouse gas emissions, improve soil health and water quality and quantity, and increase agricultural productivity. We can do this in a way that makes economic sense for producers and advances equitable access to Federal conservation programs. **We need to expand the network of technical assistance providers and expertise available to farmers and ranchers. To accomplish these goals, we need to exponentially increase funding for existing conservation programs.** Ultimately, these recommendations will help USDA expand and streamline existing conservation programs for maximum impact.

CFAD has released two additional resources: USDA Research and Science Recommendations and a concept note for the development and operation of a USDA National "Climate Bank." Sustainable, climate-smart agriculture requires a suite of policies and a systems approach to bring lasting management changes. **CFAD is committed to working with USDA and Congress as they develop policy and programs that work for producers, the environment, and society.**

Introduction

Policies to expand conservation practices must be grounded in the perspective of farmers and ranchers, with an understanding of the barriers that a range of producers face to joining new Federal programs. We know that many farmers and ranchers make farm management decisions on an annual basis, informed by current crop and livestock prices and their years of experience, in order to maximize their farm's production and profitability. Barriers to joining new programs include a backlog of applications and long waiting lists; a lack of clear, concise communication on the costs and benefits of conservation practices and programs; the complexity and paperwork involved in program enrollment; and, in some places, a technical assistance network that is stretched too thin or lacks the relevant expertise in nutrient management, irrigation management, feed management, soil health, organic transition, and new conservation technologies that producers need to make the best management decisions for their operation. The following policy recommendations are targeted to address these challenges and expand the Federal conservation incentive and support system to effectively educate and enroll the greatest number and diversity of farmers.

The U.S. Department of Agriculture (USDA) and Congress have several immediate opportunities to promote climate-smart agriculture throughout the United States. This set of policy recommendations outlines how USDA and Congress can:

- I. Exponentially increase conservation program funding,
- II. Elevate a focus on conservation and climate solutions at USDA,
- III. Tailor existing conservation programs to maximize effectiveness and promote whole-farm conservation planning,
- IV. Expand and improve technical assistance for conservation adoption, and
- V. Align financial incentives to recognize the financial and risk-reduction benefits of conservation.

As USDA considers how to best align farm programs and financial mechanisms towards promoting conservation, the following guideposts should be kept in mind:

1. **Ensure farmer profitability is at the forefront of efforts to expand conservation practice adoption.** Creating new economic opportunities for farmers is critical to expanding voluntary adoption of conservation practices and creating a successful and resilient agricultural system.
2. **Ensure that the full diversity of American agricultural producers can participate in incentive programs**, with a particular focus on including Black and Indigenous farmers, young and beginning farmers, small and midsize farmers, and farmers who grow a diversity of crops and/or integrated crop-livestock systems.

¹ https://www.nass.usda.gov/Publications/Todays_Reports/reports/fnl0220.pdf.

² Outlined in President Biden's Executive Order on Tackling the Climate Crisis at Home and Abroad (<https://www.whitehouse.gov/briefing-room/presidential-actions/2021/01/27/executive-order-on-tackling-the-climate-crisis-at-home-and-abroad/>).

3. **Create ecosystem services, maintain or increase biodiversity, and reduce the overall footprint of farming,** while considering environmental impacts beyond just sequestering carbon to include other greenhouse gas emissions reductions, soil health improvements, water quality and quantity enhancements, and wildlife and pollinator habitat protection.
4. **Start with incentivizing practices that we know are effective based on best science and evidence** (*e.g.*, cover cropping, crop rotations, rotational grazing, nutrient management, manure management, irrigation management, *etc.*) in order to start making progress while research continues on other critical practices.
5. **Invest in systems to monitor and measure the outcomes of practices and programs.** This is critical to ensure that the benefits of conservation programs are being realized. Landscape-level monitoring is essential to build consensus that USDA programs are effective tools for reducing greenhouse gas emissions. In addition to further developing USDA tools such as *COMET Planner*,^[iii] there is a need for more regional and industry-specific modeling tools to effectively measure practice outcomes across diverse geographies, climates, soil types, and production systems.
6. **Consider the long-term adoption of conservation practices, permanence of ecosystem services, and the advantages of early action by farmers.** Congress and USDA should continue to incentivize early adopters to maintain the benefits of their practices and encourage further innovation that can lay the groundwork for scalable adoption of more practices.
7. **Strive to incentivize continuous improvements.** Programs such as the Conservation Stewardship Program (CSP) help support lasting change, continual improvement, and measurable impact through long-term, renewable contracts.
8. **Avoid sending mixed signals or creating perverse incentives.** There is a need to create shared, understood objectives for agriculture policy to ensure different policies do not work at cross-purposes.

The policy recommendations outlined herein advance these principles by centering the advice and guidance from producers to design programs that will work for them, by suggesting ways to expand and improve our current conservation delivery system to advance whole-farm ecosystem planning and by providing thought leadership about the challenge of incentivizing early adopters to maintain their historic practices and progress. If implemented, the policy recommendations outlined in the following pages will advance these ideals and support our transition towards more climate-resilient and profitable agricultural and forestry systems.

I. Exponentially Increase New Funding for Existing Conservation Programs

Congress should provide USDA a three- to five-fold increase in new funding for conservation programs in order to expand adoption of conservation practices as quickly as possible on working lands. The 2021 Fiscal Year budget for NRCS conservation programs is \$3.9 billion,³ therefore we suggest increasing funding to between \$11.7–\$19.5 billion to accomplish our climate goals. Increasing conservation program funding is critical to expanding conservation adoption, especially because the last increase in program funding occurred in the 2008 Farm Bill, and program dollars have leveled off or decreased since then.⁴ A significant increase in conservation funding is the quickest strategy to immediately increase conservation adoption, directly benefit farmers and ranchers, and begin delivering immediate increases in carbon sequestration, emissions reductions, and other environmental benefits that working lands provide. Furthermore, a growing number of policymakers and agricultural groups support this idea.⁵

^[iii] <http://comet-planner.com/>.

³ <https://www.usda.gov/sites/default/files/documents/usda-fy2021-budget-summary.pdf>.

⁴ <https://www.ers.usda.gov/topics/natural-resources-environment/conservation-programs/>.

⁵ A growing number of policymakers and agricultural groups support an increase in conservation program funding. A recent letter (<https://www.nwf.org/-/media/Documents/PDFs/Press-Releases/2021/04-27-21-American-Jobs-Plan-Ag-sign-on-letter>) signed by 133 leading farm groups recently suggested a doubling of conservation program funding. The Food and Agriculture Climate Alliance (FACA), consisting of almost 70 agriculture, food, forestry, and environmental organizations, has suggested a 20% increase in program funding. Senator Cory Booker and Congresswoman Abigail Spanberger introduced the *Climate Stewardship Act* (<https://www.booker.senate.gov/news/press/with-fdrs-new-deal-as-blueprint-sen-booker-and-rep->

The Environmental Quality Incentives Program (EQIP), Conservation Stewardship Program (CSP), and Regional Conservation Partnership Program (RCPP) are three voluntary, incentive-based conservation programs that we know are effective in expanding conservation on the ground. In 2020, EQIP contracts enrolled 3.8 million acres of farmland in at least one cropland soil quality practice,⁶ and the CSP program had 6.4 million acres enrolled in active, comprehensive, whole-farm conservation contracts.⁷ A review of 26 research trials conducted by Sustainable Agriculture Research and Education program (SARE) suggests that cover crops have the potential to sequester 3 metric tons of CO₂-equivalents (CO₂e) per acre per year.⁸ Using this metric, **increasing cover crop adoption by 30 million acres through increased conservation program funding could sequester an additional 90 million tons of CO₂e annually.**

The Regional Conservation Partnership Program (RCPP) is unique in that it allows NRCS to partner with local organizations and communities to address natural resource goals at the regional level. Since 2014, RCPP has funded over 375 high-impact projects across the U.S., bringing in an estimated \$2 billion in matching funding from partners.⁹ RCPP is a model for leveraging partnerships and partner funding to achieve maximum impact from Federal conservation dollars and could be expanded, particularly through the program's Alternative Funding Arrangements (ARA), with a focus on targeting climate-smart agricultural practices.

Despite the success of NRCS conservation programs, they have long waiting lists and low acceptance rates due to lack of funds. Historically, USDA has only been able to accept ¼ of applications received for conservation programs. Exponentially increasing conservation program funding will allow NRCS to fund and execute more contracts, hire additional technical assistance personnel, and ultimately leverage NRCS's existing infrastructure to expand conservation, carbon sequestration, and environmental benefits as quickly as possible.

Ensuring Equitable Access to USDA Resources

In addition to exponentially increasing conservation program funding, measures should be taken to ensure these resources are accessible to small, beginning, Black, Indigenous, and People of Color (BIPOC), and socially or economically disadvantaged farmers and ranchers. USDA's history of discrimination against BIPOC farmers in allocating loans and conservation payments has led to a lack of trust with producers of color, which USDA must take steps to address. In addition, producers with less time and fewer resources to learn about and navigate USDA programs are often left out of funding and cost-share opportunities. However, we know that engaging the full diversity of U.S. agriculture in climate-smart practices is critical to addressing climate change and ensuring the benefits of new funding are equitably distributed.

*spanberger-re-introduce-climate-change-bill-focused-on-investing-in-farm-conservation-programs-
reforestation-and-wetlands-restoration*), which calls for nearly doubling the Conservation Reserve Program to 40 million acres a year and increasing funding for both the Conservation Stewardship Program and the Environmental Quality Incentives Program to \$7 billion a year. The Agriculture Resilience Act introduced by Congresswoman Pingree and Senator Heinrich also calls for robust investments in Federal conservation programs. In addition, Senate Agriculture Chairwoman Debbie Stabenow has made *public remarks* (<https://www.agri-pulse.com/articles/15764-stabenow-pushing-for-big-boost-in-conservation-says-biden-plan-falls-short>) pushing for a major increase in conservation program funding.

⁶https://www.nrcs.usda.gov/Internet/NRCS_RCA/reports/fb08_cp_eqip.html.

⁷https://www.nrcs.usda.gov/Internet/NRCS_RCA/reports/fb08_cp_cstp.html.

⁸<https://www.sare.org/publications/cover-crops/ecosystem-services/cover-crops-and-carbon-sequestration/>.

⁹<https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/programs/financial/rcpp/>.

In order to reduce barriers for small, beginning, and BIPOC farmers and ranchers to engaging in USDA programs, we suggest USDA place a high priority on expanding funding for non-traditional technical assistance providers that already work with these producers. For example, the Intertribal Agriculture Council plays a key role in assisting Indian producers in accessing and using USDA programs and services. In addition, streamlining existing conservation programs, fast-tracking approval and funding for conservation plans that propose to implement well-understood practices, and offering producers assistance with creating whole-farm conservation plans can help reduce barriers to engaging in USDA programs and support conservation planning for producers with fewer resources. These policy ideas are further explored later in this document.

II. Elevate a Focus on Conservation and Climate Solutions at USDA

To ensure that climate efforts at USDA are effective, strategic, and widely supported, USDA should revise the mission statement and goals for each USDA agency to create a clear and prominent focus on climate-smart agricultural practices. Agencies should be directed to prioritize conservation practices that not only sequester carbon but include co-benefits for nature including improved soil health, water quality, and wildlife habitat. Articulating a department-wide vision for on-farm outcomes (both economic and environmental) and conservation outcomes at the landscape and watershed levels would help to drive strategic decision making by individual agencies and programs.

Taking steps to improve data collection, analysis, and sharing between agencies will help USDA achieve these conservation and climate goals. Increased integration and analysis of this agricultural data is key to understanding how the food and agriculture sector can develop and implement solutions to climate change (read CFAD's *Research Recommendations*^[iv] for more detailed recommendations about USDA research and science on climate-smart agriculture). Existing tools such as *COMET-planner*^[v] can be used to provide guidance for the most impactful practices by farming systems to prioritize, as well as create proxies for measuring practice outcomes while more comprehensive monitoring and measurement systems are developed.

As USDA works to advance its data infrastructure and analysis, the agency should ensure that data architecture for USDA conservation planning and programs provides value back to producers. Producers should be able to electronically access the data they provide to [USDA] and all available USDA planning tools and incentives available to them. USDA data systems should be aligned with the tools and technologies producers need to use to participate in ecosystem services markets. USDA should expand efforts toward data interoperability to enable producers to enter data once and use it many times. This is critical to building the value proposition for producers to share their data.

III. Tailor Existing Conservation Programs to Maximize Effectiveness and Promote Whole-Farm Conservation Planning

USDA should adjust existing conservation programs to streamline program enrollment and administration, reduce barriers to enrolling in conservation programs, better communicate the benefits of climate-smart farming practices, and provide assistance for farms to optimize conservation benefits. While current conservation programs are generally effective, adjusting contract structures can reduce the significant administrative burden currently facing NRCS staff, freeing up more time to work directly with farmers on conservation planning and implementation. In addition, a stronger focus on conservation and climate planning can support farmers and ranchers in understanding how their farm management can most effectively contribute to climate mitigation efforts. Improving USDA program accessibility and ensuring support for conservation planning is widely available can help small, beginning, and BIPOC producers access program benefits.

CFAD policy recommendations to achieve this goal include:

- **Offer assistance for farms to develop conservation plans specifically tailored to optimize environmental benefits and increase production resilience to climate change impacts** while considering the economic realities

^[iv] <https://climatefoodag.org/research/>.

^[v] <http://comet-planner.com/>.

of each farm. USDA should move immediately to implement a provision included in the 2018 Farm Bill to provide producers a one-time payment for comprehensive conservation planning. Current programs such as EQIP and CSP can also promote a holistic understanding of climate mitigation and encourage the adoption of practices with environmental benefits beyond carbon sequestration, such as nutrient and irrigation management. This can also be advanced by creating bundles of climate practices and enhancements that, when combined, will decrease emissions, increase carbon sequestration, and provide long-term farm resiliency for participating farmers and ranchers. This could include bundles for feed management for livestock to reduce emissions, rice system management to reduce methane emissions, crop rotations to improve soil health, and/or a nutrient management program to increase nitrogen use efficiency.

- **Fast-track conservation plans and contracts for conservation practices that are well-understood, easy to implement, and scalable, such as cover cropping, conservation tillage, and irrigation management.** This must be done in combination with a significant increase in conservation program funding, so farmers who have been waiting to have contracts processed are not disadvantaged. Whole-farm conservation plans should not be a prerequisite for producers interested in adopting specific conservation practices, since these can present a roadblock to conservation adoption and discourage participation.
- **Prioritize the implementation of a narrower range of individual practices with scientifically supported impact values (e.g., climate, water, and biodiversity) among certain farming systems in specific regions.** A shorter list of “climate practices” will help various and diverse producers choose the most impactful practices to assist in building their own distinct agricultural management systems. States and regions can choose the practices that are most practical for the farm-systems that operate in specific areas.
- **Create multi-year EQIP contracts with declining payments over time,** whereby a producer receives a smaller cost-share payment each year as transaction costs decline. Implementing some conservation practices can have a high up-front cost, but as practices become established, they begin to produce greater benefits over time. A declining payment structure provides a greater incentive up-front, when it is needed by producers, and then declines to reflect the reduced cost and increasing benefits to the farm. Farmers who are starting their conservation journeys could apply for an EQIP contract, and after one or two contracts, farmers could then be eligible to “graduate” to CSP to maintain and expand their conservation practices.
- **Prioritize multi-practice, multi-year incentive contracts.** For example, EQIP and CSP contracts focusing on climate impacts and/or soil health should prioritize producers who desire to adopt multiple practices for multiple years, therefore increasing the odds of measurable impact and lasting behavior change. Prioritizing multi-practice, multi-year contracts reduce the need for additional transactions in the future, thereby streamlining program administration. The CSP program provides multi-year, renewable contracts to support lasting change, continual improvement, and measurable impact.

IV. Expand and Improve Technical Assistance for Conservation Adoption

USDA and Congress should increase funding for technical assistance, invest in training and technology dissemination, and expand the use of partnerships to bolster and improve technical assistance. Technical assistance is critical to providing the information and guidance needed for producers to feel confident in adopting new practices and to supporting new, beginning, and BIPOC farmers in enrolling in USDA programs. Producers need clear, streamlined communications from USDA about what programs are available and what support they can access. Creating additional flexibility and resources for NRCS field office personnel to partner with agricultural extension offices, local conservation districts, and non-traditional technical service providers can help expand capacity and address gaps in NRCS expertise. In addition, there may be creative opportunities for cross-training and expertise sharing within programs at USDA. For example, a partnership between NRCS and the USDA National Organic Program could enlist accredited organic certifying agents to deliver technical assistance to conservation during the production off-season.

Many NRCS field offices have limited expertise in several areas critical for climate planning, including livestock feed management, improved nutrient management for crops, irrigation management, pasture and advanced grazing management,

soil fertility, cover crops, perennial agriculture, diverse cropping systems, new technologies that can help mitigate the environmental impacts of farming, and the economic return on investment for regenerative farming practices. Immediately addressing these expertise gaps is essential to providing farmers and ranchers the best available information for improving the profitability and climate resilience of their operations.

CFAD recommendations to improve and expand technical assistance include:

- **Increase funding for technical assistance.** Increase technical assistance funding and support for NRCS field offices, conservation districts, and technical assistance cooperators. Additional funding is needed to expand overall capacity and ensure additional technical assistance support does not affect conservation incentives provided through EQIP and CSP.
- **Invest in training and technology dissemination for NGOs, conservation community, extension, and NRCS personnel.** There is an immediate and urgent need to train NRCS field staff and technical assistance cooperators on climate issues, programs, policies, and emerging technologies (*e.g.*, manure management) that can help drive adoption of climate solutions on working lands.
- **Invest in programs such as 4-H, Future Farmers of America (FFA), and the National Conservation Foundation Envirothon that create a pipeline for young people to become interested in agricultural extension.** In order to expand interest in and continue the legacy of a strong U.S. agricultural industry, we need to build and train a generation of smart, motivated young people who are excited to work as farmers, technical assistance providers, and extension agents.
- **Expand technical assistance partnerships through:**
 - **Increasing the use of cooperative agreements to provide non-Federal partners more flexibility** and avoiding the complexity and underutilization of the current Technical Service Provider certification process. These cooperative relationships should be designed to expand NRCS's capacity to provide climate resilience and carbon management expertise.
 - **Utilizing Conservation Stewardship Program (CSP) enhancements or Crop Assistance Program (CAP) payments to pay for the use of third-party advisors for climate management.**
- **Support and promote peer-to-peer farmer networks.** Farmers sharing their experiences and knowledge with one another is a powerful strategy to build momentum and support for climate-smart agriculture.
 - One model for creating these opportunities through USDA programs is the NRCS *Grazing Lands Conservation Initiative*,^[v] which enlists state committees and grassroots coalitions that find opportunities to increase technical assistance and create public awareness of activities that maintain or enhance grazing land resources. This model could be replicated to leverage the knowledge and experiences of early adopters to build trust and expand climate-smart agricultural practices.
 - The *Climate Adaptation Fellowship*^[vi] is another peer-to-peer model that provides farmers, foresters, and advisor the information they need to adapt to climate change. This curriculum was developed through a partnership between several universities, the USDA Northeast Climate, NRCS, and other partners, and is another model for collaborative extension efforts.

V. Align Financial Incentives for Conservation

The purpose of Federal conservation programs is to incentivize and support farmers and ranchers in adopting new conservation practices that provide societal and environmental benefits. Producers who receive this support should then be enabled to monetize the environmental benefits through enrolling in private ecosystem service markets. **The role of the government is to provide support where there is a failure of private markets to reward public goods. This includes creating financial incentives for producers who are transitioning to new conservation practice adoption and for early adopters.** It is also important to note that any policy that USDA develops must allow for and recognize existing private markets and not adversely impact, interfere or duplicate private-sector efforts. To align incentives for conservation, CFAD recommends:

^[v]<https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/people/partners/gpci/>.

^[vi]<https://www.adaptationfellows.net/mission>.

- **Transition payments for producers adopting new conservation practices.** Producers transitioning to new conservation practices may experience temporary declines in farm profitability (*e.g.*, no-till has a 5–7 year transition period), during which the ecosystem benefits of practices are also not fully realized and cannot be monetized. USDA’s organic transition payment program could be expanded to include a conservation transition payment to support producers as they make this transition. The recommendations above to streamline conservation programs, reduce barriers to entry, and lower transaction costs will also help increase the number of producers transitioning to conservation practice adoption.
- **Create crop insurance discounts or premium reductions that recognize the increased soil health and reduced agricultural risk of farms implementing conservation practices to provide financial incentives for early adopters to continue their practices.** Similar incentives for the Noninsured Crop Disaster Assistance Program (NAP), Whole Farm Revenue Program (WFRP), and Agricultural Management Assistance (AMA) Program should also be developed to ensure that non-row crop and diversified farmers can access these benefits. Designing incentives for early adopters of conservation practices to maintain the environmental benefits they have already created is critical to reward these public goods and prevent backsliding as producers adopting new practices are rewarded through private ecosystem service markets. However, not all farmers utilize crop insurance, so this strategy is not a silver bullet and must be combined with other strategies to reward early adopters for the ecosystem services they provide.
- **Clarify that all NRCS conservation practices and standards are Good Farming Practices (GFP).** Farmers who implement conservation practices and enhancements in line with NRCS standards should not find themselves in conflict with RMA rules as a result. Conservation is a key element of risk management, and RMA rules and policies should reflect this understanding. RMA and NRCS, two Farm Production and Conservation (FPAC) agencies, should coordinate so that neither issues a contradictory rule or recommendation that impacts farmers.

Two unresolved challenges are how to ensure that tenant farmers can access conservation programs and incentives, and how to design robust incentives for early adopters of conservation practices to maintain the environmental benefits they have already created. Benefits already generated by early adoption of conservation will be difficult, if not impossible, to reward through private markets. CFAD has outlined a suite of policy options for USDA and Congress to consider, including rewarding early adopters through crop insurance discounts and/or through a *USDA National Climate Bank*^[viii] (see CFAD’s Climate Bank Concept Note for more information about how this could be done). As policy conversations continue, we will stay abreast of these challenges and provide more robust recommendations and thought leadership in the future.

Conclusion

Climate change solutions must be grounded in the perspective of agricultural producers who are key to driving conservation on working lands. An exponential increase in funding for existing conservation programs is required to drive the conservation practice adoption needed in a timely, voluntary, and incentive-based way. An integrated, USDA-wide focus on climate-smart conservation practices, improved agriculture data systems, expanded technical assistance for conservation adoption, and aligned financial incentives to recognize the financial and risk-reduction benefits of conservation can help reach these goals. Furthermore, investments in measuring and monitoring the outcomes of conservation programs and practices will build the confidence that programs are delivering the public benefits they promise. Ultimately, expanding, improving, and targeting existing conservation programs can build the business case for climate-smart agricultural practices and drive the management changes needed across millions of acres of U.S. working lands.

Recommendations to Strengthen USDA's Support of Research and Science for Climate-Smart Agriculture

About CFAD

AGree's *Climate, Food, and Agriculture Dialogue*¹ includes farmers, ranchers, and foresters; environmental NGOs; supply chain companies; and former government officials. We share a common view that **climate change demands ambitious and durable Federal policy solutions that are commensurate with the urgency and scale of the problem.** We see U.S. food and agriculture system as a crucial source of solutions to climate change. These solutions must provide transparency and promote affordability while distributing costs and benefits in such a way that promotes equity and value to land managers. The scientific consensus that the climate is changing at an increasingly rapid pace is incontrovertible. The timeframe for taking meaningful action to avoid catastrophic impacts is running short. Our guiding principles for Federal policy on climate change and food systems can be viewed *here*.²

Robust and targeted research and science are fundamental to U.S. food and agriculture's response to climate change and our ability to leverage the sector to provide natural climate solutions. Our food system is vulnerable to a changing climate but also has the potential to mitigate greenhouse gases through innovative natural climate solutions that build soil health, farm resilience, and deliver ecosystem services to rural and urban communities alike. We need a research enterprise that is laser focused on the challenges before us. We need a national effort on improving soil health; soil carbon sequestration research, measurement, and verification techniques; animal feeds that reduce enteric emissions; and new seed varieties including cover crops that help us sequester more carbon or are otherwise adapted to climate change. We need a strong evidence-base to underpin public and private investment. We also need economic research and behavioral studies about new practice adoption, along with continuously improving models and predictive capacity. Strong USDA investment in research will enable U.S. agriculture to harness mitigation and market opportunities and meet the challenge of a changing climate head on.

CFAD is also releasing two additional resources: a set of recommendations for investing in Federal programs to expand on-farm conservation adoption and a concept note for the development and operation of a USDA "Climate Bank," creating financial incentives for land management innovation on hundreds of millions of acres of working lands to curb the effects of climate change. These actions will promote broader adoption of agricultural conservation practices on working lands and improve farm profitability, increase resilience, reduce risk, enhance environmental performance, and sequester carbon. USDA has the opportunity to send a strong signal to farmers, ranchers, and foresters; the supply chain; and the American public that our food system is committing to climate-smart agriculture and forging a path toward net zero emissions. CFAD looks forward to working with USDA and Congress as they develop policy and programs that work for producers, the environment, and society.

Introduction

USDA is the leading funder of basic and applied agricultural research, through both intramural and competitive mechanisms. In this document, we outline priorities to enable USDA to bring climate change mitigation solutions within a broader scope of Federal and private investment in agricultural research. Research to support producers' ability to adapt to the variable conditions caused by climate change is important but is not the subject of this paper.

Federal climate change mitigation research spans multiple USDA research and extension agencies and programs, as well as other Federal agencies. Much is already known about agricultural practices and technologies that can reduce emissions or sequester carbon while contributing to soil health or other agronomic goals. Collectively, we refer to systems that use these practices and technologies as "climate-smart agriculture."

Research can improve the evidence base around climate-smart agriculture where there are still gaps, identify and inform strategies to overcome barriers to adoption

¹<http://www.climatefoodag.org/>.

²<https://climatefoodag.org/guiding-principles/>.

at scale, monitor trends in GHG emissions and sequestration on agricultural and forest lands, and align goals at the farm scale with those of ecosystems and society at larger scales. Our recommendations focus on USDA and its Federal partners as these provide the largest levers to achieve scale of mitigation. At the same time, these recommended actions will support and expand upon important work being conducted by land-grant institutions, other universities and institutes, the Foundation for Food and Agriculture Research (FFAR), commodity and grower groups, and the private-sector.

Goals and Objectives

For USDA to achieve its goal of advancing climate-smart agriculture, it must strategically align its vast research expertise and resources. A climate-smart agriculture research enterprise should be developed that coordinates economic, social, and environmental sustainability research across USDA mission areas, the U.S. Government, and non-Federal research partners and builds the research infrastructure needed to facilitate this important work.

USDA research needs to be precompetitive, scalable, and benefit all farmers, ranchers, and foresters in order to achieve near term impacts and position the diversity of U.S. agricultural systems to make ambitious and durable contributions to climate change mitigation. We recommend that USDA's research and science programs focus on a limited number of specific objectives to achieve this goal:

- I. Coordinate science and research to maximize the effectiveness and impact of public investments.
- II. Build the business case for climate-smart agricultural practices, including the case for public benefits and public investments in farmer incentive programs.
- III. Improve USDA data sharing policies and infrastructure to facilitate research conducted by trusted partners.
- IV. Support equitable engagement by diverse producers and agricultural systems.
- V. Improve the rigor of climate models and measurements to support the U.S. Greenhouse Gas Inventory and reduce risk in private environmental markets.
- VI. Create new tools and practices to expand the climate-smart agriculture toolkit.

I. Coordinate Science and Research

Coordinating USDA's climate research investments is critical to ensure that USDA funding has the greatest impact and best complements and leverages private-sector research investments.

USDA's immediate, highest priority should be to create a "Climate Research Coordinator" position to develop a coherent "all of USDA" climate research strategy across its agencies, coordinate climate research with other Federal agencies, and engage with external research stakeholders. This position could be created in the Office of Chief Scientist to work with the Secretary's USDA Climate Advisor and other climate research leads within USDA.

A Climate Research Coordinator should be tasked with preparing an inventory of USDA climate mitigation and adaptation research to better leverage existing efforts, identify gaps for future research, and avoid duplication in efforts. This inventory should include research conducted by the Office of Research, Education and Economics (ARS, ERS, NIFA, AFRI, NASS), plus the Office of Farm Production and Conservation (NRCS, RMA, FSA) and the Office for Trade and Foreign Agriculture Affairs (FAS), as well as other Federal agencies engaging in climate research including the Environmental Protection Agency, National Science Foundation, U.S. Geologic Service, Department of the Interior, Department of Energy, and USAID.

USDA should publicly release an annual report of the inventory's findings and host "state of the science" meetings to engage the research community and other stakeholders. External research stakeholders that should be engaged include historically black colleges and universities, land-grant institutions, food and agriculture technology companies, foundations, think tanks, forestry and agricultural groups, non-governmental organizations, and leading public- and private-sector researchers from the international community.

In addition to coordinating research moving forward, USDA should analyze existing research archives to mine datasets that can provide useful insights moving forward. Historic information can be used to build the evidence base for climate-smart practices and support efforts to set industry baselines for carbon sequestration. Understanding the body of agricultural research to date will sup-

port the Climate Research Coordinator in developing a cohesive and informed research agenda moving forward.

II. Build the Business Case for Climate-Smart Practices

Farmers, ranchers, and foresters will only adopt climate-smart practices at the rate needed to substantially reduce agricultural emissions once they understand the clear economic benefits of doing so. USDA-supported intramural and extramural research can play a critical role in building this business case for co-investments in climate-smart agriculture practices by individual producers while articulating the return on investment to society from public investment and supporting development of the private marketplace.

USDA should direct research assets to conduct precompetitive analysis and modeling that demonstrates the economic value associated with climate-smart agriculture practices, including by:

- Estimate the cost of implementation and return on investment for individual growers that adopt individual or stacked climate-smart practices.
- Quantify the public benefits derived from climate-smart practices, including landscape-level impacts. These could include linked benefits between working lands and built environments for flood risk reduction, water quality improvements or fire risk reduction (*e.g.*, *Iowa Watershed Approach*³ funded by HUD), as well efforts to quantify multiple benefits from existing farm programs like the Conservation Reserve Program.
- Research the longevity and durability of environmental benefits from climate-smart practices, including dynamics such as the relationship between the length of practice implementation and accrual of soil carbon, the effects of practice reversion/termination and variability across geographies and production systems.
- Study potential positive and negative impacts of current Federal policy incentives on conservation practice adoption and crop and livestock diversification, including how adjustments to the Federal crop insurance could promote conservation. This work could also consider the use of Marketing Assistance Loans for diversification of farming operations.

This research should consider impacts of climate-smart practices on the diversity of agricultural operations, including dynamics such as size, region, commodity, and level of capital that can influence profitability. Building the business case for conservation is a keystone for increasing adoption of practices and should be a priority that is expressed in research projects across the board, not segmented into siloed research projects. Most importantly, the findings must be shared with producers and other agriculture stakeholders. Technical assistance providers, particularly NRCS field offices and land-grant university extension offices, can help with disseminating information to producers that is specific to their geographic area.

III. Improve USDA Data Sharing Policies and Infrastructure

Connecting the extensive agricultural research community to USDA's vast agricultural datasets is a critical strategy to quickly and efficiently answer key research questions about the multiple benefits of climate-smart agricultural practices while building trust across the agricultural research community.

USDA should engage trusted research partners in advancing USDA research priorities by developing data sharing and research infrastructure that allows farmers and university researchers to access anonymized USDA datasets. The scale and scope of the agriculture research investments needed to meet the climate crisis can be accomplished through developing partnerships with land-grant universities, commodity groups, and others. USDA has several datasets that can be used by external researchers to relate conservation practices to farm profitability, helping to build the business case for climate-smart agriculture.

USDA data infrastructure should be modernized in a way that respects farmer data privacy and autonomy, reduces reporting burden, and communicates useful research conclusions back to producers to inform decision-making. By investing in improvements to data collection systems and streamlining data management processes, USDA can simplify the data reporting process, which is overly burdensome for many farmers and ranchers. Creating channels to clearly communicate how producer data is being used, allowing producers to opt in or out of research projects, and allowing producers that opt in to easily access their data and research results can build trust in the farmer and rancher community that

³<https://iowawatershedapproach.org/>.

their data is being used responsibly and effectively to generate knowledge that will ultimately benefit their operations.

IV. Support Equitable Engagement by Diverse Farmers, Ranchers, and Farming Systems

For the entire agricultural sector to succeed in reducing its emissions, all types of producers must be engaged. **USDA should therefore ensure that diverse farmers, ranchers, and farming systems can participate in Federal conservation programs and adopt climate-smart agricultural practices.** This is key to reaching scale of adoption in an equitable way. Strategies for supporting equitable producer engagement include:

- Partner with state Departments of Agriculture, land-grant cooperative extension offices, and NGOs to expand extension and outreach, particularly to small and disadvantaged farmers and non-operating landowners.
- Conduct engagement and extension to historically disadvantaged farmers and ranchers, drawing from examples in the Sustainable Agriculture Research and Education (SARE) program.
- Conduct social science research to identify barriers to adoption of climate-smart agriculture practices. In particular, study barriers to participation in USDA conservation incentive programs by diverse agricultural producers and producers who rent farmland. Use these findings to identify ways to adjust programs to encourage robust participation.
- Consider the impacts of climate-smart practices on the diversity of agricultural operations, including dynamics such as size, region, commodity, and level of capital that can influence profitability.
- Expand the Specialty Crop Block Grant program to include more emphasis on mitigation practices across the diversity of regional farming systems in coordination with state Departments of Agriculture.

V. Improve the Rigor of Climate Models and Measurements

USDA should improve the rigor and transparency of climate models and measurements to support the efforts of the U.S. Greenhouse Gas Inventory and private ecosystem service markets. Research and science can help ensure that Federal investments in climate-smart agriculture and forestry are backed by strong science, using both intramural and extramural research to build the evidence base around the contribution of agricultural practices to greenhouse gas emissions and carbon sequestration. A national monitoring system that addresses both field-scale and landscape-level climate impacts in particular could enhance the rigor of the measurements and models that underlie public investments and private markets. There is an opportunity to scale up soil monitoring systems now, while developing new technologies that will drive down costs in the future. **The following measures will help USDA build the foundational knowledge necessary to measure the climate impacts of agricultural systems and practices with greater rigor than current efforts can achieve:**

- Improve the modeling of greenhouse gas emissions and carbon sequestration in agricultural soils by funding and conducting research to improve baselines and account for regional variability, greater differentiation of crops and livestock, forestry systems, increased spatial resolution and sources of uncertainty.
- Establish a national soil carbon and nitrous oxide emissions monitoring network, leveraging Agricultural Research Service and Natural Resource Conservation Service research sites together with land-grant universities. Research the durability of carbon sequestration, including dynamics such as the relationship between the length of practice implementation and accrual of soil carbon, effects of practice reversion and termination.
- Integrate remote sensing tools (*e.g.*, LIDAR, satellite imagery) with Forest Inventory and Analysis (FIA) and other field plots to improve accuracy and resolution of estimates of greenhouse gas emissions and sequestration in woody biomass (including forests, trees in croplands and grasslands, and urban trees).
- Increase the frequency of the Conservation Effects Assessment Project (CEAP) and add specific climate research objectives to enhance understanding of the relationship between conservation practices, greenhouse gas emissions, and carbon sequestration.
- Develop and pilot more precise and cost-effective carbon measurement tools for agricultural soils.

- Assess and coordinate USDA, DOE and ARPA-E SMARTFARM programs to research and quantify the net greenhouse gas footprint from different biofuel feedstocks, including land use impacts and opportunities for expanded use of agricultural biomass and processing food loss and waste.
- Link the National Soil Web Survey and the National Resources Inventory to better leverage these tools for monitoring changes in soil carbon storage.

VI. Expand the Climate-Smart Ag Toolkit

USDA should expand knowledge of climate-smart agricultural practices and develop new practices to accelerate climate change mitigation progress across the full diversity of U.S. production systems. There is a strong body of existing knowledge about the benefits of common conservation practices in major row cropping systems (*e.g.*, cover cropping and no-till) that can be leveraged to expand adoption of some practices today, recognizing variations in efficacy across different geographies and production systems. However, there is also a need to develop new strategies and practices, particularly for other crops; new crop varieties that are both more resilient to climate change and have a smaller GHG footprint; more tools for the major sources of emissions from livestock and nitrogen application; bioenergy from crop, food processing and livestock waste management; and on-farm energy use. Tools that work with the constraints and economics of smaller operations should be considered.

Some research initiatives to expand the climate-smart agriculture toolkit may fit within existing intramural and extramural research initiatives, such as within the Agricultural Research Service (ARS), NIFA's Agriculture Food Research Initiative (AFRI), or through partnership with the Foundation for Food and Ag Research (FFAR). Options that carry too much risk or lack sufficient commercial applications for existing research initiatives to take on may be prioritized by the Agriculture Advanced Research and Development Authority (AGARDA), as soon as that new authority receives Congressional appropriations and has a leader nominated by the Administration. All of these Federal research initiatives should coordinate with ongoing private-sector efforts to develop innovative agriculture technologies so as to complement rather than duplicate those efforts.

The following recommendations are designed to help USDA fill existing practice and knowledge gaps to facilitate broader practice adoption among U.S. producers.

- Invest in research and development in crop breeding for deep-rooted or perennialized analogues to current commodity crops that would sequester more carbon in root systems.
- Research, validate, and pilot commercial technologies, such as nitrogen inhibitors, soil carbon measurement tools and livestock feed additives, to inform food and ag sector decision-making.
- Conduct research into new ways to reduce emissions from nitrogen fertilizers, enteric fermentation, and manure management.
- Invest in improving tools and practices for diverse farming operations, such as farms that grow multiple crops and integrated crop-livestock systems.
- Research embedded energy in irrigation and other farm management as a basis for considering expansion of incentives for on-farm energy use, including replacement of less energy efficient farming equipment.
- Review opportunities for utilization of agricultural biomass and food processing waste streams, including bioenergy production and pyrolysis to create biochar.
- Audit the state of the science on climate impacts of various livestock and grazing practices and determine which are most likely to reduce risks and contribute to climate change mitigation.
- Advance options for carbon sequestration and emission reductions through aquaculture, including emerging opportunities such as kelp farming.
- Research plant genomics to identify varieties or specific genes that could be enhanced to provide benefits for climate change mitigation or resilience.

Conclusion

Climate change solutions must be supported by research and science. The solutions must be inclusive of the diverse interests that make up our food and agriculture system, which can be both a contributor and a solution to climate change. Coordinating the science and research to maximize effectiveness and the impact of public investments is imperative. If we can use our research enterprise to build a data-driven business case for climate-smart agricultural practices, we can create appropriate incentives and adoption to drive the management changes we need to see across U.S. working lands.

The AGree platform includes the AGree Economic and Environmental Risk Coalition (AGree E2 Coalition) and the AGree Climate, Food, and Ag Dialogue (CFAD).

The AGree Economic and Environmental Risk Coalition advocates for Federal policy improvements to bridge the gap between the adoption of on-farm conservation practices and improved profitability for farmers and ranchers. Through collaboration and frank discussion, our work on crop insurance, agriculture data access, cover crops, and banking and finance is advancing the agricultural sector's movement toward a more resilient, profitable, and sustainable American agricultural system. Visit *FoodandAgPolicy.org* to learn more and join our effort to transform Federal food and agriculture policy to meet the challenges of the future.

The AGree Climate, Food, and Ag Dialogue (CFAD) is a diverse and pragmatic group of climate, food, former government officials, and agriculture leaders working to promote Federal action on climate that is inclusive of food and agriculture. CFAD includes producers, food and agriculture companies, former government officials, and civil society organizations working together to promote Federal action on climate change that is commensurate with the urgency and scale of the climate crisis. Visit *ClimateFoodAg.org* to learn more about our work and read our guiding principles for Federal climate policy solutions.

The CHAIRMAN. Thank you, Ms. Duncanson.

And now, Senator Heitkamp, welcome. Please begin when you are ready.

STATEMENT OF HON. HEIDI HEITKAMP, CO-CHAIR, FARM AND FOREST CARBON SOLUTIONS TASK FORCE, BIPARTISAN POLICY CENTER, WASHINGTON, D.C.

Ms. HEITKAMP. Thank you so much, Chairman Scott, and thank you to the Ranking Member Thompson for letting me speak on behalf of the great work of the Bipartisan Policy Center, and my great friend and co-chair for this effort, Senator Saxby Chambliss, who I know will share my comments and urge you all to become familiar with the work that we have done.

I want to maybe just start out by adding to some of the comments that you have already heard from the Ranking Member and from the Chairman as we move into this next couple months. We have been spending a lot of time talking about how energy security is now national security, but we will be now talking about how food security is national security and global security for our democracy. And so, this is going to challenge not only our energy supply chain, but also our food supply chain. And that is why a discussion like this on how we can increase productivity, how we can reduce the costs of inputs is so critical. And I think a lot of the work that is being done right now by all the groups that you are hearing from is really geared towards making farmers more profitable, more able to sell into the global market.

I want to just talk a little bit about our process. We started out, Saxby and I did, by saying boy, have things changed. When we were in the Senate, if you had talked about climate and farmers and rural America in the same sentence, you might have been drug out of the room. The attitudes of rural America and farmers have really changed as they have seen the consequences of climate, but also as they see the opportunity of growing for, and selling to, a global market and what that means. And so, we were very convinced that the time was right for us to begin this process.

I want to just report what a soybean farmer said to me in North Dakota when I asked him about climate. He said, “I expect that we are going to have to be able to prove sustainability and climate sensitivity for the commodities that we sell into the global market in the future. Let’s get going.”

The next step that we took was evaluating where we are, and I really have to give a shoutout to the great staff at BPC. They did a great job in evaluating what that looks like. Second, I want to reiterate kind of the goals. Do no harm. Let’s keep the programs that are working, working for us. Make it economically important and viable to adapt some of these challenges, and let’s make sure that we don’t leave behind something that hasn’t been said here. The early adopters—I am always sensitive to people who, I have been doing this for a long time, where is my benefit? You are trying to promote change in others. Do I get a benefit from change? And so, we basically came up with a list of when you look at it, six themes.

I want to focus on two because I don’t have a lot of time left. The first one is workforce. You have all the data in the world, but if you don’t have somebody ready to engage with farmers and ranchers on the ground, in the field telling them look what your neighbor did over here. How are we going to help you understand how these programs work? And so, you can design all these programs. You can have all the pilot programs in the world, but if you don’t have an implementation strategy for those programs, this won’t work. And so, that is why it is so important that we educate that next generation of farmers.

The second thing I want to highlight is carbon markets. And I know that hasn’t always been a subject of consensus on your Committee, but I want to just relay some of the things that we heard. People who are going to buy into carbon markets, they want certainty. They want to know that they are not buying something that just simply is—I wouldn’t say junk, but they aren’t—they are buying something that actually has a climate impact. They have reputational risks if they don’t, and as they talk about their own kind of carbon sensitivity, they want to make sure that they are getting the bang for the buck and the environment is getting the bang for the buck. And so, that is why a lot of the research and a lot of the work that is being done by the Committee to kind of evaluate how do we give it the *Good Housekeeping Seal of Approval*, if I can use those words, and I know that Secretary of Agriculture is very engaged, and certainly the Growing Climate Solutions Act would task the Secretary with that. I think it is important that that work is started as soon as possible, because that is where we are going to see a huge benefit, economic benefit for our ag producers.

Thank you, Mr. Chairman. I look forward to the questions and answers.

[The prepared statement of Ms. Heitkamp follows:]

PREPARED STATEMENT OF HON. HEIDI HEITKAMP, CO-CHAIR, FARM AND FOREST CARBON SOLUTIONS TASK FORCE, BIPARTISAN POLICY CENTER, WASHINGTON, D.C.

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for convening this hearing: ***A 2022 Review of the Farm Bill: The Role***

of USDA Programs in Addressing Climate Change. I am joining you today in my capacity as co-chair, alongside former Senator Saxby Chambliss, of the Bipartisan Policy Center’s Farm & Forest Carbon Solutions Task Force. I appreciate the opportunity to share the views of the Task Force on the important linkages between conservation, climate solutions, and rural economic development. My testimony today focuses on the roadmap we developed for scaling public and private investments in land-based climate solutions, ensuring a high level of integrity for these solutions, and reducing barriers to voluntary stewardship practices.

For this hearing, I’d like to emphasize four key points:

1. Natural climate solutions have untapped potential in the United States. Congress and the Administration can help us tap this potential by catalyzing new carbon-based revenue opportunities for farmers, ranchers, and forest landowners.
2. Priority should be given to expanding incentives and cost-share programs for natural climate solutions, promoting new investments in workforce training and education, delivering climate-focused technical assistance, improving data and risk management, and spurring technology innovation to make natural climate solutions cheaper and easier to implement.
3. Both government and the private-sector need to step up their efforts and partner together to achieve large-scale transformation.
4. If enacted, our proposed policies will speed the deployment of natural climate solutions, deliver significant environmental co-benefits (improved air and water quality, wildlife habitat, *etc.*), and boost the economy of rural communities.

In sum, we believe American farmers, ranchers, and forest landowners have a unique opportunity, with your help, to build on a long and bipartisan history of environmental stewardship to further support—and be rewarded for—broader climate mitigation efforts.

1. Introduction

America’s farmers, ranchers, and forest landowners are key partners in the effort to combat climate change—both as business operators who are uniquely exposed to the damaging effects of extreme weather and as stewards of lands that play an important role in the carbon cycle. Studies show that boosting the amount of carbon stored in plants, trees, and soils can make an important contribution to slowing the buildup of carbon dioxide in the atmosphere, and will be needed, along with emission reductions and other strategies, to meet national and international climate goals. In fact, climate-friendly land management practices—often called “natural climate solutions”—are especially attractive, because many of them deliver valuable co-benefits in terms of wildlife habitat, recreation amenities, and air and water quality. Such practices can also make farms, forests, and rangelands more resilient to the damaging effects of climate change.

In this context, emerging markets for carbon credits, new corporate sustainability initiatives, and government incentives for conservation and greenhouse gas reductions present a substantial economic and environmental opportunity—one with the potential to generate billions of dollars of investment in working farm and forest lands. To fully realize this opportunity, however, substantial hurdles will have to be overcome. Markets for carbon credits and government incentive programs are still not fully mature, and few farmers, ranchers, and forest landowners are accustomed to viewing carbon sequestration and avoided emissions as a business opportunity. Even those who do may lack the time, expertise, and financial resources to assess their options for carbon markets or incentive programs and then implement changes in their land management practices, particularly if those changes require large up-front investments in expectation of uncertain long-term returns.

BPC’s Farm and Forest Carbon Solutions Task Force came together in early 2021 to explore practical ideas for tackling these challenges. Task force members represent a wide range of interests and perspectives, but we share the view that constructive engagement with the agriculture and forestry sectors is crucial to the success of broader U.S. climate policy.

My testimony today begins by discussing our broad coalition to scale natural climate solutions and our unique, bipartisan approach to developing consensus policy recommendations. I’ll then summarize key Task Force recommendations for new investments and strategic changes at USDA that would enable more farmers and forest landowners to engage in climate solutions without replacing core farm bill programs.

2. Task Force Background and Focus Areas

Co-chair Chambliss and I worked with 18 fellow Task Force members,^[1] including leaders from agriculture and forestry industries; environmental and conservation nonprofits; trade associations; and former government officials. Together our group combined wide-ranging expertise on key policy issues and included the perspectives of small and large agricultural operations; small and large landowners, timber companies, forest products groups, urban forestry, and public lands; center-left and center-right environmental, conservation, and hunting and fishing organizations; rural communities; and historically underserved groups—Native American Tribes, African Americans, and women producers. Task Force members also command deep knowledge about how government programs are effectively funded, overseen, and implemented, and leverage strong relationships across stakeholder communities.

In developing recommendations, we were guided by four principles that we believe are critical to the effectiveness of farm- and forest-based climate strategies and that build on our nation's track record of effective public-private cooperation in the forestry and agricultural sectors. These principles include:

- Emphasizing voluntary and incentive-based approaches,
- Finding solutions that are supportive of the needs of farm and forest producers and landowners,
- Promoting partnership and collaboration as the best way to address diverse constraints and priorities, and
- Providing for accountability and transparency in the methods used to track and quantify benefits from natural climate solutions.

With the benefit of insights and ideas generated over the course of multiple workshops and meetings and input from a panel of scientific and technical experts, our group reached agreement on 24 policy recommendations that were published in a report last month.¹ The breadth of our recommendations reflects the range of actions we believe are necessary to realize the full potential of farm- and forest-based climate solutions. Several broad themes provide a framework for organizing our recommendations and implementing a comprehensive policy approach:

1. Increase investment in natural climate solutions through existing farm bill programs and offer pathways to new market opportunities for farmers, ranchers, and forest landowners.
2. Expand technical assistance for implementing natural climate solutions and address related workforce needs.
3. Strengthen the integrity of voluntary carbon markets and increase access to these markets.
4. Develop new public and private financial and insurance instruments that address barriers to the broad adoption of natural climate solutions.
5. Enhance resilience to wildfire, drought, insects and disease, and invasive species on a landscape scale.
6. Foster technology innovation in the agriculture and forestry sectors to make natural carbon solutions cheaper and easier to implement and to address measurement and monitoring challenges.

The next section of this testimony summarizes key task force recommendations that relate to USDA programs and authorities under the jurisdiction of this Committee.

3. Build on the Foundation of Existing Farm Bill Programs

The Task Force acknowledged the value of existing farm bill programs by designing many of our recommendations to build from, address gaps in, or complement these programs. There is a strong bipartisan history of including provisions in the farm bill that support conservation, and many of these programs have become very popular with producers. Moreover, there are efficiencies to be gained in using existing programmatic infrastructure and resources. We see the upcoming 2023 Farm Bill as a key opportunity to authorize and implement strategic changes at USDA that enable more farmers and forest landowners to engage in climate solutions without replacing core farm bill programs. Our subset of recommendations for improving USDA programs primarily relate to opportunities within the following farm bill titles:

^[1] <https://bipartisanpolicy.org/carbon-solutions-task-force/>.

¹ Available at: <https://bipartisanpolicy.org/report/federal-policies-to-advance-natural-climate-solutions>.

- Title [II]: Conservation.
- Title [VII]: Research, Extension, and Related Matters.
- Title [VIII]: Forestry.
- Title [XII]: Miscellaneous (Support for beginning, socially disadvantaged, and veteran farmers and ranchers).

In addition, we offer a number of recommendations that could be enacted through legislative vehicles other than the farm bill— including, for example, through the Growing Climate Solutions Act, Rural Forest Markets Act, Trillion Trees Act, and the annual appropriations process. For a comprehensive look at all Task Force recommendations, please refer to our full report available at: <https://bipartisanpolicy.org/report/federal-policies-to-advance-natural-climate-solutions>. I have included the executive summary as an appendix to this testimony.

A. Conservation Incentives

We recommend that Congress substantially increase USDA funding for key conservation cost-share and incentive programs under Title [II] of the farm bill, dedicating these funds specifically for greenhouse gas reductions and carbon sequestration purposes (Task Force report recommendation 1A). The Task Force is aligned with more than 200 agriculture and conservation organizations that expressed support last summer for doubling farm bill conservation program funding²—so that private working lands can both take advantage of new carbon-based revenue opportunities and help lead the fight against climate change. The Bipartisan Policy Center assessed the employment and economic effects of investing in farm- and forest-based climate solutions on America’s public and working lands, finding that new Federal funding could support up to 22,000 jobs per year and contribute up to \$2.2 billion per year to U.S. gross domestic product.³

USDA programs with the greatest potential to achieve positive climate and economic outcomes in the land sector include but are not limited to the Environment Quality Incentives Program (EQIP), the Conservation Stewardship Program (CSP), the Regional Conservation Partnership Program (RCP), the Landscape Scale Restoration (LSR) program, the Farming Systems Project (FSP), and the Conservation Technical Assistance (CTA) program. We recommend establishing climate-focused program metrics and benchmarks to evaluate program effectiveness (Task Force report recommendation 1B).

Many of these programs are implemented by USDA’s Natural Resources Conservation Service (NRCS). Other task force recommendations aimed specifically at NRCS include streamlining the NRCS process for adopting new conservation practice standards (Task Force report recommendation 1D), expanding existing measurement networks like the National Resources Inventory to better integrate climate and carbon-related data (recommendation 1E), and expanding the NRCS network of technical service providers through more innovative partnerships (recommendation 2C). Congress could also authorize the NRCS to be a lead agency in establishing a process for farmers, ranchers, and forest landowners to receive a one-time payment for early adoption of climate-smart practices (recommendation 4D), and in establishing a new, interagency cross-boundary rangeland health initiative (recommendation 5C).

B. Technical Assistance and Workforce Development

Our recommendations call for expanding Federal technical assistance to achieve greater and more effective uptake of climate-friendly practices and to promote more informed decision making that maximizes economic and environmental co-benefits and ensures long-term sustainability. Investments in workforce development are also vital to support the next generation of farmers, ranchers, and foresters. Although some relevant workforce development programs and many core technical assistance programs that support Title [II] implementation are authorized in legislation other than the farm bill, our recommendations identify several opportunities related to Titles [VII] and [XII].

These include expanding private-sector partnerships with the Cooperative Extension program for climate-targeted technical assistance (Task Force report recommendation 2A) and providing tailored technical assistance (similar to the Farm-

²Letter: 216 Groups Call for Double Agriculture Conservation Funding. Available at: <https://www.nwf.org/-/media/Documents/PDFs/Press-Releases/2021/08-04-21-Letter-216-Groups-Call-for-Double-Ag-Cons-Funding>.

³Investments modeled include wildland firefighting, Federal forest thinning and replanting, tree planting on marginal lands, cover cropping, grassland restoration, and anaerobic digesters. For more information go to: <https://bipartisanpolicy.org/ncs-resources>.

ing Opportunities Training and Outreach Program authorized in the 2018 Farm Bill) to encourage Tribes and historically underrepresented producers and landowners to adopt climate-friendly practices (recommendation 2B). We also recommend new investments in education and workforce development through extension, national service corps programs like AmeriCorps, Tribal colleges and universities, and historically Black land-grant universities (recommendation 2D).

C. Land Access

Just as a strong workforce is necessary to scale natural climate solutions, preventing the conversion of productive working lands and increasing access to land is a critical and underappreciated climate strategy. Therefore, we urge Congress to assess and develop new incentives—such as cost-shares, state block grants, and tax reform—to improve land access, tenure, and leasing, especially for new, small, and historically underserved landowners and producers, and owners of heirs' property and fractioned Tribal lands (Task Force report recommendation 4C). New Federal incentives could help address the major financial, social, and legal obstacles that limit secure access to affordable farmland.

D. Improving Data Tools and Strengthening Emerging Carbon Markets

We recommend that USDA strengthen its data, modeling, and technical/decision support tools to provide farmers, ranchers, and forest landowners with accurate estimates of the impacts of climate-smart practices (Task Force report recommendation 2F). These tools include, but are not limited to, COMET-Farm, COMET-Planner, LandPKS, DairyGEM, GRACEnet, APEX, Rangeland Analysis Platform, CART, and the Forest Inventory and Analysis program. More reliable models and improvements in other predictive tools are needed to improve integrity and transparency in voluntary carbon markets and to reduce the administrative and technical burdens faced by potential participants in Federal conservation programs, supply chain sustainability programs, and voluntary carbon markets.

The costs of monitoring, reporting, and verifying climate benefits can be prohibitive for small producers and forest landowners seeking to participate in voluntary carbon markets. Similarly, a lack of clarity, transparency, and standardization among credit buyers, project developers, and landowners can be a barrier to quality assurance for farm- and forest-based carbon credits. Currently, however, there are no government programs that seek to address these issues. Task Force members believe the private-sector must step up, in concert with targeted public investments, to address problems with transparency and liquidity, incomplete risk management mechanisms, and inadequate financing that are making it difficult for supply to respond to market demand. We therefore recommend that Congress authorize new efforts to improve market integrity and new funding to reduce barriers to entry to emerging carbon markets (Task Force report recommendation 3A). We also call on USDA, in collaboration with other Federal agencies, to advance public-private partnerships for enhancing trading infrastructure and developing insurance and structured finance products for voluntary carbon markets (recommendation 3C).

E. Forestry

The Infrastructure Investment and Jobs Act of 2021 allocates historic levels of funding—over \$6 billion—for forest restoration, hazardous fuels management, and wood products innovation, among other provisions that support natural climate solutions. Accordingly, our recommendations include a strong focus on policy implementation, including through Title [VIII] Forestry programs, so that this and other recommended funding can be deployed quickly and effectively.

Task Force members believe the time is now to build on these critical investments to enhance the resilience of our natural and working lands in the face of increasing threats from wildfires, droughts, floods, and other extreme weather, as well as threats from pests and invasive species. This includes providing needed resources to the USDA Forest Service and Department of Interior, not only for wildland fire-fighting, but for prevention strategies like thinning, prescribed burns, training, fire detection via remote sensing, and prediction using high performance computing. An all-of-government approach to wildfire resilience is essential (Task Force report recommendation 5B).

We also recommend pursuing a comprehensive strategy to modernize, expand, and fund the network of public and private seed collections and tree nurseries (recommendation 5A). Current estimates suggest that rapidly expanding reforestation demand, partly due to wildfire trends, will require more than doubling tree nurseries' current output, from roughly 1.3 billion seedlings per year to 3 billion.

F. Research

Innovation in agriculture and forestry is critical to meet the evolving economic and environmental demands on these sectors. Thus, we enthusiastically support R&D investments that will make natural climate solutions less expensive and easier to implement (Task Force report recommendation 6A). Innovation is also required to improve the tools available to monitor, quantify, and verify environmental and climate benefits and reduce related costs.

To meet these needs, we believe USDA must emulate the more integrated research, development and commercialization approach that exists in the DOE National Labs. Consistent with Title [VII], the Task Force strongly supports increased funding across the USDA enterprise, including for the Foundation for Food and Agriculture Research. We also call for increased cooperation to promote innovation in natural climate solutions—across Federal agencies (especially DOE/ARPA-E, NIST, USGS, and NSF), universities, and the private-sector. Enhancing the innovation pipeline, from research and development to broad commercialization of new technologies, is critical to scaling farm- and forest-based climate solutions.

4. Conclusion

The bipartisan infrastructure bill will provide critical resources for implementing natural climate solutions, particularly in the forestry sector. But the levels of funding authorized in that legislation, while historic, represent just a down-payment on the investments that will be needed to meet the diverse needs of producers and land managers in the decades ahead. Looking toward the next farm bill, we see a strong opportunity and widespread support for a suite of policies to increase access to Federal Government programs and private market opportunities for producers and landowners of all types and sizes, and across the whole natural climate solutions supply chain. We strongly believe this can be accomplished without taking away from core farm bill programs and instead drawing on policymakers' decades of experience supporting and implementing voluntary and incentive-driven conservation solutions for America's farmers, ranchers, and forest landowners.

The 24 recommendations put forth in our full Task Force report reflect confidence that the Federal Government—and USDA in particular—can be effective in catalyzing the rapid scale-up of farm- and forest-based carbon solutions. Beyond helping us meet climate goals, these solutions will stimulate investment in rural communities and bolster the long-term resilience and productivity of America's public and working lands. With the bipartisan support that exists for all these objectives, progress is not only possible, but very much within reach. Co-chair Chambliss, members of the Task Force, and I look forward to a productive dialogue and partnership with Congress to inform your work positioning America's farmers, ranchers, and forest landowners to continue to deliver climate solutions.

APPENDIX A: EXECUTIVE SUMMARY OF THE BPC FARM AND FOREST CARBON SOLUTIONS TASK FORCE POLICY RECOMMENDATIONS

BPC Farm and Forest Carbon Solutions Task Force Policy Recommendations

Executive Summary

America's farmers, ranchers, and forest landowners are key partners in the effort to combat climate change—both as business operators who are uniquely exposed to the damaging effects of extreme weather and as stewards of lands that play an important role in the carbon cycle. Studies show that boosting the amount of carbon stored in plants, trees, and soils can make an important contribution to slowing the buildup of carbon dioxide in the atmosphere, and will be needed, along with emission reductions and other strategies, to meet national and international climate goals. In fact, climate-friendly land management practices—often called “natural climate solutions”—are especially attractive, because many of them deliver valuable co-benefits in terms of wildlife habitat, recreation amenities, and air and water quality. Such practices can also make farms, forests, and rangelands more resilient to the damaging effects of climate change.

In this context, emerging markets for carbon credits, new corporate sustainability initiatives, and government incentives for conservation and greenhouse gas reductions present a substantial economic and environmental opportunity—one with the potential to generate billions of dollars of investment in working farm and forest lands. To fully realize this opportunity, however, formidable hurdles will have to be overcome. Markets for carbon credits are still not fully mature, and few farmers, ranchers, and forest landowners are accustomed to viewing carbon sequestration and avoided emissions as a business opportunity. Even those who do may lack the

time, expertise, and financial resources to assess their options for carbon markets or incentive programs and then implement changes in their land management practices, particularly if those changes require large up-front investments in expectation of uncertain long-term returns.

BPC's Farm and Forest Carbon Solutions Task Force came together in early 2021 to explore practical ideas for tackling these challenges. Task force members represent a wide range of interests and perspectives, but we share the view that constructive engagement with the agriculture and forestry sectors is crucial to the success of broader U.S. climate policy. Over the course of multiple workshops and meetings, and with input from a panel of scientific and technical experts, we sought to develop proposals that reflect four guiding principles, including the importance of:

- Emphasizing voluntary and incentive-based approaches,
- Finding solutions that are supportive of the needs of farm and forest producers and landowners,
- Promoting partnership and collaboration as the best way to address diverse constraints and priorities, and
- Providing for accountability and transparency in the methods used to track and quantify benefits from natural climate solutions.

To organize our recommendations and ensure that our approach to farm- and forest-based climate solutions is comprehensive, we also identified six distinct policy objectives, or “themes”:

1. Expand existing farm bill programs that deliver climate benefits and offer pathways to new market opportunities for farmers, ranchers, and forest landowners.
2. Expand technical assistance for implementing natural climate solutions and address related workforce needs.
3. Strengthen the integrity of voluntary carbon markets and increase access to these markets.
4. Develop new public and private finance and insurance instruments to help overcome barriers to the broad adoption of natural climate solutions.
5. Enhance resilience to wildfire, drought, insects and disease, and invasive species on a landscape scale.
6. Foster technology innovation in the agriculture and forestry sectors to make natural climate solutions cheaper and easier to implement and to address measurement and monitoring challenges.

Our recommendations in each of these areas are summarized below and detailed in our full report. Many of these ideas build on legislation already passed by the 117th Congress, including the Infrastructure Investment and Jobs Act, and on policy debates that are informing the development of the 2023 Farm Bill. Together, these 24 recommendations reinforce our view that the Federal Government has a tremendous opportunity over the next several years to put in place policies and programs that will jump-start the rapid scale-up of farm- and forest-based carbon solutions. Given growing bipartisan support for such solutions—not only as another tool for achieving climate goals, but as a means for spurring investment in rural communities and in the long-term resilience and productivity of America's farms, rangelands, and forests—we are confident that progress is not only possible, but very much within reach.

Theme 1: Expand existing conservation programs

-   Increase funding for key USDA conservation programs.
-   Set benchmarks and goals for tracking the adoption of climate-friendly practices and quantifying their benefits.
-   Issue guidance on how existing USDA programs can assist landowners who are interested in accessing carbon markets.
-   Streamline the process of setting new standards for conservation practices.
-   Expand USDA's measurement networks to better integrate climate-related data.

Theme 2: Address technical support and workforce needs

-   Recruit private-sector partners to work with USDA and Extension offices to provide training and information on climate-smart practices.
-   Set goals and benchmarks for helping historically underrepresented landowners implement natural climate solutions.
-   Expand technical assistance on climate issues and opportunities to socially disadvantaged and Tribal producers and landowners.
-   Invest in education and workforce development, including through extension and scholarship programs.
-   Enhance the collection, sharing, and interoperability of climate-related data by USDA and other agencies.
-   Strengthen USDA's technical capacities by investing in state-of-the-art datasets, models, and analytical tools.

Theme 3: Strengthen voluntary carbon markets

-   Improve the integrity of voluntary carbon markets and reduce barriers to entry through targeted legislation.
-   Use the Commodity Credit Corporation to support climate-smart practices, leveraging carbon markets and supply chain initiatives.
-   Support public-private efforts to develop infrastructure, insurance, and structured finance products for carbon trading.

Theme 4: Develop new finance and insurance instruments

-   Adopt a tax credit to incentivize ecologically appropriate agriculture- and forest-based sequestration.
-   Assess impact of conservation practices on crop yields and insurance payouts, and create incentives for reducing climate risk.
-   Develop new strategies for overcoming barriers related to landownership and succession.
-   Provide a one-time payment to early adopters of climate-smart agriculture and forestry practices.

Theme 5: Enhance carbon storage and climate resilience of farm and forest lands

-   Modernize and expand public and private seed collections and tree nurseries to meet reforestation demand and support scale-up of natural climate solutions.

  Implement an all-of-government approach to increase wildfire resilience.

  Create a new cross-boundary initiative to improve the health and carbon sequestration potential of rangelands.

Theme 6: Foster farm- and forest-based climate innovation

  Increase funding for USDA research and expand R&D collaboration across Federal agencies, universities, and the private-sector.

  Expedite FDA approval of safe feed additives that reduce greenhouse gas emissions from livestock operations.

  Support emerging markets for innovative wood products through better integration of USDA programs, Federal procurement, and manufacturer incentives.

The CHAIRMAN. Thank you very much, Senator Heitkamp. And now, Ms. Raygoza, please begin when you are ready.

STATEMENT OF SHAKERA RAYGOZA, OWNER, TERRA PRETA FARM; CFAP2 TECHNICAL ASSISTANT, NATIONAL YOUNG FARMERS COALITION, EDINBURG, TX

Ms. RAYGOZA. Thank you to the Honorable David Scott and Glenn "G.T." Thompson for holding this important hearing. I appreciate the opportunity to share my story.

My name is Shakera Raygoza, and I, alongside my husband, am the owner and operator of Terra Preta Farm in Edinburg, Texas. We grow certified organic vegetables with 15 acres in wholesale production, and 1 acre in production for local farmers' markets and community-supported agriculture. I work as the farm sales manager and with the National Young Farmers Coalition, providing technical assistance to young Black, indigenous, and people of color farmers applying for USDA Farm Service Agency loans. Because I

have benefitted so much from USDA programs, I want to help other farmers to gain access to those programs.

When we first started farming in 2009, my husband had a bachelor's degree in agriculture, and I was a certified nurse with no farming experience. We began farming by borrowing a small tract of land from our neighbor. Growing our farm business was challenging because we had to relocate 3 years in a row due to our leases being terminated because the owners were expanding into the land for development, or they were offered more by other growers.

Farm Service Agency ownership loans helped us purchase our own land, and we directly benefitted from FSA operating microloans. We have also benefitted from the Natural Resources Conservation Service Environmental Quality Incentives Program, funding for high tunnels, cover cropping, land leveling, and irrigation systems.

Throughout our time farming, I have noticed how climate change has affected and changed our work. Living in the Rio Grande Valley, hurricanes and heavy flooding have hit our area three times in a row from 2018 to 2020. The most recent, Hurricane Hannah, hit in July of 2020, dumping more than 9" of rain in the area in just 2 days. The floods damaged our cover crops, causing \$4,000 in losses. And even though we usually have mild winters, we have had many extreme cold days recently. Last winter during Winter Storm Uri, we experienced a hard freeze and lost $\frac{1}{3}$ of our crops. These losses totaled \$60,000, more than $\frac{1}{2}$ of our annual revenue. I am currently still trying to navigate the Non-Insured Crop Disaster Assistance Program to get help for those losses. Fortunately—or unfortunately, communication between the local office has been painfully slow, and the USDA staff are not sure how to help a small-scale diversified farmer like myself.

To support the future of agriculture, USDA must improve staff training and increase the number of USDA staff specifically dedicated to small and beginning farmers and outreach. Crop insurance is too expensive, and disaster relief programs are not accessible to small and diversified farms.

We want to do more to mitigate climate change on our farm, including on-farm renewable energy, drip tape for water conservation, and biochar for sequestering carbon. We would benefit from programs that will provide funding up-front for conservation, without placing the burden of financing onto the farmers who may not have access to credit.

When I have applied for the programs with USDA, I found the process is long and requires a lot of paperwork. We almost lost out on purchasing our farmland due to a lengthy process. Loans are designed for commodity farmers who grow one or two crops. Figuring out how to convert our production of over 40 crops to yields per acre and present proof of our market prices requires a lot of time that we just don't have as owner-operators with off-farm jobs.

Many farmers I talk with about CFAP2 appreciated the streamlined process and broad range of eligible crops. Young farmers would benefit from streamlined applications for diversified farms.

When I first started farming, there were many local producers who sold at my farmers' market. Ten years later, only one or two

of those original farmers are still farming. Young farmers are the future of agriculture, but we need the support from USDA in order to continue sustainably growing food for our communities while dealing with the changing climate. We as farmers have the unique ability to sequester carbon in the soil by using climate-smart methods but lack the capital, access to credit, and land to expand our climate action. USDA must focus on expanding programs and supporting farmers like me who build our businesses for resilience and are already invested in this work. Investments like this are critical for the future of our rural communities, feeding our families, and helping the next generation of farmers to be at the forefront of climate action.

Thank you.

[The prepared statement of Ms. Raygoza follows:]

PREPARED STATEMENT OF SHAKERA RAYGOZA, OWNER, TERRA PRETA FARM; CFAP2
TECHNICAL ASSISTANT, NATIONAL YOUNG FARMERS COALITION, EDINBURG, TX

Thank you to the Honorable David Scott and Glenn ‘GT’ Thompson for holding this important hearing. I appreciate the opportunity to share my story. My name is Shakera Raygoza, and I, alongside my husband, am the owner-operator of Terra Preta Farm in Edinburg, Texas. I am also the local market manager and the wholesale sales manager on the farm, overseeing processing and packing, bookkeeping, and marketing. We are currently farming on 15 acres in wholesale production, with 1 acre in small-scale production for local farmers markets, and a community supported agriculture (CSA) program. I work with the National Young Farmers Coalition (Young Farmers) providing technical assistance to young Black, Indigenous, and People of Color (BIPOC) farmers applying for USDA Farm Service Agency loans and previously the Coronavirus Food Assistance Program 2 (CFAP2). Because I have benefited so much from USDA programs, I want to help other farmers gain access to those programs.

When we first started farming in 2009, my husband had a bachelor’s degree in agriculture and I was a registered nurse with no farming experience. We began farming by borrowing a small tract of land from our neighbor to grow food for our young family, and then started selling the surplus produce at local farmers markets. It was a challenge to grow our farm business because we had to relocate 3 years in a row due to our leases being terminated because the owners were expanding into the land for development or they were being offered more from other growers to rent. In each location, we would invest in the soil by adding compost and organic matter to the soil but we were hesitant to implement more climate-smart practices without secure land access. By 2012, we had a steady stream of customers at the farmers markets and 15 CSA members, so we decided to purchase our own land with an FSA Farm Ownership Loan. For the past 8 years we have been growing Certified Organic vegetables for our local community through farmers markets and a CSA veggie box program, and for the past 3 years we have added wholesale accounts in the regional wholesale market, including a major grocery chain in Texas. We’ve directly benefited from FSA Farm Ownership Loans and Farm Operating Microloans, and the Natural Resources Conservation Service (NRCS) Environmental Quality Incentives Program (EQIP) funding for high tunnels, cover cropping, land leveling, and irrigation systems with ponds. We also were recipients of the State of Texas Young Farmer Grants and CFAP1 and CFAP2.

Throughout our time farming, I’ve noticed how climate change has affected and changed our work. Living in the Rio Grande Valley, we’ve been hit hard by hurricanes that are becoming stronger and more frequent in the past 5 years. Hurricanes and heavy flooding have hit our area 3 years in a row from 2018 to 2020. The most recent hurricane, Hurricane Hanna, hit in July 2020, dumping more than 9” of rain in the area in just 2 days. The floods damaged our cover crops, causing \$4,000 in losses. And even though we usually have very mild winters, we’ve had a lot of freezes recently, which are very uncommon in this area. Last winter, during Winter Storm Uri—the record-breaking storm that left millions without power, dozens dead, and caused \$24 billion in overall damages—we experienced a hard freeze, resulting in us losing $\frac{1}{3}$ of our crops. These losses totaled \$60,000—more than $\frac{1}{2}$ of our annual revenue. I’m currently still trying to navigate the Noninsured Crop Disaster Assistance Program (NAP) to get help for those losses. Unfortunately, communica-

tion between the local office has been painfully slow and USDA staff and technical assistance providers aren't sure how to help a small-scale farmer like myself. Crop insurance is not affordable to farmers like me, and disaster relief programs are not accessible to small and diversified farms. To support the future of agriculture, USDA needs to change the way it serves young farmers. We would have benefited from having access to outreach programs, easily accessible online resources and tools, and technical assistance to help us apply for USDA programs. We also would have benefited from well-trained staff in county offices who were aware of our needs and could have guided us toward programs tailored for our small-scale farm. I would like to see more programs that provide up-front funding without placing the burden of financing projects onto the farmers who may not have access to credit.

Since winters are also getting warmer and temperatures are fluctuating more, we have faced an increasing amount of pest pressure. Over the past 2 to 3 years, we are seeing more and more cucumber beetles and aphids, which are challenging to manage and cause damage to our crops. Climate change is also affecting how our crops grow—as temperatures fluctuate, we have been trying to account for those changes by buying heat, cold, and drought resistant varieties. We are also adding organic matter to our soils to increase moisture retention and soil fertility. On the farm, we try to incorporate climate-smart agricultural practices and minimize tillage to allow the natural soil ecosystem to thrive. Small farmers are already doing many things to sequester carbon and preserve natural resources on a limited budget, but we need more help. We want to do so much more and increased access to cost-share dollars would make it economically feasible for us to invest in climate resilience.

To do my part in fighting climate change, I am interested in on-farm renewable energy and integrating more sustainable practices into my operation. For example, I would like to use a solar powered tractor and install wind turbines to harness the strong coastal winds we have here to provide energy for my farm. I'm also interested in conserving water by collecting rainwater from my farm buildings. We are currently using drip irrigation to conserve water, but the rise in prices on drip tape is prohibitive. We are also experimenting with biochar to sequester more carbon and add biomass to our soils, but the equipment needed to produce biochar is expensive and not accessible to small farmers. I need support to continue this project and others, like building a biodigester to convert food waste to fertilizers and renewable biogas. We need more support and increased funding for programs like Sustainable Agriculture Research and Education (SARE) grants to develop new technologies. SARE provides money for farmer-led research and outreach, and is critical for farmers like me who are committed to sustainable agriculture.

In my 10 years of farming, I've been fortunate enough to have access to several USDA programs, but I know that this experience is not the case for all young, beginning, small, and BIPOC farmers. Because I've been working in South Texas for so long, my husband and I have developed relationships with our local USDA offices. Despite this, I've experienced challenges that make it difficult to use these programs. One significant barrier is the reimbursement model for EQIP. We didn't have any capital to buy materials and cover labor costs for the installation of irrigation pipes and a high tunnel, so we had to take out a microloan through FSA to fund the project. EQIP programs have contract terms and farmers do not have the time to wait to go through a 3–4 month loan application process. For our most recent EQIP project we had to take out a personal loan from a commercial lender at a higher interest rate. We were fortunate to be approved for the loan in time to complete the project within the contract period, but I believe that was due to having off-farm income, great credit, and farm sales data to strengthen our application. The reimbursement model is a major challenge for beginning farmers short on capital, unaware of microloan programs, and those who have bad credit or no access to traditional forms of credit, have student loan debt, and don't have off-farm income to fall back on.

Additionally, when I have applied for programs with USDA, I've found that the process is long and requires a lot of paperwork. My husband and I were both working off-farm jobs to provide for our family, so it took us a long time to gather all the required documentation and place it in the required format. Having to explain our work using rigid terms and units was also difficult. Figuring out how to convert our production of over 40 crops to yields per acre and present proof of our market prices to justify our business plan required a lot of time that we just don't have. The applications are designed for large commodity farmers who grow one or two crops. We were on our own for this process and eventually had to send in several revisions, which took even more time. We could have benefited from technical assistance and staff more knowledgeable about small-scale, diversified farming, as well as streamlined applications for diversified farms.

Through my work with the National Young Farmers Coalition, I have the privilege of providing young BIPOC farmers technical assistance with accessing USDA programs like CFAP2 and FSA loan programs. I have found that many were unaware of the programs and very appreciative of the outreach. Young farmers that requested technical assistance didn't feel comfortable working with their local offices because of discrimination, didn't understand how to complete the forms or where to access online resources, and had language barriers. Many had misinformation and assumed that they weren't eligible because they were a small diversified farm. Others were interested in applying, but didn't have time to complete the forms and would have preferred a streamlined online application process. I was able to provide one-on-one bilingual support for the farmers, making connections between farmers and local offices.

When I first started farming, there were a lot of local producers who sold at my farmers market. Ten years later, only one or two of those original farmers are still farming. Young farmers are the future of agriculture, but we need the support from USDA in order to continue sustainably growing food for our communities while dealing with a changing climate. Despite being directly affected by climate change, we as farmers have the unique ability to sequester carbon in the soil by using climate-smart methods like planting cover crops, using no- and reduced-tilling, and managed grazing. We often don't have the startup capital needed to get off the ground quickly, often don't have access to traditional forms of credit, and are not eligible for many of the programs that are out there and tailored to larger farms, like crop insurance and disaster relief. Young farmers and farmers of color are already more likely to use climate-smart agricultural practices, and USDA must focus on expanding programs and supporting farmers who are already doing this work. By incorporating these methods into our farming practices, we can continue providing healthy food to our local communities, but we can only do this with secure access to land. I would like to see USDA and Congress focus on land security for young and BIPOC farmers.

Passage of bills like the Agricultural Resilience Act (ARA) will be instrumental in supporting young farmers on the frontlines of the climate crisis. The policy changes outlined in the ARA should be used to reimagine conservation in the farm bill and how these programs can support young and BIPOC farmers to act on climate.

Thank you for listening and holding this important hearing. I appreciate the opportunity to share my story and the story of so many farmers like myself.

The CHAIRMAN. Thank you very much, Ms. Raygoza. Thank you. And now, Dr. Humiston, please begin when you are ready.

STATEMENT OF GLENDA HUMISTON, Ph.D., VICE PRESIDENT, AGRICULTURE AND NATURAL RESOURCES, UNIVERSITY OF CALIFORNIA; DIRECTOR, AGRICULTURAL EXPERIMENT STATION AND COOPERATIVE EXTENSION SERVICE, OAKLAND, CA

Dr. HUMISTON. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to speak on this subject and the next farm bill.

For more than a century, California's \$50 billion agricultural sector has depended on the land-grant university for new technologies and research breakthroughs needed to stay competitive and be responsible stewards of the land. Beyond on-farm production, California's working landscapes include forests, wetlands, mines, and water bodies that are valuable sources of ecosystem services. Those services provide biological necessities such as clean water, nutritious food, and livable climate, as well as economic benefits such as jobs and revenue.

Extreme climate events are changing California's ecosystems. Fires, floods, drought, and more invasive pests are already affecting agriculture. For example, unseasonably warm weather now causes many fruit and nut trees to bloom before the last frost, causing great economic losses. Changing climate decreases water

supplies, increases wildfires, and threatens agricultural productivity.

To combat this, we must enable working landscapes to adapt and become a solution to climate change. According to the National Academy of Sciences, U.S. soils and forests have the potential to sequester 500 million metric tons of carbon dioxide annually. Markets for carbon credits are one solution to move us there.

Such climate-smart practices require we fully utilize USDA programs and leverage collaborations between government, academia, and the private-sector. We need voluntary market- and incentive-based programs, and a focus on science-based outcomes. New science and technologies will allow farmers to remain economically viable while generating co-benefits, such as improved water holding capacity of soils, pollinator habitat, and carbon sequestration. We are moving to expand relations between the life sciences and engineering and other technology specialists to develop those complex solutions to these challenges. Some examples are placing solar panels over irrigation canals to reduce evaporation of precious irrigation water, while also producing electricity—something Congressman Costa has long supported—implementing healthy soil practices to improve groundwater recharge, and dairy digesters to create biofuels rather than harmful greenhouse gases.

Other opportunities exist in forest health efforts that convert excessive fuel loads, biomass, into valuable bioproducts. Expanding the capacity to manufacture advanced wood products can support economic development in rural communities. Examples of this work include converting that biomass into hydrogen and liquid biofuels to reduce diesel in trucks.

In California, we are excited to work with the Governor and the state legislature to secure \$185 million investment in UC to expand climate-focused research innovation and workforce development. This funding will establish regional workforce hubs to provide on-the-job training opportunities for students and leverage career certification programs for college prep and non-degree seeking individuals.

USDA's Climate Hub should be expanded to engage in more stakeholders, as should the Forest Service's work on wood products and ability to enter into long-term stewardship agreements with state and local partners. Rural Development, the Agricultural Marketing Service, and many other USDA programs help build climate solutions through more efficient regional food systems, workforce training, certification of BioPreferred products, and risk management.

To help rural economies better adapt to climate change, we need senior USDA leadership coordinating climate issues across programs and pushing interagency cooperation. USDA must also collaborate with Federal entities to support improvements to broadband access, and with programs like the Economic Development Administration, to ensure that access to capital, effective economic development, and infrastructure investments are effectively delivered. Such distribution of program dollars also requires that the current definition of *rural* be updated. Far too many communities are improperly denied USDA resources due to the antiquated definitions of *rural* versus *metropolitan*.

Federal capacity funds are leveraged many-fold by competitive and private industry partnerships. Competitive grants stimulate new ideas and speed up some research; however, they can also—shift toward short-term project research. It can take several years to develop a new crop variety, longer for tree crops, and even longer to fine-tune new technologies.

When UC Davis designed a machine to automate harvesting tomatoes in the 1960s, it required agronomists to breed a less delicate variety of tomato that could be machine harvested. There is a critical need to invest in a well-balanced mix of capacity and competitive funds for research, as well as significant investments in ag research facilities. Such investments will help ensure farmers and ranchers have access to the sound science, technologies, and information they need to build climate resilience and mitigate environmental impacts.

I thank you for the opportunity and look forward to questions. [The prepared statement of Dr. Humiston follows:]

PREPARED STATEMENT OF GLENDA HUMISTON, PH.D., VICE PRESIDENT, AGRICULTURE AND NATURAL RESOURCES, UNIVERSITY OF CALIFORNIA; DIRECTOR, AGRICULTURAL EXPERIMENT STATION AND COOPERATIVE EXTENSION SERVICE, OAKLAND, CA

Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee, my name is Glenda Humiston, and I serve as the Vice President of Agriculture and Natural Resources (ANR) for the University of California (UC) system. I am honored to have this opportunity to discuss the importance of agricultural research, and other USDA programs, as you begin work on the next farm bill.

With UC ANR serving as a vital partner, California continues to be the nation's top agricultural state. For more than a century, California's \$50 billion agricultural sector has depended on UC ANR, in partnership with our UC campuses, for the stream of new technologies and research breakthroughs needed to stay competitive and be responsible stewards of the land. We are proud to be part of the Land-Grant partnership that was developed between states and the Federal Government with the 1862 Morrill Act, 1887 Hatch Act and the 1914 Smith-Lever Act. That enterprise has, for over 130 years, advanced scientific knowledge in all aspects of food production, and improved production capacity, profitability, and safety of the nation's food system.

With over 71,000 farms producing 400 different commodities, California is an agricultural behemoth and the sole provider of many high-demand farm products while also exporting roughly 1/3 of its agricultural production each year. Beyond on-farm production, California's working landscapes include farmland, ranches, forests, wetlands, mines, water bodies and other natural resource lands, both private and public, that are vital sources of ecosystem services. These services are ways that the natural world provides biological necessities, such as clean water, nutritious food, and a livable climate, as well as indirect economic benefits, such as jobs and revenue created along food value chains. More broadly, they encompass intangible goods that contribute to human well-being, such as recreation, aesthetic inspiration, and cultural connection.

Ensuring that those ecosystem services are functioning and remain available to utilize is an ever-growing challenge. There can be no doubt that extreme climate events are changing California's landscape—fires, floods, drought, more invasive pests are already affecting agriculture. For example, unseasonably warm weather now causes many fruit and nut trees to bloom before the last frost, causing great economic losses. In the coming decades, the changing climate is likely to further decrease the supply of water, increase the risk of wildfires, and threaten coastal development and ecosystems.

To combat such future perils, we must harness the ability of our agricultural and other working landscapes to adapt, to mitigate and where possible, to become a solution to climate change. According to the National Academy of Sciences, U.S. soils and forests have the potential to sequester about 500 million metric tons of carbon dioxide annually. Emerging markets for carbon credits and government incentive programs could generate tens of billions of dollars per year in new investment for working farm and forest lands within the next several years.

Within this framework, USDA programs are critical to our efforts to support carbon sequestration, improved water management, healthy soils, forest restoration, hazardous fuels management, and wood products innovation, among other provisions that support natural climate solutions. USDA's new Partnerships for Climate-Smart Commodities is a great example of how targeted funding for pilot projects can create market opportunities for commodities produced using climate-smart practices.

As we pursue those climate-smart practices, it is critical that we make full use of existing programs and leverage collaborations among them wherever possible. Supporting partnerships between government agencies with academia and the private-sector will enable production of multiple benefits from various actions. As part of this we need to utilize voluntary, market and incentive-based programs to the greatest extent possible and maintain a focus on science-based outcomes. In many situations, transformative innovation is needed—moving beyond just improving existing methods and processes to totally re-thinking how our systems are designed to deliver policy and programs.

UC ANR supports California farmers and ranchers to be resilient to extreme weather events with data-driven tools, methods, and technologies. For example, we are developing drought, heat, and pest-tolerant crop varieties that allow farmers to remain economically viable while also being resilient to extreme weather. Finding new crops suitable for California soils and ecosystems not only improves the productivity of the farm but can have co-benefits such as improving water-holding capacity of the soil, increasing native pollinator habitat, and boosting local economies by increasing value-added products.

We are also pushing our research system to expand collaborative efforts between experts in soil sciences, plant pathology, biochemistry, and other sciences with technology experts in robotics, sensors, artificial intelligence, materials, supply chain logistics, and energy systems to solve today's complex problems in agriculture. Much like the biomedical revolution, it is the integration of multiple disciplines into a single project that can lead to transformative innovation that improves productivity, food safety, and ecosystem services while also giving rise to new businesses. Great examples of such transdisciplinary research and development include:

- An initiative to place solar panels over irrigation canals to reduce evaporation of precious irrigation water supplies for farmers while also producing electricity.
- Implementing healthy soil practices, like cover crops and no-till, to enhance capture of rain and improve groundwater recharge.
- Programs for farmers to install dairy digesters to convert potentially harmful greenhouse gases into valuable biofuels.

To develop the science, new technologies and better farming practices that are desperately needed, increased funding for agriculture and food-related research and extension is necessary as are new investment in agricultural research facilities. Public funding for agricultural research in the U.S. has declined in real dollars over the past few decades while deferred maintenance of research facilities greatly hampers scientists' work. Greater investments will help ensure farmers and ranchers have access to the scientifically rigorous tools and information they need to build climate resilience, mitigate environmental impacts, and increase the productivity of their land.

Other exciting opportunities can be found in forest health efforts that convert excessive fuel loads—biomass—into valuable bioproducts while reducing risk from catastrophic wildfires. California's wildfire crisis continued its destructive march in 2020, each year worse than the one before. Working closely with regional economic development organizations and our California Economic Summit partners, UC ANR is a key partner in developing and implementing recommendations to improve forest health, reduce wildfire risk, incentivize innovation in new and innovative wood products industries and build capacity for manufacturing to enhance forest and environmental health and resilient rural communities. Examples of this work include:

- Organizing controlled burn associations with local communities and other forest treatment practices such as a software program, Match.Graze, that improves use of grazing.
- Partnering with the Inland Empire Economic Partnership and the southern California commercial ports to convert biomass into Hydrogen and other liquid biofuels to replace diesel in trucks—the largest source of air pollution in that region.
- Educating homeowners on landscaping, defensible space, and fire-wise plants to improve home-hardening, reduce risk from fire and conserve water.

- UC Engineering research on materials science is developing new advanced wood products and data to demonstrate the multiple values of construction with such products.
- Teaming up with community colleges to provide workforce training in forest professions.

The U.S. needs robust funding for wildfire prevention, research, recovery, and extension. Cooperative Extension academics are lead experts in forestry and wildfire research and they provide critical resources to inform strategic fuels management, enhance community wildfire planning, and build community fire adaptation and resiliency. USDA's Climate Hubs should be expanded so that they can regularly engage stakeholders and prioritize vital research amongst more partners. The U.S. Forest Service's work on bioproducts is extremely valuable as is their willingness to enter into long-term stewardship agreements with state and local partners.

In California, we are very excited to be working with the Governor and the state legislature to secure a \$185 million investment in UC to build new capacity in climate-focused research, innovation, and workforce development. For example, with this funding we would establish Regional Workforce Hubs that will provide on-the-job training opportunities for university and community college students as well as well as leverage the professional learning and career certification infrastructure of the UC Extension programs to offer a portfolio of training opportunities, tools, and resources for college-prep and non-degree seeking individuals.

Just as these programs allow us to implement climate smart agriculture and healthy forests' initiatives, they also support regional economic development and job creation. Rural Development, the Agricultural Marketing Service and many other USDA programs are important partners as we build climate solutions through more efficient regional food systems, improved supply chains, workforce training, manufacturing of BioPreferred products, and food security initiatives.

If we are to promote resilience and help rural economies better adapt to climate change, we need to harness all programs throughout the U.S. Department of Agriculture. That means having senior USDA leadership coordinating climate issues across the entire agency and robustly serving as USDA's climate representative at all interagency climate-related meetings. For example, USDA must collaborate with Federal entities like the Federal Communications Commission to support improvements to broadband access, which is critical for climate-smart precision technologies and rural economies. Similarly, just as USDA has partnered with the National Science Foundation on research initiatives and jointly funding competitive grants, it needs to build closer partnerships with programs like Commerce's Economic Development Agency and Treasury's Community Financial Development Institutions to ensure that access to capital, effective economic development planning and infrastructure investments are targeted appropriately and delivered well.

One important way to help ensure wise distribution of program dollars to give the current definition of "rural" serious examination and re-engineering; as it stands now, far too many communities are improperly denied USDA resources due to the antiquated definitions of rural and metropolitan. Strongly encouraging more cross-agency proposals throughout USDA and enhanced support for public-private partnerships would remove barriers and hurdles for industry and communities alike.

The current mix of Federal and state capacity funds is generally leveraged many-fold by Federal competitive grants, grants from private industry, and other types of unrestricted gifts and awards to faculty conducting research at the nation's land-grant universities. Competitive funding processes can elicit new ideas and speed up certain research projects; however, they also encourage a shift from programmatic research towards shorter-term project research. Failure to invest in a well-balanced mix of capacity and competitive funds for food and agriculture research could have very negative consequences for decades to come—consequences that would take significant time to reverse.

It takes at least 7 to 15 years of research and development to develop a new crop variety—longer for trees/vines. Deploying and/or adapting new agricultural technologies can be even longer. For example, when UC Davis engineer, Coby Lorenzen, designed a machine to automate the harvest of tomatoes in the 1960's, it also required agronomist, Jack Hanna, to develop a less-delicate variety of tomato that ripened uniformly and could be easily plucked from the plant, essential qualities that made machine harvesting feasible. Federal funding that recognizes these realities as well as improvements in technology transfer and support for commercialization is vital.

Faculty and staff at land-grant universities across the nation recognize that their work takes place on behalf of a greater good, a broader goal, and a common vision that is much bigger than their individual achievements. Members of this House

Committee on Agriculture can be confident that every dollar of Federal investment authorized by the farm bill and expended at land-grant universities is guaranteed to be leveraged further, and to spawn innovation and discovery that will be translated into solutions to improve the lives of U.S. citizens. I thank you for this opportunity to provide testimony.

The CHAIRMAN. Thank you, Dr. Humiston.
And now, Dr. Outlaw, you may begin.

**STATEMENT OF JOE L. OUTLAW, PH.D., PROFESSOR,
EXTENSION ECONOMIST, AND CO-DIRECTOR,
AGRICULTURAL AND FOOD POLICY CENTER, DEPARTMENT
OF AGRICULTURAL ECONOMICS, TEXAS A&M UNIVERSITY,
COLLEGE STATION, TX**

Dr. OUTLAW. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to testify on behalf of the Agriculture and Food Policy Center at Texas A&M University as you focus on the opportunities that producers have to positively impact climate change.

As many of you know, the primary focus of AFPC has been to analyze the likely consequences of policy changes at the farm level with our one-of-a-kind dataset of information that we collect from commercial farmers and ranchers located across the United States. Working closely with the commercial producers has provided our group with a unique perspective on agricultural policy. While we normally provide the results of policy analysis to you or your staff without recommendation, today I am carrying the message from the 675 producers we work with across the United States.

The set of conservation programs in Title II have a strong track record of incentivizing producers to retire some of the country's most fragile land, or implementing environmentally beneficial projects or practices on working lands. The producers we work with have very strong positive views about these programs, with the only drawbacks being they have more projects they are willing to do than there is money to do them.

In preparation for this testimony, we emailed our representative farm members the following points that I planned on making, and asked them to let us know if they agreed or disagreed with each of the five points. They agreed.

Number one, having a strong safety net from Title I programs ARC, PLC, and the marketing loan in Title XI crop insurance remains critical even with new carbon market opportunities. In the words of a wheat farm panel member from Washington State, "It is the peace of mind we get from knowing the bottom can't completely fall out from under us that keeps us going." Most felt that crop insurance was going to be the key safety net program this year with high prices and reiterated do no harm. This leads me to the point that might not be shared by others on this panel. In my opinion, tying climate-smart practices to the crop insurance program should not be done, not to premiums, not to participation, nor to indemnities. The farmers we work with are worried about the long run implications for crop insurance of tying climate-smart provisions to the policy, and that it will lead to regional winners and losers depending upon practices that are available.

Number two, USDA conservation programs CRP, CSP, and EQIP that have incentivized a broad array of conservation practices have

worked well in the past. They have just been underfunded. These programs have a strong history of helping producers undertake practices that scientific studies have found provide proven environmental benefits. Producers much prefer this type of approach to the current carbon program situation.

Number three, Congress should strongly consider providing financial incentives to early adopters who are not eligible to participate in current carbon programs due to the additionality requirement. If it is good to sequester carbon, it should also be good to keep carbon sequestered. Many of the producers who responded to my request had indicated that they are disgusted with the system that only rewards late adopters. I believe that the government and this Committee has a role in ensuring that producers with carbon already stored are incentivized to keep the carbon sequestered. Potential programs should avoid the incentive to reverse production systems so that carbon already stored is released in order to capture program benefits.

Number four, all producers, regardless of size, region, or crops planted should have opportunities in any new USDA climate programs. This statement appears fairly benign, but let me assure you it is not. If all producers in the U.S. do not have some USDA NRCS identified practice they can undertake in the name of sequestering carbon, then there will be regional winners and losers as carbon programs are created.

Number five, Congress should consider providing USDA the authority to safeguard producers from being taken advantage of in current carbon markets dealing with private entities. For example, signing a carbon contract with at least one current company would require a producer to forego commodity and conservation program benefits on that land.

The agriculture industry is in need of guidelines that take the mystery out of the current carbon market opportunities. If private carbon markets are ever going to matter, they have to be more transparent than they are currently. The current benefits are weighted too low to lock into a multi-year agreement with a lack of structure and transparency in this market.

Mr. Chairman, that completes my statement.

[The prepared statement of Dr. Outlaw follows:]

PREPARED STATEMENT OF JOE L. OUTLAW, PH.D., PROFESSOR, EXTENSION ECONOMIST, AND CO-DIRECTOR, AGRICULTURAL AND FOOD POLICY CENTER, DEPARTMENT OF AGRICULTURAL ECONOMICS, TEXAS A&M UNIVERSITY, COLLEGE STATION, TX

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to testify on behalf of the Agricultural and Food Policy Center at Texas A&M University as you focus on the opportunities that producers have to positively impact climate change. As many of you know, the primary focus of AFPC has been to analyze the likely consequences of policy changes at the farm level with our one-of-a-kind dataset of information that we collect from commercial farmers and ranchers located across the United States.

Our Center was formed at Texas A&M University more than 30 years ago at the request of Congressman Charlie Stenholm to provide Congress with objective research regarding the financial health of agricultural operations across the United States. Since that time, we have worked with the Agricultural Committees in both the U.S. Senate and House of Representatives, providing Members and Committee staff objective research regarding the potential farm-level effects of agricultural policy changes.

Working closely with commercial producers has provided our group with a unique perspective on agricultural policy. While we normally provide the results of policy analyses to you or your staff without recommendation, today I am carrying the message from the nearly 675 producers we work with across the United States.

In 1983, we began collecting information from panels of four to six farmers or ranchers that make up what we call representative farms, located in the primary production regions of the United States for most of the major agricultural commodities (feedgrain, oilseed, wheat, cotton, rice, cow-calf and dairy). Often, two farms are developed in each region using separate panels of producers: one is representative of moderate-size, full-time farm operations, and the second panel usually represents farms two to three times larger.

Currently we maintain the information to describe and simulate 94 representative crop and livestock operations in 29 states. We have several panels that continue to have the original farmer members we started with back in 1983. We update the data to describe each representative farm relying on a face-to-face meeting with the panels every 2 years. We partner with the Food & Agricultural Policy Research Institute (FAPRI) at the University of Missouri who provides projected prices, policy variables, and input inflation rates. The producer panels are provided *pro forma* financial statements for their representative farm and are asked to verify the accuracy of our simulated results for the past year and the reasonableness of a 6 year projection. Each panel must approve the model's ability to reasonably reflect the economic activity on their representative farm prior to using the farm for policy analysis.

The set of conservation programs in Title II have a strong track record of incentivizing producers to retire some of this country's most fragile lands through the conservation reserve program (CRP) and the agricultural conservation easement program (ACEP) or implement environmentally beneficial projects or practices on working lands through the conservation stewardship program (CSP), the environmental quality incentives program (EQIP) and the regional conservation partnership program (RCPP). The producers we work with have very strong, positive views about these programs with the only drawbacks being they have more projects they are willing to do than there is money to do them, and they question how priority areas are determined regionally. For example, in FY 2019, 41,471 EQIP applications were funded of the 149,574 received or only 27.7%. Of the roughly 108,000 remaining applications, 46% were determined valid, but unfunded.

USDA is already using existing programs to incentivize climate-smart practices through, for example:

- Targeted "Climate-Smart Agriculture and Forestry EQIP" in select states.
- Providing \$300 million in RCPP funding for 85 projects focused on climate-smart agriculture.
- Expanding CRP enrollment by 4 million acres by raising rental rates and expanding the number of voluntary incentivized environmental practices allowed. NRCS is also establishing a "climate-smart practice incentive" and pays for the establishment of trees and permanent grasses, developing wildlife habitat, and wetland restoration.

In addition, the 2018 Farm Bill established EQIP Incentive Contracts which blend EQIP and CSP to provide financial assistance to producers for adopting conservation activities. It was first available in FY 2021 in four pilot states and is now available nationwide. Contracts are for 5 to 10 years in length with a \$200,000 payment limit over the life of the 2018 Farm Bill (expires 2023).

In preparation for the testimony today, we emailed our representative farm members the following points that I planned on making and asked them to let us know if they agreed or disagreed with each of the five points. They were also asked if there was anything that they thought I was missing; I will point out the areas that were suggested below. The panel members were emailed Saturday afternoon with the request to reply by midday Monday. At the time of submitting this written statement, we had received 105 responses.

1. ***Having a strong safety net from Title I programs (ARC/PLC and the marketing loan) and Title XI (crop insurance) remains critical even with new carbon market opportunities.*** They unanimously agreed with this statement in spite of the fact they expect very little benefit from Title I programs this year. In the words of a wheat farm panel member from Washington State . . . "it's the peace of mind we get from knowing the bottom can't completely fall out from under us that keeps us going." Most felt that crop insurance was going to be the key safety net program this year with high prices and several reiterated "do no harm." This leads me to the point that

might not be shared by others on this panel: in my opinion, tying climate-smart practices to the crop insurance program should not be done—not to premiums, not to participation, nor to indemnities. The farmers we work with are worried about (1) the long-run implications for crop insurance of tying climate-smart provisions to the policy and/or (2) that it will lead to regional winners and losers, depending upon practices that are available.

2. ***USDA conservation programs (CRP, CSP and EQIP) that have incentivized a broad array of conservation practices have worked well in the past. They have just been under-funded.*** These programs have a strong history of helping producers undertake practices that scientific studies have found provide proven environmental benefits. Producers much prefer this type of approach to the current carbon program situation where the significant record keeping requirements, additionality requirements, uncertain soil tests, and very low financial benefits have the majority of our representative farm panel members not interested in participating.
3. ***Congress should strongly consider providing financial incentives to early adopters who are not eligible to participate in current carbon programs due to the additionality requirement. If it is good to sequester carbon it should also be good to keep carbon sequestered.*** Many of the producers who responded to my request indicated that they are disgusted with a system that only rewards late adopters. In their words “they chose to no-till or implement cover crops for economic and environmental reasons many years ago, but a carbon market should reflect the value of both stored and in the process of being stored carbon.” I can understand in the current carbon market that companies are wanting to make a difference by paying to remove carbon from the atmosphere. That is why I believe that the government and this Committee has a role in ensuring producers with carbon already stored are incentivized to keep the carbon sequestered. Potential programs should avoid the incentive to reverse production systems so that carbon already stored is released in order to capture program payments. Further, what happens when producers who have adopted no-till practices can’t get herbicides (which replace cultivating) to control weeds?
4. ***All producers regardless of size, region, or crops planted should have opportunities in any new USDA climate programs.*** This statement appears fairly benign, but let me assure you it is not. If all producers in the U.S. do not have some USDA NRCS identified practice they can undertake in the name of sequestering carbon, then there will regional winners and losers—including by both crop and by size—as carbon programs are created. In addition, several of the producers responded that carbon payments should not be payment limited as doing so would likely reduce the effectiveness of the program.
2. ***Congress should consider providing USDA the authority to safeguard producers from being taken advantage of in current carbon markets dealing with private entities. For example, signing a carbon contract with at least one current company would require a producer to forgo commodity and conservation program benefits on that land.*** The agricultural industry is in need of guidelines that take the mystery out of the current carbon market opportunities. For example, many of the different companies utilize their own proprietary test for soil carbon. Why? Also, why would a company require the field under contract with them to be ineligible for other nonrelated USDA benefits? If private carbon markets are ever going to matter, there has to be more transparency than there is currently. The current benefits are way too low to lock into a multi-year agreement with the lack of structure and transparency in the market. Having said this, several producers we work with have said they would rather not have the government get involved in the carbon market at all and asked me to point out that while they see a problem—it could be made worse.

Mr. Chairman, that completes my statement.

Figure 1. Representative Farm and Ranch States With Those Responding to Questions

The CHAIRMAN. Thank you, Dr. Outlaw, and I thank all of you for your excellent testimony.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us the necessary time to get to as many questions as possible. And also, please, please, please keep your microphones muted until you are recognized in order to minimize background noise.

And now, I recognize myself for 5 minutes.

Ms. Raygoza, let me—you gave—you brought out some interesting points, and one of our Committee's concerns is that we recognize the many challenges that our beginning farmers are having. You all are our future, the beginning farmers. You mentioned a couple of things I would like you to address. You mentioned a problem with up-front money. You also mentioned a lengthy process, lack of capital, access to land. You brought a lot of very important points out that I would like for you to address in order of importance in order that we may make the necessary recommendations to address these issues that you and our beginning farmers are facing. Could you start with what you mean by up-front money?

Ms. Raygoza?

Ms. RAYGOZA. Yes. Thank you for the question. Up-front money I am referring to is the money we had to gain up-front to implement the EQIP practices. For example, on my farm we were approved for land leveling and we had to take out a personal loan to cover the cost of implementing that practice. And we also had to get financing through a line of credit in order to implement some irrigation systems on our farm.

And so, those are the up-front costs I am speaking of. Fortunately for us, we have good credit, but many young farmers, they might not have good credit to access those financing options. So, I

think that is key for making those programs accessible to farmers is to have those funds available up-front so we don't have to look for other financing options.

The CHAIRMAN. Well, very good, and I am sure all of us will be addressing that concern, and certainly the USDA are very mindful of your testimony on those points.

Senator Heitkamp, in your testimony you mentioned the importance of expanding technical assistance for natural climate solutions and addressing workforce needs. Could you address those? How will this benefit some of our historically underserved producers, Senator Heitkamp?

Ms. HEITKAMP. I think clearly anyone who knows anything about agriculture knows that we have left some farmers behind, and a lot of that isn't just about access to capital. It isn't just about land challenges that you all have. But it also is about access to information and access to the expertise. And it seems to me that we need—if we are going to recognize—let's take North Dakota. 91 percent of all of North Dakota is engaged in production agriculture, and even if you are not recognized as an ag state, you still have a lot of land and you still have a lot of ag producers. Every state in the Union, including states like Massachusetts, have a baseline in agriculture. And so, we can't leave anyone behind if we are going to do it.

But the problem that you have with workforce is we train workforce, but do we deploy them appropriately? And, I know from my experience—well, take the EQIP Program. During a horrible drought in western North Dakota, an early adopter of the EQIP Program actually was able to grow grass and did not have to buy hay. All of a sudden, his neighbors were looking across the fence. What a great moment that would have been to deploy a team of people to say, "Hey, this is how you do the EQIP Program," and not rely on just that producer to producer discussion. And so, I think deploying a workforce, this is really true in forestry as well, and we had a lot of discussions about workforce in forestry. We know we have a workforce crisis. We have a lot of Americans who would love to do climate work, would love to work in rural America. We just need to get them trained and deployed. And that is not just in states, it is not just in Cask County, which is where Fargo is. It has to be in every county where we have an ag producer.

The CHAIRMAN. Thank you, Senator.

And now, Ranking Member, I recognize you for 5 minutes.

Mr. THOMPSON. All right, Mr. Chairman, thank you very much, and thanks to all the members of the panel for your testimony.

As you know, USDA has announced its \$1 billion Climate-Smart Commodity Partnership Initiative Pilot. Many of you have heard me question the Department's authority to unilaterally create this pilot, and I am also concerned about the precedent this pilot sets and its impact on farmers and ranchers. It is my understanding that the CCC dollars will flow to a wide range of partners, and it is very unclear how much the funding will make it into the hands of producers, farmers.

Now, I do not believe that USDA or the taxpayers should be subsidizing corporations' arbitrary climate goals, nor do I believe we should be funding a climate cottage industry. I do believe in the

role that agriculture plays and the leading role that our farmers, ranchers, and foresters play when it comes to the climate.

That said, more concerning, however, is USDA moving forward creating climate-smart commodities when we have not examined the impact on farmers and ranchers.

Dr. OUTLAW, first of all, thank you for continuous leadership serving the agriculture industry. As an economist, do you have thoughts on the Climate-Smart Commodity Initiative and its impacts on farmers and ranchers?

Dr. OUTLAW. I certainly do. Obviously, I think that the effort is positive, but as someone who worries about markets and what is going to happen to producers, when you start developing climate-smart commodities, unless you have the ability for every area of the country to participate, then you are going to segment and you could potentially have segmented markets. Those that are done with climate-smart practices might—the only reason you do this is to try to get a better price for those commodities. So, one of the things—and just point blank, if you are going to do this, you have to be very, very careful, which I am not sure we have ever been careful enough to do this. Because you could absolutely create winners and losers in the same commodity, and much less the same region or different regions of the United States.

Mr. THOMPSON. Yes, I mean, isn't it true that within agriculture, you have different climates, soil types, how much moisture? I mean, how much nutrition is in the soil? There is a lot of variability of American agriculture, what our farmers and ranchers face.

And so, what happens to a cotton farmer who can't grow climate-smart cotton? What do you see as the impact on that market?

Dr. OUTLAW. Well, if this works and end-users pay more because of those practices, then they would be getting lower prices for their cotton without the benefit of getting those higher prices. It really is differentiating the market, and that is the one thing that I think has got to be protected on these practices and this effort.

Mr. THOMPSON. Yes, and the unilateral use of \$1 billion out of the CCC by the Secretary and the Department at a time when commodity prices—not all of them, but some are at a record high, we have commodities that are not there but inflationary costs are at record high, and the CCC is how we deal with those types of crises.

With this \$1 billion that has been committed unilaterally, I believe without authority, are we using government funding to put some growers at a disadvantage?

Dr. OUTLAW. Potentially, certainly.

Mr. THOMPSON. Last year, I introduced with the support of colleagues the SUSTAINS Act (H.R. 2606), which would allow for third parties, including corporations and businesses of all sizes—that was the beauty of it. It wasn't just the Googles, the Microsofts, the mega folks we talk about, but the mom-and-pop hardware store, the tractor supply place. Those who want to achieve their climate credentials would be able to invest in NRCS conservation programs, and in doing so would allow the private-sector to partner with farmers and ranchers and landowners in support of agriculture conservation.

Do you believe that this concept of public-private partnership where we would be able to fund more of these conservation pro-

grams, perhaps other programs within the farm bill, is something that you and others would support?

Dr. OUTLAW. Obviously without having all the details, but on its surface, we have a number of public-private partnerships that have worked in agriculture for quite some time. As long as both parties felt like the goals and objectives of the program were going to be achieved, I would say that would be a positive.

Mr. THOMPSON. Thank you. I am just about out of time. I will let my time expire, but I would ask that any of the other witnesses, if you have comments on that I would love to receive them in some written form of the SUSTAINS Act. The text is out there, so you can really take a fair read and a look at it.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you.

The gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations, is now recognized for 5 minutes.

Mrs. HAYES. Thank you, Mr. Chairman, and thank you for holding this important hearing.

My district is a leader in climate-smart agriculture. Our producers run small, diversified farms and often use ecofriendly practices. Our farmers are passionate about the expansion of USDA conservation programs, and increasing access for small and beginning farmers.

Ms. Raygoza, in your testimony you described how you built your farm from 1 to 15 acres over time, and that you now produce 40 different crops on your land. That is very impressive growth. But you also described that when applying to USDA programs to help aid your expansion, you found that applications are designed for large commodity farmers who grow one or two crops.

My question for you today is what are some of your recommendations for making these application processes easier for small, diversified farms like yours?

Ms. RAYGOZA. Thank you, Mrs. Hayes. I would recommend that the application process is simplified, or that we can input our data in units that make sense for us. For example, we had to convert our 100' beds of spinach into yield per acre units, and we sold in bunches or bundles, and converting that to pounds. That is just one example of the work that we had to do, and we work off-farm jobs as well. And so, that is a burden for applicants. So, I would recommend having those applications more flexible so that we can input the data in terms that we use. Also, I would recommend having market prices available, just gathering more data on organic pricing. I know we had to present a lot of the information ourselves, and so, just more information available for officers that are helping for loans, for example, and other programs.

Mrs. HAYES. Thank you. That is very helpful, and in line with what I am hearing from farmers in my own district.

In your testimony, you described how you provided technical assistance to other farmers in your area, particularly those who had misconceptions about eligibility and had small farms much like yours. What are some ways that you think we can strengthen outreach and education for young and beginning farmers, and where do you think the misconceptions about eligibility come from?

Ms. RAYGOZA. What I found is that many of the small-scale farmers assumed that these programs were for large farmers, and that they wouldn't be eligible because their revenue was very small compared to large farms. Also, they didn't know or consider the application process to be worth the time, because sometimes those applications are lengthy and because of the return, they felt like it wasn't something they could invest time into. And I would recommend just having those cooperative agreements with organizations like National Young Farmers that can relate better with young farmers that already have established relationships can improve outreach, and also having resources available online for farmers to research. I mean, a lot of our farmers are online right now, the young farmers, so just having those resources online, the application available online, would also increase participation.

Mrs. HAYES. Well, thank you so much for all of the work you have done here in this area, especially to educate young farmers. That is near and dear and so important to me.

My last question is farmers in my district—thank you, Ms. Raygoza.

But farmers in my district are passionate about expanding conservation programs in the next farm bill. Many have supported a double-funding of programs and are most interested in increasing funding for the Environmental Quality Incentives Program, Conservation Stewardship Program, and Agriculture Conservation Easement Program.

Senator Heitkamp, can you describe the impact that doubling conservation programs in the next farm bill would have, specifically for small farmers and new and beginning farmers, quickly?

Ms. HEITKAMP. I mean, it would be huge. One thing that we should be looking at is how many of these programs are oversubscribed, which means there are so many more people who want to access them. And so, we have to get more adopters. We better not leave, as the last speaker said, the early adopters behind like the people in your state who are already engaged in these kinds of practices.

But basically, we have long discussions at the task force. My personal position was whoever wants in these conservation programs should get in these conservation programs and up the ante and create greater incentives. Now we recognize that there are budget constraints and so, the task force didn't make that bold of a recommendation. But I totally agree with you. It is critical that we get more adopters in and that we do more encouragement for the great programs we already have. Let's use the tools we have. Let's fund them appropriately.

Mrs. HAYES. Thank you, Senator.

Mr. Chairman, I apologize. My time has expired. I yield back. Thank you.

The CHAIRMAN. Thank you.

The gentleman from Georgia, Mr. Austin Scott, is now recognized for 5 minutes.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman, and I will try to be significantly briefer than that.

I want to point out a couple of things briefly. One is that approximately 12 percent of the U.S. farms—these are farms that have

more than \$250,000 in revenue—account for somewhere around 90 percent of the food supply in the United States. I think as we push forward with these things, while we need to provide additional support for beginning, young, and small farmers, we need to make sure that that is not being done at the expense of the U.S., and candidly, the global food supply.

I also want to point out to my colleagues something that I think is very important. President Zelenskyy met with Congress this morning. He showed tremendous leadership. One of the things that I do not think is being discussed enough is the fact that Ukrainian farmers put 50 million metric tons of corn and wheat into the global food supply. Trade in the Black Sea is closed. Russia and Belarus are responsible for—they are the number two and the number three producer of potash in the world. If our crops inside the United States do not have access to fertilizer, then the yields inside the United States and other major food producers will go down.

Mr. Chairman, my ask is that over the next couple of weeks that we, as the Agriculture Committee, would have a hearing on the potential reduction in the global food supply and the impact of hunger and the geopolitical stability around the world as we push forward over the next couple of weeks.

And so, I don't have a specific question for the panel. I have a couple of generals in my office that I intend to speak to right now about that same issue. But I do think all of us need to be aware of the unrest that comes from widespread hunger in the world, and recognize that Ukraine puts 50 million metric tons of food into the global food supply. And that is how much they export, and it is not going to be there this coming year. The Russian exports are not going to be there this coming year, and it is just something I think we as the Agriculture Committee should have a hearing on.

And with that, Mr. Chairman, thank you for allowing me the time to make that statement, and I look forward to continue discussions with the Committee on this.

The CHAIRMAN. And let me just say, Mr. Scott, that we as a Committee are moving forward. We know that the farmers in Ukraine may not be able to plant this spring because of the fighting. We also know that some parts of Ukraine will not be capable of being planted because of the damage of this terrible and wrong Russian invasion. And also, I will be asking you and my other colleagues to join me in sending a letter to Secretary Vilsack to bring some additional tools to help address this humanitarian crisis that is now taking place as a result of this terrible, awful Russian invasion.

So, I look forward to working with you on that, and your points are well-spoken and well taken. We on the Agriculture Committee will be out front and doing all we can to make sure that we do not have a hunger crisis. You point out well the position of Ukraine and Russia in terms of wheat, in terms of fertilizer. 66 percent of all that fertilizer is produced right in that area, and so, we are mindful of it. Thank you for your comments.

And now, the gentleman from California, Mr. Costa, who is also the Chairman of our Subcommittee on Livestock and Foreign Agriculture, is now recognized for 5 minutes.

Mr. COSTA. Well, thank you very much, Mr. Chairman, for holding this important hearing today as it relates to America's contribution and efforts as it relates to climate change. And I, too, want to commend not only Mr. Scott's comments as it relates to the disruption of food products, wheat production, and fertilizer products that come from Ukraine, but your sensitivity and acknowledgement of it as well that we on the Agriculture Committee and the impacts on foreign agriculture need to be conscious of as we plan ahead. The pariah Putin has invaded Ukraine, and in my view, he is a war criminal and we have to support Ukraine. But that aside, we also need to know the impacts not just to people who need to eat in that part of the world, but its impact on American agriculture as well.

I want to get back to the specific testimony of our witnesses here, and Dr. Humiston, you and I have worked together. Your testimony, I thought, was very important in a couple of areas that I would like you to quickly comment on.

I think agricultural production in America has done a lot to deal with the impacts of its carbon footprint and climate change. Ag energy is continuing to expand exponentially as we make changes, and whether we call it green energy, our use of methane or a whole host of sources, it really results in best management practices, in my view.

You and I have a lot of experience in, as you noted, in over the last 10, 15 years of looking in California how we do our part. I am wondering if you would like to talk about some other examples. You talked about the solar efforts of covering some of our water conveyance facilities. Under the category of not reinventing the wheel, what best management practice would you say we can build upon for next year's farm bill as we look at expanding American agriculture's ability to deal with our part? And I, too, push back as Representative Thompson indicated on some inaccurate reporting, and I would really invite *The New York Times* and others to come out to California and see what we have been doing, because I think they need to cover all of the aspects of what American agriculture is doing.

Do you care to comment?

Dr. HUMISTON. Yes, thank you, Congressman Costa. I appreciate that question.

Here in the U.S., we have a powerful track record that is world-renowned in converting science into actionable best management practices. We have nations from all over the world approaching us on how do we do that? How does our land-grant system, our cooperative extension, our NRCS, all of our various programs, how do they do it? Because we do a great job, and we have. And I think that is important. You have heard from all the speakers today about the importance of the voluntary, incentive-based programs—

Mr. COSTA. So, how do we build upon that with next year's farm bill and with the bipartisan infrastructure package that we passed?

Dr. HUMISTON. Well, two things. I mean, we have heard some folks concerned about investments that USDA is currently making in these. Personally, I think we have to make these investments. If we want our farmers to be able to deal with extreme weather

and avoid additional regulations, we have to create incentive programs that really have some meat on the bones, which includes the kind of funding that USDA is attempting to put out there.

I would also say that we have to leverage our existing programs to the degree possible, and particularly cross pollinate them. For example, in California, we are really working hard to create a biomass manufacturing sector. We are working closely with our forests because there is a lot of volume there. What we are missing is the infrastructure, supply chains, and capability to do something with that biomass. If we can get that in place, our farmers are going to be able to utilize that same infrastructure and manufacturing for agricultural biomass and start turning a waste product into a profit center.

Mr. COSTA. I have limited time left here. I would suggest you put together a list of these various proposals and prioritize them on how we might, with the examples that you cited, how we combine these best risk management practices as we look at next year's farm bill.

You touched upon the definition of *rural*, and this has been a problem that you and I have both dealt with. We have a lot of rural America that doesn't qualify under the Federal definitions of *rural*. What would you suggest on how we deal with that?

Dr. HUMISTON. We have to start raising the limits on eligibility for a lot of these programs on population, and we have also got to stop using this antiquated rural *versus* metropolitan. The way it is currently used right now, if you have one community in a county that has a population of 50,000, the entire county is labeled metropolitan. You look at many of our counties that are huge agricultural counties. It is ludicrous to have them considered metropolitan, especially when you consider the amount of agricultural product from them.

Mr. COSTA. I concur. Thank you.

The CHAIRMAN. Thank you.

The gentleman from Arkansas, Mr. Crawford, is recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman, and I would also like to associate myself with the comments that Mr. Austin Scott made earlier with regard to the situation in Ukraine and the impact that that can have here in the United States with regard to ag production. And that brings up a question I want to direct to Dr. Outlaw, and it has to do with fertilizer exports to the west. Russia just announced a suspension in fertilizer exports to the west. We know that that is driving input costs, and meanwhile, India, the world's second biggest producer of rice, wheat, and sugar, is set to spend \$20 billion this year, \$20 billion, to provide free fertilizer to their farmers. So, everyone here is aware of the staggering increase for inputs on the farm. Fuel is one of them, as I mentioned, fertilizer, pest control, seed, machinery. I want to say that for most field crops, there has been a corresponding or an even greater increase in the commodity prices.

But as you know, this is not the case for rice. Prices are only slightly up, not nearly enough to cover rising input costs. India is spending billions of dollars, as I mentioned, to flood the world with cheap and dirty rice, while taking the lead on emissions and stor-

ing the world rice market. I hear U.S. rice farmers are even starting to decline, maybe even go out of business.

Can you comment on the situation for rice, and then I have another question I will ask about getting our priorities in order with so much focus on things like cover crops.

Dr. OUTLAW. Sure. As most of the Committee knows, we do work with all types of producers and among all the different types of production systems we work with, rice is the one that is actually not doing very well and not projected to do very well over the next few years, mainly because they don't benefit from the higher prices to offset all these high costs that you mentioned.

All I can say is that the safety net that we have that was constructed with reference prices that were put in place in the 2014 Farm Bill that were using costs, because our group helped a lot with that, from basically the 2012 time period is well out of date. So, we need to start thinking about ways that the reference price could be ratcheted up to take some of the pressure off producers.

Mr. CRAWFORD. Let me ask you this. Would you support indexing reference prices? I mean, the current farm bill, I think reference price as a baseline is 2012, obviously not adequate to meet the demands of input costs today and production costs. Would indexing be a good option in this scenario?

Dr. OUTLAW. We have actually looked at indexing over the last 10 years many different times for different Members of this Committee, and there are approaches that will work. You have to be really careful which indices you tie these movements to, but it certainly would work and offset some of the cost, although be realistic that the indices kind of—they are delayed. But it would still be better than nothing.

Mr. CRAWFORD. Right. So, I mean, I understand that you can't index something based on a future projection. It would have to be based on probably a 3 year history or something like that, rolling average, and I get that. But the fact that we can have a conversation about the potential for indexing to address this shortfall I think is worth mentioning.

On the topic of climate change, I think it is important in the context of agriculture when we start talking about climate change that we kind of establish this, I guess, baseline, if you will, and the difference between environmental activism and active environmentalism.

So, for folks on the outside that have an agenda that don't really understand agriculture, let me just be clear. Farmers produce on land that they derive their income from. It is in their interest to achieve a degree of sustainability so that they can produce next year and the year after and the year after, and also to hand that land down to their families so they can continue to produce. So, any attempt to malign producers is grossly misguided when we rely on our American ag producers to be the mainstay of our food source globally. And think about what is going in Europe right now and Ukraine, and the impact that is having. Historically, the United States has been the bread basket of the world, but we have engaged in policy that now encumbers U.S. producers to the degree that we can no longer be the bread basket of the world. And when we see the calamity that is taking place in Ukraine and the poten-

tial there for them to not be able to provide for themselves and the impact it is having on their economy as the bulk of their production goes to the Middle East and Africa. As Mr. Austin Scott suggested, there is the potential for global hunger that we don't need to exacerbate that problem by engaging in misguided environmental policy.

I appreciate you guys being here today. Thank you.

The CHAIRMAN. Thank you.

And now, the gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Chairman Scott and Ranking Member Thompson, for hosting the hearing today. Thank you to the witnesses for being here.

Senator Heitkamp, welcome back to Congress. Black, Tribal, family, and rural farmers and ranchers need structural reforms that ensure fair market prices and infrastructure supporting transitions to reformative farming. So, what types of initiatives does the USDA plan on designing to incentivize better formative practices for socially and economically disadvantaged and rural communities?

Ms. HEITKAMP. I think you know, Congresswoman, that USDA has made this a new priority where it hasn't been a priority in the past, and that is a tragedy. I can't speak for the Bipartisan Policy Center who I am representing, but I think people need to be educated on the land restrictions that families face in traditional communities where there was way too much paternalism. That is true for Native American families; that is true for some traditional African American farmers.

And so, as we look at USDA practices and how we can reach out and make sure that farming is an equal opportunity for everyone to be successful, and historic, as you know, both in Native communities and in African American communities, certainly the court system has ruled that there have been past inequities. Let's not just try and think about those past inequities and how we fixed those problems. Let's think about how we can move forward to make farming opportunities available to everyone.

But one of the things that I think is critical is this workforce, is this ability to get access to information, and as the Chairman has said, what role can traditional Tribal colleges—our Tribal colleges in North Dakota do a great job in reaching out to local ranchers and farmers. They have collaborations which can make such a difference for Native American, in our case, usually ranchers.

Ms. ADAMS. Good.

Ms. HEITKAMP. But let's look at what the traditional colleges and campuses could do to provide that assistance.

Ms. ADAMS. Great. Thank you so much.

Dr. Humiston, unless there is a real systemic change, we now know that emissions from agriculture will make it impossible to achieve the Paris Agreement of limiting global warming to no more than 2° Celsius. We currently fall short of the target 1.5° Celsius at this current rate. Global food systems are reliant on us to meet this goal.

So, if the climate crisis continues to proceed in the manner predicted, how will it impact the nutritional value of food?

Dr. HUMISTON. Thank you for the question.

That is a great question because we are still doing analysis on exactly what that does mean. Obviously, as crops start moving because of changes in ecosystems due to extreme weather and climate, it is going to make it tougher for farmers to be able to produce some of those crops that are needed. We are also finding that the nutritional quality of some food, for example, if certain crops like stone fruit don't have a freezing point so that they can be produced, we start losing those kind of crops that are so important to our diet.

So, we are still working on that issue, but I think what is really important is that we make available to farmers the ability to see that transition and move towards being able to continue to produce those crops.

Ms. ADAMS. Great, thank you.

So, Mr. Conner, in your testimony you mentioned that food waste accounts for eight percent of all global greenhouse gas emissions. Your team nutrition program provides education about food waste loss prevention. So, would you please explain what the climate impact the food waste loss prevention education has? What does it have on that?

Mr. CONNER. I appreciate the question. I would just say, it is one of our recommendations that are part of the Food and Ag Climate Alliance. It makes some sense, if you think about it. If you produce food, you have the inputs, the labor, everything that goes into the production of that food and it simply gets discarded. The waste there alone is intolerable in that circumstance, but then you add the disposal, and the creation of greenhouse gas emissions that comes with having that product in landfills and other areas. It is something that needs to be addressed and we are proposing a pretty extensive education and training program that begins with USDA feeding efforts to attempt to do all that we can to minimize that, because we think there are gains that can be made in greenhouse gas emissions by simply better utilizing the very food that our farmers are putting on the table for you.

Ms. ADAMS. Thank you, sir.

Mr. Chairman, I am out of time. I yield back.

The CHAIRMAN. Thank you.

The gentleman from Tennessee, Mr. DesJarlais, is recognized for 5 minutes.

Mr. DESJARLAIS. Thank you, Mr. Chairman, and I appreciate our witnesses being here today.

As we struggle with the trucking shortage and supply chain issues, we are experiencing 40 year high inflation, record fuel prices, fertilizer shortages, crippling and overburdensome EPA regulations that creates even more uncertainty. We are sitting here today having a second climate change hearing, and I guess it is a little frustrating, considering our farmers are climate champions.

But Mr.—Dr. Outlaw, I am sorry, some of the environmental community have continued to villainize farmers and ranchers even though modern American agriculture is the most sustainable in the world, and clearly provides climate benefits. Our producers are

great stewards of their land, as modern agriculture delivers benefits including reduced inputs, healthier soil and water, and increased carbon sequestration.

Do you believe that farmers and ranchers are currently being given the credit or recognition that they deserve for practices that generate climate benefits?

Dr. OUTLAW. No, I do not. As you said perfectly, our producers spend their livelihood in keeping the land in the most productive manner they can, and over my 30+ year career doing policy, I have witnessed a lot of different groups take aim at commodity producers because they would either want the money or they want to try to bust everything up so that things are different. In my mind, just like you said, I believe that our producers are the most productive in the world, and they do have a spot where they absolutely care about the environment, absolutely care about productivity, and keeping the land in production for their children to take over.

Mr. DESJARLAIS. Let me stay with you.

We know producers are facing a lot of uncertainty this year, particularly in light of the situation in eastern Ukraine—eastern Europe, rather, and while some of the headwinds farmers are facing may be outside of our control, there are commonsense decisions we make here at home that could help our farmers, such as producing more domestic energy or ensuring that producers have access to the chemistries they need, rather than letting EPA pull labels based on unsound science. Despite high commodity prices, the farmers I talked to are concerned about the margin they will make in light of soaring costs.

Speaking from your experience with the 94 representative farms when farmers are facing narrow or negative margins, what are some of the areas that they cut back on, and how does this affect production and potential climate impacts?

Dr. OUTLAW. That has been the one thing that I didn't understand about the environmental community attacking production agriculture, because if they are not successful or not making money, one of the places they do tend to cut corners on is some of the conservation practices that they would do otherwise.

So, that is one of the areas where obviously practice-wise, they tend to cut back on doing the tiling for their land, or they are doing terracing, other practices that would make the land more productive in the future. But they also cut back on the family living withdrawals that they take from their operation, just trying to make ends meet.

Mr. DESJARLAIS. I appreciate that.

To our other witnesses, broadband is an issue that was touched upon in today's testimonies. When this Committee speaks on broadband connectivity, it is normally a Rural Development issue. I believe this needs to be part of the climate solutions discussion. Can either of you comment on how increased broadband connectivity could increase innovation and productivity for farmers at the field level, and wouldn't this be a huge step forward as it relates to precision agriculture technology?

Dr. HUMISTON. Yes, thank you.

We have some exciting new technologies coming online, but a great many of those do require bandwidth, and that is a huge miss-

ing piece in much of rural America. We are working closely with a variety of public and private partners to try to get repeaters and boosters and increase that bandwidth out there. But we are also trying to work with entities like our National Labs and some of our very strong engineering programs to really reduce the need for the bandwidth in some of this technology, too.

But at the end of the day, it all comes down to funding and having the infrastructure out there.

Mr. DESJARLAIS. Thirty seconds, if you would care to comment?

Mr. CONNER. Congressman, certainly you have identified a key problem here. Broadband is absolutely necessary for modern agriculture, for precision technologies that are a necessary part of any climate debate. Without it we have one hand tied behind our back.

Mr. DESJARLAIS. Thank you all, and Mr. Chairman, I yield back.

Ms. HEITKAMP. If I could just comment. I think we talk about broadband, but let's not leave wireless behind, because having the ability to go out into the farm and use your cell phone is critical, too.

Mr. DESJARLAIS. Thank you.

The CHAIRMAN. Thank you very much.

The gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is now recognized for 5 minutes.

Ms. SPANBERGER. Thank you so very much, Mr. Chairman, and to our witnesses, thank you for being here. And certainly as the Chair of the Conservation and Forestry Subcommittee, every hearing we have we are highlighting the role and the important role that our farmers and producers have, not just in feeding America, feeding the world, but also in nurturing our planet. Certainly as Ranking Member Thompson said, farmers are climate champions, and so, I am a little bit surprised to hear so many comments about unnamed groups that are challenging farmers because in this Committee and in our Subcommittee and with the witnesses we have today, and the farms I visit across my district, what we talk about every single time is how farmers are leading the way in practices that are so important not just to their bottom line, not just to their community, not just to the health of their land, but to our country and the world. And in fact, there are documentaries talking about how important and how vital and integral and transformative our farmers and producers are. They are leading the way not just in the United States, but throughout the world. And so, I want to thank them for that.

But I do want to talk about the issues that they face and the challenges that they face. Certainly—and I will turn to you first, Senator Heitkamp. When we are talking about some of the incredible conservation practices, regenerative farming practices, rotational grazing practices, so many of these practices can be trial and error. There is so much important research going on, but yet, there is attrition on the ground for trained technical assistance providers who really can provide site specific, soil specific solutions to implement conservation practices effectively. We know between Fiscal Year 2004 and Fiscal Year 2018 staffing levels at the NRCS have declined 19 percent, and unlike other Federal agencies, as I know you are aware, Senator, 98 percent of NRCS staff are located out-

side of Washington, D.C. They are located by our farmers and producers. They are located in our rural communities across America. And as such, when we have attrition at NRCS, it is felt disproportionately by those who are seeking support and help as they implement conservation practices on their land.

So, certainly, Senator, as part of your testimony you focused on the need to expand technical assistance through workforce development. I am personally an advocate for increased funding to provide higher paid NRCS employees, but I am concerned that increased salaries alone certainly won't contend with the challenge.

What steps should we be considering taking as we are looking towards the 2023 Farm Bill so that we can better develop a pipeline of staff, and how could we potentially leverage federally funded resources, such as land-grant universities, to this end? And I will start with the Senator.

Ms. HEITKAMP. Well, I am such a believer that we have to keep the people who understand rural America in rural America, and in order to do that, we have to make sure that they can earn a living. But Congresswoman, I am just urging you all not to reduce local staff. If you want to get this done, if you want to expand American agricultural productivity, do what we have always done so well. Our land-grant colleges, getting our extension agents out there. Let's build a pipeline from FFA. One of the growing youth groups is really Future Farmers of America. They are our future leaders. They care, and so let's make the commitment today to keeping people helping rural America and rural farmers.

Ms. SPANBERGER. Thank you so much, Senator.

Dr. Humiston, if you care to comment on that question at all from your perspective as well?

Dr. HUMISTON. Well, the Senator did a great job on that. I would add to it that that pipeline is really critical, and we have to start young.

One of the challenges we have is we actually have a lot of great jobs in the agriculture and natural resources sectors, but too much of the public think the only jobs are farmer or farmworker. There are literally thousands of other jobs, and we have to get people to understand that and start looking to those. So, we are partnering up with our community colleges. We are starting in grade school with 4-H. I am a 4-H as well as a Future Farmer of America alumni, and it really does make a difference even to get urban and suburban kids interested in looking at the agricultural sciences and opportunities throughout the supply chain. Things like regional food systems gets people interested. Look how many cooking shows are on TV now.

Ms. SPANBERGER. Thank you so much.

Certainly in one of the counties I represent—well, many of the counties I represent have tremendous programs in the high school, but one of the counties has just implemented a specialty center that will begin next year focused on environmental science, focused on soil health, and hopefully will create a pipeline for folks going out into the field, either continuing to work their own lands or support others.

My time has expired. I have so many more questions. I am grateful to the witnesses for being here, and Mr. Chairman, I yield back.

The CHAIRMAN. The gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. Thank you, Mr. Chairman.

Let me go right to Dr. Humiston. You were talking about fuel loads and forestry, *et cetera*, obviously a very, very big concern in my district in California, western states, as you know, just one fire burned approximately 1 million acres last year, the Dixie Fire, and many others in the six-digit range. So, your comments are very timely and very appreciated in that regard.

So, how do we further the utilization of these products? You mentioned it is the end-use that is the problem, really turning it into something—I mean, we can harvest it, we can haul it, we can stack it somewhere, we can put it on a deck somewhere, but there doesn't seem to be a home for utilizing it. So, does that really boil down to investment in biomass plants to make electricity, or what is on your mind on that?

Dr. HUMISTON. Well, I am not a fan of biomass plants to produce electricity, only because it costs several times more than producing electricity in other ways. But we have a lot of bioproducts that could be profitable centers for both forestry and agriculture, bioplastics, cellulosic nanofibers, biofuels, great many programs, and advanced wood products.

The challenge is the lack of infrastructure to get it from the forest or the farm into that final product. And I am thrilled to say in California, we have done some really exciting things recently. I have been co-chairing an effort with the Rural County Representatives of California, RCRC, which is a statewide group of the 39 rural county supervisors in our state who have actually themselves stood up a financial entity and created a supply chain from forest through manufacturing to markets in Asia for wood pellets. And now because of that example, we are able to get other folks to look at these same kind of supply chains and link them up in frameworks that allow us to do more of that both for forest and ag biomass.

Mr. LAMALFA. What is the foreign use of those wood pellets?

Dr. HUMISTON. It is basically Japan and South Korea trying to wean themselves off nuclear, and it is a short-term solution. Wood pellets are not a long-term fix, but they are a great solution in the next 5 or 10 years.

Longer-term, we really have to be looking at the use of biomass for, as I said, bioplastics and other uses, particularly the advanced wood products which sequester carbon for decades in our buildings.

Mr. LAMALFA. Why can't we be looking at for generating electricity in our own country more over having to, we are having a situation with natural gas right now and with coal and things like that. Why wouldn't this be—and indeed, the bugaboo you ran into with the other—green with solar and wind. Those are not 24/7 sources of power. They are, at best, a portion of the day.

Dr. HUMISTON. There is a role for biomass being burned to produce electricity to be part of that power 24/7 where wind and solar sometimes are not available. There is definitely a role for that, and there is a real role for co-gen where you have biomass being utilized for electricity that has been used within a very close arena, which often can pencil out. But in the past, we have done

work for several years now where it has been very clear that producing electricity from biomass, even from established plants, does cost several times more than that same electricity from other sources. It is just not the most economically efficient use. And frankly, as we try to clean up the huge amount of biomass in our forests, I believe we have to find profitable ways to do that or we won't get the job done.

Mr. LAMALFA. Well, certainly as far behind as we are on our forest management, fire suppression is costing us billions and billions more each year. The costs we are seeing in air quality, water quality, loss of wildlife, loss of the asset itself, I think it would be not out of line for the Federal Government to pay to remove this material and turn it into something that could be used.

Just talking about it from a point of forest health.

Dr. HUMISTON. Actually, you are right on. If we could get our forests back to a healthier state—which actually means considerably less tree density and biomass than we currently have in most of our forests in the western states, we would have not only less risk of fire, we could produce more water. We have studies showing that the Sierra could produce 15 percent or more water than it currently does because of unhealthy forests.

And then, of course, there is wildlife habitat, there is recreational opportunities, which is a huge economic sector in many of our western states, all of which would benefit from healthier forests.

Mr. LAMALFA. Music to my ears on that water side there, because obviously we are very dire—we ought to be talking about more of that in this Committee. I would suggest, Mr. Chairman, is that California is not going to be producing many crops with acres being zeroed out this year. We have hundreds of thousands of acres being zeroed out. It is the second year in a row that number is increasing. We are not going to have these products that all of our country relies on from California, so that is big.

So, thank you for your testimony.

Dr. HUMISTON. Thank you.

The CHAIRMAN. Thank you.

The gentlewoman from Ohio, Ms. Brown, is recognized for 5 minutes.

Ms. BROWN. Thank you, Chairman Scott and Ranking Member Thompson, for holding this hearing, and thank you to the witnesses for joining us today to review the role of the USDA programs in addressing the urgent climate crisis.

Congress considered and passed the 2018 Farm Bill on a bipartisan basis, and it provided significant investments to incentivize sound farming practices that not only reduce pollution, but also make our farms more resilient to the changing climate. We must recognize that climate change is a clear and imminent threat to our planet.

As stewards of this planet, we have the moral responsibility to protect the air we breathe, the water we drink, and the world we leave behind. To stay ahead and competitive, we must be smart about how we use and manage our farmlands, and American farmers and ranchers can be an active partner in this endeavor. I look forward to working with all of you as we look for climate solutions that work for everyone.

Mr. Conner, what do you believe are some of the most helpful tools from the 2018 Farm Bill to help producers address climate concerns while also supporting their operations, and how can they be built upon to better work for producers?

Mr. CONNER. I will answer that two ways, Congresswoman.

First, I think the 2018 Farm Bill provided an excellent foundation in terms of the Title II programs. This is technical assistance; this is financial assistance for farmers to do good things on their farms that may be just on the edge of viability in terms of economics, and the bill provided great assistance. Many of our FACA recommendations that we put forth today and talked about today follow the model from those programs in the 2018 and past farm bills. We believe producers are very comfortable with those. We believe they are programs that help a variety of farmers, and we would, for that reason are encouraging additional resources be added in the next farm bill to Title II and a number of those efforts that have been identified today.

Ms. BROWN. Thank you very much.

While we continue to fight climate crisis together, we must ensure that resources are available to everyone, particularly underserved farmers.

So, Ms. Raygoza, you have used a number of programs within the USDA and you have touched on some of the barriers that you faced while using these programs. As it relates to the programs that you have used, what programs do you think work well and which do you believe need improvement to better help historically underserved farmers?

Ms. RAYGOZA. Yes. The programs that worked really well for our farm was the EQIP Program. So, for example, for conservation, for cover cropping, we participated in the organic program but what worked well for us was that we were able to apply those programs to all of our acreage, and I think what we can do to improve is to make them—like I mentioned, the cost available or the funding available up-front. Also, for many of these programs, an issue for many farmers is land access so we can implement these programs, allowing the farmer to have a short-term lease and be able to access these opportunities as well. Because many young farmers have short-term leases, we need to be able to have that as an option to implement these programs.

Ms. DUNCANSON. Can I just chime in on that also very quickly? On our farm, we utilize EQIP as well as a CSP contract, and I would like to just echo what has been mentioned here before about the fact that those who have helped us try some practices here on the ground that have been beneficial to our resiliency, but the application process itself is tedious and very time consuming, and you definitely need to have technical assistance to go through there. We are very lucky in the county that we live in that we do have expertise to help us, but I don't see those folks staying around in this area. They will move around to other areas, which is fine. But I do worry about their replacements, so I would like to just say that Senator Heitkamp's issues about using all the different programs and colleges at all different levels throughout the country to get people involved in technical assistance to provide it on the land

from a food point of view as well as from a production point of view.

Thank you.

Ms. BROWN. Thank you, and my time has expired, so thank you so much, and I yield back.

The CHAIRMAN. Thank you.

The gentleman from Illinois, Mr. Davis, is recognized for 5 minutes.

Mr. DAVIS. Thank you, Mr. Chairman. I appreciate this hearing happening, but my farmers and producers are not talking to me about climate change issues. They are talking to me about the ever-soaring input costs, how is this Administration, how are we in Congress addressing those high costs and inflationary pressures? What is the Biden Administration doing to tone down the rampant spending? And reports just this week show average gas prices in the U.S. have risen 22 percent, and that is just in 2 weeks. And yet, the Biden Administration refuses to uphold the Renewable Fuel Standard, an immediate solution to lower emissions and reduce costs at the pump. Inflation is now at over eight percent. Ag input costs are rising, as I mentioned, and showing no signs of slowing.

And it is not just that. This Administration has abandoned our farmers in so many ways, be it through pushing a new regulatory scheme with their WOTUS rewrite, abandoning President Trump's Navigable Waters Protection Rule, creating new obstacles for pesticide use, and failing to follow through on existing trade deals.

The ag economy is hurting across the board. They are concerned about whether or not they are going to be able to afford to plant a crop this year. And look, we can always talk about addressing climate change issues. I mean, America deserves credit and our farmers deserve a lot more credit for what they have done to reduce greenhouse emissions.

Can any of the witnesses please tell me and speak to the way inflation, these input costs, and maybe even these reckless policies make it impossible to predict what a market looks like months from now, yet alone a year from now when we start talking about this farm bill? Our farmers want to know if they are going to be able to survive before we get to the next farm bill.

Mr. Conner, would you like to respond?

Mr. CONNER. Congressman Davis, thanks for that opportunity.

I do not disagree with you that the coffee shop talk today is not climate change. It is world events. It is fertilizer prices. It is a number of things that are literally sort of in your face, and I concur with that.

I will say, though, that we find great interest to—from our producers when we start talking about climate in the context of incentive-based, in the context of additional resources and revenues in your pocket. And you know, that is in desperate need out there in rural America, given the challenges that we face. Farmers need a better shake, and we are doing this right now to try and give them that, and we wouldn't be sitting here addressing these concerns if it didn't have that strong, strong potential associated with it.

On the biofuels front, I am well aware of what you are saying. The number of facilities out there that are offering the higher-oc-

tane blends is dismal out there in rural America, and you know, we are missing a great opportunity there. We need that infrastructure, and some of those investments we are talking about in this climate debate, to raise those numbers, because right now, we cannot have much of a market impact when I believe the figure is like 3,000 retail outlets out of tens of thousands of outlets actually offer these higher blends. And that is totally inadequate. We have to change it.

Mr. DAVIS. It is. Retail outlets are not going to invest in offering new choices if they don't know if the Administration is going to follow the existing law into the Renewable Fuel Standard. There is no certainty. How in the world can you expect somebody in the private-sector to make a business decision when they don't know if decisions here in Washington are going to actually follow the law? And that is what is frustrating to us. I mean, we have heard promises from Administrations in the past and the current Administration about what they are going to do to help our ethanol producers, what they are going to do to help our farms. They are not doing it, and that is what is frustrating. We are in a kind of spin cycle of whether or not to be able to get these products out into the marketplace.

Dr. Outlaw, did you want to make a comment on the input costs or any of the other issues that our farmers are facing?

Dr. OUTLAW. Well, obviously we have done a couple of studies, one from Congresswoman Letlow on the impact of fertilizer prices on all of the farms, and it has been huge. We did an analysis just looking at nitrogen as well, and it was big.

The honest answer is that I hope that the prices that the futures market is reflecting come true, because if not, we are going to have a big disaster because the costs have gone up, in some cases 28 to 40 percent across the board for different types of commodities, and that will put a lot of people in very dire straits.

Mr. DAVIS. It is going to put them in dire straits. Imagine if we had to compete against our global competitor where we see war ravaging in Europe, and imagine if there weren't any issues with the Brazilian soybean crop. But that cannot be permanent, and we cannot allow these costs to be permanent.

I yield back, Mr. Chairman.

The CHAIRMAN. Thank you. Thank you very much, Mr. Davis, and I do want to assure you that President Biden has not abandoned our farmers. And as you recall, Secretary Vilsack was in here and spoke very pointedly about the things that this Administration is doing.

The gentlewoman from New Hampshire, Ms. Kuster, is now recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman, and thank you for holding this important hearing, the very first hearing dedicated specifically to addressing climate change in our Committee. I am excited to continue this discussion as we look to how we can continue to utilize the farm bill to reduce emissions in the agriculture sector and maximize how our farms and forestlands store carbon.

I always like to begin these conversations by recognizing the incredible work that farmers and foresters in New Hampshire and across the country are already doing to mitigate climate change,

and as we look ahead to the reauthorization of the farm bill next year, this is an excellent opportunity to take stock of what is working in the current farm bill and what we can do to improve and better serve our farmers and producers.

So, in that vein, I believe one of the most important things we can do to address climate change is to keep farmland as farms and forestland as forest. That is no easy task in states like mine where land values are rising and development demands are significant. These factors can box out young and beginning farmers in particular.

Thankfully in New Hampshire, we have a wonderful organization like Land for Good that do an incredible job providing technical assistance to beginning farmers and helping them connect with available agricultural land. But the fact remains we need to do more to focus our nationwide effort around farm transitions and ensuring that the next generation of farmers get off to the right start.

Ms. Raygoza, your testimony perfectly exemplifies this need. It would have been easy for you to get discouraged and find another line of work when land access presented so many hurdles, but I am glad you hung in there. You mentioned you were able to make use of FSA farm ownership loans, but could you comment on other ways that we can grow the farm bill to help with these land access challenges, and what is the National Young Farmers Coalition's vision for making access easier for new farmers?

Ms. RAYGOZA. Yes. So, for me and my farm, it was very important for us to be able to have access to land. We did struggle to apply, and so, the application process could be streamlined. We appreciate the microloan program that is helping many farmers get started, so we would like to see a continuation in those programs for microloans with the streamlined application process for farmers to access those programs.

Also, equitable land transition so that farmers can be able to transfer into land and have access to those as well.

Ms. KUSTER. Great.

Ms. RAYGOZA. Yes, thank you.

Ms. KUSTER. Go ahead. I also—sorry, our time is short, so I am going to cover the role of family forest operations as well in addressing climate change.

New Hampshire is the second most forested state in the nation, and we know very well that working forests already play an important role as carbon sinks.

Recently, the Bipartisan Policy Center's Farm and Forest Carbon Solutions Task Force released their policy recommendations in the thorough report that we have heard about today. I was pleased to see excellent recommendations for better utilizing forests as natural climate solutions.

One recommendation that stood out to me was the need to modernize and expand our seed collection and tree nurseries. Doing so would not only help reforestation efforts in the aftermath of fires, but could also help prepare for adapting our existing forestlands to climate and weather patterns.

Senator Heitkamp, I appreciate your leadership on this report and wondered if you could expand on how BPC would urge Con-

gress to strengthen seed and nursery collections through the farm bill?

Ms. HEITKAMP. I think that it is the single most important part of our recommendations in forestry that we make sure that we have the seedstock, we make sure that we are building resiliency. And so, I would say that in the whole—I mean, we have to take care of our forests. We have to stop the forest fires. We have to look at what we are going to do to reforest our communities, especially for the private landowners who are doing the job so adequately.

I teased Saxby. I said, we joke in North Dakota that our tree is a telephone pole, and so he really—I led the way in terms of forestry, making sure that we were—that you all were well-represented. But I think that you have to really take a look at the whole span, whether it is what is happening right now with forest fires and the impact of climate, but also how do we build back our forests and our industry in a way that is going to be sustainable into the future? And so, this seedstock is so critical and important, and that is what we heard, and that is why we built the recommendation.

Ms. KUSTER. Great. Thank you so much.

With that, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you.

The gentleman from Georgia, Mr. Allen, is recognized for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman, and I don't want to sound like a broken record, but as has been stated here earlier, my folks back home are not tuned into this hearing. In fact, I have very few questions, but I can tell you what they are saying back home. I will tell you what I see is the biggest threat to this nation.

Right now the world is on the edge of global upheaval, and today's hearing focuses on none of our farmer's critical issues, not one. Two of the world's leading suppliers of wheat, corn, and fertilizers are at war. Commercial activity in Ukraine ports has not resumed since Russia's invasion, which could leave to an inability to export their commodities.

Folks, my farmers are trying to figure out whether to plant. I am begging them to plant. It is planting season, and they don't even know what fertilizer is going to cost because it is going up every single day. It is time for this Administration to engage and this Committee to engage. The Administration continues their shortsighted war on fossil fuel, which has increased our dependence on foreign energy. What is amazing to me is we are sending \$75 million a day to Russia, not counting what Europe is sending. We are financing the dadgum war. I mean, folks, you can't make this stuff up.

These attacks on production of fossil fuels here in America and our domestic greenhouse gas emissions are, in part, responsible for, first, the global reliance on fossil fuels in Russia, and the Russian war effort, and second, when it come to the reduction of American greenhouse gas emissions, all that does is cause a net increase in global greenhouse gas emissions.

I have tried to be patient with the Administration. I recognize that they have their priorities, but folks, this body and this Congress and this Administration better get our priorities in order.

Certainly, one is a \$30 trillion debt. We are talking about spending more money, more money. Where is it going to come from? In order to have that, you got to have national security. How about jobs and the economy? Where do you think the money comes from? Education, healthcare, we got a lot of issues to address here, and most of it is dealing with nutrition and the farm.

Right now—well, I had asked the President—40 Members signed on to a letter to ask the President to restore the previous fossil fuel regulatory environment and production incentives that we had in this country that made this country energy independent and the most powerful country in the world just 18 months ago. We had an oil war between Russia and Saudi Arabia at \$7 a barrel and going lower, and look at today. Folks, it is out of control and we have let this happen because we got our eye on the wrong ball.

Dr. OUTLAW, when we [inaudible] in the U.S., it sends a market signal to U.S. competitors to increase their production, which usually leads to more negative environmental consequences. We had the situation in Brazil that plowed up half of the [inaudible] for carbon dioxide. Do Federal regulators, USDA, are they taking into account the impact globally of this regulatory situation?

Dr. OUTLAW. I can't speak to all of that. I don't believe that we are focusing more on our producers, and I don't think that what is happening in other countries is something that has been looked at very closely.

I do know that some of our biggest competitors like Brazil have their own environmental issues that if commodities start being traded, looking at their footprint, they would be in a little bit different situation competitive-wise than they are currently.

But no, I don't believe—to answer your question, I don't believe so.

Mr. ALLEN. All right. Well, I am sorry. I am out of time. I yield back, Mr. Chairman.

The CHAIRMAN. The gentlewoman from Maine, Ms. Pingree, is now recognized for 5 minutes.

Ms. PINGREE. Thank you very much, Mr. Chairman, and thank you for holding this important hearing.

While I know we are all focused on the activities that are going on in Ukraine and our hearts go out to those people and hope that we can continue to do more, we also understand that could have a huge impact on energy, on commodity prices, on availability of food around the world, it doesn't mean that we shouldn't be holding this hearing today. These are also very important issues, and I really appreciate that you are doing that.

So, my questions. Senator Heitkamp, so nice to see you again. Thank you for the work that you have been doing. One of the recommendations in the Bipartisan Policy Center's report was to streamline NRCS process for adopting new conservation practice standards. Currently, the practice requires stakeholders to petition for an interim practice, and then NRCS studies that interim practice for 3 years or more. This is something I have been interested in, as I have been pushing for NRCS to support compost, which is finally on its way as an interim practice. But could you talk a little bit about why streamlining the process is important as we think about climate change, and how do you think NRCS should ap-

proach developing new conservation practice standards in a way that supports innovation without undermining their scientific credibility?

Ms. HEITKAMP. Well, you have already heard from the producers here that the application process is way overbearing and yes, they are grateful for the help, but why—I mean, farmers don't want to be paperwork people. They want to get out and farm. And so, the first thing I would look at is even on those proven programs, making sure that the application process is streamlined and available.

But if we really believe that we have an emerging crisis in climate, why is [inaudible]? Why shouldn't we basically be early adopters and get out there and get it done? And so, we really believe that USDA has done a great job in designing programs, in implementing and researching programs, but they need to have an implementation date that is much quicker and they need to have an implementation plan that deals with, as I have been a broken record here, workforce on the ground, technical assistance on the ground, making sure, and then evaluate. Get as many adopters out there, evaluate, and you can always walk back and say that didn't work the way we thought it was going to work. Let's try something else.

And so, let's not study something to death to the point where we don't get the job done.

Ms. PINGREE. Yes, thank you so much. I really do appreciate the work you are doing.

Ms. DUNCANSON, I want to ask you a question, and just want to say I am a Minnesotan by birth myself, yah, sure, you bet ya. My family—my mother was born on a farm in Kenyon. My grandfather came from Norway, like so many Minnesotans, and my uncle farmed it for years. Also, I know you are not that far away from St. Peter, so my brother and sister went to Gustavus. So, we got southern Minnesota covered there.

But I want to ask you a question. We are making a lot of progress on aligning good conservation practices and crop insurance, but I think there is still a lot of work to do. The report included in your testimony noted that there is research on this currently underway through the 508(h) process, which allows third parties to propose new crop insurance products with the goal of eventually opening the door to new insurance rating methodologies that explicitly consider a farmer's conservation practices. So, could you talk a little bit more about the effort and what you hope will come out of the process?

Ms. DUNCANSON. Yes, thank you very much, and I appreciate your pointing out the great State of Minnesota and your connections to it.

Yes, that process has been part of what we have worked towards and are hopeful about that will get out on the landscape and try to see what really is resilient and working and could be incentivized or recognized as a way to make crop insurance continue to be part of our resiliency plan. Keep in mind that for so many of us, crop insurance is the way to make sure we can farm another day.

We also need to make sure that crop insurance kind of platform is available to all farmers, regardless of what they grow and where

they grow it and how they grow it. So, we are looking forward to using some of the pilot that we are finding out about right now and also with the PACE Program, which is a split-application of nitrogen opportunity, a brainchild of Ellen Eichhorn, and just see where we can go with that.

Ms. PINGREE. Great. Well, thank you so much. I appreciate the work you have been doing, and your representation of farmers.

I think I only have 20 seconds left, so I will yield back my time and submit my other questions for the record. But thank you to all the panelists. You have been very helpful, and we really appreciate you all presenting your side today. Thanks so much. I yield back.

The CHAIRMAN. Thank you, Ms. Pingree.

The gentleman from South Dakota, Mr. Johnson, is recognized for 5 minutes.

Mr. JOHNSON. Thank you, Mr. Chairman, and I want to pick up or add on to the conversations that Ms. Kuster had started on forest products and good forests.

I will start with Senator Heitkamp and then maybe if we have time left over, I might have some questions for Dr. Humiston.

But Senator, you talked in your testimony a lot about the power of production agriculture to help with some of these things, but I noticed your organization title also has forest in its name. And so, talk to us about the role that forests, and particularly forest products, can play in gathering up this carbon, sinking it, holding on to it for a long time.

Ms. HEITKAMP. What better way to sink carbon than to keep it in the wood, right? I mean, we recognize that forests can be such a big part of this.

I want to just talk a little bit about what concerned our Committee and our bipartisan effort. Number one, forest fires, and there was a lot of discussion about USDA programs building greater resiliency so that we don't basically lose the carbon sink in a forest fire. And so, we want to modernize seed collection and tree nurseries. We want to implement an all of government approach. I think that was one of the concerns, and also, working with state governments. You heard New Hampshire, Maine is a huge forestry state, Georgia. Our states, not so much, as you know, although you have the Black Hills. You know, and I think the cross-boned re-initiatives to improve health and carbon sequestration potential of rangelands, and so, there is a whole ecosystem that we talked about.

One of the things that we did, pretty effectively, was sit down and say if we are going to—and we haven't talked a lot about it here today—but if we are going to sell carbon credits, how do we guarantee that those are real? And certainly, the forestry industry today is on the leading edge of carbon credits and making sure that we are doing the research and giving the certainty on carbon credits that can be bought on the market where we actually see a climate result. And people—I mean, we heard from very large folks who would buy a lot of credits if they were sure that these credits would be, in fact, legitimate in terms of carbon capture. We think that the early adopters are going to be in forestry, and so, there are a lot of real opportunities out there to have those conversations. And the American forestry industry, whether it is people who

provide basically work on public lands or those who have their own private lands, stand ready to do this, and that is the exciting part is everybody is in on it.

Mr. JOHNSON. You are right about so much of that, Senator, as well as the point that the Black Hills has so many trees. But don't sell North Dakota short. I have seen the trees in Medora and they are both beautiful.

So, you talk about the—I think you talk about the health of the forest. I think that is good, but talk to me specifically about forest products, because we are losing so much of that forest products industry in this country, and I think that can be the real value add, because not only do you take the long life of these trees, but you extend the ability of that wood to hold carbon when you have them in telephone poles, as you mentioned, and chairs and tables.

I mean, what role does the forest products industry play?

Ms. HEITKAMP. Huge, and you have already heard it from the California perspective. The important part of it as we were talking about biomass as an energy producer, but how about advanced manufacturing and making sure that those forest products are actually being utilized and used to produce furniture or used to produce building materials right here in this country. I think I would defer this question to our great colleague from California. They are doing some amazing research there, and I think her testimony really spoke to this already, Congressman.

Mr. JOHNSON. Yes, great. Let's do that, Senator. I have 45 seconds left, Doc. Talk to me about any research that is being done at the University of California on innovation in the wood products and forest products industry.

Dr. HUMISTON. So, many of the engineering schools have departments of material science that are doing a great deal of work finding all kinds of new uses for biomass of all sorts.

I have to say, basically anything that is made from fossil fuel can be made from renewable biomass, and as we start moving towards that bioeconomy, we are going to create new profit centers for our farmers, our foresters, and even more importantly, perhaps, our rural communities, most of which have not really recovered from the 2008 Great Recession. And this is a huge opportunity we would be foolish to ignore and not pursue.

Mr. JOHNSON. I wish we could go deeper, but I am out of time. Thank you very much, and I yield back, sir.

The CHAIRMAN. Thank you.

The gentleman from Arizona, Mr. O'Halleran, is recognized for 5 minutes.

Mr. O'HALLERAN. Thank you, Mr. Chairman and Ranking Member, for organizing this important hearing.

Arizona has been hit particularly hard by climate change. We are in the midst of an extreme drought that has been worse since 1,200 years ago, according to a lot of scientists. On top of this, the decades of outdated wildfire practices have led to a concentrated, dense forest that have left much of northern Arizona. I have all or parts of the six National Forests in Arizona, along with the Grand Canyon, so I have watched as Arizona's wildfire season has started earlier and earlier each year.

I am happy to see an increased focus on fire prevention, but our current mitigation efforts can only go so far. The Infrastructure Investment and Jobs Act (Pub. L. 117-58) accounted for \$6 billion for forestry programs, and I am encouraged by Secretary Vilsack's recent announcement in Arizona to use some of the funds to implement a 10 year strategy to confront the wildfire crisis.

Dr. Humiston, thank you for your testimony. Fire and drought are major concerns of many Arizonans and Americans, particularly those in northern and eastern Arizona. More fire severe and drought severe conditions are clearly linked to climate change. Can you speak to how the farm bill can support a collaborative, economically sustainable approach to addressing these concerns?

Dr. HUMISTON. Thank you for the question.

There are several ways the farm bill can assist with this. One is to just make sure that our U.S. Forest Service has the ability and expanded ability to enter into long-term master stewardship agreements with local government and economic development organizations to make use of that biomass, and that we keep pursuing the technologies to enable us to both get that biomass out of forests without causing environmental degradation—and we can do that. We are finding the tools; we are finding the methodologies. But then also look to entities like our Rural Development and their ability to finance some of that supply chain and infrastructure and manufacturing base that we need to make good use of that biomass. That is just a few examples, but there are many, many more.

Mr. O'HALLERAN. Thank you.

During the last farm bill, we did try to address the extension of contracts and also some of the other partnerships. We have to go further this time.

Senator—

Dr. HUMISTON. Could I add one more thing? I am sorry.

Mr. O'HALLERAN. Sure, you can.

Dr. HUMISTON. I am so sorry.

I forgot to mention that one of the things we are doing that I think is going to be of critical importance moving forward is we are making use of our cooperative extension advisors in new and different ways to help facilitate that organizational need to build those supply chains and help stand up that manufacturing base and work with our local communities. All too often, our small rural communities don't have the capacity or the people to try to undertake such big projects, such construction and development projects, and that is what rural cooperative extension is perfect for. We are placing new advisors throughout California to do exactly that right now.

Mr. O'HALLERAN. Thank you, and I agree with that thought process.

Senator, the USDA's Natural Resources Conservation Service programs have a record of success in advancing conservation, forestry, and renewable energy efforts to achieve positive climate and economic outcomes. However, as we work towards an effective farm bill, we must take a critical approach to these programs and adapt them to effectively address present day issues.

How can we improve USDA's NRCS programs, and do you believe that these are changes that would make the NRCS programs

easier for historically underserved producers to use, and what about the Native American producers in particular? Thank you, Senator.

Ms. HEITKAMP. I know that I keep coming back to this, but it is about workforce. And when I was in the Senate, I was Ranking Member on a committee that looked at the retiring workforce. We have to build workforce. We have to deploy workforce, and we have to deploy workforce where we haven't before.

We have the technologies. We had a whole committee of soil scientists talking about do soils actually embed carbon, and yes, we can do all of this. But, if we don't get people to adopt the practices that are being recommended through NRCS, and how we do that is we get workforce on the ground. And so, I would say find a collaboration with Tribal colleges. I know you have some great Tribal colleges in Arizona. They are reaching out to your land-grant colleges. Make those collaborations, incentivize outreach to traditional African American schools, and get the workforce on the ground. People will do it if they know how to do it.

The CHAIRMAN. The gentleman from Indiana, Mr. Baird, is now recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman and Ranking Member Thompson, for having this important hearing. I really always appreciate you having such knowledgeable witnesses on our panel.

But, I think we are all concerned about the Ukraine. We also have tremendous respect for their extraordinary courage to defend their homeland. And having said that, our hearts go out to what is taking place in that country.

I think we are also concerned, as many of my colleagues have mentioned, about the impact that the current economic situation is having on our agricultural industry, and we need to recognize that as we move forward with our farm bill.

I have also appreciated hearing many of the witnesses indicate today that agriculture can play a major role in this climate mitigation kind of work, and I think that is exciting for agriculture. Cover crops, no-till, forestry management, all of those are tools that the farmers and ranchers have been using and can use in the future.

Another area of interest to me is in the livestock area whereby you can use feed ingredients to reduce enteric emissions from cattle, for example, methane, the gas release and so on. So, I think we need a pathway through the system to approve products like that, maybe through USDA rather than FDA so that it is not considered an antibiotic or something like that, but rather a feed ingredient.

But having said all of that, I really see biotechnology as a major factor in what happens in agriculture as we try to produce the food and fiber for our ever-increasingly hungry world. So, I am just going to throw out one example when I am trying to talk about biotechnology. Genetically engineered nitrogen-fixing bacteria can be used as a biofertilizer, and it really enhances a plant's ability to take up nutrients and so on.

So, my questions are going to be to Mr. Conner and to Ms. Duncanson. So, Mr. Conner, would you care to elaborate on the importance of biotechnology and research and so on as we move forward in agriculture?

Mr. CONNER. Congressman, thank you for the question, and I will say I think it is fundamental. We focused a lot on this hearing on Title II provisions in the farm bill, which are the conservation provisions, and they are very, very important. But one of the things that the Food and Ag Climate Alliance will also be focusing on is many of our recommendations are in the research and development area. We do believe that if we are going to meet the challenges that we have in front of us with the criteria that we have laid out in terms of helping producers, that technology and research are going to be key to that, and we do look forward to working with this Committee in the research title of the farm bill, as well, in making sure that we are on the right path to meet our objectives, which is at the end of the day, do good by the American farmer and do good by the food security that we enjoy in this country.

Mr. BAIRD. Thank you.

Ms. Duncanson?

Ms. DUNCANSON. Yes, thank you very much for that question, and just to echo upon what Mr. Conner said earlier, we are very pro-biotechnology, especially when we look at some of these opportunities with new microbiomes and products on our landscape here at our farm, Highland Family Farms. We have run many pilots and many tests. Some of those products we have adopted. Some of them are not within our budget, but they will get better over time.

Research is an important component of moving American agriculture forward, and forestry. I mentioned in my testimony that we are also converting some acres to organic production. There is research to be done in that realm, too, as we look at the resiliency and eliminating and reducing risk on all facets of what we do here.

So, we look forward to all the new programs that are available to us, but we also are very dependent on our land-grants to do some research at their facilities with scientists and move science forward too at the same time.

I appreciate the comments, and I would just like to end by saying I have appreciated everything that everyone has brought up here today. It is overwhelming right now for American agriculture as we look at the challenges that face us. We are a resilient bunch. No matter what we do on the landscape, we will continue to look for good partners, look for good advice, technical assistance, government programs, private industry ideas to continue to move forward, and will hope to adopt those into the new farm bill.

Mr. BAIRD. We are an optimistic group. We always have been, so thank you for those answers. Thank you very much, witnesses.—

Ms. DUNCANSON. That is—

Mr. BAIRD. I am not sure, Mr. Chairman, how much time I have left, but if any of the other witnesses would like to comment—

The CHAIRMAN. Your time has expired, unfortunately.*

The gentleman from California, Mr. Carbajal, is now recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman, and thank you to all the witnesses for taking time to testify before our Committee today on these important issues.

* **Editor's note:** the responses to the information referred to are located: for Ms. Heitkamp, on p. 332; Ms. Raygoza, on p. 333; Dr. Humiston, on p. 334; and Dr. Outlaw, on p. 334.

Like many areas of California, my district produces wonderful agriculture products, including the best, bar none, strawberries in the country, wine grapes, broccoli, avocados, and much, much more. I am proud of the contributions California's 24th District makes to our nation's food supply and the economy. Like many areas of California, my district also knows the consequences of climate change all too well, as we have experienced devastating fires and prolonged drought. California has long been the country's top agricultural state. Let me repeat that: top agricultural state, and leading the fight against climate change. This is in part because of the research funded by the farm bill programs, and by our terrific universities like Cal Poly San Luis Obispo, and the University of California system, who has an institution in my district.

Dr. Humiston, can you elaborate on some of the ways that UC cooperative extension can help with wildfire prevention and research? I know you touched on this a little bit, but if you could elaborate a little bit more it would be great. And as we look towards drafting a farm bill in 2023, what are some of the USDA's programs Congress can improve to better assist with wildfire prevention and recovery?

Dr. HUMISTON. Thank you for the question.

Cooperative extension is deeply engaged in several different activities around wildfire risk reduction and also forest health. For example, we have coordinated local communities and homeowner's associations to create controlled burn associations where we provide training and actually organize controlled burns that help remove that excessive fuel load and keep the forest healthy.

We also have our master gardeners program increasingly working with homeowners on how to make their house fire-wise, improving their landscaping plants to be less prone to fire, giving defensible space, hardening where necessary, and really reducing that risk, which is huge. And as you know in California, and many of the western states and elsewhere, where winds can blow embers from a fire ½ mile to a mile ahead, you have really got to do that defensible home hardening to protect our homes.

There are several other farm bill programs that are critical to helping us with this. I mentioned earlier the biobased products, so I won't do that again. But there are many programs there, and I will say one other item that hasn't been mentioned yet, not specific to fire, but drought which you brought up is the need to make sure we have adequate water resources for irrigation for our farmers to grow those crops that you named.

One thing that I personally would love to see would be some loosening of the language around Rural Development's ability to do piping from wastewater treatment facilities out to irrigation water sources. That is such an obvious win/win between urban and rural and our farmers, and yet right now, the language doesn't really allow that itself, as well as the population limits make it impossible to do that kind of infrastructure, even though it would serve our communities and our farmers very much.

Mr. CARBAJAL. Thank you.

Dr. Humiston, in your testimony you mentioned that drought and heat tolerant crop varieties are being developed. Can you speak to the impact this could have on water conservation efforts

in California, and the role farm bill programs played in this research?

Dr. HUMISTON. Yes, absolutely. I mentioned the need to develop new crop varieties, and this is critical. We are seeing our ecosystems actually move around. Obviously a little bit to the north as different sectors of the state warm up, and again, this isn't just California. But finding those crop varieties that maybe have a shorter growing season, are able to grow with less water, and the ability to perhaps use saltier soils are all critical to be able to keep productivity up.

The other item that is really exciting is the ability to really use data to help us with managing this type of productivity. We have created a software system called Crop Manage, some of our cooperative extension folks over on the coast, that actually allows farmers who utilize it to reduce their need for water and nitrogen fertilizer as much as 40 percent and still maintain the same levels of productivity on many specialty crops. We are working to expand that to additional crops as we speak.

Mr. CARBAJAL. Thank you.

Ms. Raygoza, I don't know if I have enough time, but I agree with you that young farmers are the future. I want to help support these young, aspiring farmers succeed and produce food for our country. Do you think some type of workforce development partnership between USDA and community colleges would be useful to teach young farmers how to navigate USDA resources and learn about climate practices?

The CHAIRMAN. The gentleman's time has expired, but you may respond in writing to him. Thank you.

[The information referred to is located on p. 333.]

Mr. CARBAJAL. Thank you.

The CHAIRMAN. The gentleman from Ohio, Mr. Balderson, is now recognized for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman, for the time. Thank you to the panel for being here.

Senator, it is nice to actually get to ask you a question. I enjoy your time on *Squawk Box*, so it is actually good to see you here. So, thank you.

Ohio runs a soil and water management program called H2Ohio that is showing some promise in lessening runoff from farm fields into rivers and streams, and provides farmers with financial incentives. It is interesting to me that farmers are being paid different prices for these programs. For example, if a farmer has a nutrient management plan, they receive \$2 per acre. If a farmer uses variable rate fertilization, they receive \$8 per acre. Combining practices can pay farmers up to \$30 per acre. I am curious if any of our panelists today know about what type of price discovery is occurring in these new carbon markets, and how these prices paid to farmers are determined? To follow up with that, perhaps we can start with you, Dr. Outlaw, which is a great name, since you have a background in agricultural economics.

Dr. OUTLAW. Right. At this point, there isn't very much transparency in how those prices have been determined. I wouldn't consider there to be a working market right now for carbon. Maybe—

you don't really have a market when you don't know how the prices are being determined, plain and simple.

Mr. CONNER. I would just say, Congressman, I think we are all in total agreement on that, including our own Secretary of Agriculture, and that is part of the reason the programs that he has put forward and recently announced is really sort of a discovery, if you will, type of program designed to create the data and the information that are going to be necessary to overcome some of these carbon market issues, including transparency that we have talked about. And we do commend the Secretary for recognizing that this is not just full speed ahead, that we do need to collect a lot of information here in the process before jumping into this thing with both feet, and in our view, he has done that with his announcement last week.

Mr. BALDERSON. Okay, thank you. Would anybody else like to add? Okay.

Ms. DUNCANSON. I just would like to add, if I could, please, that sometimes you have to go slow to go fast. So, if we have some programs out there that will figure out some ways to pay producers on any size or scale for doing a practice and get them into the groove of doing that, that is helpful. But we have to have good data to make sure what we are doing is being impactful. So, the data here again, data collection and analysis becomes really important to how we move forward.

Dr. HUMISTON. If I could add to that, too. All the comments thus far are right on. I would say that we are doing a lot of work not only around the idea of carbon markets, but ecosystem services which I mentioned in my testimony.

Our farmers and foresters and natural resource managers produce a lot of ecosystem services that the general public enjoys and doesn't pay a dime for. And if we can start finding the framework to start compensating for some of those ecosystem services, many of which are climate-smart practices, that too will help us move all of these issues forward in a more positive direction.

Mr. BALDERSON. Okay, thank you.

My next question, while the Biden Administration and Beltway think tanks continue to push a climate agenda based around new and untested programs, I am interested in working on climate solutions that will work for our farmers. When I hear from farmers about climate solutions, they talk about the need for more research, more boots on the ground support, access to precision agriculture technology, and the need for broadband connectivity to support this technology. To me, this all sounds like assistance that is available within current farm bill programs. Is the solution as simple as doubling down on these proven programs? And anyone from the panel can answer.

Mr. CONNER. I would just respond to that by saying I think part of the solution certainly is the existing framework that we have in place. That framework has corrected a lot of environmental problems for American agriculture through the years, whether it is erosion, water quality, wetlands, those kinds of things, and so, we are building off of that to move forward with what we are calling climate-smart agriculture. It is not 100 percent of the solution, but

it is a big part of it, and we believe that the mechanisms are in place to really go down that pathway aggressively.

Dr. HUMISTON. I would add, we need to not reinvent the wheel. We have some great programs, many of which need increased funding because the needs have grown. But I would also say that we need to really pursue interagency collaborations and making sure we are leveraging those programs amongst the different agencies far more than we currently do.

Mr. BALDERSON. Thank you all very much. My time has expired. Mr. Chairman, thank you.

The CHAIRMAN. The gentlewoman from Iowa, Mrs. Axne, is now recognized for 5 minutes.

Mrs. AXNE. Thank you, Chairman Scott, and thank you to all the witnesses for being here. It is very much appreciated. Hello, Senator Heitkamp, very nice to see you again, and all the other folks that are here.

This is a great topic, one of extreme interest to me. As this Committee continues its work on reviewing the 2018 Farm Bill in preparation for next year, it is clear to me that we need strong investment in conservation and renewable energy in order to meet the ever-increasing challenge of climate change. We know that our family farmers are on the front-lines of climate change and have seen firsthand the devastating impact that volatile and devastating weather. Boy, I know that in Iowa. We just had another tornado unfortunately go through our state.

But our family farmers are also a key part of the solution, and they have been champions of conservation and stewards of their land for generations. And as we learn more about climate change, it is critical that we equip our farmers with all the tools and resources and voluntary incentives that we can do to make sure that they meet those challenges.

The success of the biofuels industry is a great example of this, and from 2008 to 2020, the Renewable Fuel Standard resulted in the reduction of nearly 1 billion metric tons of greenhouse gas emissions from our transportation sector through the use of biofuels blends. In fact, biofuel production is on track to hit net-zero carbon emissions in the coming decades, all while being significantly cheaper at the pump than fossil fuels.

So, over this last year, I have been focused on expanding access to higher blends of ethanol as a way to reduce our emissions and to provide a more affordable option for our consumers. The legislation I have would build upon USDA's successful Higher Blends Infrastructure Incentive Program and ensure more fuel retailers can provide E15 at higher blends of ethanol, giving consumers access to, of course, more affordable, cleaner, and domestic source of fuel. And so, while my legislation passed the House last year, I was disappointed to see it stall in the Senate.

So, to you, Senator Heitkamp, I know you were heavily involved in biofuels policy when you served your great State of North Dakota. What role do you see biofuels playing in combating the climate crisis, and what suggestions do you have for Congress and for the Senate and for the Administration as a whole when looking at biofuels policy?

I think you are still muted.

Ms. HEITKAMP. My first suggestion is follow the law, and a previous speaker talked about this Administration. We had this problem in the Obama Administration with blend walls. We had this problem in the past Administration with waivers, and now we are still experiencing this problem. We have to give the industry certainty. But in addition to the work that you are doing, I am proud of the role that I played in passing section 45Q, which is a tax credit which the ethanol industry is going to use, not only to continue their great work in terms of climate, but to also sequester the CO₂ from their processes.

And so, we know that this is an industry that will adapt when given the certainty of market, and so the single most important thing that you can do, follow the law. Give them certainty to market. Set some goals that I know they can achieve, whether it is by doing the practices they are doing right now, or carbon capture. And so, I am really excited about the future of this industry, but [inaudible].

Mrs. AXNE. Thank you. I—you cut out a bit here, but I think you completed your answer. Thank you, Senator Heitkamp. I appreciate that.

I want to turn to cover crops real quickly here. Last summer, the USDA announced the availability of the Pandemic Cover Crop Program, obviously to help our producers offset the costs associated with cover crops and providing a discount on their crop insurance premiums.

Ms. Duncanson, thanks again for joining us here today and sharing your expertise. Can you tell me what level of interest you have seen from producers regarding cover cropping, or specifically the Pandemic Cover Crop Program, and what suggestions you have to improve it or other ways to incentivize more cover crops?

Ms. DUNCANSON. Thank you for that question. Yes, I appreciate being asked it.

There aren't as many people involved in cover crops as I wish, but that is coming along. As I mentioned earlier, sometimes you have to go slow to go fast, which means giving those incentives and making it easy to apply. Just yesterday, our family finished applying through FSA for the Cover Crop Program and we will utilize that as we pay for seed to expand cover crops throughout our operation. When I inquired at our FSA office, they said that about 30 percent of the folks that are serviced had applied for cover crops, and I see them as I travel the country. I see different cover crops becoming used more rapidly around the country, but here again, we are talking about technical assistance to get information and good data about—

The CHAIRMAN. The gentlelady's time has expired, unfortunately.

The gentleman from Kansas, Mr. Mann, is recognized for 5 minutes.

Mr. MANN. Thank you, Mr. Chairman, and thank you all for being here this morning and participating in today's hearing.

Farm bill conservation programs, as we all know, have generally generated wide bipartisan support in Congress, and wide adoption amongst farmers and ranchers. The extensive participation in conservation programs, I believe, comes from the flexibility for individ-

ualized operations, incentives for locally-led and voluntary efforts, and coordination with state technical committees.

In regards to climate specifically, I think it is important and my priorities would be to make sure that whatever you do is producer-focused, voluntary, not at the expense of other programs, and also make sure that we don't penalize our early adopters and things that are already happening.

To that effect, I guess my first question would be to you, Mr. Conner. For decades producers across the big 1st District, my district in Kansas, and the country have taken advantage of incentive-based programs by voluntarily making changes on their farms and ranches to be efficient stewards of their resources. Recently, I am starting to hear a lot from producers that have been implementing no-till practices for decades, but they would not qualify to participate in carbon market programs because their practice is not considered new. In some cases, these producers were told that they would need to farm conventionally for two growing seasons just to qualify for carbon market programs.

Can you expand on the importance of voluntary conservation efforts and discuss why it is important for Congress to make sure that we don't hinder or penalize early adopters?

Mr. CONNER. It is a great question, Congressman, and let me just say that the importance of these programs is really top line, and not only because they have been effective in the past, and as I noted earlier, these programs have solved many of the challenges that we have faced in American agriculture before, and done so in a way that, again, has been income enhancing. And that is the bottom line in terms of our recommendations, and we believe that that can be done here.

For the early adopters, this is something the Food and Ag Climate Alliance struggled with. I will just tell you that we ended up with a recommendation that simply suggested that there be a one-time payment in addition to what other subsequent payments may be coming down the pike, a one-time payment to those early adopters to compensate them for the work that they have done on their farms, and certainly not to penalize. And I would even add a worst-case scenario where they might tear up conservation practices only to be able to collect for the new ones. And obviously, that is just borderline stupidity to have that kind of policy in place.

So, we struggled with it. We came up with a recommendation, but it is certainly an area in the farm bill where we want to work with this Committee to develop what is the appropriate compensation for those early adopters, because they need it and should get it.

Mr. MANN. No, I appreciate that and appreciate how producer-focused your organization and group is on these issues. I wholeheartedly agree.

One last question will be for Dr. Outlaw. One of my top priorities in my role on this Committee is protecting crop insurance. It is absolutely vital to our ag producers all over my district, all over the country. We want to make sure that we protect crop insurance so that producers can sustain their operations year after year, even in the face of uncertain weather.

My question is what do you consider the role of crop insurance to be when dealing with uncertain or extreme weather events, and how should crop insurance enter into the overall conversation we are having about climate practices?

Dr. OUTLAW. Well, I think it is very involved. The local weather patterns have helped define a farmer's APH, which helps define their coverage, and so, crop insurance and conservation programs go hand in hand.

The issue I have, and what I testified to was that trying to link those together, in my opinion, is not a good idea primarily because you can always create winners and losers with programs, as an example, if producers in your state are not able to take advantage of some of these programs, then they wouldn't get the premium discounts that some other folks are suggesting would be out there. So, I suggested in my testimony that people need to pay really close attention to try to link these programs together.

There are many programs and many outlets through USDA to get money to producers to do climate friendly practices, climate-smart practices. It doesn't have to be tied to crop insurance.

Mr. MANN. Very good. Thank you all. My time is expiring, and with that, I yield back.

Thanks, Mr. Chairman.

The CHAIRMAN. Thank you.

The gentleman from Illinois, Mr. Rush, is now recognized for 5 minutes.

Mr. RUSH. I certainly want to thank you, Mr. Chairman, and this has been quite a hearing, and I really want to thank the witnesses for appearing before us today.

I don't see Senator Heitkamp on.

Ms. HEITKAMP. I think—I am here. You have lost my video, but I can hear you and I can answer.

Mr. RUSH. Okay.

Well, thank you so much, Senator.

Senator, I have a question for you. In your testimony, you discuss ensuring land access, especially for new and small and historically underserved landowners and producers. This is an issue that I have been working on for quite a while now, and it is an issue that really connects with me personally. My grandfather owned a farm in Norton County, Georgia, southwest Georgia, and it was my family farm. And my father, to his dying day, always wanted to try to figure out what happened to the farm and how we could reclaim the farm.

That is the plight that is shared with a number of African American descendants of farmers to our land. And so, can you expound, if you will, on what new Federal incentives could address the financial, legal, and social obstacles that currently limit access to affordable farmland, specifically? And in general, is there any ideas or suggestions you may have that could give some relief, some advice, some help to individuals who may want to question the loss of their family farmland, and some of the impediments that heirs property rights have caused for African American farmers specifically, and other farmers in general?

The next part of my question is how can urban farming play a role in increasing access to land and/or enacting good climate policy? So, that is a lot, Senator, but you are capable. Please.

Ms. HEITKAMP. Yes, that might be beyond my pay grade, but I am going to suggest to all of you that one of the looming crises in America is land ownership and absentee land ownership. Even in a state like North Dakota, over only 25 percent of the land that large farmers farm is actually owned by the farmer themselves, and so, we have a situation where we have land ownership by people who are not actually producing, who are not—I mean, they are making money obviously from rents. And so, once that land becomes available, it is incredibly difficult for small family farmers or for people who want to reestablish or expand their farm to actually be able to afford it. If we want to keep a culture of family farming in this country, we have to look at land ownership. And if we want to rectify past wrongs that have been done, we have to look at that chain of title. We have to look at kind of this from the standpoint of people who, quite honestly, lost their land inappropriately, who had it taken from them, or who now have it tied up in land trusts and they are unable to access the asset.

And so, this land ownership goes beyond what you, Congressman Rush, what you have identified, but it is absolutely one of those heads-up to what is coming at us in the future. We have to fix past wrongs, but we also have to look at the challenges that land ownership will present to making sure that we are producing enough food to feed our country and feed the world, because it will restrict us in terms of access to that asset for agricultural production.

Mr. RUSH. Thank you, Senator.

The CHAIRMAN. You are absolutely right, Senator.

Thank you, Congressman Rush.

Mr. RUSH. Thank you.

The CHAIRMAN. The gentleman from Iowa, Mr. Feenstra, is now recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Scott and Ranking Member Thompson.

I am proud of our farmers and producers in my district who are leading the way in farming practices that result in productive harvests and clean environment. For years, the agriculture industry has implemented practices that reduce emissions, enrich the soil, and protect our natural resources. These practices have improved our quality of life by allowing farmers to produce more food, fiber, and fuel for all of us.

Iowa's 4th District leads the nation in ethanol and biofuels production. In addition to great economic benefits, USDA reports that the greenhouse gas emissions associated with corn ethanol are 43 percent lower than gasoline. Similarly, biodiesel and renewable diesel are 74 percent less carbon intensive than petroleum fuels. Programs under Title IX of the 2018 Farm Bill have bolstered renewable energy production in the United States. For example, the Biofuels Education Program has stimulated both consumption and investment in biodiesel through education efforts. Funding offered through these programs have been leveraged to promote biodiesel sustainability benefits, provide technical assistance to equipment manufacturers, and develop fuel quality assurance programs.

Another program of Title IX, the Advanced Biofuel Payment Program, has provided mandatory funding through the 2018 Farm Bill. The program provides assistance to small fuel producers looking to create long-term increases in biofuel production.

Senator Heitkamp, how has the Title IX of the farm bill advanced cleaner burning domestic energy production that benefits farmers and the environment?

Ms. HEITKAMP. I would like to just repeat back to you, Congressman, what you just said. When you look at the actual reductions, you look at the opportunity, and I want to—I don't know if you guys could hear me when I was responding, but when we look at what the Iowa ethanol industry is doing and what South Dakota is doing and North Dakota is doing, they are looking at carbon capture to actually even expand on those numbers. Carbon capture behind the process which can even reduce their greenhouse impact greater. And so, I think that when [inaudible] access to the market by limiting infrastructure, or people who just don't like corn ethanol. [inaudible].

The CHAIRMAN. Senator, we are having a little more difficulty, but you can respond to that in writing.

[The information referred to is located on p. 332.]

Mr. FEENSTRA. And I will resume. I just appreciate what Senator Heitkamp is saying, and it is just amazing to hear the positive reinforcement that is being talked about in this Committee hearing when it come to biofuels, ethanol, biodiesel, and so forth.

And yet, what is shocking to me is never once have we heard from the Administration, and this is so concerning right now when we are at such a precipice with our country that we are desperately trying to find energy and fuel. And yet, not one word, crickets. And I am so disappointed in that, just really disappointed.

The 2018 Farm Bill authorized the Soil Health and Income Protection Pilot Program, called SHIPP, a voluntary program that allowed short-term contracts for producers to target marginal acres in the field. This is a really great program. Dr. Humiston, how has this program empowered producers to adopt conservation practices, and do you agree with locally-led programs like SHIPP to target these certain areas?

Dr. HUMISTON. Thank you for the question.

Yes, I absolutely agree with locally-led programs. I served as a director on a soil and water conservation district myself in California for many years, and it is that locally-led program that lets us make sure that practices are specific to the soil, the climate, the ecosystems that our farmers are operating in.

As to the short-term program you mentioned, it is a critical opportunity to allow farmers to implement practices that they might not otherwise be able to afford. As we all know, agriculture is challenging to pencil out under the best of circumstances, let alone some of the circumstances we have now, so that type of program is exactly what we need, particularly for some of our small and beginning farmers, too.

Mr. FEENSTRA. Absolutely. Thanks for your comments, and I yield back.

The CHAIRMAN. The gentlewoman from Illinois, Mrs. Bustos, who is also Chair of the Subcommittee on General Farm Commodities and Risk Management, is now recognized for 5 minutes.

Mrs. BUSTOS. Thank you so much, Mr. Chairman, and really, I want to say thank you for holding this hearing. It is really important that we hear from all the witnesses who are with us.

And I know we have heard a lot today—I had another hearing going on. My staff briefed me on the highlights of this. But I know we have heard a lot about the importance of crop insurance, and the USDA has rolled out some new products in recent years that addressed these challenges that we have.

I want to start out by asking Ms. Duncanson a question. Would you please talk about what other new crop insurance products or risk management tools might be necessary in order to help our producers mitigate the impacts of the climate change that we are all experiencing?

Ms. DUNCANSON. Thank you very much for that question, and I appreciate that.

Let's keep in mind that we have said time and time again here today about the vital importance of crop insurance, and with every new project or every new product that comes out of that system, it needs to be actuarially sound. And so, anything that we introduce, we always want to make sure that test is done. All these products are about resiliency and eliminating risk, so as we look at good farming practices that are established through USDA and new things that are happening out on the landscape, we look forward to using the sound advice of this Committee, of USDA, of others in private industry, as well as the system about how we introduce a program.

As you may know, the PACE product, which is about split-application of nitrogen rates, is in its pilot stage throughout your state and the University of Illinois is managing part of that data collection and analysis for us, and that really looks at the opportunity for farmers to split-apply nitrogen when it is needed, but it gives the opportunity for an insurance program, should you not be able to get the product on in a timely fashion. So, we look forward to seeing about the adoption of the PACE, and are pleased that we were able to provide research for its creation.

Mrs. BUSTOS. Thank you, Ms. Duncanson.

All right. I am going to try to ask Senator Heitkamp a question, and we will see if this will work.

In the most recent report of your Farm and Forest Climate Solutions Task Force noted the importance of expanding programs that deliver climate benefits and offer pathways to new market opportunities for farmers, ranchers, and forestland owners. So, just last month, the USDA announced the Partnerships for Climate-Smart Commodities, which probably everyone in this room knows, is a \$1 billion program for pilot projects that create new opportunities for climate-smart commodities across the value chain.

So, Senator, hopefully you can hear me and hopefully we can hear your answer, but can you expand on what sorts of projects that you envision through these partnerships, and how you see them impacting rural America?

Ms. HEITKAMP. Well, I am very excited about them, Congresswoman. I think that when you look at it, it is going to be a community collaboration, so let's look at a corn farmer in North Dakota that is growing cover crops that is saying, "I am sequestering CO₂. I am doing everything right, but I need to have verification." And so, they can work with the land-grant colleges. They will be able to work with local entrepreneurs, tech companies to try and do that verification. Because we know without that verification, the new carbon markets won't work because people aren't going to buy carbon credits that aren't real.

And so, I really applaud the Secretary. I think—to think that you sit in Washington, you can design a program here is absolutely [inaudible] to throw out an opportunity, and let us in rural America develop the programs, that is where we are going to find the solutions. And I think it is a great idea. I think it is a great use of resources, and I think you are going to see great results.

Mrs. BUSTOS. Hear, hear. Great answer. Thank you, Senator. It is great to see you.

I will pass on my next question because I know I can't get it answered within the next 40 seconds, so with that, I will yield back, and again, Mr. Chairman, thank you so much for holding this hearing and thank you to our witnesses.

The CHAIRMAN. And thank you.

The gentleman from Alabama, Mr. Moore, is now recognized for 5 minutes.

Mr. MOORE. Thank you, Mr. Chairman.

This is a question to all the panelists, and so, anyone can feel free to answer this.

The EPA estimates that the agricultural global greenhouse gas contribution was 24 percent for all emissions, over double that of the agriculture share in U.S. emissions, which is less than ten percent. Why do you all think this is, and also, what do you think other nations should be doing to follow the leadership of the U.S. agricultural industry? Thank you.

Mr. CONNER. Congressman, there is no question in our mind that American agriculture is at the very, very top of its game in food production internationally, and we are the cleanest, the most advanced, least footprint, and we take great pride in that. And I know this Committee takes great pride in that designation, and that is so important to us as we talk about food is a national security issue, going forward. We are going to need to produce a lot of food in this country, and it has to be produced obviously in the most sustainable, cleanest way possible. And we understand that, and that is why these recommendations that everyone is talking about at great length are so important, because they are programs designed to come along beside farmers and landowners across the country to really encourage them to be able to produce. This is all about producing food. It is not about holding people back; it is about really adding to a growth industry and doing so in a way that is responsible. And we are proud of who we represent in this industry, and again, I know this Committee is as well.

Dr. HUMISTON. I would add to that that it is critically important that we ensure our data, our analysis of that data, and the results we get from it is accurate. It is based on science and real numbers.

A lot of the numbers that we see on greenhouse emissions from agriculture are based on very different formulas of how to even calculate that. That is one of the huge issues out there. Some of them are based on data that was released by the United Nations Food and Ag Organization a decade or so ago that they themselves since debunked, and yet, academics and scientists and advocates still utilize that false data. I don't pretend to have the actual answer because frankly, academics are still working on figuring that out, but I do know that if we are going to make smart investments in good solutions and keep our agriculture going, we have to understand that yes, agriculture produces some greenhouse gases. It does. But it also sequesters and can be a solution to that, and we have to look at both sides of that equation. It is not just one. Frankly, if we were to do that type of calculation for every industry sector in every aspect of our lives, none of them are going to come out well.

So, we have just got to really think about the data, that it is analyzed properly, the science is good, and then use that to make the kind of investments that will give us the most bang for the buck.

Mr. MOORE. Those are some very good points, and thank you.

Any idea on how we can bring other nations along? I mean, I am always concerned about us penalizing our producers and then letting the rest of the world run wild. Do you have suggestions on how to bring other people along to join us in this effort?

Mr. CONNER. Again, Congressman, I don't think we are talking about penalizing here. The Food and Ag Climate Alliance's fundamental principles talk about enhancing farm income, enhancing opportunities in rural America, and I think this is what we can do for the world. We can be the trailblazer here in terms of putting forth policies that help farmers and help them to do it the best that they possibly can. I don't know of any nation that wants to stomp on the people that are producing the food and feeding them. That just runs pretty counter to anything good and right in this world. And so, to the extent that we can model this, I believe others will follow.

Dr. HUMISTON. And I would add to that, that it is critically important our scientists from every country on the planet be able to interact with each other. And yes, I will say we need to provide appropriate cybersecurity and secure information as needed, but nevertheless, we find solutions here that may work for another country. Another country may find a solution that is wonderful for us here, and the less we try to reinvent the wheel or duplicate something already done, the more resources we have to move towards implementing solutions.

Mr. MOORE. Thank you for the answers.

Mr. Chairman, I am going to yield back my time. Thank you.

The CHAIRMAN. Thank you.

The gentlewoman from Washington, Ms. Schrier, is now recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman, and welcome to all of our witnesses.

I would just like to touch on a few issues today. First one is that I would like to discuss the measuring, monitoring, and verification of success of sustainable farming practices and forestry practices. And I know that measuring climate benefits accurately and cost ef-

fectively as a result of changing land management practices still remains a challenge. Our ability to measure soil carbon sequestration precisely, for example, is crucial to set realistic policy goals and design effective incentives, but it can also present us with a situation if we can't measure it well, finding ourselves in this situation where suddenly everything is referred to as climate-friendly or clean when we don't have a way to measure, and suddenly the designation of clean and climate-friendly just becomes meaningless.

And so, this first question is for Deputy Secretary Conner and Senator Heitkamp, for both of you. And my first question is kind of part A and part B. (A) is how would you work with definitions and measurements to ensure meaningfulness as we give these designations; and (B), which USDA programs do you suggest Congress expand upon to advance measurement tools and technologies of climate benefits for agriculture?

Senator Heitkamp, we will start with you.

Ms. HEITKAMP. Thanks so much.

I think it has been pretty clear that I think that we don't yet have good measurement tools, and that is why it is important that we, number one, continue the research, continue the education, because the last thing that we should be doing in agriculture is making a claim about climate that is not valid. It will set us back in terms of our goal, which is really to commoditize that carbon credit and make it an income stream for the people who own the land who are producing on the land.

And so, I think there have been a number of carbon markets. They have had their difficulties for exactly this reason, and I think we are going to have to present solid science.

Now, with that said, we can't delay this process too long, making perfect the enemy of good. We are going to learn as we adapt, and so, to me, I think that Secretary Vilsack is trying to build out the expertise, but at the end of the day, we need authorization from Congress to undergo this work. I think that the bill that is crossing over from the Senate was one that I would have been proud to advance to all of you. I hope you consider it and then advance it, because it will get the resources that Secretary Vilsack needs to do this work.

Ms. SCHRIER. Thank you.

Deputy Secretary Conner, do you have about a 30 second answer before I go to another—

Mr. CONNER. Yes, I will be very brief. I will just say that it is our view that Secretary Vilsack's Partnership for Climate-Smart Commodities that was announced really is a massive pilot project designed to gather the kind of information that you are seeking. I think we are in 100 percent agreement with the panel on that. It is a big pilot project from all regions. We look forward to the results of that and analyzing that information, and I think it will be informative in terms of a long-term climate policy then for this country.

In terms of which USDA programs, I will tell you I think this is a collaborative effort across many agencies. We acknowledge a role for ARS in terms of data analysis here, Agricultural Research Service. But certainly, the technical service providers that will be coming online here through NRCS are going to be the people with

the boots on the ground that producers will be interacting with. They will be walking the fields, analyzing what works and what doesn't and reporting that back, and they are going to be a critical part of that.

We have to make sure we have the people on the ground.

Ms. SCHRIER. I have one more part that I just want to touch on really quickly, because we don't always have measurements. But I want to highlight a program we have here in Washington State called the Sustainable Farms and Fields Program. It is a bipartisan voluntary program that supports farmers who are implementing practices that we already know work, and it leaves out some types of farmers, but it is a way to do this without the measurements, and it gives farmers different options for participation, like they can use funds for very site-specific consultations. They could purchase a seed drill with it, or seeds for cover cropping, or even payments for contracted carbon storage. And so, I just want to highlight that there are programs even in advance of having those perfect measurements that can advance these climate goals in addition to the ones that you just mentioned.

Thank you, and I yield back.

The CHAIRMAN. The gentlelady from Florida, Mrs. Cammack, is recognized for 5 minutes.

Mrs. CAMMACK. Well, thank you, Mr. Chairman. I appreciate it. Can you all hear me okay?

The CHAIRMAN. Yes, we can.

Mrs. CAMMACK. Excellent, thank you, Mr. Chairman.

I have to be honest. I am incredibly frustrated. It has been about 14, 15 months now since the beginning of the 117th Congress, and to date, we have had six, six hearings about climate change, and one about production agriculture, one. Like I said, I am very frustrated. I represent an area that is home to producers, and as the lone Republican for the State of Florida on the House Agriculture Committee, this issue is incredibly vital to my state. We are a top ten producer of agriculture products in the country, and to say that this hearing is redundant is putting it nicely. It really does betray the really serious, dire needs of our producers that they are facing right now with fuel, input costs through the roof, labor concerns, taxes, regulations, red tape. You can't even begin to understand the frustration of our producers, because we haven't brought them before the Committee. We haven't had these conversations. And if you ask any of my producers in Florida whether the pressing concern for them is covering irrigation canals with solar panels or figuring out how they are going to afford fertilizer in the coming months, I think it is pretty obvious what they are going to choose as the issue of concern for them. And the fact that this hearing isn't even a review of the farm bill program, as the Majority would have us believe, it is instead a wish list of climate change priorities. It is a wish list of things that lack practicality. And so, I am really, really frustrated.

And I echo the frustrations of producers not just in Florida, but across this country that feel that they are screaming at the top of their lungs and it is falling on deaf ears in Washington and in the halls of Congress. Again, the cost of fuel. Has that been addressed? No. There is no feasible plan from this Administration or this Com-

mittee to address that. The best that has come out is we are going to work to make electric vehicles and charging stations happen in rural America. Folks, we don't even have broadband. That is a pie in the sky idea. While well-intentioned, it misses the mark by a mile.

And I just can't even begin to tell you about the labor concerns. Just even 2 weeks ago, having to work to process applications for H-2A workers because we had blueberries—it is blueberry season in my district—and they have no help in order to pick the blueberries. This is a continual issue that we are seeing.

The cost of fertilizer, Mr. Chairman. Alarm bells have been ringing. We now have Russia invading Ukraine, and many people know that Russia and Belarus are the major supplier of potash. And when I speak with our producers, they are facing issues of regulatory hurdles here in the country, and then you look to our Canadian friends who, when you look at the Canadian Pacific Rail Line, they are looking at a strike. What are our producers supposed to do in the face of input costs that make doing business unreasonable?

I feel extraordinarily frustrated for our producers because this Committee has had opportunity after opportunity to talk about these issues that are on the minds and being discussed at kitchen tables around this country, and instead, it is being neglected for political agenda.

You talk about the important role of forestry and timber and how that plays into carbon capture, but what happens when the privately owned and workforce in my district in Florida are sold because the cost of labor and fuel and inputs are so high it is unsustainable? One forester in my district let me know just last week, he has seen \$10,000 in increased fuel costs, just in fuel costs. He told me that if prices stay this high, which, of course, this Administration has indicated that it will and they will continue to stay this high, he is going to sell his land. Do you really want the next crop to be a foundation slab, because it won't be production agriculture. And I think there needs to be a come to Jesus discussion in this Committee about the future of agriculture, and I am not talking about climate change. I am talking about production agriculture, and if any person on this call has eaten today, you should be concerned about production agriculture in our country, which is a national security concern.

I cannot believe that we are picking and choosing the issues that are a national security concern for every American regardless of where you live in the country and what box you check.

Mr. Chairman, I apologize. I respect you, but—

The CHAIRMAN. The gentlelady's time has expired.

The gentleman from California, Mr. Panetta, is now recognized for 5 minutes.

Mr. PANETTA. Thank you, Mr. Chairman. I appreciate this hearing, and thanks for all of the witnesses and your testimony, and of course, all of your work to highlight what I do believe is an important issue.

Also, of course, I want to thank Dr. Humiston for everything that she has done for my district on the Central Coast of California and

for the State of California, the number one agricultural producing state.

Look, I think we can all sympathize and empathize with the concerns and frustrations that my colleague from Florida just expressed; however, I would disagree with her in the sense that this isn't about politics. This really is about policy, policies that we are talking about to deal with a very pressing issue amongst many that our people in agriculture have to deal with. We get that, but this is a time that we can talk about what type of policies we can put in place, going forward, into the 2023 Farm Bill dealing with climate change and how it affects our agricultural producers. Not just in Florida, not just in California, but throughout the entire country.

Now, look, in my district on the Central Coast of California, as I always say, we have a lot of *bounty*, and we have a lot of *beauty*. And with our bounty, we have a number of specialty crops. You name it, we grow it. I cannot stress that enough, especially in the Salinas, the Pajaro, and the San Juan Valleys. When it comes to our beauty, we have a National Park, we have a national monument, we got a National Forest, we got a national marine sanctuary, for Pete's sake. But that leads to my third B, and what that B is, is having a *balance*. What is the type of balance that we need to have to be concerned with our environment, but continue to produce the fresh fruits and vegetables that my agricultural producers do. It takes a lot of work together. It takes a lot of work coming to the table and making sure our producers are at the table to talk about the protections for agriculture, for ag workers, and yes, even for our environment. Because trust me, what I like to remind people, if anybody wants fresh air, clean water, and healthy soil, it is those that work in agriculture.

Now, Dr. Humiston, I was lucky to have time with you yesterday in my office to have a good conversation. I want to focus on something in regards to what you mentioned in your introduction about *rural* designation. Basically talking about how that has severely impeded the ability of our communities and our farmers and ranchers to benefit from many Federal programs, even those programs aimed at strengthening our rural communities.

Briefly, can you discuss further the need to revisit the definition of *rural* and elaborate a little bit on how the current definition limits climate-smart investments in rural economies that unfortunately don't meet the unrealistic criteria that can be imposed on them to meet the designation of *rural*?

Dr. HUMISTON. Thank you, Congressman. I appreciate the question.

If you will indulge me for 30 seconds before I answer that, I just want to say that I, too, understand the frustration that many people have expressed today. My father currently manages our family's cattle ranch in southwest Colorado, a family farm that could only support he and my mother as an economic institution. Because of that, I chose to go on a path of policy and planning related to the farm bill, farm practices, everything I do now and have for 30 years, to make sure my father can keep farming and people like him can keep farming. And one issue that hasn't come up today that I think is critical is that we are talking about a farm bill that

is not just for today and the next 5 years. My father, my siblings, and I are trying to make sure that my grandson and my great nieces and nephews are able to keep on farming, and we have not discussed that today, and a lot of these climate-smart agriculture programs are what are going to enable those farms to be functioning in 10 and 20 years, particularly in states where we are already seeing devastating effects from extreme weather.

To your question, I have already mentioned several examples previously. The biggest one I just mentioned a second ago that is worth repeating is examples from Rural Development. That is the one where we have probably got some of the worst constrictions concerning population. Things like the water programs that cannot operate in a community over 10,000.

If you look up and down California and other states, we have drought. We have water shortages for irrigation. We need to utilize every source of water we can. A healthier forest will produce more water. We are exploring things like—excuse me, I forgot my English there for a second. Getting water from the sea, *et cetera*. But recycled water from our urban areas is a huge opportunity to provide irrigation water, and the reality is communities that are small are not going to have the volume that can pencil out putting the infrastructure in place to get that highly treated wastewater—in most cases, treated to drinking water standards—out into the agricultural areas where it can help our farmers that need irrigation water. That is just one example. There are many, many others around other USDA programs, and how even our research dollars are allocated. California gets far less of allocation for capacity funds than almost 20 other states simply because of the size of our counties, and that ridiculous definition about *metropolitan*.

The CHAIRMAN. Thank you. Your comments are well taken.

The gentlelady from Louisiana, Ms. Letlow, is now recognized for 5 minutes.

Ms. LETLOW. Thank you, Chairman Scott, and thank you to all the witnesses for your testimonies and valuable insight.

While there are big questions contributing to the conversation here today, and most of my questions have already been addressed, I would like to direct my comments to Dr. Outlaw.

Dr. Outlaw, first, I want to personally thank you and your team for the great work in conducting a study to analyze the economic impact on higher fertilizer prices on the Agriculture and Food Policy Center's 64 representative farms, including the grain farm located in my district. And as you know, we are now 2 months out from the publication and findings of that report. Yet, the situation in our countryside continues to be exacerbated. I continue to hear the concerns of our farmers, particularly our rice farmers, about the unpredictable challenges they face with increased cost of production, many of who are considering whether to plant this year. This is a troublesome trend.

Dr. Outlaw, with additional challenges we are now facing globally, the situation has only gotten worse, particularly on fuel and fertilizer. Your study concluded that rice farms experience the highest fertilizer cost increase, averaging \$62.04 per acre, which accounts for an astronomical impact in overall input costs. What

might that look like today, and do you agree it is getting worse, and could we quantify that?

Dr. OUTLAW. Yes, I do agree it is worse. We are currently updating the study. I don't think it is a secret, but the Senate Agriculture, Nutrition, and Forestry Committee has asked for an updated study. If it is a secret, it is not anymore.

But the reality is, is that when we did that study, we had pulled numbers as of the end of the year, and the first couple of months of this year conditions have deteriorated even more, so I would suggest that the estimates we gave you are probably 20 to 30 percent or maybe even lower than they will be next time.

Ms. LETLOW. Wow. Well, thank you again for your dedication and expertise in evaluating farm policies and applying them to our hardworking farmers and ranchers on the ground.

Mr. Chairman, I yield back the remainder of my time.

The CHAIRMAN. Thank you.

The gentleman from Georgia, Mr. Bishop, is now recognized for 5 minutes.

Mr. BISHOP. Thank you very much, Mr. Chairman. Thank you, Ranking Member Thompson. Thank you both for holding this hearing, and I want to thank our witnesses for coming and the great information that they are bringing, and I extend a special welcome to Senator Heitkamp.

I want to put on my hat as an appropriator. Through the Fiscal Year 2022 agriculture appropriations bill, USDA is going to receive significant investments to research sustainable agriculture systems and to identify solutions to help the agriculture industry as it constantly evolves to mitigate and adapt to climate change. The examples include the NRCS's COMET Farm, the Forest Service's Forest Inventory and Analysis Program, the ARS Research Labs, the USDA Climate Hubs, NIFA's extramural research initiatives and extension activities, ERS research reports, and statistical and spatial data from the National Agricultural Statistics Service. These USDA agencies, along with the Offices of the Chief Economist and the Chief Scientist, conduct research for producers to have better data for better decisions.

I will start with Mr. Conner. Can you tell me—and I would like for the other witnesses to answer this as well—is additional research needed to better understand how climate change will impact farmers, ranchers, and forest owners, and are there additional needs for improvements for existing research tools? And how can USDA help close these knowledge gaps?

Mr. CONNER. Congressman, I appreciate the question. I believe there is a substantial role here that you have identified on a number of these programs.

Let me just say that we encourage USDA to focus—and I believe they are—on this path of measurement and better data collection, and this has been a bit of a theme through this hearing of the need for this. It really is sort of holding us back in terms of proper representation of farmers out there, because we just don't have that good measuring consistency of data, how it is collected. I would also say something significant from our standpoint is the number of soil sampling reference sites out there, which are critical, again, for gathering data to determine carbon uptake and these sorts of

things, additional dollars to expand those number of sites, again, to make sure that these programs are not just benefitting one area or one group of farmers, but very, very broadly dispersed. I think that is a critical element of that as well.

And finally, I will just say generally speaking, we really encourage you as appropriators to recognize the role of the Agricultural Research Service and the role that they play in here in terms of that research that ultimately USDA puts on the ground and puts in the hands of farmers.

So, thank you for all your work, Congressman, on the Appropriations Committee. I know this has been a tough slough, but there will be a great outcome from this, we believe.

Mr. BISHOP. Thank you, Mr. Conner.

Dr. HUMISTON. I would add to that—

Mr. BISHOP. Any other witnesses?

Dr. HUMISTON. I would add to that, that there are some very exciting developments in new technologies. We have mentioned robotics and drones, but one example that I would highlight is a recent grant we received that is joint between University of California, University of Illinois, Cornell, and the Agricultural Research Service looking at how artificial intelligence can help us improve every aspect of our food systems, from production to workforce, distribution, processing, *et cetera*. And that is just one example of how, again, we can find these ways to utilize the different agencies and find new technologies that will help us achieve our goals.

Ms. DUNCANSON. If I can just chime in here, too.

I agree with the other two witnesses and appreciate the question from the Congressman. USDA does have a lot of data. We would hope that the mission areas can share that data in common units, aggregate it, analyze it, and make sure it is anonymized.

Mr. BISHOP. Thank you very kindly.

With that, Mr. Chairman, I will yield back the balance of my time.

The CHAIRMAN. Thank you.

The gentleman from Texas, Mr. Cloud, is recognized for 5 minutes.

Mr. CLOUD. Thank you, Mr. Chairman. I appreciate the time and this discussion today.

On one hand, I am very excited that we are having a hearing on the farm bill. We have had many hearings not related to the farm bill in this term, and I also wanted to thank our future Chairman for his comments at the beginning of this hearing, and certainly appreciate his level-headed approach to the discussion.

In this term we have had hearings on a retroactive blueberry bill. We have had hearings on electric tractors when no one I am talking to in the ag industry is asking for electric tractors right now. I did talk to a farmer last week whose tire went out on his tractor and he can't seem to find a tire to continue the good work that he is trying to do on his farm.

It was just said that if anyone wants clean air, clean water, understands the need for us to be good stewards of our environment, it is the ag community, and I think indeed we have seen that. Historically, what we have seen is we have seen yields of the American ag worker go up. We have seen inputs go dramatically down, and

yet, the approach right now is to bring the heavy hand of government into that equation as if we can somehow be the savior to a problem that is already being solved by the ag community. And so, I have very strong concerns about that. Historically, what we have seen in the past is whenever government steps in, even to lock in what might be the current great innovation, we lock it in at today's innovation and we actually stifle future innovations. And so, I think it is very important that we approach this conversation with all the due diligence it deserves, and especially how we have seen the policies. It has been said a number of times, but it is worth saying again. What we are seeing today, going on right now, the American experience for the family right now as you go to the grocery stores, you are wondering about food prices, you are wondering about lack of supplies on the shelves. You go to the American farmer, and you are seeing shortage of supplies. We are wondering about high fertilizer prices. We are wondering about pesticides that are not available and what our yields are going to look like a year from now. Couple that with the geopolitical events going on and the disruption that that will cause, we should be talking in this Committee about what we can do and what that is going to look like a year from now for the American family and for our food supply.

But today, we are talking again about the Green New Deal and what we can do about that. And so, Dr. Outlaw, could you speak to—you mentioned in your written testimony that many farmers have concerns over government involvement in carbon markets. Can you elaborate on these concerns?

Dr. OUTLAW. Yes. I have been doing this about 30-some odd years, and over time, even with well-based intentions, sometimes the results out of Washington are not as people thought they were going to be.

But, I think I will answer another question real quickly. The one thing that I would like for this Committee to move forward on is farmers are out there questioning all the different companies have their own soil carbon test, and no one has really mentioned that today that if you really wanted to have one good thing come out of this hearing—which many will—getting to the bottom of trying to establish one test that even the International Panel on Climate Change has met six times and hasn't come up with one test. So, that is an area that needs to be addressed.

But frankly—

Mr. CLOUD. Yes, that was going to be my next question, actually. If there was one way to measure carbon, but you are saying there is not a uniform way? Lots of people are doing it different ways so it is hard to have real valid data?

Dr. OUTLAW. It leads to a tremendous amount of confusion, why each company has their proprietary methods currently, and it seemed like this was a really good function of the Federal Government to kind of come up with this is a measure, and we are going to suggest people use this measure.

Mr. CLOUD. It would seem to me and what we have seen in the past, of course, when government intervenes into things like this, and indeed in carbon markets in the past, with the promises to the American ag worker is, "Hey, you will get some sort of financial

benefit out of this.” What typically seems to have happened is that we take \$10 out of an industry, and about \$9 of that ends up in a bureaucratic regulatory investigator bundle, and about \$1 of that might go back to the ag worker. And so, what the ag worker ends up trading for their small pittance, in a sense, is a heavy-handed regulatory effort that, throughout history, would seem to be not worth—it is a dance with the devil, so to speak.

Would you give your thoughts on that?

Dr. OUTLAW. Just to be clear, everything is voluntary so far so producers have a choice, but you are right. They are not acquiring very much money for this.

The CHAIRMAN. The gentleman’s time has expired.

The gentlewoman from the U.S. Virgin Islands, Ms. Plaskett, who is also Chair of the Subcommittee on Biotechnology, Horticulture, and Research, is now recognized for 5 minutes.

Ms. PLASKETT. Thank you so much, Mr. Chairman, and I want to thank you for this hearing and all the hearing that you have held which are important to the American people, and along with the subcommittees which you are the *ex officio* chair of, really provide the support and the underpinnings for the farm bill that we are going to be working on.

Ms. DUNCANSON, I wanted to ask you a question. In the appendix of your testimony, you suggest that soil health improvement should be built into the Federal Crop Insurance Program into their rating model. Would this change be intended to replace the current rating model, or would it just be an alternative that farmers could choose?

Ms. DUNCANSON. At this juncture, my level of expertise regarding that isn’t quite up to snuff as it should be for today. It has been a long morning. But, at this point, I think that we are open to looking at and including that if it is actuarially sound and can be helpful, and look towards advice on all different levels on if this would work throughout the country.

Ms. PLASKETT. Thank you.

As we all know, farmers over 65 years of age outnumber farmers under 35 by more than six to one, and many U.S. farmers are set to retire in this coming decade. To support the next generation of farmers and ranchers, transition productive farmland, revitalize our nation’s rural communities, all while tackling the climate crisis, considerable progress must still be made in how Federal agencies, including the USDA, serve young farmers and farmers of color.

Ms. RAYGOZA, what are the primary changes that you would like to see to improve accessibility to the farm bill conservation programs?

Ms. RAYGOZA. I would like to see more trained staff that are trained for working with small, diversified farmers and farmers of color that are able to provide that technical assistance that they need to access the programs. Also, I know that for our farm, we have participated in a lot of different programs, but that is because we have been working for a long time, and I think if we had relationships set up with, like, the Young Farmers Coalition, working with those different groups that already have the ties with the communities would also increase participation.

Ms. PLASKETT. Thank you. Thank you for that. I agree wholeheartedly with you. I know in my district in the Virgin Islands, the concern is the amount, not that the individuals who are there at USDA are not competent or helpful, but they are overwhelmed and can't really provide the support that is necessary for the amount of individuals that want to go into farming or the amount of technical assistance that they need, from bookkeeping to precision farming across the line. So, I think that that work, along with work with our cooperatives, is really important.

Mr. Conner, in your testimony you mentioned expanding Rural Energy for America Program, REAP, eligibility to include cooperatives. Can you explain how this would better enable investments that address climate change, and are those investments limited to one technology?

Mr. CONNER. Congresswoman, I don't think they are limited to one technology. The REAP Program is a very valuable program and it has provided a variety of different types of assistance to date. It is a highly underfunded program, and so, one way to have an immediate impact is to adequately fund that program, and again, that money could be distributed and the benefits received in very, very short order.

For us as cooperatives, as you know, we are, particularly in the livestock and dairy sector, we are a big presence, processing as much as 70 to 80 percent of the milk produced in this country. We are on farms and ranches every single day, and we believe there could be a role, going forward, in terms of managing the manure and circumstances that are creating greenhouse gas circumstances for co-ops. We would like to see them eligible for the REAP Program, again, as the group that is working directly with our farmer-owners, we just feel like there could be a benefit by expanding that eligibility, given the role that we play, particularly, again, in the anaerobic digester and manure management kinds of issues. But that is just one example.

Ms. PLASKETT. Thank you so much, and Mr. Chairman, thank you for the opportunity to question the witnesses, and I yield back.

The CHAIRMAN. Thank you, Ms. Plaskett.

The gentleman from Florida, Mr. Lawson, is now recognized for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman, for having this hearing. It is a great hearing. It is very educational, and it is something that we really needed to have, and all the other hearings have been very good. I want to thank the witnesses for being here today to answer a lot of questions and give us some insight of what is going on with climate change.

Now, according to the Federal Communications Commission, only 78.6 percent of Florida rural areas have access to high-speed broadband services, and this will be to the former Senator. How can the Rural Utilities Service best help communities get broadband and take advantage of the associated benefits?

Ms. HEITKAMP. Well, I think that when you look at a state like North Dakota, we have the best rural broadband in the country. In fact, my mother-in-law who lived out on the family farm had better broadband in a rural community than they did in Fargo, North Dakota. I will tell you how that happened. It happened by a commit-

ment from our rural telecoms who really stepped up and basically said we are going to make this investment. We need to not only look at having the money, but who is going to deploy that money, and obviously coming from a state like North Dakota and my background, I believe co-ops are hugely beneficial. I think that what you have to really watch for in implementing a lot of the broadband dollars that you are is that you don't have companies chasing after and using those dollars to compete in areas where you already have rural broadband. We know it is always the last mile. As we used to say in the electric business, it is always the last mile deploying that is going to cost the most. And so, USDA has to be very strategic in how they deploy these dollars. They have to identify where these dollars need to be—are most acute.

One thing I will tell you, and I know we talk a lot about broadband, but I think we have not done enough on wireless. Many of your communities in Florida and across the country do not have cell tower access. They can't actually make a phone call when they are stranded on the road. I have people in Native American communities, students who drive around looking for a signal, holding their hand out of their car so that they can advance their work product to their teachers. And so, we have to not just focus on broadband, but the entire connectivity that includes wireless, because I think that is going to be where you are going to get the AI, the data information, the data transfers from the fields.

So, thank you, Congressman, for all the work that you guys are doing, and good luck in Florida doing what we did in North Dakota.

Mr. LAWSON. Thank you very much, and I am glad you mentioned about sticking an arm out the window to try to get a signal, because sometimes going through the district, I had to do that or wait until I go up a hill. I lose it when I go down a hill, and so it is great that you mentioned that. It is really great.

Now, I know firsthand that the current Federal definition of *rural* classification limits many counties, especially several in my district, because of their proximity close to an urban center. And these are rural areas, but I have had situations where when funding has been available, I have areas that don't qualify—and this goes to Dr. Humiston. Can you speak to how the current definition limits investment in rural economics, and how changes in the definition drives investment in climate-smart technology? I mean, this is very, very important because I can give you an example. When I speak about Jacksonville, before you get into the City of Jacksonville, it might be 40 or 50 miles in the city. It affects counties like Baker that is right outside, because they are in that urban municipal service area. What can we do to change that?

Dr. HUMISTON. So, several years ago we did create new language about the Rural Development's business programs that would allow construction of food manufacturing processing facilities in larger cities. In essence, we took the population limits off, because those facilities were directly serving farmers. To the degree we can start being smarter about all of the Rural Development programs to make sure they are serving rural needs—Rural Development, that is the name—we need to quit thinking about population as the only criteria for eligibility to these, and it is across all the Rural Devel-

opment programs. It is just a matter of being smarter about how we serve rural and what rural is.

The CHAIRMAN. Thank you very much. The gentleman's time has expired.

Mr. LAWSON. I yield back, Mr. Chairman.

The CHAIRMAN. Thank you.

Ladies and gentlemen, this comes to a conclusion of our hearing, and I want to thank you on behalf of our House Agriculture Committee. I want to thank all of our witnesses. Your testimony has been very helpful on this very, very important issue, and all of the issues that we have covered this morning in terms of perspectives on how our farm bill programs are meeting their missions, while helping to develop and implement solutions to the climate crisis and supporting our agriculture producers and our rural communities. It is very important to me that we look at all the ways that farmers are using our farm bill programs to mitigate climate change, among all the other issues that we have been faced with.

In Georgia, we have seen more frequent natural disasters. Hurricane Matthew in 2016, Hurricane Irma in 2017, and Hurricane Michael in 2018, back-to-back. We see them lined up coming off the African coast into the islands, and then devastating our most fertile agriculture territory, which is the southeastern United States. And these extreme weather patterns throughout our country is certainly getting worse, and it is very important that we have heard from you today in terms of your thoughts on how we can address these as we move through and develop our next farm bill so that we can reverse this trend through farming practices that many of our farmers are doing here. Regardless of what it is, we now have things like carbon credits. We have different ways of assisting and partnering with our farmers. Some in this want to do it by carbon credits. They want to do it by how much soil—carbon our farmers can sequester. Others by cover crops. We are having difficulty in how we label and define all these areas. It is new for us, and that is why it is important for us not to run from this, but to solve it. We can solve these fires. They are burning up so much. Many of our livestock and animals are burned up in those fires.

And so, I want to thank each of you. We have had a great hearing, and in terms of our farm bill so that we can serve the needs of our great farmers and our great nation.

And so, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from our witnesses to any questions posed by a Member. And so, this hearing is now adjourned. Thank you.

[Whereupon, at 1:50 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

March 24, 2022

Hon. THOMAS J. VILSACK,
Secretary,
U.S. Department of Agriculture,
Washington, D.C.;

Hon. SAMANTHA POWER,
Administrator,
U.S. Agency for International Develop-
ment,
Washington, D.C.

Dear Secretary Vilsack and Administrator Power,

We write to urge you to leverage the resources available in the Bill Emerson Humanitarian Trust (BEHT), an emergency international food aid program administered by the United States Department of Agriculture (USDA) and the United States Administration for International Development (USAID), to help address ongoing humanitarian food crises. The deteriorating state of global food security and the ongoing pressures on availability of commodity food assistance resources warrant the dispersion of those funds.

Over the past year we have seen the emergency food and nutrition needs of hungry citizens around the world intensify, resulting from events such as the COVID-19 Pandemic, conflicts, and natural disasters. The USDA estimates that around 1.2 billion people were food-insecure in 2021, a 32 percent increase from 2020, and recent trends indicate that the number is on the rise. In countries such as Afghanistan, the Democratic Republic of the Congo, Ethiopia, Haiti, South Sudan, Syria, and Yemen, we have seen a dire need for food assistance.

The immediate need for aid, particularly commodities, will likely increase in light of Russia's unprovoked invasion of Ukraine. Ukraine is a large producer of wheat and grain, and if production levels drop it is likely that we will see corresponding pressure in the global grain markets. This may be compounded by further shocks to global grain, energy, and fertilizer supply, as Russia is rightfully sanctioned for its actions. Together, Russia and Ukraine supply 26 percent of global wheat exports and Ukraine supplies 13 percent of the world's corn. Supply shortages or increased prices will disproportionately impact developing and middle-income countries that rely heavily on imports of food.

In light of these complex and disturbing circumstances, we request that you use the BEHT to bolster American assistance to hungry people around the world. The trust was created for use during times of exceptional need, and the acute hunger crises that too many people are experiencing justifies the use of these funds.

Sincerely,

Hon. DAVID SCOTT,
Chairman

SUBMITTED LETTER BY HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM GEORGIA; ON BEHALF OF SARAH GALLO, VICE PRESIDENT, AGRICULTURE AND ENVIRONMENT, BIOTECHNOLOGY INNOVATION ORGANIZATION

March 16, 2022

Hon. DAVID SCOTT,
Chairman,
U.S. House of Representatives,
Washington, D.C.;

Hon. GLENN THOMPSON,
Ranking Minority Member,
U.S. House of Representatives,
Washington, D.C.

Dear Chairman Scott, Ranking Member Thompson, and Members of the Committee:

The Biotechnology Innovation Organization (BIO) is pleased to submit a statement for the record the United States House of Representatives Committee on Agriculture hearing entitled, "A 2022 Review of the Farm Bill: The Role of USDA Programs in Addressing Climate Change."

Introduction

BIO¹ represents 1,000 members in a biotech ecosystem with a central mission—to advance public policy that supports a wide range of companies and academic research centers that are working to apply biology and technology in the energy, agriculture, manufacturing, and health sectors to improve the lives of people and the health of the planet. BIO is committed to speaking up for the millions of families around the globe who depend upon our success. We will drive a revolution that aims to cure patients, protect our climate, and nourish humanity.

BIO supports testimony delivered at the hearing on behalf of the Food and Agriculture Climate Alliance (FACA). As a member of FACA, BIO believes that the Coalition's shared climate policy priorities, developed by organizations representing farmers, ranchers, forest owners, the food sector, state governments and environmental advocates, can greatly inform the work of the Committee.

¹<https://www.bio.org/>.

Addressing Climate Change with Innovation

As Congress begins the process of authorizing the next farm bill, BIO applauds the Committee for exploring how climate change can be addressed through the U.S. Department of Agriculture (USDA) and the farm bill.

Last year, when the Committee held its hearing, “Climate Change and the U.S. Agriculture and Forestry Sectors,” BIO noted in its statement for the record² that to meet the challenge of climate change, it is crucial to lead with science and innovation.

A farm bill centered on innovation stands to incentivize the adoption of cutting-edge technologies and practices, resulting in benefits to the environment and rural economies. Farmers, ranchers, sustainable fuels producers and manufacturers need comprehensive legislation, like the farm bill, to deliver a strong message; namely, biotechnology offers immediate and long-term answers to combat climate change. And to maintain U.S. leadership, programs must be supported by streamlined and expedited regulatory pathways for breakthrough technology solutions.

At its core, the farm bill promotes durability. The next farm bill offers a timely opportunity to examine innovation’s influence on the resiliency of our economy in the face of global climate challenges. It also provides an unparalleled platform to grow trust in the innovation ecosystem, so more communities and consumers can embrace deployment of biotechnology with confidence and enthusiasm.

USDA Farm Bill and Climate Programs

BIO believes the government can and should play a catalytic role in providing guidelines for carbon markets. As the Committee examines how USDA programs can address climate change and interact with existing ecosystem markets, it should support government-established infrastructure to measure and verify carbon sequestrations at the local farm level. This will ensure both USDA programs and private markets will be successful and operate with credibility. It also will enable producers to invest in and adopt innovative technologies to reduce emissions and be properly rewarded.

Agriculture continues to play a positive role in tackling climate challenges—precision plant breeding, biostimulants, microbial inoculants, enhanced animal feed with enzymes—each of these cutting-edge innovations is reducing emissions and helping domestic producers adapt to a changing environment and bolster productivity. Carbon markets and other USDA programs must keep pace and continue to foster acceptance for new technologies, thereby protecting the stability of the agricultural supply chain.

However, without clear direction from USDA on its role, it is difficult for innovators to model the environmental benefits and leverage the financial resources needed to bring critical technologies to market. Additionally, it is virtually impossible for individual farmers, ranchers, or foresters to comprehend the myriad programs in the marketplace and readily assess the impacts to their own operations. If we want to realize the benefits of sequestering carbon dioxide in the soil, improving soil health, and protecting waterways, we must clearly define roles and responsibilities for both government and the private-sector.

Conclusion

The agricultural innovations that BIO’s member companies are developing will allow producers to sustainably provide the food, feed, fuel, and fiber needed for a growing world. The development and deployment of these technologies will be crucial to helping farmers and ranchers be a part of the solution to climate change and provide them with the tools to be self-sustaining and resilient to a volatile climate.

BIO is committed to working with the Committee toward the development of the next farm bill that will address the climate crisis and support innovation in agriculture.

Sincerely,

SARAH GALLO,
Vice President, Agriculture and Environment,
Biotechnology Innovation Organization.

SUBMITTED STATEMENTS BY HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS
FROM GEORGIA

STATEMENT 1

ON BEHALF OF CINDY CLARK, SENIOR POLICY MANAGER REGENERATIVE AGRICULTURE
POLICY, CERES

Ceres Climate-Smart Agriculture and Healthy Soil Working Group Statement

The Ceres Climate-Smart Agriculture and Healthy Soil Working Group, a part of the *Ceres Policy Network*,^{1*} is a coalition of major food and fiber companies that are committed to addressing climate change through joint action on agriculture. These companies are increasingly involved in working directly with farmers, in ways that benefit both parties, and with the U.S. Department of Agriculture (USDA).

These companies share a recognition that **expanding nature-based climate solutions, including forests, grasslands, and other natural ecology, while adopting climate-smart agriculture practices, is critical to limiting global warming to 1.5° Celsius**, which scientists say is necessary to avoid further catastrophic impacts of the climate crisis. Already, the climate crisis is getting worse—it has become brutally clear is that without urgent and robust action, climate change will remain a tremendous threat to our economic, financial, and human well-being.

We commend the House Agriculture Committee for holding this hearing to review the role of USDA programs in addressing climate change. With American agriculture contributing about 10% of U.S. greenhouse gas emissions, this important discussion comes as we increasingly focus on the threat from climate change to our food supply and our national security. To do its part meet the goal of limiting warming to 1.5° Celsius, the U.S. has set a target to cut emissions in half by 2030 and achieve a net zero emissions economy by 2050. This means we *have only 8 years to meet our 2030 goals* and get on track to limit the climate threats that only grow more ominous.

There are many ways that farm bill policies can accelerate the drive to net-zero. We see programs that exist throughout all 12 titles of the farm bill that should be focused through a climate lens.

- As our member companies partner with farmers to address climate change, the farmers often rely on farm bill **voluntary conservation programs**:
 - Funding for **technical assistance** is an enormous hurdle and we have encouraged USDA to re-imagine all aspects of technical assistance as we try to help scale up on-farm conservation.
 - **The land-grant and cooperative extension network** is also a valuable resource for farmers and could be better incorporated into the provision of technical assistance, helping farmers to evaluate and incorporate climate smart agricultural practices.
 - **“Train the trainer” programs**, particularly at our historically black colleges, Tribal colleges, and Hispanic-serving institutions, can also significantly expand capacity and ensure that the profit opportunities from new ecosystems markets are available to all farmers.
- **The demand for better practice outcome data and data interoperability** is a key theme that runs throughout farm bill programs, from commodity subsidies to forestry programs to crop insurance. Private companies are collecting data from farm customers, in addition to the reporting farmers are required to provide to USDA in return for program payments. Through the farm bill, *USDA should develop a system where aggregated farm-level data can be shared with companies, and aggregated company-collected data can be shared with USDA.*
- Within the horticulture title, the **National Organic Program (NOP)** has long been the model for farms incorporating regenerative ag practices. Our working group has recommended to USDA that organic system plans could be streamlined with greenhouse gas protocols, including electronic record keeping to meet both NOP planning and ecosystem market needs.

This farm bill must resist the temptation to solve past problems. It must plan for the future, because the future is here already. **The climate crisis is a trade issue,**

¹<https://www.ceres.org/networks/ceres-policy-network>.†

* **Editor’s note:** references annotated with † are retained in Committee file.

a nutrition issue, a rural development issue—it affects every title of the farm bill, just as the farm bill affects every single American. Congratulations to the House Agriculture Committee for recognizing this.

CINDY CLARK,
Senior Policy Manager Regenerative Agriculture Policy,
Ceres.

*Ceres' Climate-Smart Agriculture and Healthy Soil Working Group*²

For more than 30 years, *Ceres*³ has brought together the most influential capital market leaders to solve the world's greatest sustainability challenges. *Ceres' Climate Smart Agriculture and Healthy Soil Working Group* is made up of businesses from the *Ceres policy network*⁴ that are committed to advancing Federal regulation and legislation at the state and Federal levels that de-risk the efforts of farmers and ranchers to reduce greenhouse gas emissions, build climate resilience, and increase soil health. For information, please reach out to Cindy Clark ([Redacted]).

STATEMENT 2

ON BEHALF OF TED MC KINNEY, CHIEF EXECUTIVE OFFICER, NATIONAL ASSOCIATION OF STATE DEPARTMENTS OF AGRICULTURE

On behalf of the National Association of State Departments of Agriculture (NASDA), we appreciate the opportunity to submit this statement outlining the priorities of state departments of agriculture on policies related to the roles of USDA programs in addressing climate change. We request that this statement be included in the record.

NASDA represents the commissioners, secretaries, and directors of the state departments of agriculture in all 50 states and four U.S. Territories. State departments of agriculture serve as advocates for the productive use of America's farmland while also being a trusted resource to our nation's farmers and ranchers who want to participate in USDA's conservation programs. In fact, many producers are the direct beneficiaries of the successes of innovative state conservation programs in addition to USDA's programs.

In this role, NASDA encourages the Committee to ensure Congress and USDA work in partnership with state departments of agriculture to make the next farm bill the most impactful yet. NASDA members recognize the achievements of current conservation programs but also recognize many of these programs have become oversubscribed. As the Committee begins hearings on the 2023 Farm Bill, NASDA has recommendations to improve USDA's conservation programs.

NASDA recommends the Committee include the following policies as it begins consideration of the 2023 Farm Bill:

- Protect the voluntary status of the current conservation programs, while creating voluntary, incentive-based climate smart agricultural programs that are practical and provide benefits for farmers and ranchers.
- Invest in the successful conservation programs such as EQIP, ACEP, CSP, and RCPP.
- Streamline the process, reduce barriers to access, and increase flexibility for conservation programs, which will allow state partners to achieve the best outcomes.
- Enact policies that credit ongoing efforts of many farmers and ranchers that have previously adapted climate smart strategies to reduce emissions, sequester carbon, and improve resiliency.
- Implement climate policies that focus on advancing science-based outcomes.
- Promote fairness and equity within the agriculture community through climate solutions.

Since 2020, NASDA has been a founding member of the Food and Agriculture Climate Alliance. This alliance is dedicated to working together to promote voluntary, incentive-based, science-based, and bipartisan solutions to climate change. NASDA supports the recommendations from the Food and Agriculture Climate Alliance.

³ <https://www.ceres.org/homepage>.

⁴ <https://www.ceres.org/networks/ceres-policy-network>.

NASDA stands ready to assist this Committee as it begins consideration of the 2023 Farm Bill.

Please contact Zachary Gihorski ((Redacted)) if you have any questions or would like any additional information.

SUBMITTED LETTER BY HON. RICK W. ALLEN, A REPRESENTATIVE IN CONGRESS FROM GEORGIA

February 28, 2022

Hon. JOSEPH R. BIDEN,
President of the United States,
 White House,
 Washington, D.C.

Dear President Biden:

Over the last few days, we have seen Russia launch an unjustified war against a sovereign nation and our strategic partner, Ukraine. We unequivocally condemn Russian President Vladimir Putin and his attacks, which have put the lives of millions and security of Europe in grave danger. However, rather than take concrete steps to deter President Putin, your Administration's energy policies have only emboldened his actions. Specifically, your gift of the Nord Stream 2 Pipeline granted Putin more control over energy in the region while at the same time, your policies weakened America's energy independence.

Energy independence is critical to national security, as our adversaries like Russia understand the world is now more dependent on foreign oil and natural gas. That's why we are demanding that your Administration immediately restore the oil production policies that were established in 2017 under the Trump Administration. Under these policies, America was energy independent. The past Administration lifted the ban on Federal leasing for coal production and lifted restrictions put in place during the Obama Administration that killed the production of oil, natural gas and shale energy through the Clean Power Plan.¹ Furthermore, President Trump signed a memorandum restoring construction of the Keystone XL Pipeline, providing a safe and reliable way to transport energy resources between the United States and Canada to strengthen America's energy security and generating billions in revenue to boost economic growth.²

In contrast, one of your first actions as President was to kill American energy independence by issuing an Executive Order revoking the permits for the Keystone XL Pipeline, a first signal to adversaries like Russia that America would be dependent on foreign oil.³ And yet, even in the midst of the impending military invasion, on February 17, 2022, the Federal Energy Regulatory Commission (FERC) released updated guidance to delay and deny natural gas pipeline projects.⁴

These misguided policies have left the American people paying skyrocketing prices at the gas pump and empowered Russia to invade Ukraine, which will only result in gas prices continuing to surge for Americans and our European allies.

Failed policies by your Administration have devastating impacts, both at home and abroad. As you come before Congress and our country to deliver the State of the Union, we urge you to include in your speech a strong commitment to the American people that you will end this war on American energy, restore the Trump Administration policies to spur domestic oil production, and restore the Keystone XL pipeline. America must once again be energy independent so the world less reliant on malign actors.

Sincerely,

Hon. RICK W. ALLEN,
Member of Congress

Mr. BAIRD. . . .

* * * * *
. . . would you care to elaborate on the importance of biotechnology and research and so on as we move forward in agriculture?
* * * * *

Mr. BAIRD. I am not sure, Mr. Chairman, how much time I have left, but if any of the other witnesses would like to comment—

The CHAIRMAN. Your time has expired, unfortunately.

Agricultural biotechnology involves an array of tools and approaches that can involve conventional breeding techniques and genetic engineering that are implemented to improve the health and sustainability of plants, animals, and microbes. Advances in biotechnology can enable scientists to introduce or suppress traits in organisms used for food, fiber, industry, and even pharmaceuticals.¹* Designed carefully, biotechnology and research present tremendous opportunities to improve agricultural sustainability, profitability, crop yields, soil health, and reduced need for water and chemical inputs. In short, research and innovation in this space and innovation can reduce risk and enhance resilience.

It is worth noting that the U.S. currently leads in the production of engineered crops, cultivating nearly 40% (185 million acres) of total genetically engineered crop acres planted worldwide. Our nation also leads globally the development of advanced genetic technologies and applying them to crops and livestock to enhance nutritional qualities, reduce allergenicity, enhance growth rates, reduce susceptibility to pests and diseases and reduce the dangers of animal rearing.

There are also unique opportunities in forestry biotechnology and research. According to the most recent national insect and disease risk assessment carried out in 2012 by the U.S. Forest Service, some 81.3 million acres—nearly seven percent of all U.S. forested land—are at risk of losing at least 25 percent of tree vegetation between 2013 and 2027 due to insects and diseases.² The severity of impact of these threats can be mitigated through land management practices and by biotechnology approaches to confer resistance to the vegetation at risk to enhance forest health. In fact, a recent National Academies report recommended further research on the mechanisms that govern trees' resistance to pests and adaptation to a changing climate. There is significant potential for both agricultural and forest biotechnology to enhance resilience and reduce risk.

Senator Heitkamp, how has the Title IX of the farm bill advanced cleaner burning domestic energy production that benefits farmers and the environment?

Ms. HEITKAMP. I would like to just repeat back to you, Congressman, what you just said. When you look at the actual reductions, you look at the opportunity, and I want to—I don't know if you guys could hear me when I was responding, but when we look at what the Iowa ethanol industry is doing and what South Dakota is doing and North Dakota is doing, they are looking at carbon capture to actually even expand on those numbers. Carbon capture behind the process which can even reduce their greenhouse impact greater. And so, I think that when [inaudible] access to the market by limiting infrastructure, or people who just don't like corn ethanol. [inaudible].

The CHAIRMAN. Senator, we are having a little more difficulty, but you can respond to that in writing.

Title IX of the farm bill has been critical in supporting research and development of agricultural and forestry feedstocks used to produce bioenergy, as well as financing commercial scale production facilities. As such, it helps the industry meet the demand for low-carbon biofuels created by the Renewable Fuel Standard and for wood-based bioenergy, while also supporting thousands of jobs throughout rural America. Today there is greater pressure on the biofuels industry to reduce its carbon footprint to better compete with other transportation fuels like electricity. It is my hope that Congress will reauthorize Title IX in the 2023 Farm Bill, and through that title, provide the financial resources necessary to enable research into ways that bioenergy industries can further decarbonize, including through reduced emissions from the on-farm supply chain to the collection and sequestration of carbon dioxide from biofuels production plants across the country.

 . . . would you care to elaborate on the importance of biotechnology and research and so on as we move forward in agriculture?

* * * * *
 Mr. BAIRD. I am not sure, Mr. Chairman, how much time I have left, but if any of the other witnesses would like to comment—

The CHAIRMAN. Your time has expired, unfortunately.

Biotechnology and research is key to identifying new climate smart practices that are effective. We would support more producer guided programs and grants such as the Sustainable Agriculture Research & Education (SARE) program, a U.S. Department of Agriculture National Institute of Food and Agriculture (NIFA) grants and outreach program. SARE is the only farmer-led research program and a critical tool in helping farmers fight climate change. In addition to providing grant funding for farmers to lead research on sustainable agriculture, the program is also critical in peer-to-peer learning by sharing the research findings with other farmers across the country. Research from SARE helps small-scale, diversified farmers implement conservation practices and measure their climate mitigation impacts.

Insert 2

Mr. CARBAJAL. Thank you.

Ms. Raygoza, I don't know if I have enough time, but I agree with you that young farmers are the future. I want to help support these young, aspiring farmers succeed and produce food for our country. Do you think some type of workforce development partnership between USDA and community colleges would be useful to teach young farmers how to navigate USDA resources and learn about climate practices?

The CHAIRMAN. The gentleman's time has expired, but you may respond in writing to him. Thank you.

Yes, I support the development of partnerships between USDA and community colleges. USDA Beginning Farmers and Rancher Development programs in my region provided me with the technical support that my farm needed to begin. As the average age of farmers increases, more programs and partnerships are needed to

encourage young people to become farmers and to learn about the programs available to them at USDA.

Other ways to support young farmers include passage of the Civilian Climate Corps Act, making college more affordable, and canceling student debt, as student debt is one of the top issues preventing aspiring farmers from entering the field.

* * * * *
Mr. BAIRD. I am not sure, Mr. Chairman, how much time I have left, but if any of the other witnesses would like to comment—
The CHAIRMAN. Your time has expired, unfortunately.

Biotechnology allows farmers to grow more food on less land using farming practices that can be more environmentally sustainable. For example, seeds yielding more per acre, plants naturally resisting specific insect pests and diseases, and farming techniques designed to improve soil health and conservation. Biotechnology can also develop crops that are engineered to tolerate specific herbicides, which make weed control simpler and more efficient. Other examples include developing biofuels, improving plant growth, and enhancing animal health and breeding.

The positive aspects of biotechnology include nutritional quality improvement, transfer of the desired traits of plants and animals, and the minimization of pesticide use. However, some concerns have also been raised over biotechnology's potential to cause a decrease in biodiversity and a negative impact on health and the environment. Given the huge potential for positives, significant investment is needed in research to ensure that preferred outcomes are achieved.

* * * * *
Mr. BAIRD. I am not sure, Mr. Chairman, how much time I have left, but if any of the other witnesses would like to comment—
The CHAIRMAN. Your time has expired, unfortunately.

Biotechnology research and research in general is incredibly important in increasing the productive capacity of the existing fixed land base and reducing the costs of production. While this is not my area of expertise, I understand that the U.S. is generally being outspent on agricultural research by many of our major competitors. Over time, this would be expected to erode any competitive advantage U.S. producers have over producers from other countries. Especially in those situations where governments control the development, production and availability of new technologies.

SUBMITTED LETTER BY EARTHJUSTICE

March 25, 202[2]

Hon. DAVID SCOTT,
Chairman,

House Committee on Agriculture ,
Washington, D.C.

Thank you for the opportunity to testify on the role of climate change in the agriculture sector, and how to take advantage of this sector's tremendous prospects to both reduce greenhouse gas (GHG) emissions and restore the amount of carbon lost from soil. This testimony highlights the need to prioritize agriculture's climate impact in the 2023 Farm Bill and offers recommendations on holistic, scalable approaches to agriculture and land management that should be incorporated into this critical legislation.

Agriculture must be part of any solution to the climate crisis. Agriculture is highly vulnerable to the more extreme and variable weather that climate change is bringing, and our food and economic security depend upon both stabilizing our climate and increasing the resilience of our food system. Agriculture is also a major contributor to climate change, and we cannot reach our climate goals without more aggressively and effectively addressing this contribution.^{1*}

The urgency of the climate crisis must be met with effective answers. The 2023 Farm Bill provides a powerful tool to address agriculture's contributions to climate change. We offer this testimony to address key impacts of climate change in agriculture and explore the following points:

1. The 2023 Farm Bill must consider and account for the true climate impact of agriculture, which should include the large climate impact of agricultural land use and accurately reflect the potent impact of methane and nitrous oxide emissions. The 2023 Farm Bill should incentivize the many agroecological practices that provide proven ways to reduce GHG emissions and sequester and store carbon. Scaling up these efforts and funding additional research into them offer effective mitigation tools to address the climate crisis.
2. The 2023 Farm Bill must center proven GHG reducing climate solutions while identifying and rejecting false solutions to address the climate crisis.
3. The 2023 Farm Bill must promulgate policies that meet the needs of all those who are a part of our food system, including workers and small-scale producers, and that enhance food justice, environmental justice, and economic justice.

Fortunately, agriculture can play a pivotal role in tackling the climate crisis. Implementation of well-documented climate-friendly agricultural practices can increase the amount of carbon removed from the atmosphere, increase the amount of carbon stored in soil, and/or reduce agricultural emissions of carbon dioxide, nitrous oxide, and methane. These practices will also often increase resilience to extreme weather, reduce environmental and public health harms, and, in most cases, over time, improve producer productivity or profitability. While proven, these practices are used on only small portions of U.S. farmland; policy changes are needed to dramatically accelerate their adoption. Crafting that policy is the task of this Committee, which has an important opportunity to make a huge impact and secure a resilient future through the 2023 Farm Bill.

I. The 2023 Farm Bill Should Consider and Address Agriculture's True Climate Impact

Given the tremendous impact climate change has on the agriculture sector, agriculture's significant contributions to the warming planet, and the very real threat posed by the climate crisis, this Committee must consider climate in the 2023 Farm Bill. As part of this undertaking, it is imperative the Committee understands the true climate footprint of the agricultural sector.

¹See EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990–2019* † (2021), <https://www.epa.gov/sites/production/files/2021-04/documents/us-ghg-inventory-2021-main-text.pdf>. EPA concludes that agriculture's GHG emissions are about 10% of total U.S. GHG emissions; as explained below, this approach significantly understates the correct figure.

* **Editor's note:** references annotated with † are retained in Committee file.

Figure 1. Climate impacts of from the agriculture sector extend far beyond direct emissions on the farm.

Though the Environmental Protection Agency (EPA) estimates that agriculture is responsible for about 10% of U.S. GHG emissions (see *Figure 1*, Bar 1),² this figure excludes many factors that contribute additional emissions from the sector. This figure does not account for emissions from on-farm fuel and electricity use (see *Figure 1*, Bar 2) or the significant emissions associated with the manufacture of agricultural inputs like fertilizer (see *Figure 1*, Bar 3).

Additionally, these estimates do not account for the impacts of methane on policy-relevant timescales, as EPA utilizes 100 year timeframes rather than a more relevant 20 year timeframe (GWP20) accurately reflecting methane's concentrated warming impacts (see *Figure 1*, Bar 4).³ While the 100 year timeframe is common in scientific analysis, the U.S. is now debating policies to reduce emissions far sooner so the 20 year timeframe is more relevant for such discussions. The IPCC has consistently noted the need to appropriately tailor GWP choices to their appropriate policy contexts.⁴ The 20 year timeframe has also been adopted in policy contexts at the state-level, including for example, New York state's greenhouse gas inventory and in its climate planning.⁵ This revised framework will help policy makers recog-

²See EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990–2019*† (2021), <https://www.epa.gov/sites/production/files/2021-04/documents/us-ghg-inventory-2021-main-text.pdf>.

nize the tremendous importance of methane abatement, showing that agricultural methane emissions alone are about 10% of all U.S. GHG emissions on a policy relevant timescale. (See *Figures 2 and 3*).

Figure 2. Greenhouse gas emissions calculated according to 100 year and 20 year global warming potentials (GWP), showing the significant impact of timescale on estimating methane emissions.

Figure 3. Anthropogenic methane emissions by source. EPA 2019. Inventory of Greenhouse gas emissions and sinks.

A major omission in this account of agriculture's climate footprint is related to land use. Each year, the conversion of grassland or forest to cropland and grazing land results in enormous losses of stored carbon. This is included in EPA's GHG Inventory but in another section attributed to another sector, while it is really a function of agriculture. See *Figure 1*, Bar 5.

In addition, the true climate impact of clearing land for agriculture extends well beyond immediate losses from land conversion.⁶ The use of land for growing crops or raising livestock—62% of the contiguous United States—precludes this land from continuing to sequester carbon at the rates it would have had that land been left undisturbed as native vegetation. Full climate impact would include the “quantity of carbon that could be sequestered annually if [that land] were instead devoted to regenerating forest [or grassland].” See *Figure 1*, Bar 6. Adding this continuing yearly impact of prior land conversion to the annual agricultural system emissions significantly increases agriculture's true climate change footprint.⁷

Thus, when correctly calculated to include all agriculture related climate change impacts, it is clear that the overall impact of agriculture to climate change is equivalent to far more than only 10% of U.S. GHG emissions. A more complete account-

ing requirements for the State of New York, 17 J. INTEGRATIVE ENV'T SCI. 69–81 (2020),[†] <https://doi.org/10.1080/1943815X.2020.1789666>.

⁷See EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990–2019* (2021) at 2–3, Table 2–1, <https://www.epa.gov/sites/production/files/2021-04/documents/us-ghg-inventory-2021-main-text.pdf>.

ing of these contributions including each of the factors laid out above raises this estimate closer in magnitude to total emissions from the transportation sector—and thus Congress must treat abatement of these emissions with equal importance. This estimate is in line with numerous recent estimates at the global scale, which place food and agricultural emissions at $\frac{1}{3}$ or more of anthropogenic greenhouse gas emissions.⁸

In addition to recognizing the broad climate impact of agriculture and the many ways in which this accounting is often underestimated by a failure to consider the factors above, it is also important to note that estimates of methane emissions from animal agriculture and soil nitrous oxide emissions are among the most uncertain⁹ and likely underestimated emission sources in EPA's GHG inventory. Improved measurement, monitoring and reporting is critical to establishing a valid baseline to guide efforts for emission reductions from agriculture. In particular, several recent studies indicate that estimates of methane emissions from animal agriculture substantially underestimate actual emissions.¹⁰

Any solution to the climate crisis must focus not only on agriculture's potential to store more carbon in the soil, but also on the need to reduce agriculture's GHG emissions. The 2023 Farm Bill presents a powerful tool to address each of these sources of emissions in a way that not only ameliorates the threat of climate change, but also has the potential to increase agricultural productivity and farmer and rancher profitability.

II. The 2023 Farm Bill Should Incentivize Agroecological Practices that Provide Proven Ways to Reduce GHG Emissions and Sequester and Store Carbon in Soil.

Several climate-friendly practices with demonstrated benefits are available to reduce agriculture's GHG footprint. A large body of scientific literature, in addition to traditional knowledge and experience, support the environmental benefits of these practices, making them excellent candidates for effectively and efficiently increasing carbon sequestration, reducing GHG emissions, and building climate resiliency. However, due to financial and technical barriers, adoption of some of the most effective climate-friendly practices remains low. This Committee should include in the 2023 Farm Bill incentives for the adoption of practices with the greatest climate benefits, while also supporting continued research on how to most effectively adopt these practices at scale across the nation, as these practices offer a true climate solution while also leading to higher yields, fewer inputs, and thus greater profitability.

Agroforestry has a strong potential for restoring carbon stocks lost due to land conversion and increasing carbon sequestration relative to conventional farming—with realistic rates of adoption leading to carbon sequestration rates equal in magnitude to over a third of fossil fuel emissions in the U.S.¹¹ Agroforestry practices, including alley cropping, silvopasture, and riparian forest buffers, integrate or reintroduce woody vegetation into crop and animal farming systems where the landscape would naturally support such vegetation. Alley cropping systems integrate trees and shrubs into crop production, while silvopasture refers to the integration of trees and shrubs with livestock activities.¹²

Improved nutrient management is another practice with enormous climate benefits. Synthetic nitrogen fertilizer application and other agricultural soil management practices account for about half (depending on timeframe of analysis) of GHG emissions from agriculture. In addition to representing a large proportion of the environmental footprint of agriculture, these emissions are responsible for over $\frac{3}{4}$ of all ni-

¹²See, e.g., Shibu Jose & Sougata Bardhan, *Agroforestry for Biomass Production and Carbon Sequestration: An Overview*, † 86 AGROFORESTRY SYS. 105 (2012); see also Ranjith P. Udawatta & Shibu Jose, *Agroforestry Strategies to Sequester Carbon in Temperate North America*, 86 AGROFORESTRY SYS. 225 (2012).

trous oxide emissions across sectors in the U.S.¹³ Reducing nitrous oxide emissions from agriculture is particularly urgent as the warming potential of nitrous oxide is 265–298 times greater than carbon dioxide.¹⁴ Improving nutrient management practices, including precision application, cover crops and longer and more varied crop rotations (which naturally provide nutrients and thus reduce fertilizer needs), using natural rather than synthetic fertilizer (thus also avoiding the significant GHG emissions of fertilizer manufacturing), riparian buffers, and soil amendments, can greatly reduce the climate footprint of agriculture by reducing nitrous oxide and other emissions.¹⁵

Many of these practices will also help increase soil carbon sequestration, thus further reducing net GHG emissions. These practices build organic matter by introducing a wider range of inputs into soil, maintaining soil cover throughout the year, and minimizing soil disturbance and erosion.¹⁶ Moreover, these practices prevent nutrient runoff and improve water quality, increase water retention and thus reduce the need for water inputs, and even avoid air pollution. In addition, these practices can reduce the vulnerability of crops to pests and pathogens, thereby reducing the need for pesticides that are harmful to pollinators and water quality,¹⁷ and further help protect biodiversity and thriving rural communities.

Accelerating adoption of these practices through technical and financial support and incentives, as well as through the conservation compliance program, and protecting land in long-term conservation programs are among the most effective strategies to reduce the climate footprint of agriculture. At the same time, avoiding the further conversion of grasslands is one of the most impactful agricultural activities to mitigate climate change.¹⁸

In addition to cropland practices that can help mitigate climate change and build resilience to it, there are proven practices for grazing and raising livestock that can help achieve these goals and it is critical for the Committee to explore ways the 2023 Farm Bill can accelerate the adoption of these practices as well. Grazing is now conducted on about 800 million acres of the U.S.—the most widespread land use in the country. Managed rotational grazing systems have been shown¹⁹ to reduce soil loss and increase soil and plant carbon storage, helping to reduce net GHG emissions. Dry manure management produces a small fraction of the methane of the more typical wet management now used at most dairies and swine operations.²⁰ Feed optimization, methane destruction, and other measures can all reduce the GHG impact of livestock.

With most livestock and poultry raised in a relatively few facilities (see *Figure 4*), changed practices at a relatively few facilities can make a big climate difference. Currently, animals are raised in heavily concentrated conditions at a small proportion of operations: over 50% of dairy cows in the United States are in the 4% of operations that stock 1,000 or more dairy cows. More than 90% of hogs in the United States are in the 12% of facilities that stock 2,000 or more hogs, and more than ¾ of all cattle on feed in the United States are in the 5% of facilities that

stock 1,000 or more cattle.²¹ Given that greenhouse gas emissions from enteric fermentation and manure are largely dependent on the number of animals raised in facilities, reducing emissions from these largest facilities has the potential to cut back total emissions significantly.

Figure 4. Concentration of U.S. Livestock by Facility Size. Data from USDA Census of Agriculture.

Each of these practices has proven climate benefits. They can increase the amount of carbon removed from the atmosphere, help restore the amount of carbon stored in soil, and/or reduce agricultural emissions of carbon dioxide, nitrous oxide, and methane. These practices will also often increase resilience to extreme weather, reduce environmental and public health harms, and, in most cases, over time, improve producer productivity or profitability. However, they are now used on only a small portion of U.S. grazing and crop land or animal operations. This Committee should focus on ways to greatly accelerate adoption of these practices, as well as increasing investment in research into their benefits and technical assistance to help with their adoption, when crafting the 2023 Farm Bill. Research, outreach and technical support, and financial assistance to increase adoption of these practices together would go a long way towards ameliorating agriculture's overall climate impact.

²¹ See USDA National Agriculture Statistics Service state level data: <https://sustainablefoodfarming.shinyapps.io/CAFOINVENTORY/>.

III. The 2023 Farm Bill Should Center Climate Solutions and Equitable Access To USDA Programs

In the 2023 Farm Bill, Congress has both an opportunity and obligation to invest in agricultural solutions to the climate crisis and empower farmers and ranchers to play key roles in addressing the warming climate. We urge Congress to consider policy solutions and programs that incentivize adoption of climate-friendly practices that are proven to sequester carbon and reduce GHG emissions. These practices not only effectively reduce agriculture's climate footprint, but they also help build resilience, improve water and air quality, and protect biodiversity. The 2023 Farm Bill provides a powerful ready-made tool that can provide funding for these practices, and for more research and technical assistance related to them, in an effort to provide a true solution to the growing climate crisis.

This Committee should not only center agroecological practices in the 2023 Farm Bill, but it should also ensure that the policies and programs it funds in this legislation uplift the values of equity, inclusion, and dignity and that funding opportunities are equitably accessible to all producers. Congress and the USDA should recognize the traditional ecological knowledge from Black and Indigenous communities that have contributed to advancing environmental sustainability and responsible stewardship of natural resources. Many agroecological practices supported in USDA programs are rooted in traditional and ancestral knowledge from these communities. The farm bill should recognize these communities for their expertise and contribution, and Congress should advocate for Black, Indigenous People of Color (BIPOC) producers to benefit justly and fairly from USDA programs.

Due to a long, enduring history of discriminatory and exploitative practices—including systemic denial of farm loans and other assistance to BIPOC producers by the U.S. Department of Agriculture—most of the country's farm, crop and range land is owned by white farmers and ranchers.²² Discriminatory practices and policies continue to plague the agricultural sector. With this problematic history in mind, the 2023 Farm Bill must do more to remedy USDA's legacy of civil rights violations and racism that persists to this day by reforming current programs and funding schemes to address discriminatory practices. Congress should provide funding for technical assistance and outreach by diverse service providers with linguistic and cultural competency, partnering with community-based organizations and local community leaders who have earned trust of farmers and producers, employing BIPOC experts to lead trainings on issues unique and salient to local communities, and where possible, and make trainings and technical assistance opportunities credit-bearing in partnership with land grant universities. The farm bill should expand existing programs and offices that offer support and outreach to disadvantaged farmers and communities and should incorporate climate mitigation goals into these programs.

At the same time this Committee considers ways to incentivize the suite of proven agroecological climate-friendly practices in the 2023 Farm Bill, so too should it be wary of false climate solutions that have received recent attention, for example, biofuels, wood-based bioenergy (especially from whole trees), and biodigesters for livestock waste. Not only do many of these practices fail to reduce GHG emissions (when all factors are correctly analyzed), but they may in fact exacerbate them, while at the same time causing environmental and public health harms and worsening inequities in the agricultural system.

A large proportion of farm bill programs support animal agriculture, including financing many practices that entrench polluting systems rather than facilitating transitions towards a climate-friendly food system. In particular, anaerobic biodigesters are very costly and largely ineffective with limited overall climate mitigation potential, especially when compared to alternative [manure] management methods. Because anaerobic biodigesters rely on the production of methane to be profitable, they incentivize increasing methane production and promote waste generation without impacting the much larger share of methane emissions from enteric fermentation produced at these operations. They are also usually [deployed] on only the largest animal operations, so any public support for them effectively worsens the consolidation of the industry and inequities of the system. Digesters also continue to pose or exacerbate hazards through groundwater and surface water contamination, do not address and can increase nitrous oxide emissions, and do not address the runoff of nitrogen into waterways. Moreover, methane leakage from these facilities can be substantial, causing them to be net sources of methane rather than low-

²² See USDA National Agricultural Statistics Service *Census of Agriculture 2017*.

ering methane emissions.²³ Furthermore, biodigesters release additional pollutants such as nitrogen oxides (NO_x), sulfur dioxide, and particulate matter.²⁴

In addition, Congress should consider the demand side of the food and agricultural systems and the role it can play in contributing to and addressing the climate crisis. Demand for production of certain agricultural goods—including, for example, “renewable” biomass for biofuels (corn, soy) and foods with a higher climate footprint (beef, dairy)—drives sustained or increasing GHG emissions. Reducing demand for such products while incentivizing a shift to those with lower climate change impacts provides powerful opportunities for addressing the warming planet. Among other tools, the government’s procurement practices and marketing incentives should be closely considered.

Thus, as this Committee determines what practices to include in its toolbox for tackling the climate crisis through the farm bill, it should consider not just methods of reducing GHG emissions, but also the broader environmental and social effects of greater adoption of such practices, both positive and negative.

* * * * *

In sum, we urge the Committee to include a climate focus in the 2023 Farm Bill, given the role agriculture plays in the climate crisis and the tremendous opportunity it has to address it. The farm bill provides a ready-made tool that has powerful potential to reduce GHG emissions while improving productivity to feed the growing population, as well as increased profitability for our farmers and ranchers.

Respectfully submitted,

Earthjustice
Washington, D.C.

MUSTAFA SAIFUDDIN

SUBMITTED STATEMENT BY ENVIRONMENTAL WORKING GROUP

To avoid the worst effects of climate change, we must reduce greenhouse gas emissions from agriculture.

Agriculture is a significant and growing *source*¹ of greenhouse gas emissions that, if left unaddressed, will jeopardize our efforts to avoid a climate crisis. In particular, *nitrous oxide*² emissions from fertilizing crops and animal feed, and the *methane*³ emissions from livestock and their manure, are growing sources of greenhouse gas emissions. Unless we reduce nitrous oxide, carbon dioxide and methane emissions from agriculture, we will fail to make the greenhouse gas reductions *needed*⁴ to avoid the worst impacts of climate change.

Voluntary conservation programs administered by the Department of Agriculture (USDA) could play a significant role in reducing the impacts of farm pollution, reducing greenhouse gas emissions, and mitigating the effects of climate change.

Unfortunately, many farmers are *turned away by USDA*^{5*} when they apply to participate in voluntary conservation programs because the agency lacks the resources to accommodate them. Last year alone, more than 100,000 farmers were

turned away⁶ from USDA’s two flagship working lands conservation programs. What’s more, most USDA conservation funding flows to practices that fail to reduce emissions.

To meet the climate challenge, Congress must increase funding for conservation programs and must ensure that practices that reduce greenhouse gas emissions are prioritized. Fortunately, the same practices that reduce nitrous oxide and methane emissions also improve air and water quality and make our farms better able to withstand the extreme weather caused by climate change.

To address the climate crisis, the Committee should:

- Quickly enact the Build Back Better Act, which includes \$27 billion for conservation practices that reduce greenhouse gas emissions
- Make climate change the primary focus of working lands conservation programs.
- Make long-term and permanent easements the primary focus of land retirement and restoration programs.
- Support job creation in the *plant-based*⁷ and alternative protein sectors.
- Reduce support for conservation practices that do not reduce emissions.
- End support for “climate-dumb” conservation practices that increase emissions.

In the past year, USDA has taken steps to incorporate climate goals into conservation programs, including the establishment of a *pilot program*⁸ within EQIP, announcing a *new initiative*⁹ to finance the deployment of farming and forestry practices that reduce emissions, *creating*¹⁰ a new Climate-Smart Practice Incentive for general and continuous signups within the Conservation Reserve Program (CRP), and *releasing*¹¹ an updated list of agriculture and forestry practices that reduce emissions for the Conservation Stewardship Program (CSP) and EQIP.

Much more must be done to ensure that existing conservation programs are helping to meet our climate goals and to support job creation in the plant-based and alternative protein sectors.

For example,

- Most of the practices identified by states as “priority practices” to be eligible for 90 percent cost-share under EQIP do not reduce greenhouse gas emissions or, in some cases, actually increase emissions.
- Several practices eligible for enrollment in EQIP’s Conservation Incentive Contracts (CIC) either do not address greenhouse emissions or actually increase emissions.
- The list of CSP “climate-smart” agriculture and forestry practices does not include bundles of enhancements.
- Most Conservation Reserve Program acres are returned to production after contracts expire, releasing soil carbon into the atmosphere.
- Acres enrolled in the Conservation Reserve Enhancement Program have fallen.
- Agricultural land easements do not require that producers adopt any practices that reduce emissions as a condition of enrollment.
- While USDA has provided nearly \$50 billion¹² in subsidies to livestock operators since 1995, USDA has provided just \$30 million to support jobs in the plant-based protein industry.

Some “climate dumb” conservation practices *actually increase emissions*.¹³ Other practices and enhancements financed through EQIP and CSP provide little to no

benefit to the environment or public health. According to *EWG analysis*,¹⁴ payments for these structures, equipment or facilities appeared in 1/3 of EQIP contracts but received nearly 2/3 of EQIP payments, diverting badly needed resources from proven practices.

Even if we stopped burning fossil fuels today, greenhouse gas emissions from food and farming could make a climate catastrophe unavoidable. Farmers are already bearing the brunt of the extreme weather caused by climate change. But, the devastating economic impacts of the climate crisis are not the only reason for farmers to act: as emissions from energy and transportation continue to fall, and emissions from fertilizer and animals grow due to rising protein demand, agriculture's contribution to the climate crisis will steadily increase. By 2050, greenhouse gas emissions from animals and the production of their feed could easily account for 1/3 of U.S. emissions

Thank you for the opportunity to submit testimony for the record.

SUBMITTED STATEMENT BY THE BREAKTHROUGH INSTITUTE

Despite being frequently overlooked in conversations about climate change, supporting public-agricultural research programs is a powerful, bipartisan climate mitigation strategy with clear economic co-benefits. Agricultural research benefits the climate by:

- Boosting agricultural productivity, enabling farmers to produce more food on less land, with fewer inputs and greenhouse gas emissions
- Advancing specific research areas—such as fertilizer innovation and methane-inhibiting cattle feed additives—with especially potential to reduce greenhouse gas emissions

Since the 1960s, innovation-driven productivity advances have enabled farmers to reduce land use by nine percent and cut the carbon footprint per pound of milk and chicken by over 50 percent.¹ Unfortunately, spending on agricultural research has stagnated, and much of our nation's agricultural research infrastructure is in disrepair. For example:

- Total public spending on agricultural research and development fell by nearly 30 percent between 2002 and 2015^{2*}
- Agricultural Research Service (ARS) facilities have about \$1 billion in deferred maintenance³
- Nearly 70 percent of agricultural research facilities at colleges and universities, for example, are near the end of their useful life⁴

The Federal Government cannot rely on the private-sector to make up for insufficient public funding, for a few reasons:

- Public and private agricultural research are complements, not substitutes. The private-sector invests more in food and feed manufacturing and farm machinery engineering, while the public-sector conducts nearly all research related to the environment and natural resources, human nutrition, and food safety.⁵ In addition, public agricultural research tends to spur additional private-sector investments in research.⁶

⁷John King, Andrew Toole, and Keith Fuglie. 2012. "The Complementary Roles of the Public and Private Sectors in U.S. Agricultural Research and Development." † Economic Brief. Vol. 19. https://www.ers.usda.gov/webdocs/publications/42858/32186_eb19.pdf?v=0.:2.

- Environmentally and socially beneficial research often has a long payback period or is unlikely to result in commercializable products, making it unattractive for private-sector investments.

Increasing agricultural research funding in the 2023 Farm Bill—by boosting authorization levels for existing Title [VII] programs, authorizing new research programs, and providing some mandatory research funding—would yield huge climate and economic benefits. For example, relative to a business-as-usual scenario, doubling public agricultural research spending over 10 years would:

- Increase global crop production by 3.4 percentage points
- Reduce global crop prices by around 8.4 percentage points
- Reduce international agricultural land use by about 63,000 square miles (about the size of Iowa)
- Reduce global greenhouse gas emissions by at least 109 million metric tons carbon-dioxide equivalent per year (1/6 of U.S. agricultural emissions)⁷

Additional funding would allow USDA programs to accelerate research in high-impact areas, such as:

- Beef production—The U.S. could reduce emissions from beef production by 48% if existing and emerging mitigation technologies—such as methane-inhibiting feed additives for grazing cattle and low-carbon cattle breeding—were improved and fully adopted by 2030⁸
- Soil management—If applied on half of U.S. cropland, enhanced rock weathering, an innovative practice that entails spreading crushed silicate rocks on the soil, could remove around 0.4 billion tonnes of carbon dioxide from the atmosphere each year⁹

In order to adequately address the climate challenge, all USDA research programs and agencies will need sufficient funding so the Department can fund a diverse portfolio of agricultural research projects.

SUBMITTED QUESTIONS

Response from Hon. Charles F. Conner, President and Chief Executive Officer, National Council of Farmer Cooperatives; Co-Chair, Food & Agriculture Climate Alliance

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. For the past couple years now, you've all heard me talk about the opportunity we have for climate to be a boon for agriculture rather than a boondoggle. One specific example I've spoken of many times, is the capability we already have for animal feed ingredients that improve the sustainability and enteric emissions of livestock, if only our regulatory system allowed for a pathway to approve these products. I'm proud that just last week we were able to secure additional funding to FDA's Center for Veterinary Medicine to continue working in this direction, but I fear this is still not keeping up with the innovation and technology that will be crucial to American agriculture's ability to sustainably feed the world ahead.

Can you touch on the importance of clear, science-based, and timely regulations from Federal agencies, so America's farmers can sustainability increase production and resilience in the face of climate change with less regulatory burden?

Answer. Congressman, you are exactly correct about increasing feed use efficiency or feed digestibility as an important means to further reduce the livestock and poultry sector's already small share of total U.S. greenhouse gas emissions. Quality re-

search in these areas will help agriculture and the climate. We need that research and an expedited regulatory approval process to support farmers' and ranchers' access to such technological innovations. These include improved genetics developed using a range of breeding methods, such as gene editing, genomic enabled predictive breeding, and genetic engineering.

You indicated a prime example of this when noting the lengthy regulatory approval process for feed additives and the significant impact these products can have on reducing emissions from livestock. It is important for FDA and other regulatory bodies to find an appropriate risk-based level of regulation of products such as feed additives or those utilizing biotechnology, without stalling innovation. We urge this Committee to take a closer look at the regulatory process for these innovative products such as feed additives which promote public health and animal well-being while reducing environmental impacts.

Additionally, we encourage all agencies that regulate the food and agriculture sector to take a look at modernizing and streamlining approaches toward regulating products of biotechnology, especially as they have the potential to mitigate climate impacts, in order to keep pace with science and allow agriculture to have a positive role in reducing our nation's collective impact on the climate.

Question 2. On a very similar note, I firmly believe the extraordinary achievements in biotechnology over the past several decades have given our farmers and ranchers innovative tools to produce higher yields with less inputs as well.

For example, genetically engineered Nitrogen-fixing bacteria is used as a biofertilizer to enhance the plants' nutrients all while reducing soil runoff. I feel these cutting-edge technologies are also crucial for the Administration's goal to achieve additional, measurable, and verifiable carbon reductions and sequestration in agriculture.

As the agriculture industry continues striving to play the role of a solution to climate change, what are ways to ensure farmers have access to and the interest in deploying new tools for climate impact such as biofertilizers and other biological products?

Answer. As you note Congressman, we are in the midst of tremendously exciting advancements in agriculture developed through the use of biotechnology that can help the farmers' and ranchers' bottom lines while making significant contributions to our country's climate change objectives. These innovative technologies allow new plant varieties and animal breeds to continue to produce more with less—less water, less land, fewer inputs, and lower emissions. With the publication of USDA's final SECURE Rule in August of 2020, the regulatory framework for USDA is set. However, we believe that there are other areas where USDA can assist with furthering the adoption of biotechnology and its corresponding benefits. For example, as part of its responsibility under the Coordinated Framework, USDA should continue to be proactive in encouraging the Environmental Protection Agency (EPA) and the Food and Drug Administration (FDA) to publish risk- and science-based biotechnology regulations and guidance that foster innovation and increase the overall adoption of new biotechnologies.

Question 3. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. While digesters have tremendous potential for producers and our greater national climate mitigation efforts, I often hear how hindered their adoption can be.

Would any of you care to touch on the barriers your organizations have seen to a more widespread adoption of digesters, and ways we could help foster increased access to this technology?

Answer. We also believe methane digesters have the potential to play a major role in helping dairy and livestock operations reduce emissions, but as you said, producers experience various barriers to installing this technology on their operations. The biggest impediments we hear about from producers are the extraordinary upfront installation costs as well as the human and financial resources needed to maintain the functionality of the digester long-term. Furthermore, identifying and maintaining profitable outlets for energy produced by the digester, such as through natural gas pipelines or creating electricity for the grid that returns a fair price to the producer, are significant challenges. Farmers already have full-time jobs and often don't have the time, expertise or financial resources to maintain a digester in a way that increases their bottom line. This is especially true for smaller producers where the economics of having a digester do not pan out for their operation size. However, we believe farmer co-ops could play a major role in mitigating these costs

and risks, especially with the help of USDA programs such as the Rural Energy for America Program (REAP).

REAP is an oversubscribed program and is in critical need of additional funding to meet demand. Expanding REAP's eligible entities to include farmer co-ops, regardless of the co-op's size, would help facilitate the wider adoption of renewable energy technologies such as anaerobic digesters. Co-ops are already trusted partners for farmers and could therefore play a major role in assisting with the adoption of this technology on behalf of their members to take the burden off of their producer-owners. As you noted, these are highly effective climate mitigation tools for reducing, destroying and converting methane and nitrous oxide emissions from livestock manure and other waste. We just need to break down the significant barriers to adoption facing producers and make digesters a more viable tool in the agriculture industry's climate mitigation strategy.

Question 4. Last May, USDA announced a \$10 million initiative to quantify the climate benefits of CRP contracts. When we idle land in the U.S., it sends a market signal to U.S. competitors to plant more which can result in negative environmental outcomes. For example, in 2018, *Reuters* reported that as the world's largest soybean exporter, Brazil had plowed under more than ½ of the Cerrado, a vital storehouse for carbon dioxide.

Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Answer. The supply and demand effects of a CRP sign-up domestically and internationally can vary from being very great to quite small, depending on the type of land involved or being targeted in the sign-up, the number of acres involved, and the other major highly variable forces at work that drive supply and demand. Such effects can have implications for greenhouse gas emissions. So yes, in general, USDA should take the effects on carbon emissions into account when making a CRP sign-up decision but must do so along with multiple other considerations that are relevant to that decision. Given that these considerations do not all lead to the same conclusion, USDA's task is to find the correct balance.

Response from Kristin Weeks Duncanson, Owner and Partner, Duncanson Growers; Member, AGree Economic and Environmental Risk Coalition*

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. On a very similar note, I firmly believe the extraordinary achievements in biotechnology over the past several decades have given our farmers and ranchers innovative tools to produce higher yields with less inputs as well.

For example, genetically engineered Nitrogen-fixing bacteria is used as a biofertilizer to enhance the plants' nutrients all while reducing soil runoff. I feel these cutting-edge technologies are also crucial for the Administration's goal to achieve additional, measurable, and verifiable carbon reductions and sequestration in agriculture.

As the agriculture industry continues striving to play the role of a solution to climate change, what are ways to ensure farmers have access to and the interest in deploying new tools for climate impact such as biofertilizers and other biological products?

Answer. Innovation is critical in helping farmers address the threats from climate change. We try new things on our farm every year. This year we are again modifying our cover crop seed mix, growing rye as a cover to sell for seed, and transitioning 100 acres from conventional to organic corn.

Biologics are piquing the interest of farmers partly as a result of consumer demands for sustainability and partly because of widening weed resistance to traditional crop protection products. Farmers are usually quick to adapt biotechnology in many forms. The opportunity to reduce N use for cost and environmental reasons are good motivators for adapting to biologics but, like anything, you have to balance the use.

The trusted advisors that we consult will play the biggest role in deploying these technologies: our crop consultant, research from our land-grant universities, and our local co-op. And we all know that farmers watch either closely and farmer networks are key. When safer, more environmentally-friendly products work on one farmer's crop, her neighbors will take note.

Question 2. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts

* **Editor's note:** Ms. Duncanson did not have a response for *Questions 2-3*.

are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Response from Hon. Heidi Heitkamp, Co-Chair, Farm and Forest Carbon Solutions Task Force, Bipartisan Policy Center

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. While digesters have tremendous potential for producers and our greater national climate mitigation efforts, I often hear how hindered their adoption can be.

Would any of you care to touch on the barriers your organizations have seen to a more widespread adoption of digesters, and ways we could help foster increased access to this technology?

Answer. Anaerobic digesters work best at farms that collect large amounts of manure as a liquid or slurry each day. An anaerobic digester is a closed system that harnesses the natural process of anaerobic digestion to produce biogas and other useful coproducts. The U.S. Environmental Protection Agency (EPA) AgSTAR Program estimates that biogas recovery systems are technically feasible at over 8,000 large dairy and hog operations alone.¹ Overall, 317⁽¹⁾ anaerobic digesters are operating at livestock farms in the United States. Policy opportunities to address barriers and increase access to digester technology include:

- **Providing Financial Assistance:** One of the biggest obstacles to the widespread adoption of on-farm anaerobic digestion has been cost. To help pay for up-front capital costs, anaerobic digester operators may use several *funding sources*,⁽²⁾ * including grants, cash reimbursements, loan guarantees, industrial bonds, private funding, and other cost-sharing agreements. USDA programs that fund anaerobic digesters include the Rural Energy for America Program (REAP) and the Natural Resources Conservation Service (NRCS) Environmental Quality Incentives Program (EQIP).
- **Facilitating Connection to Markets:** In addition, up-front capital and operating costs may be offset by revenue generated from the digester system's operation. These include the sale of electricity, fuel, and other co-products—like soil amendments, compost, and fertilizer—that are generated by the system. Examples include innovative American-made fertilizer, seed and agriculture inputs, and retail, including access to retail through wholesale and distribution markets.²
- **Assisting with Project Planning and Development:** It can be complicated to ensure that enough funding will be available to make an individual anaerobic digester project pencil out in terms of both up-front capital costs and ongoing

* **Editor's note:** footnotes annotated with † are retained in Committee file.

²USDA Announces Plans for \$250 Million Investment to Support Innovative American-made Fertilizer to give US Farmers more choices in the Marketplace | USDA † (<https://www.usda.gov/media/press-releases/2022/03/11/usda-announces-plans-250-million-investment-support-innovative>).

operating and maintenance costs. Technical assistance is critical to break down information barriers, especially for medium and small farms. Anaerobic digesters can be worth the investment at a small farm depending on the rate obtained for the sale of electricity back to the local utility, from carbon credits, or from potential sales of system-related coproducts (*e.g.*, composts and fertilizers). Thermal applications for the biogas may be an excellent option in place of electricity generation. Also, smaller farms may benefit from co-digestion of other biomass feedstocks (*e.g.*, food scraps) to boost biogas production and increase the financial viability of the project. Examples include the aforementioned USDA REAP and the EPA AgStar programs.

- **Research & Development:** Use of anaerobic digestion at poultry and beef operations is also growing as new technologies enter the market. Although projects at poultry and beef farms are technically feasible, their economic feasibility can vary.

Question 2. Last May, USDA announced a \$10 million initiative to quantify the climate benefits of CRP contracts. When we idle land in the U.S., it sends a market signal to U.S. competitors to plant more which can result in negative environmental outcomes. For example, in 2018, *Reuters* reported that as the world's largest soybean exporter, Brazil had plowed under more than half of the Cerrado, a vital storehouse for carbon dioxide.

Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Answer. Many factors influence producer decisions to bring new lands into production or to enroll or re-enroll in programs like the USDA Conservation Reserve Program (CRP), including the overall availability of prime agricultural lands, costs of converting lands from rangeland or forests to cropland, expected soil moisture conditions and input costs. According to recent USDA analysis from the Natural Resources Inventory (NRI), only 1.3% of prime farmland is enrolled in the CRP, while 25 times this amount of prime farm acreage (or over 100 million acres) exists outside the program that is presently not in crop production and is managed as rangeland, pastureland, and forestland.³

With this additional supply of high-quality potential cropland already available and the relatively marginal production potential within CRP acreage, it is unlikely that a drastic change to farm CRP acres intensively would have significant impacts on overall production yields and thus influence global supply trends and equally complex planting and land-use decisions in foreign markets. While CRP likely has no measurable impact on deforestation rates in Brazil and associated emissions, USDA no doubt must maintain a vested interest in combating tropical deforestation and land conversion that results in harmful impacts to wildlife, water supplies and global greenhouse gas emissions.

USDA analysis also shows that CRP is no longer dominated by whole farm and whole field enrollment, but instead is comprised of grassland that is regularly hayed and grazed (especially under flexibility afforded under drought conditions), a series of small buffers, filter strips, and wetlands at the edges of fields (predominantly installed to provide targeted water quality benefits) and some lands in forests or shelterbelts. Accordingly, CRP is a vital part of producers' working lands operations, useful in adapting to changing climate conditions and integral to their commitments to stewardship and sustainability.

The capacity to quantify these conservation benefits remains critical to enhancing the value proposition of U.S. agriculture broadly and more specifically in ensuring that producers are acknowledged and accounted for through their commitments to combat climate change through voluntary and incentive-based programs. In response to corporate sustainability initiatives, emerging trade dynamics and other factors incorporating climate considerations in the marketplace, CRP is likely to continue to be an asset for U.S. producers.

Response from Shakera Raygoza, Owner, Terra Preta Farm; CFAP2 Technical Assistant, National Young Farmers Coalition

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts

³March 2022 Letter to Grain and Field Association from Secretary Vilsack regarding the Conservation Reserve Program and the Ukraine Crisis: † <https://www.politico.com/f/?id=0000017f-efb9-d0cd-a3ff-ffb9e0830000>.

are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. While digesters have tremendous potential for producers and our greater national climate mitigation efforts, I often hear how hindered their adoption can be.

Would any of you care to touch on the barriers your organizations have seen to a more widespread adoption of digesters, and ways we could help foster increased access to this technology?

Answer. Lack of awareness on anaerobic digesters, costs, and city regulations are the barriers we face. Young farmers also largely prefer other mechanisms for climate mitigation, such as compost management.

Question 2. Last May, USDA announced a \$10 million initiative to quantify the climate benefits of CRP contracts. When we idle land in the U.S., it sends a market signal to U.S. competitors to plant more which can result in negative environmental outcomes. For example, in 2018, *Reuters* reported that as the world's largest soybean exporter, Brazil had plowed under more than half of the Cerrado, a vital storehouse for carbon dioxide.

Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Answer. My recommendation is that USDA should focus on offsets domestically, as well as climate-smart agriculture, so that we can be leaders internationally on this front.

Response from Hon. Glenda Humiston, Ph.D., Vice President, Agriculture and Natural Resources, University of California; Director, Agricultural Experiment Station and Cooperative Extension Service

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. While digesters have tremendous potential for producers and our greater national climate mitigation efforts, I often hear how hindered their adoption can be.

Would any of you care to touch on the barriers your organizations have seen to a more widespread adoption of digesters, and ways we could help foster increased access to this technology?

Answer. Funding is needed for both support dairy farms installing equipment, such as CDFA's Dairy Digester Research and Development Program (DDRDP), and infrastructure to facilitate distribution of the renewable natural gas (RNG). This takes both investment and opportunities to scale up projects. Below is a great example:

Aemetis Biogas Central Dairy Digester Project's dairy renewable natural gas (RNG) cleanup and compression unit and interconnection with PG&E's gas pipeline in Keyes, California. This project involves a cluster that, when complete, will include 60 dairy farms. It currently counts eight dairy operations, funded partly by CDFA's Dairy Digester Research and Development Program (DDRDP) with more than \$11 million in 2018 and 2020. In addition to the CDFA funding, award recipients provided another \$14 million in matching funds for the total cost of over \$25 million in funding. The projects generate RNG which is sent to the newly inaugurated centralized conditioning facility for processing and injection into the utility common carrier natural gas pipeline. The methane greenhouse gas reductions achieved through these projects are estimated to be equivalent to removing 18,000 passenger vehicles from the roads each year for 10 years or providing electricity to 17,000 homes each year for 10 years.

Question 2. Last May, USDA announced a \$10 million initiative to quantify the climate benefits of CRP contracts. When we idle land in the U.S., it sends a market signal to U.S. competitors to plant more which can result in negative environmental outcomes. For example, in 2018, *Reuters* reported that as the world's largest soybean exporter, Brazil had plowed under more than half of the Cerrado, a vital storehouse for carbon dioxide.

Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Answer. USDA should take many factors into account when creating policy to reduce carbon emissions in agriculture, such as effective practices, cost/benefit analyses, and ecosystem responses.

Response from Joe L. Outlaw, Ph.D., Professor, Extension Economist, and Co-Director, Department of Agricultural Economics, Agricultural and Food Policy Center, Texas A&M University

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. Another area I feel strongly that our farmers and ranchers stand the opportunity to find benefit for their bottom line as well as their sustainability efforts are through bioenergy technologies that the 2018 Farm Bill helped pave the way for. One such technology that comes to mind is the use of anaerobic digesters to turn farm waste into valuable energy. While digesters have tremendous potential for producers and our greater national climate mitigation efforts, I often hear how hindered their adoption can be.

Would any of you care to touch on the barriers your organizations have seen to a more widespread adoption of digesters, and ways we could help foster increased access to this technology?

Answer. Anaerobic digester technology has been available for decades without widespread adoption. Roughly 25 years ago I conducted research over this topic and found two primary reasons for slow adoption. First, the initial cost of installing the digester is substantial and in the early years of digesters, the only way to recoup and this cost was to generate electricity and sell excess electricity back into the grid to reduce farm energy costs. At that time, there were states that did not allow net metering (allowing the meter to turn backward reducing farm energy costs) so truly many early digesters were just an additional cost with limited ability to have it pay for itself. While there have always been environmental benefits to methane capture, many producers did not see that as enough of an incentive to pay the cost when the majority in the industry were not doing it.

Over time, digester technology has evolved and programs such as those administered by the State of California have paid for the installation of the digester (even outside of California) with stipulations the resulting energy is shipped to California. Currently there are companies who will pay the installation costs for the farmer in exchange for control over the energy produced. Currently I have a masters student who is doing an economic analysis of the new approaches which should be completed early next year.

Question 2. Last May, USDA announced a \$10 million initiative to quantify the climate benefits of CRP contracts. When we idle land in the U.S., it sends a market signal to U.S. competitors to plant more which can result in negative environmental outcomes. For example, in 2018, *Reuters* reported that as the world's largest soybean exporter, Brazil had plowed under more than half of the Cerrado, a vital storehouse for carbon dioxide.

Would this panel recommend that USDA take into consideration increased carbon emissions in competitor countries when policymakers idle productive land here at home?

Answer. I think first I would ask USDA to determine exactly where U.S. producers rank relative to our primary competitors in terms of emissions from agricultural production. Brazil has been using no-till technologies on a widespread basis for many years and could be considered by some to superior to the U.S. (if you ignore the initial burning of forests) when comparing emissions.

**A 2022 REVIEW OF THE FARM BILL
(HORTICULTURE AND URBAN AGRICULTURE)**

TUESDAY, MARCH 29, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON BIOTECHNOLOGY, HORTICULTURE, AND
RESEARCH,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Stacey E. Plaskett [Chair of the Subcommittee] presiding.

Members present: Representatives Plaskett, Delgado, Brown, Schrier, Panetta, Pingree, Carbajal, Rush, Baird, Davis, Bacon, Jacobs, Balderson, and Letlow.

Staff present: Lyron Blum-Evitts, Malikha Daniels, Martin Prescott III, Emily Pliscott, Ricki Schroeder, Patricia Straughn, Jennifer Tiller, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. STACEY E. PLASKETT, A
DELEGATE IN CONGRESS FROM VIRGIN ISLANDS**

The CHAIR. This hearing of the Subcommittee on Biotechnology, Horticulture, and Research entitled, *A 2022 Review of the Farm Bill: Horticulture and Urban Agriculture*, will come to order.

Welcome, and thank you for joining us for today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today. And this is my opening statement.

Good morning, and thank you to my colleagues and our witnesses for joining me today as we review the 2018 Farm Bill, Horticulture Title, and urban agriculture. This will be a two-panel hearing where we will hear from the USDA Under Secretary Moffitt and Natural Resources Conservation Service Chief Cosby on our first panel, followed by a second panel with industry stakeholders and producers.

The Horticulture Title of the farm bill covers programs that support the specialty crop industry, USDA-certified organic products—both crops and animals—hemp, local agricultural markets, and more. In my district of the U.S. Virgin Islands, farmers are mostly small and local producers. Many of these producers participate in

programs such as the USDA's local agriculture programs, among others, so today's topics are very important to me.

While other farm bill titles can benefit these sectors, today's conversation will focus on the Horticulture Title provisions and the specific provisions related to urban agriculture in the 2018 Farm Bill. Some of these provisions include the creation of the Local Agricultural Market Program to support the development, coordination, and expansion of domestic direct-to-consumer marketing, local and regional food markets, and value-added agricultural products and the establishment of an Office of Urban Agriculture and Innovative Production at USDA to provide urban ag producers resources to take advantage of USDA programs and initiatives and to promote urban, indoor, and other agricultural practices.

Other provisions in the 2018 Farm Bill also enhanced enforcement of organic products, limited programmatic fraud, developed new technologies, strengthened USDA organic certifications, and provided organic producers with accurate data collection to ensure that organic agriculture is part of the climate-smart agriculture solutions. Producers in these sectors have been able to leverage programs in the Horticulture Title to face the challenges posed by the COVID-19 pandemic.

As we move toward a greater sense of normalcy, we are invested in making sure producers in the industry have the necessary resources in this space and particularly when it comes to addressing the unprecedented supply chain disruption and challenges to market access many producers experienced during the pandemic. Today's hearing presents an important opportunity to conduct oversight into the programs from the 2018 Farm Bill and consider how we best support producers and stakeholders.

[The prepared statement of Ms. Plaskett follows:]

PREPARED STATEMENT OF HON. STACEY E. PLASKETT, A DELEGATE IN CONGRESS
FROM VIRGIN ISLANDS

Good morning, and thank you to my colleagues and our witnesses for joining me today as we review the 2018 Farm Bill Horticulture Title and Urban Agriculture. This will be a two-panel hearing where we will hear from USDA Under Secretary Moffitt and Natural Resources Conservation Service (NRCS) Chief Cosby on our first panel, followed by a second panel with industry stakeholders and producers.

The Horticulture Title of the farm bill covers programs that support the specialty crop industry, USDA-certified organic products (crops and animals), hemp, local agricultural markets, and more. In my district of the U.S. Virgin Islands, farmers are mostly small and local producers. Many of these producers participate in programs such as USDA's local agriculture programs, among others, so today's topics are very important to me.

While other farm bill titles can benefit these sectors, today's conversation will focus on the Horticulture Title provisions and the specific provisions related to urban agriculture in the 2018 Farm Bill.

Some of those provisions include the creation of the Local Agriculture Market Program to support the development, coordination, and expansion of domestic direct-to-consumer marketing, local and regional food markets, and value-added agricultural products and the establishment of an Office of Urban Agriculture and Innovative Production at USDA to provide urban ag producers resources to take advantage of USDA programs and initiatives and to promote urban, indoor, and other agriculture practices.

Other provisions in the 2018 Farm Bill also enhanced enforcement of organic products, limited programmatic fraud, developed new technologies, strengthened USDA organic certifications, and provided organic producers with accurate data collection to ensure that organic agriculture is part of climate-smart agriculture solutions.

Producers in these sectors have also been able to leverage programs in the Horticulture Title to face the challenges posed by the COVID-19 pandemic. As we move toward a greater sense of normalcy, we are invested in making sure producers and the industry have the necessary resources in this space, particularly when it comes to addressing the unprecedented supply-chain disruptions and challenges to market access many producers experienced during the pandemic.

Today's hearing presents an important opportunity to conduct oversight into programs from the 2018 Farm Bill and consider how we should best support producers and stakeholders.

The CHAIR. I would now like to welcome the distinguished Ranking Member, the gentleman from Indiana, Mr. Baird, for any opening remarks he would like to give.

**OPENING STATEMENT OF HON. JAMES R. BAIRD, A
REPRESENTATIVE IN CONGRESS FROM INDIANA**

Mr. BAIRD. Thank you, Madam Chair. I appreciate everyone being here and appreciate all the Committee having the opportunity to have this kind of hearing.

I think this hearing marks an important step as this is our first hearing to review the Horticulture Title of the 2018 Farm Bill. So as we prepare for the next farm bill, it is important to hear from both USDA and stakeholders to learn what is working and what is not. The Horticulture Title is broad and it covers a variety of issues, including specialty crop, invasive species, plant health, crop protection tools, local agriculture markets, food safety, and hemp.

While today's hearing lends itself to provisions in title X, it is important to note there are provisions in other titles of the farm bill that impact the horticultural industry. I look forward to future oversight of these other provisions.

The specialty crop industry is very diverse and includes fruits and vegetables, tree nuts, dried fruits, and horticulture and nursery crops. The sheer diversity and unique set of challenges for this industry can make the development of specialty crop policies difficult. However, one program that has proven to be effective is the Specialty Crop Block Grant Program. This program was first funded in 2006 and provides State Departments of Agriculture funds to award promotion and marketing grants aimed at improving the competitiveness of specialty crops in the United States. I believe that one reason this program is so successful is because it allows states to fund projects that are unique to their specialty crop industries.

Another important program authorized in the Horticulture Title is the Plant Pest and Disease Management and Disaster Prevention Program, which works to strengthen, prevent, detect, and mitigate invasive species. As we all know too well, invasive species can have a significant impact on the agricultural industry. Both USDA and State Departments of Agriculture play a critical role in controlling the spread and eventually eradicating these invasive species. I am pleased that my colleagues found it necessary to maintain the significant advances made in 2014 for this program, and I look forward to learning how we can further improve this program to prevent the spread of invasive species.

Another important provision I am excited to hear more about today is the creation of the FIFRA Interagency Working Group in the 2018 Farm Bill. This working group, consisting of USDA, EPA,

Department of the Interior, the Department of Commerce, and the Council of Environmental Quality is designed to help improve the consultation process required under the Endangered Species Act for pesticide registration and registration review. I am all too familiar with just how cumbersome this interagency cooperation can be, especially in regard to the ESA. It is important that producers have continued access to these critical tools to protect their crops from damaging insects and weeds.

The past three farm bills have shown significant progress in the Horticulture Title. However, as much has changed in the world since 2018, I am eager to hear more about the impacts and challenges of these programs and suggested ways we can improve the delivery. I thank Under Secretary Moffitt and Chief Cosby and all the other witnesses for taking the time to be here with us today. Your insight and expertise and service to agriculture are greatly appreciated, and I am looking forward to having a robust conversation about programs within the Horticulture Title today.

And with that, Madam Chair, I yield back.

The CHAIR. Thank you to my Ranking Member.

I want to thank our witnesses who are with us today. We have two panels. Our first panel I am pleased to welcome two distinguished individuals. Our first witness is Ms. Jenny Lester Moffitt, who serves as the Under Secretary of Marketing and Regulatory Programs at the United States Department of Agriculture.

Our second witness for the first panel is Mr. Terry Cosby, who is the Chief of the Natural Resources Conservation Service. Welcome you both today. We will now proceed to hearing your testimony. All other Members are requested to submit their opening statements for the record so that the witnesses may begin their testimony and to ensure there is ample time for questions. Each of our witnesses will have 5 minutes. The timer should be visible to you, and that timer will count down to zero, at which point your time will have expired.

Under Secretary Moffitt, thank you so much for joining us and please begin when you are ready.

STATEMENT OF HON. JENNIFER LESTER MOFFITT, UNDER SECRETARY FOR MARKETING AND REGULATORY PROGRAMS, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Ms. MOFFITT. Thank you, Chair Plaskett, Ranking Member Baird, and Members of the Committee. Thank you so much for the opportunity to be before you today to share the work of the United States Department of Agriculture's efforts to build more and better markets for American agriculture.

In my role at USDA, I have had the honor of meeting people around the nation who are building innovative partnerships to solve problems in their communities. Earlier this month, I visited Atlanta. Seven years ago, the public transit authority there, MARTA, partnered with farmers and organizations to open fresh markets at transit stations located in neighborhoods with limited food access. In 2018, the program received funding through the Local Food Promotion Program funded through the farm bill to expand their reach. When I visited, I saw the impact firsthand of peo-

ple having access to fresh, healthy produce. The program shows just how important partnerships are to addressing local and regional food needs. And it demonstrates one of the core values of our goals at USDA, to create more and better markets for farmers and consumers, not from the top down, but from the bottom up and the middle out. This is the power of the farm bill. And the authorities in funding provided in it by Congress are helping us strengthen and build a more resilient food system in communities across the country in a variety of ways because there is no one-size-fits-all solution to approaching the challenges faced by producers and consumers.

As I travel the country, I hear repeatedly how important the Local Agriculture Marketing Program is to farmers and to communities. That is why we dedicated \$130 million from the American Rescue Plan Act (Pub. L. 117-2) to expand and strengthen opportunities for farmers to sell to institutions such as universities, hospitals, and settings operated by local, Tribal, and state governments through the LAMP Program. And that is why we have also dedicated \$600 million to creating new programs to build partnerships that improve local food procurement opportunities and marketing channels while providing nutritious food to food banks, pantries, and schools.

Partnerships are critical to building more and better markets. Just look at organic agriculture. The public-private partnership that drives the Certified Organic Program is thriving. Between 2019 and 2020 organic retail sales increased 13 percent. We will continue to protect the organic seal, supporting aspiring farmers, and strengthen the organic program.

So that is why I am pleased today to announce that the review of the Origin of Livestock final rule is complete, and details will be made later today. I know many Members of this Committee have worked for a long time on this rule, and we are thankful for your leadership. This rule will give organic producers more opportunities to compete fairly in the market by establishing clear standards that ensure more consistent production and certification practices. At the same time, we need to support farmers transitioning to organic to provide increased opportunities for mentorship. With partnership in mind, we are developing this initiative as Secretary Vilsack announced last summer to invest at least \$200 million to support farmers transitioning to organic.

Partnership also drives us as we look forward into the future. In partnership with State Departments of Agriculture, we awarded \$170 million last year in the Specialty Crop Block Grants to fund the growing need for critical research, marketing, and education programs for specialty crops. And this year we have another \$73 million available to support more of this work. We have also partnered with 45 states and 48 separate Tribes to approve plants for hemp production, creating new income streams and supporting broader rural prosperity.

And, as we enhance markets to build new ones, we will continue to create partnerships with technical assistance providers so that farmers and ranchers, especially those who have been historically underserved, have support navigating our programs because having the programs is not enough. We must also ensure access.

In addition, we continue the relationships with trade partners around the world as we grow international markets for American agriculture. Trade is an essential economic driver in many rural communities and supports more than 1.3 million American jobs.

I would be remiss if I did not recognize the dedicated staff at USDA, at the Agricultural Marketing Service, and at the Animal and Plant Health Inspection Service who work hard to strengthen American agriculture. In fact, APHIS is celebrating its 50th anniversary this weekend, and their work ensuring animal and plant health has helped build better markets for both domestic and international trade partners abroad.

Thank you again for the opportunity to be here today and for your leadership. I look forward to working collaboratively with Members of this Committee and Congress as you work to draft the 2023 Farm Bill and continue to champion American agriculture. I am happy to address any questions you have. Thank you.

[The prepared statement of Ms. Moffitt follows:]

PREPARED STATEMENT OF HON. JENNIFER LESTER MOFFITT, UNDER SECRETARY FOR MARKETING AND REGULATORY PROGRAMS, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

[Chair] Plaskett, Ranking Member Baird, and Members of the Subcommittee, thank you for the opportunity to appear before you today to share the U.S. Department of Agriculture's (USDA) efforts to build more and better markets for producers and consumers, including through the implementation of the Horticulture Title of the Agriculture Improvement Act of 2018 (2018 Farm Bill).

It is an honor to serve the American people as the Under Secretary for Marketing and Regulatory Programs and to be with you here today. My mission in this job is simple. It's to be the best advocate I can be for the farmers, ranchers, producers, consumers, and communities we serve.

My roots are in agriculture. I grew up on a farm in a rural area where I saw firsthand how important farmers, ranchers, and producers are to their communities and to our country. I know, and you know, how hard they work and the challenges they face every single day to provide the food, fiber, and fauna that shape so many aspects of our economy and way of life.

During the pandemic, we saw just how hard individuals in roles across all links in the food supply chain worked to feed Americans and just how many challenges they faced. We saw the last few years highlight long-term systemic challenges, even as we also saw the food system adapt, innovate, and persevere.

Now we as a country have a unique chance to learn from the lessons of the last few years and move beyond them to build upon that adaptation and innovation to support a food system that's stronger, more resilient, and more equitable than before. Our ability to feed ourselves is a matter of national security, nutrition security, and economic security. As President Biden has said, we have the opportunity to build the economy not from the top down, but from the bottom up and the middle out. This work provides a direct opportunity to invest in rural communities in ways that will support prosperity for generations to come.

That's why USDA is committed to addressing those challenges by building more and better local, regional, national, and international markets for producers and consumers while ensuring animal and plant health. I'm excited to share more details on that work with you today, and to work with the Committee and Congress as you draft the next farm bill.

Local Agriculture Market Program

There is no one size fits all to fix to these challenges. Success is going to take new partnerships, new innovations, and new ways of thinking and a recognition that solutions are likely to vary place to place. Thanks to Congress, we already have some strong tools in our toolbox, including the Local Agriculture Market Program (LAMP) that I would like to highlight first today.

Just last month, I visited an innovative collaboration in Georgia. Now, Georgia is a state with a lot of fruit and vegetable production, but in bustling Atlanta, access to these local healthy fruits and vegetables has been limited in certain communities. The Metropolitan Atlanta Rapid Transit Authority (MARTA) came together with or-

ganizations including Community Farmers Markets, Atlanta Community Food Bank, Open Hand, and Wholesome Wave Georgia to start fresh markets at five transit stations. These markets accept cash, credit, debit, and Supplemental Nutrition Assistance Program (SNAP) Electronic Benefit Transfer cards. SNAP benefits are doubled at the market through the Double Up Food Bucks program. This work, now in its seventh year, was boosted with a USDA Local Food Promotion Program grant funded by the 2018 Farm Bill, which is a part of the larger LAMP authorization. I truly loved seeing how this innovative partnership transformed food and nutrition insecure communities into opportunities both for the people living there and the farmers who grow produce in the state.

The Local Food Promotion Program that supported the MARTA project is part of LAMP, which was established in the 2018 Farm Bill, with Congress providing \$50 million a Fiscal Year in mandatory funding starting in FY19. Congress has also provided discretionary appropriations for some of the programs that are a part of LAMP and in 2021 a supplemental appropriation of \$100 million was provided for LAMP through the Consolidated Appropriations Act of 2021. USDA's LAMP grant programs also consist of the Farmers Market Promotion Program and the Regional Food Systems Partnerships at Agricultural Marketing Services (AMS) and the Value-Added Producer Grants run through USDA's Rural Development.

As I have traveled the country, I have heard repeatedly how AMS's LAMP grants have been a catalyst to support and energize local and regional food systems. It's timely that we highlight these programs today since March is National Nutrition Month. So many of the recipients I've met with are making a real difference when it comes to nutrition security of their communities while also building more and better markets for producers.

In Massachusetts, for example, I visited a farm that had received funding resulting from a Farmers['] Market Promotion Program grant to the Southeastern Massachusetts Agricultural Partnership. With these funds, the farm is constructing a new farmstand to help build and expand their local markets, particularly focused on growing their customer base to include those using SNAP benefits to ensure that everyone, regardless of income level has access to healthy, fresh food and are able to support their local farmers.

In California, I had the opportunity to meet with Maria, a farmer from just outside Salinas, and hear her story and her struggles as a farmer who hasn't had the same access to programs and markets due to language barriers, size barriers, and production barriers. Thanks to a Farmers['] Market Promotion Program grant and a Local Food Promotion Program grant received by a local organization, the Community Alliance with Family Farmers, she was able to access in-language support and build market connections including with institutional, food bank, and pantry partners.

Supporting farm to institution growth is a real under tapped opportunity for many local food systems. That is why we have dedicated \$130 million in supplemental American Rescue Plan (ARP) Act funding to promote competition and create more and better markets for local and regional food producers by expanding and strengthening opportunities to sell to institutions, such as universities, hospitals, and settings operated by local, tribal, and state governments. The supplemental ARP funding USDA has dedicated to this farm to institution work is divided into \$65 million for Fiscal Years 2022 and 2023 each.

Local Food Purchase Assistance Cooperative Agreement Program and the Local Food for Schools Cooperative Agreement Program

I'd be remiss if I didn't mention that we are also currently seeking applications from states, Territories, and Tribes for the Local Food Purchase Assistance Cooperative Agreement Program and the Local Food for Schools Cooperative Agreement Program. As the LAMP programs work to build capacity for producers to access new markets, these two programs are designed to build and engage local procurement marketing channels while providing nutritious food for food banks, pantries, and schools.

Through both of these programs, we are working with states, Territories, and Tribes to assist them in building their own unique and flexible plans to purchase and distribute domestic foods from local, regional, small, and underserved farmers and ranchers for use in nutrition programs, building the necessary infrastructure for local and regional procurement along the way.

These programs demonstrate the incredible power and opportunity of partnerships and how they strengthen American agriculture by building new markets and enhancing existing markets for producers of all backgrounds, scale, and scope, as well as how they can work to build a more resilient local and regional food system.

These efforts put rural prosperity front and center, supporting a circular economy where the value added to food happens and stays locally. With these programs both the investment in the food purchased, as well as the food delivered, stays in the broader community, supporting longer term economic growth.

Organic Production

Our work at USDA building more and better market opportunities for producers is also evident in our work on organic markets. Organic agriculture provides a climate-smart option, and ever-changing consumer tastes call for a variety of products and production methods. Nowhere else is that clearer than in certified organic production where consumer demand continues to climb.

At the start of 2022, there were 28,403 certified organic businesses in the United States. U.S. organic retail sales totaled a record \$61.9 billion in 2020, up approximately 13 percent from 2019. Since being confirmed, I've met with current and aspiring organic farmers where I heard about the importance of consistent national standards as well as the need to keep supporting and educating certifiers, and the need to provide wraparound support for transitioning farmers. As someone who grew up on and later managed an organic farm myself, I understand how important this is.

When my dad decided to convert to organic production in the 1980's, I watched him reach out to fellow growers to seek mentorship, guidance, and to get their hands-on expertise on issues like production practices and certification. He was fortunate because we had folks he knew, but not everyone who wants to get into organic agriculture has that same access and support. Those connections are crucial to new and beginning farmer success.

Of course after farmers have transitioned to certified organic production, there also must be a supply chain and markets ready to support organic production. I know many Members of this Committee paid close attention to market disruptions in organic dairy production last year, particularly in the Northeast. This has underscored the broader need to build long-term resilience of regional dairy supply chains and is why USDA announced that we are investing \$80 million in American Rescue Plan Act funding, split between the four existing Dairy Business Innovation Initiatives, to further support processing capacity expansion, on-farm improvements, and technical assistance to dairy producers, including those focused on organic markets.

The Organic brand, supported by robust national standards, is well-recognized and trusted by many consumers. To protect this important brand and ensure consistent standards for our producers, we are working on several rules.

First, we are moving forward with the Origin of Livestock and Organic Livestock and Poultry Practices rules to set how dairy cattle can be transitioned into organic production and clarify the USDA organic standards for these industries, including around production, transport, and slaughter. Both rules are currently under review and I know U.S. organic producers are eager to see them enacted soon.

We are also working to finalize the Strengthening Organic Enforcement rule-making, which will implement the farm bill's Title X provisions to significantly update organic standards to respond to industry growth and the growing complexity of organic supply chains. The rule will also incorporate many recommendations from the National Organic Standards Board to strengthen the integrity of the USDA organic seal. The final rule will be submitted to the White House Office of Management and Budget in the coming months.

Enforcement is a critical component of our organic standards so that consumers have confidence in the brand. Our work to establish the "Organic Agricultural Product Imports Interagency Working Group," as set forth in the 2018 Farm Bill enables USDA and Customs and Border Protection (CBP) to advance joint work on organic import oversight, organic enforcement, and data sharing. This working group meets regularly, with the following key successes:

- facilitating trademark protection of the USDA organic seal;
- facilitating data access to CBP systems;
- enabling AMS staff positioning in the CBP Commercial Targeting and Analysis Center (CTAC);
- supporting inter-agency collaborative efforts to build the NOP electronic organic import certificate; and
- providing essential feedback for the Strengthening Organic Enforcement rule.

This collaboration with CBP also extends to our electronic organic import certificate in CBP's import system (called the Automated Commercial Environment—ACE). This system is designed to modernize existing international organic trade tracking and data collection systems. The organic import certificate was launched

in Spring 2020 and is now being used on an optional basis by organic importers. Certifiers, who generate the import certificate, do not have access to the CBP system, so next, AMS conducted a pilot test and desktop exercises to identify requirements for a fully electronic workflow that will generate and validate certificates outside the CBP system. This technology, which will expand the existing Organic Integrity Database, is now being developed and will be launched concurrently with the implementation of the Strengthening Organic Final Rule. The outcome will be effective oversight of organic imports without slowing legitimate and vital trade.

Hemp

Part of building new markets includes opening the door to new crops to create income streams in support of broader rural prosperity. The 2018 Farm Bill directed USDA to establish a national regulatory framework for hemp production in the United States. USDA published a final rule on January 19, 2021, that provided regulations for the production of hemp in the United States, which became effective on March 22, 2021.

To foster public awareness and input during the regulation-drafting stage, USDA conducted a webinar that hosted more than 4,100 registrants from around the country, engaged with Native American Tribal representatives on multiple occasions, maintained ongoing interaction with multiple internal and external government agencies with related responsibilities, and engaged with global companies with interest in U.S. hemp production. USDA had held hundreds of meetings with industry stakeholders and other Federal partners.

USDA worked diligently to quickly review and approve state hemp plans before the December 31, 2021, statutory deadline. Forty-five states are now operating under USDA approved plans. USDA administers the hemp programs in New Hampshire, Mississippi, Hawaii, North Carolina, and Wisconsin. We continue to work very closely with Tribes to develop their hemp programs and have approved programs for 48 separate Tribes.

Throughout 2020 and 2021, the hemp program developed the Hemp Electronic Management Platform (HeMP) which collects licensing, mapping, testing, disposal, and remediation data from all U.S. hemp producers for sharing with law enforcement as required under the 2018 Farm Bill. The program continues to conduct extensive and critical stakeholder outreach for USDA producers, states, Tribes, laboratories, and law enforcement.

Specialty Crop Block Grants

As we work to enhance markets into the future, the need for research, innovation, education, and marketing only grows. In my previous role at the California Department of Food and Agriculture, I know first-hand how important the Specialty Crop Block Grant Program (SCBGP)—authorized and funded through the farm bill—is to the states as they partner with the specialty crop industries to fund critical research, marketing, and education programs that best meet the needs in their states. In California, we funded pest and production research which included key climate-smart agriculture priorities as well as non-research projects, such as, education programs for beginning farmers and marketing programs.

Section 101 of the Specialty Crops Competitiveness Act of 2004 (7 U.S.C. 1621) authorized USDA to provide state assistance for specialty crops, and the 2018 Farm Bill funded the SCBGP through 2023. USDA administers this program by awarding grants to State Departments of Agriculture to enhance the competitiveness of fruits and vegetables, tree nuts, nursery crops.

Last year, USDA announced \$170 million in grants, which was made possible thanks to \$73 million from the 2018 Farm Bill and an additional \$97 million that Congress provided through the Consolidated Appropriations Act of 2021. Then on January 25, 2022, USDA announced \$72.9 million in available funding for 2022.

This past January, I was able to travel to Washington State to see these grants in action as they support important production research and innovation, as well as market development for apple, pear, and cherry growers in the Pacific Northwest. From research to education to marketing, the program is supporting specialty crops to be more competitive and resilient.

In an effort to further quantify and demonstrate the impact of this program, AMS established standardized national outcome measures to demonstrate the program's performance toward fulfilling its statutory purpose; review annual performance reports, final reports, audit results, and final financial statements; posts final performance reports on the SCBGP website; and disseminate project findings at appropriate meetings and conferences. These updated performance measures for the Specialty Crop Block Grant Program, the Farmers['] Market and Local Food Promotion Program, the Acer Access and Development Program, and the Dairy Business Inno-

vation Initiatives will not only lead to greater transparency but allow us to disseminate valuable information about the programs. Specifically, for the SCBGP the new standardized national outcome measures will allow for a complete evaluation of the increases in consumption and consumer purchasing of specialty crops, access to specialty crops, food safety knowledge, pest and disease control processes, development of new seed varieties, expanded research, and improved environmental sustainability. The updates, which were announced last July,¹ will apply to the Fiscal Year 2022 grant cycle and beyond.

International Markets and Other Activities

As part of our push for more and better markets, we are also looking to increase the markets outside of the country for American growers. As many farmers and ranchers will tell you, and as many of you know well, trade is essential and is an important economic driver in many rural communities. The United States exported a record \$172.2 billion in farm and food products in FY21, up 23 percent from FY20. Producers, processors, exporters, and rural communities have all benefited, with each \$1 billion in U.S. agricultural exports stimulating another \$1.14 billion in domestic economic activity and supporting more than 7,700 full-time civilian jobs. That means exports support more than 1.3 million American jobs, not just on the farm but also in related industries such as food processing and transportation.

Part of enabling this trade success is by ensuring animal and plant health for products coming into the U.S. and those that we are sending to other countries. This means doing all we can to keep foreign pests and diseases out of the country so that our producers can ship their products all around the U.S. and to overseas trading partners who can trust that our products meet their standards. Our Animal and Plant Health Inspection Service (APHIS)—and its valuable employees—strives every day to protect the health and value of American agriculture. In just a few days, on April 2, APHIS will be celebrating its 50th anniversary.

These unsung heroes at APHIS have, for fifty years, kept harmful pests and diseases out and helped to maintain and expand access for healthy agricultural products.

Most of America might not see their work on a day-to-day basis, but they benefit from their impact constantly. I know that I did when I worked on my family's organic farm and when I served at the California Department of Food and Agriculture. As we approach this important anniversary, we should all take a moment to appreciate what the agency has accomplished and how critical its people have been to its success. APHIS, through the hard work of its employees, has provided incalculable value to American agriculture and will continue to ensure that U.S. farmers and ranchers have access to more markets for their healthy products for the next fifty years. I would also like to thank this Committee and Congress for the additional support that was provided to APHIS through the American Rescue Plan to conduct much needed monitoring and surveillance of susceptible animals for SARS-CoV-2 that is supported by our One Health collaboration. Although not the subject of today's hearing, it is another critical part of APHIS' work to prevent, detect, report, and respond to all potential emerging threats to American agriculture, be it plants or animals, and human health.

Outreach and Equity

I want to note, that even as we roll out these incredibly impactful programs, we are doing a disservice if they are not accessible to all. From running my family farm, I experienced firsthand how difficult it can be to maneuver through all the pieces needed to apply for a grant or loan from USDA. Farmers and ranchers don't have extra hours in their day to navigate all the layers of application processes on their own. Having readily available technical assistance to help our farmers and ranchers access all of these programs is just as important as having these programs in place.

For communities that have been historically underserved by the Department, the need for wraparound technical assistance is even greater. That's part of why I'm so proud of the technical assistance work USDA is doing, like the newly announced effort for meat and poultry processors that includes partnerships with the Flower Hill Institute and Intertribal Agriculture Council. These efforts are only the start and I look forward to building on this work in the months and years to come.

Conclusion

Thank you again for the opportunity to be here today and for your leadership in support of American agriculture and your trust in USDA. USDA is committed to

¹<https://www.ams.usda.gov/services/grants/performance-measures>.

working on behalf of the American people to foster more and better markets while we also support climate smart agriculture and forestry, address nutrition and food insecurity, build rural prosperity with a more circular economy, and ensure equity and inclusion in all that we do. I look forward to working with each of you to advance these shared goals through the 2023 Farm Bill.

Working with Congress, I believe we can—and must—continue to support and strengthen markets for American agriculture. Together, we have an opportunity to enhance existing markets, build new markets, and ensure fair markets to enhance rural prosperity, reduce nutrition insecurity, and combat climate change so that American agriculture is even stronger than it is today.

I look forward to working collaboratively with Members of the Committee and Congress as you work to draft the 2023 Farm Bill and continue to champion American agriculture. I would be happy to address any questions you may have.

The CHAIR. Thank you very much, Under Secretary.

Chief Cosby, please begin when you are ready. Thank you, Madam Under Secretary, for your testimony.

STATEMENT OF TERRY COSBY, CHIEF, NATURAL RESOURCES CONSERVATION SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Mr. COSBY. Thank you. Chair Plaskett, Ranking Member Baird, and Members of the Subcommittee, thank you for the opportunity to appear before you today to discuss USDA support for urban agriculture. My name is Terry Cosby. I am the Chief of the Natural Resources Conservation Service. Prior to becoming Chief, I was a State Conservationist in Ohio during the launch of the Cleveland High Tunnel Initiative; I have seen firsthand the many benefits of urban agriculture for the communities. I have seen youth inspired to agriculture careers when they are otherwise drifting. I have seen people develop businesses that either supplement other jobs or provide a primary source of income. I have seen people's health improve and communities come together.

I greatly appreciate the Subcommittee's invitation, and I look forward to the conversation today.

The USDA Office of Urban Agriculture and Innovative Production, which I will refer to today as the Office, is housed within the NRCS, but our work is supported by and coordinated across the Department. The Office works collaboratively with other USDA agencies to support urban producers. We established an internal advisory committee with members from over 20 USDA agencies to guide and contribute to USDA urban agriculture efforts. The 2018 Farm Bill authorized \$25 million a year—

The CHAIR. Excuse me, Chief Cosby. I am so sorry to interrupt you, but to the Committee staff, the timer is not visible, thank you.

Chief Cosby, you got some extra time there if you would like to start again.

Mr. COSBY. Thank you for that. The 2018 Farm Bill authorized \$25 million a year for the Office. In Fiscal Year 2020 Congress provided \$5 million; in Fiscal Year 2021 \$7 million; and in Fiscal Year 2022, \$8.5 million.

Feedback and engagement from urban producers and stakeholders across the country will be critical for USDA work to support urban agriculture in communities. The inaugural meeting of the Federal Advisory Committee for Urban Agriculture and Innovative Production was held virtually on March 23rd and 24th. Fourteen hundred and thirty people registered to attend, and 184 reg-

istered to provide comments during the public forum. I am happy to provide further details about what we learned during the Q&A. The Committee and the public feedback will guide future priorities for the Office. As a public meeting, it was recorded and will be made available through our *Farmers.gov* urban website.

USDA offers several targeted opportunities for urban communities and projects. Our Urban Agriculture and Innovative Production Competitive Grant Program supports projects that promote community gardens and nonprofit farms, provide job training and education, and develop business plans and zoning for urban agriculture with priorities given to communities lacking access to fresh and healthy foods. Since the Office started, this program has funded 31 awards totaling just over \$7.9 million. Additionally, our Cooperative Agreement Pilot Program funds local government projects to develop and test strategies to increase compost and reduce food waste. Since the Office started, this program has funded 37 awards totaling just over \$3 million. This spring we will announce the opening of two funding opportunities.

The Office has collaborated with the Farm Service Agency to establish 11 pilot urban county committees, which will provide feedback on how USDA can support urban agriculture in our local areas. To demonstrate USDA's commitment to urban agriculture, FSA and NRCS are establishing brick-and-mortar urban service centers, as well as mobile presence in each city selected for the urban county committees. These service centers will connect urban producers to USDA programs and services developed in urban areas, including the local and regional market initiative that Under Secretary Moffitt discussed earlier. USDA will engage trusted community-based organizations in each city to build trust and to raise awareness of USDA services available and support urban producers through the sign-up process.

Importantly, our efforts are not limited to these cities. NRCS and FSA are ensuring that in all states field offices are trained to support urban producers. The Office is updating an urban agriculture toolkit to help producers and employees easily find all USDA programs supporting urban agriculture. We are also preparing training on how to work with urban customers for employees across USDA. At NRCS, we are reviewing guidance and technical documents, practice standards, and payment rates to remove barriers to serving urban producers and ensure payment rates are reflective of costs of producing food in urban locations.

High and low tunnel standards have been adjusted so health, stormwater runoff, water conservation and pollinator habitats are currently under review. We are working to support urban producers in transition through the environmental EQIP Program and our Conservation Stewardship Program.

In conclusion, USDA is committed to supporting urban agriculture and believe it plays an important role in addressing food insecurities, climate change, and inequity. However, we note that there is more work to be done. I want to thank you again for the opportunity to appear before the Subcommittee to provide an update on USDA's urban agriculture efforts, and I look forward to the questions.

[The prepared statement of Mr. Cosby follows:]

PREPARED STATEMENT OF TERRY COSBY, CHIEF, NATURAL RESOURCES CONSERVATION SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Introduction

[Chair] Plaskett, Ranking Member Baird, and Members of the Subcommittee, thank you for the opportunity to appear before you today to discuss USDA's work to advance and expand support for urban agriculture. USDA's Office of Urban Agriculture and Innovative Production (the Office or OUAIP) is housed within the Natural Resources Conservation Services (NRCS), but NRCS works collaboratively across the Department to implement our responsibilities as a collaborative effort with the many USDA agencies and offices that have missions and programs that support urban producers and innovative production.

The overview of the Office's accomplishments and plans that I will share with you today provides only a high-level lens into the actions we are taking. The benefits are realized by the individuals who receive service, perhaps for the first time, that enable them to begin, expand, or enhance food production in their local community. Through the work of this Office and of urban agriculture efforts across the Department, USDA strives to uplift communities that have been previously overlooked and lacked access to many USDA resources. I know first-hand from my experiences in Cleveland, Ohio, that promoting urban agriculture can inspire youth to go to college to specialize in agricultural fields; create opportunities for entrepreneurs to start up small businesses and create jobs; provide fresh, healthy foods to communities in need; and improve the quality of life for all residents by reclaiming abandoned open spaces.

The Office coordinates urban agriculture efforts across USDA through an internal advisory committee. The internal advisory committee allows employees from all USDA agencies to engage directly on matters important to urban agriculture and innovative production and to guide the work of the Office. Members work collaboratively on outreach products, training efforts, funding announcements, project selections, metrics to measure success, and supported the selection of the new director for the Office of Urban Agriculture and Innovative Production. The Office also holds regular discussion with other Federal agencies, like Housing and Urban Development and the Environmental Protection Agency, to discuss opportunities for collaboration.

Funding

The 2018 Farm Bill included an authorization of an appropriations for each of Fiscal Years (FY) 2019 through 2023 of \$25 million a year to carry out the responsibilities of the Office and the Urban Agriculture and Innovative Production Advisory Committee. In FY20 Congress provided an appropriation of \$5 million for this work, then \$7 million in FY21, and \$8.5 million in FY22. Last year, approximately 90% of the Office's appropriated funding went directly to the public via the Office's two funding opportunities: Urban Agriculture and Innovative Production (UAIP) competitive grants, which expand opportunities for urban and innovative production in areas lacking access to fresh healthy food, and Composting and Food Waste Reduction (CFWR) cooperative agreements, which funds local governments pilot projects to promote composting and food waste reduction.

USDA has also used appropriated funds to support the establishment of the Urban Agriculture and Innovative Production Federal Advisory Committee and the pilot Urban County Committees that are being established through the Farm Service Agency's County Committee authorities. In addition, the Office is developing outreach materials to help local producers and local staff better understand USDA programs that can assist urban and innovative producers, and we are also developing internal training for USDA staff to prepare them to work with these new producers.

Federal Advisory Committee

The inaugural meeting of the Federal Advisory Committee recently took place with a virtual meeting on March 23rd and 24th. We introduced the new committee members to the public and provided the public an opportunity to provide feedback to the committee. This public feedback will be instrumental in shaping USDA's continued investment and support for urban agriculture. In all we had 1,240 persons register to attend the session and 132 registered to provide feedback to the committee during the public forum. This public feedback, in addition to the experiences of the committee members, will help form USDA's future priorities for the Office.

Urban County Committees

For nearly 100 years, county committees have provided a direct link between the farm community and USDA, allowing grassroots input and local administration of USDA programs. Each year, the Farm Service Agency (FSA) holds elections where

local farmers can run for, or vote for, county committee membership. County committee members have a say in what kinds of FSA programs their county will offer, ensuring local FSA agricultural programs serve the unique needs of local producers. As of March 7th, the Office and FSA have established 11 Urban County Committees (UCOC) in Albuquerque, NM; Atlanta, GA; Cleveland, OH; Dallas, TX; Minneapolis-St. Paul, MN; New Orleans, LA; Philadelphia, PA; Phoenix, AZ; Portland, OR; Richmond, VA; and St. Louis, MO.

These UCOCs will focus exclusively on urban production and will provide feedback on how USDA programs can encourage and promote urban, indoor, and other emerging agricultural production practices in the local area. Additionally, UCOCs may address issues such as food access, community engagement, support of local activities to promote and encourage community compost and food waste reduction.

The UCOC locations were selected based on a number of factors, including levels of economic distress, diversity, proximity to Tribal nations, the number of students receiving free or reduced-price school lunch, as well the number of farm-to-table projects, urban farms, community and residential gardens, and green infrastructure projects within metropolitan and suburban areas.

Urban Service Centers

To demonstrate USDA's commitment to serving urban and innovative producers, FSA and NRCS have jointly committed to opening brick and mortar urban service centers and having a mobile presence in each city selected for the pilot program. FSA and NRCS are working with local stakeholders and local USDA staff to identify locations for service centers within each city that will be accessible and welcoming to local urban and innovative producers. These urban service centers will offer urban and innovative producers the full suite of applicable USDA programs and services, including farm loans and conservation program assistance, as well as serving as a way to connect urban and innovative producers to the local and regional market initiatives that Under Secretary Moffitt discussed earlier. FSA and NRCS anticipate having staff on the ground in all locations serving urban and innovative producers in the fall of 2022.

While our teams will be working to build out physical urban service centers in the identified cities, we are working with all of our states to ensure that field staff are trained and committed to reaching out to and serving urban producers and communities and connecting them to local and regional market opportunities. This continued effort will include training and additional resources to ensure that urban outreach and service is available and expanded in every state across the country.

Community-Based Organizations

To support the launch of these urban service centers, FSA and NRCS are developing a strategy to engage trusted community-based organizations (CBOs) in each location to conduct outreach and raise awareness of USDA services available to urban producers. CBOs will be critical for building trust to ensure that local urban and innovative producers feel comfortable providing the personal information required to enroll in USDA programs. The arrangements with CBOs in each city will be modeled on the role of the Federation of Southern Cooperatives in the Cleveland High Tunnel Initiative. In Cleveland, the Federation of Southern Cooperatives encouraged local youth to become trained to install NRCS hoop houses, leading to a group of local high school students forming a business installing hoop houses. This provided enough income to allow some of these young people to attend college, which they otherwise could not afford. Similar community engagement and job training opportunities will be a priority for CBOs engaged to work in each city getting an urban service center.

Competitive Grants—Implementation and Planning Projects

The Urban Agriculture and Innovative Production (UAIP) competitive grants program supports a wide range of activities through two types of grant types—Planning and Implementation. Eligible activities include operating community gardens and nonprofit farms, increasing food production and access in economically distressed communities, providing job training and education, and developing business plans and zoning. Priority was given to projects with positive impact in areas with limited access to [healthy] affordable food as listed in the USDA Food Access Research Atlas. In FY20 and FY21, NRCS made 31 awards totaling just over \$7.9 million to recipients across the country.

Cooperative Agreements—Community Compost and Food Waste Reduction (CFWR) Pilot

In FY20 and FY21, NRCS made 37 awards totaling just over \$3 million to local governments to develop and test strategies for planning and implementing munic-

ipal compost plans and food waste reduction efforts. Priority was given to projects that anticipate or demonstrate economic benefits, incorporate plans to make compost easily accessible to farmers, including community gardeners, integrate other food waste strategies, including food recovery efforts, and collaborate with multiple partners.

We will continue to build on these investments and hope to soon announce the availability of UAIP competitive grants and CFWR cooperative agreements for FY22, totaling approximately \$6 million in available funds.

Outreach Activities

Although each individual USDA agency is working to conduct outreach for their programs that are available to urban producers, the Office is collaborating with our USDA agencies to create an outreach toolkit, which will be an efficient mechanism for customers and stakeholders to identify resources and services available across USDA. We anticipate it will be released later this year after we ensure it is well-vetted. Our goal is for this to be a product that builds over time as we learn more of what the urban and innovative customers need. In addition, we are working to expand our presence on social media to ensure we reach communities that are not connected to our traditional outreach efforts. The UCOC, described above, will also be helpful in amplifying services available to their communities. This Office is working to provide training across USDA as well as within each of our agencies to improve our employee's knowledge about the needs of urban customer.

Organic

We are also working to ensure the support available through USDA programs and services for organic production and organic transition, including conservation assistance, is available for urban producers. NRCS offers support for organic and transitioning producers through the Environmental Quality Incentives Program (EQIP) and the Conservation Stewardship Program (CSP). NRCS has continued to invest in targeted improvements to financial and technical assistance to better serve organic producers, including actively recruiting more Technical Service providers (TSPs), improving outreach efforts, and updating our conservation practice standards and payments to better serve organic producers. The demand for conservation assistance to support organic and transitioning producers exists in both rural and urban communities and we are continuing to tailor these tools and programs to expand investments in organic conservation. We are also expanding training and support for NRCS field staff, and this will include within urban communities, to support organic and transitioning producers.

Removing Barriers and Other Efforts to Improve Services

Within NRCS, we are undergoing a thorough review of all our guidance and technical documents, practice standards, and payment rates to ensure they do not present barriers to participation for urban and small-scale producers. We also want to ensure the payment rates are reflective of the costs of producing food in urban locations. For example, we are looking at the units of measurement within our practice scenarios, features of conservation practices when working on smaller scales, and labor and transport issues that appropriately represent producer costs. We have already undertaken adjustments to high and low tunnel standards and are looking now at practices needed to improve soil health, address storm water runoff, water conservation, and pollinator habitat in urban communities.

Conclusion

USDA is committed to advancing urban agriculture in communities across the country and the [OUAIP] will continue to play a critical role in working across USDA to provide financial assistance to individual producers, invest in community projects, support agricultural education, spur innovation, and give urban producers a voice in USDA at both the local and national levels.

We will ensure that the continued growth of the Office and urban agriculture investments at USDA is driven by community and public input, including through the feedback received at the inaugural Federal Advisory Committee meeting and the future work of the Committee.

These actions are a significant step forward, however we know there is more work to be done to ensure we can build trust and provide quality service in the urban communities we are working to serve. USDA is committed to providing tangible results for urban and innovation agriculture through partnerships with communities, stakeholders, and individuals that are made possible through the authorities provided to the Office of Urban Agriculture and Innovative Production and through a variety of other farm bill programs.

The CHAIR. Thank you very much for both of the testimonies. At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us to get as many questions as possible. Please keep your microphones muted until you are recognized in order to minimize background noise. I recognize myself for 5 minutes.

Honorable Jennifer Lester Moffitt, may I ask you, what steps are USDA taking to reduce supply chain challenges to further support orderly marketing of fruits, vegetables, and other specialty crops?

Ms. MOFFITT. Chair Plaskett, thank you for that question. We are taking several steps because we know the challenges are many and so the solutions also must be many. So, one of the key things that we are doing of course is working on many of the port issues and the supply chain issues with ports, so just a couple weeks ago I was able to join Senator—yes, I was able to join, sorry, Senator Cantwell in Portland at the Port of Portland to open a new pop-up site there so ag shippers can get their products to international markets and also domestic markets.

I think a key thing is the work that we are doing on more and better markets generally the work we are doing on local and regional markets, the things that we are doing to create thriving local and regional food systems. So the work I talked about with the LAMP Program is very important because it is building more community capacity for producers to be able to supply local and regional markets. It is building the community networks. It is building the infrastructure. So we are working on relieving pressure points along the food supply chain by adding and enhancing existing local and regional markets throughout the supply chain.

We currently are also, of course, working in partnership with the specialty crop industry. As we know, the Specialty Crop Block Grants are really important as far as enhancing competitiveness. So again, more and better markets for specialty crops are really key and crucial.

I talked about the work that I saw in Georgia. There are so many different communities. I visited Massachusetts earlier this year as well where there are producers who are also accessing new local and regional markets. They are selling to universities, they are selling to hospitals. These are ways that we are bringing more access for especially fresh fruits and vegetables and produce into new markets and enhancing and really diversifying the supply chain.

The CHAIR. Well, can I ask as a follow-up to that, you talk about specialty crops and competitive grants. There is always an issue in all agencies at all levels in ensuring that underserved or small communities, rural areas, that those smaller farmers have access to be able to compete in these areas. Is there any special thought or what are you all doing to ensure that that takes place?

Ms. MOFFITT. Absolutely. And ensuring access to our programs is essential. It is something that is a priority for us in this Administration, and it is a priority for me personally, as someone who was a producer myself and I know how challenging it can be to access grants, to apply for grants. So things like technical assistance

are really key pieces that we are doing really to be able to provide that.

So just on Friday for our Meat and Poultry Processing Expansion Grant Program that we have at USDA, we announced new technical assistance providers. These are people that we have partnered with who we are contracted with and who are skilled and have the technical expertise to work with small and midsize producers to be able to do all of the work, the pre-application work as well as the application work to be able to apply for and access USDA funding. So technical assistance is key, and then also of course just making sure we are doing the outreach in an appropriate way and really building relationships with trusted partners, partners in the communities who know and have that same access that we are looking for so that people are aware of the program and also are able to participate.

The CHAIR. Thank you. I may not have time, Chief Cosby, for you to be able to answer this, but any written response that you could give would be appreciated. As you are aware, the 2018 Farm Bill established the Federal Advisory Committee for Urban Agriculture and Innovative Production to, “advise the Secretary on the development of policies and outreach relating to urban indoor and other emerging agricultural practices.” I understand that the Federal Advisory Committee held its first public meeting last week and was hoping if you could share with the Committee in written format or at different points if you may have this during the questioning the details of that first meeting. So thank you very much for that.*

At this time I would ask the Ranking Member, Mr. Baird, if you have any questions, your 5 minutes are next.

Mr. BAIRD. Thank you, Madam Chair. I appreciate that.

Under Secretary Moffitt, in your written testimony you say farmers and ranchers don't have extra hours in their day to navigate all the layers of application processes on their own. Does Congress need to update any of the programs in the Horticulture Title to streamline the application process making it easier for producers to apply?

Ms. MOFFITT. Yes, so certainly that is, as someone who, again, was a farmer and ran my family's farm for 10 years, I know firsthand the many hats that farmers and ranchers are wearing. And so the access to programming is really important, and technical assistance is important.

You also highlighted the need for more streamlined applications as well. That is something that we have been working on as well at USDA so that we are not just certainly providing technical assistance through trusted local partners but also working on streamlining our applications. We are constantly listening, and every grant that we do we are taking an iterative approach, bringing feedback in that we hear from producers, from applicants to make sure that we are best serving the people that we are needing to serve, and so that means making sure we are serving farmers and ranchers, making sure that we are serving communities especially as well. And so, we are taking that in and we are working on that through all of the process. Technical assistance support is a key

* **Editor's note:** the information referred to is located on p. 417.

part of that as well, so ease of application, as well as the technical assistance is a key part of what we do.

Mr. BAIRD. Well, thank you. I have another question for you. Your testimony also states that we should continue to support and strengthen markets for American agriculture, so I am kind of changing the game a little here. It is important to talk about the role both USDA Under Secretary for Trade and Foreign Agricultural Affairs and the USTR Chief Agricultural Negotiator play in developing new markets for U.S. exports. I am disappointed that neither position currently has a nominee and I hope that the Biden Administration will work expeditiously to fill these vacancies.

With that being said, are the current programs in the Horticulture Title enough to support markets for specialty crops in the United States or should we be looking at a new authority to carry out this mission? Go ahead.

Ms. MOFFITT. Yes, absolutely, thank you for that very important question. And since I have started at USDA, we have worked very closely between the Marketing and Regulatory Programs mission area and the Trade and Foreign Agricultural Affairs mission area. The work that we do collaboratively and in partnership is important to support trade, so I certainly want to recognize that, certainly, we are working ahead and charging ahead in that.

There are many programs that we have through APHIS really taking a science-based approach, looking at the science, working with our trade partners, addressing those different trade barriers, having that dialogue with our trade partners so that we can open up markets.

A really key part of that—and you mentioned in your opening statements, the PPQ section 7721, the funding that we have for plant and pest disease management, surveillance, working especially in partnership with State Departments of Agriculture and other local governments so that we know what pests are out there, we can eradicate, we can control again so that we are constantly able to address the trade issues that might arise. So we have, certainly, those important programs in place right now.

Mr. BAIRD. I really appreciate hearing about the interagency cooperation, I think that is so important that we all head in the same direction. So I want to change to the Chief. In your written testimony that the Office of Urban Agriculture and Innovative Production talks regularly with the Federal agencies like HUD and the EPA to discuss opportunities for collaboration. Can you describe this effort in more detail and what collaboration will those agencies look at?

Mr. COSBY. Thank you, sir, for that question. And I will tell you that early on we have been working alongside Secretary Vilsack and Secretary Fudge, met, and we had a lot of conversations about how the agencies can work together on urban agriculture. When you start talking about that and looking at the basic needs when you talk about housing, when you talk about food, just the basic needs, these two agencies working collaboratively together—

The CHAIR. Sorry, could you please turn your microphone on?

Mr. COSBY. It keeps going off.

The CHAIR. Thank you.

Mr. BAIRD. And, Madam Chair, I am about out of time. I have gone over time. Can we allow the witness to finish this question?

The CHAIR. Of course.

Mr. BAIRD. Thank you.

Mr. COSBY. As the agencies are working together collaboratively, as I said before, it is great that we can do that because if you can service the basic needs of individuals from the housing, which HUD helps with, and when we start talking about healthy and safe foods, which NRCS, the Office of Urban Ag is helping with, we are accomplishing a lot. But we have had a lot of conversations with our HUD partners, and we are having conversations from all the Federal family about how we can all work together to support urban agriculture and what happens in a lot of these areas.

There is a lot of help needed in our urban sector from access to land to understanding how to grow fresh fruits and vegetables, also for looking at the type of soils that these fruits and vegetables will be grown in, and so we have a lot of help that we can offer, but it has been great, the collaboration between not only all the agencies within USDA but the Federal family to pull together to support urban agriculture.

Mr. BAIRD. Thank you very much, and I appreciate the witnesses' comments. And with that, Madam Chair, I yield back.

The CHAIR. Thank you. I now recognize the gentlewoman from Ohio, Ms. Brown, for 5 minutes.

Ms. BROWN. Thank you, Chair Plaskett and Ranking Member Baird, for holding this hearing, and thank you, everyone, for joining us today to review horticulture and urban agriculture programs in the farm bill. I would first like to take a moment to recognize and congratulate Mr. Cosby on his appointment as Chief of USDA's Natural Resources Conservation Service. Prior to his current post, Mr. Cosby served as the State Conservationist in Ohio for 16 years. During his time as State Conservationist, Mr. Cosby worked to transform northeast Ohio into a national leader in the urban agriculture movement. So, Chief Cosby, you have left quite a legacy, and I look forward to working with you, building upon the success you helped jumpstart back home.

In your written testimony, you referenced your firsthand experience in promoting urban agriculture in Cleveland, so can you speak to the specific projects that were developed there?

Mr. COSBY. Thank you for the question, Representative Brown. It is great to see you.

Ms. BROWN. Thank you.

Mr. COSBY. And, as State Conservationist in Ohio for 16 years, it was great just working on urban agriculture along with all the rural things that we did. But I was approached back in 2011, 2012 then at the time by Congresswoman Marcia Fudge, who was the Congresswoman there, now is the HUD Director, Secretary. We worked and talked a lot about the Congressional district there in Cleveland and how we could help, from food insecurity and all of the health issues that were going on in the inner city from diabetes to high blood pressure and all the health risks.

Something that we talk about a lot is that—and I use this term all the time is that your ZIP Code should not dictate your life expectancy because in the inner city there in Cleveland and if you

drove down the road 10 miles, your life expectancy went up by almost 15 years because of what was happening in the inner city.

And so we looked at how we could help, and we brought in our Farm Service Agency director and we sat down and started talking about how can we help this Congressional district? And so from that we started talking about food and food insecurities and raising vegetables. One of the things that was happening in Cleveland is there was a lot of abandoned homes and homes being torn down, and so we had these abandoned lots that we talked about. There is a lot of green space we talked about.

One of the things is Cleveland is also a refugee city, folks that are coming from other countries that didn't have access to land, to grow fruits and vegetables from their native land, and so it was a great thing. We worked very closely with community-based organizations to identify the need and also to build trust in the community. A lot of times there is not trust in these communities, and so we were able to build a lot of trust there. And from that I know that in the city I know there are now close to 2,000 houses built there.

Something else that happened there when you start talking about neighborhoods, folks were able to come out in the evenings. They were there working in their gardens, and it became a social event. We had individuals that were producing vegetables and paying their way through college, entrepreneurships. You can do a lot of things from urban agriculture, and it benefits the communities so greatly.

Ms. BROWN. Thank you. That kind of led into my second question, which was the benefits you witnessed from the projects like the Cleveland High Tunnel and the High Tunnel Initiative and I was just curious if that model could be successfully replicated and scaled to other cities.

Mr. COSBY. We are already doing that. I think what we started there in Cleveland has been a model that we are trying to use across the country, all over the country with 11 offices that have been announced so far. We are working with those State Conservationists on FSAs. We are looking at how we can do that. We are establishing urban county committees out there to help with this. And so it is all hands on deck, and it is a project that is near and dear to my heart and is something that we are really going to work hard on.

But, it doesn't have to have one of these established offices. Urban agriculture can happen anywhere in this country, and so we are working with all of our State Conservationists across the country to make sure that happens.

Ms. BROWN. Well, thank you very much. I know I am nearing the end of my time, but I do have one other question. And that is that we know in 2018 the farm bill directed USDA to establish the Office of Urban Agriculture, which is currently housed in NRCS. How are you working internally within the agency and externally across agencies like the Department of HUD to grow urban agriculture? And with that, I would yield back. Thank you.

The CHAIR. Thank you. I would ask the witness if he could respond to that in writing as time has expired at this time.**

With that, I would now recognize the gentleman from Illinois, Mr. Davis, for 5 minutes.

Mr. DAVIS. Thank you, Madam Chair. It is great to be with you, my friend, and also my good friend Mr. Baird, the Ranking Member. And I appreciate you holding this Subcommittee hearing.

As the former chair of this Subcommittee, I actually have been enjoying the discussion on how we can improve the Horticulture Title to actually adapt to this post-pandemic reality where high inflation persists, ag input costs are rising, and the supply chain crisis really continues to strain our local communities. These are the issues that affect our farmers and our producers most right now, and they are not being taken very seriously in my opinion by President Biden, and I believe it is something that we are going to have to take into consideration as we look toward the next farm bill if this Administration's *status quo* continues.

The 2018 Farm Bill sought to bolster our ag economy by enhancing and creating new programs to ensure our farmers and producers can stay competitive. For example, the Local Agricultural Marketing Program, the hemp program, increased technical assistance and marketing programs for producers were always envisioned to give our domestic producers more opportunities to be successful and strengthen our national security via domestic food security.

So my question for you, Under Secretary Moffitt, it is great to see you and I appreciate you being here. Also Chief Cosby, thank you for our conversation before the hearing. I look forward to working with both of you throughout the next few years. Under Secretary Moffitt, how do you see our USDA marketing programs needing to evolve and adapt to ensure that our farmers and producers who have been at the forefront of what is looking to turn into a financial crisis for many of them, how can they keep their heads above water?

Ms. MOFFITT. Yes, thank you for that question. And, as you mentioned, many of those programs that you outlined are essentially, exactly doing that. The Local Agricultural Marketing Program is building more community capacity and connections to really strengthen the ties between farmers and consumers, close those linkages, and really strengthen the ties, so we are bringing more of that food dollar back to producers, which is an important way to strengthen our rural economy, our agricultural economy, and our food system. It also creates a really strong thriving food system.

You talked about equity and access and technical assistance to our programs, and that is very important, especially for producers. We talk a lot about building our capacity from the ground up and the middle out, really strengthening, again, the ability that farmers and ranchers can continue doing.

Certainly, we are working on and we are very well aware of many of the supply chain issues and working very intently on addressing those through the myriad of things I talked about, the pop-up sites at the ports, talked about a lot of the work that we

** Editor's note: the information referred to is located on p. 417.

are doing really to keep a finger on the pulse on what is happening, as well as pivot and address issues that we are hearing from producers, farmers, and ranchers.

I know firsthand from my own family's experience how tight things can be, and we hear that day in and day out, and that is our primary position is to really be there and to support farmers and ranchers and consumers across the country.

Mr. DAVIS. So under the marketing programs you mentioned, those are the programs that you feel are helping our producers the most to address the high inflation and rising input costs?

Ms. MOFFITT. It is very important that we are really building a thriving food economy. As we address all of the different things, we are really making sure that we are addressing it, again, from the bottom up and the middle out. That is a key thing. I see, as I have traveled around the country visiting with different consumers, for example, and producers, I was in Iowa last week meeting with a pork producer, and she talked about how they are working and procuring and buying and building community access with 1,700 different local suppliers. And so that is really about addressing all of the different supply chains because as we are looking at important work on meat and poultry supply chain, it also is about all of the producers, whether it is equipment manufacturers, seed dealers, electricians, all of the people in rural America who are part of our ag economy really keeping that pulse on and making sure that we are doing what we can to address those.

Mr. DAVIS. Well, thank you, and thank you for your responses. I look forward to working with you over the next few months and into the next Congress as we debate this next farm bill to see the real results.

And, Chief Cosby, one last comment. I would really love to work with you as we go to the next farm bill on creating some flexibility within the programs that your agency oversees.

Thank you. I yield back.

The CHAIR. Thank you very much for your questions.

At this time I recognize the good doctor from Washington State, Congresswoman Schrier, please, for your 5 minutes.

Ms. SCHRIER. Well, thank you very much, Chairwoman Plaskett, for holding this important hearing, and welcome to our witnesses.

Under Secretary Moffitt, it is a pleasure to see you again, and I want to thank you again for coming out to Washington State a few months back so that you could see the great work happening and how important specialty crops are to Washington State. When you were in town, we were able to highlight the importance of the Specialty Crop Block Grant Program, and I just want to take a moment to emphasize just how important this is. It falls under the Horticulture Title of the farm bill, and the Block Grant Program and its partner, the Specialty Crop Research Initiative, fund research to address the critical needs of specialty crops in our state, around the country, and frankly, around the world because of applicability. They support more than 300 crops in Washington State, and past funding for projects in Washington has supported efforts to combat fungicide resistance in wine grapes, precision irrigation for fruit growers, pest prevention, and we also talked about little cherry disease.

Under Secretary Moffitt, I would love to hear a little bit from you about these vital programs and how you evaluate them. So, for example, could you tell us about the work that USDA has done to establish standards to measure the performance of the Specialty Crop Block Grant Program and the Farmers' Market and Local Food Promotion Programs and what those measures tell us about how these programs are meeting their goals?

Ms. MOFFITT. Yes, thank you so much, Representative Schrier. It was a pleasure to be out there in Washington State to meet with producers and to see the impact of the Specialty Crop Block Grant Program. Coming from the California Department of Agriculture, I know how important that program is in partnership and administration with State Departments of Agriculture to see what was going on and the research that is being funded in the programs that are being funded in Washington State was really just a wonderful, wonderful day, so thank you for having me in your district.

And, yes, performance measures are so important, and we actually did a lot of work in the past couple years, and I am really pleased that this round of the Specialty Crop Block Grants, as well as our other programs, have new performance measures, new objectives that we have created, and we did this in very strong partnership with grantees. We wanted to make sure that as we were adjusting our performance measures we were getting the data that we need to really provide the input but also that we are not being an overburden on the people who we are trying to, supporting and are partnering with in that research. So we did update our performance measures last year, and the new round of Specialty Crop Block Grants now includes those new performance measures.

We see the impact. As you mentioned, of course, the number of grants in Washington State through the life of the program, we have funded over \$880 million in programming in, again, partnership with states as well as on over 11,000 different crops. And so gathering that data so that we have the feedback that we need to better understand the impact of the program while also not being a burden too much on our grant applicants is a key part of that. So I am excited that we were able to update our performance measures and our metrics there and look forward to getting new data from producers and from our applicants as well.

Ms. SCHRIER. Thank you. And thank you for striking that balance. I think that will be a big relief for our farmers and researchers.

I wanted to mention two more things. First is really short. I just wanted to thank you for finalizing the rule for the Origin of Livestock. My organic dairy farmers will be just thrilled to hear this.

And then last, I wanted to touch on SCRI, the Specialty Crop Research Initiative funding. There is supposed to be a matching element. There was a waiver that was available for SCRI that allowed our farmers to participate. That was left out in the last farm bill. We have had a fix every year to make sure that our farmers and our researchers could participate because a matching fund would make that prohibitively expensive and would block this. And so I would just like to call attention to that to make sure that we keep that waiver in this next farm bill.

And thank you very much, and I yield back.

The CHAIR. Thank you for your questions.

And at this time I will recognize Representative Balderson for your questions for the witnesses in this first panel. And thank you for participating in the hearing.

Mr. BALDERSON. Thank you very much, Madam Chair. And I thank everyone for coming to the Committee today. Perfect timing for myself I guess.

My first question is for Under Secretary Moffitt. Good morning. You mentioned in your testimony that the USDA is allocating \$130 million in ARPA funds to promote competition and create more and better markets for local and regional food producers by expanding opportunities to sell to various institutions. Can you elaborate on what exactly USDA will be spending these funds on and what current or new programs within the Horticulture Title will be required for USDA to properly expand these opportunities to farmers?

Ms. MOFFITT. Yes, sir, and thank you for that question. The \$130 million is included in the Local Agricultural Marketing Programs Grant, the Local Food Promotion Program, as well as the Regional Food Systems Partnership Program, two grant programs that are part of that family of four grants. And what we have seen in the past couple years is a very strong trend upward of applications, so we have seen almost a doubling of the applications from 2020 to 2021 in the demand for the program, and so hence the need to supplement that with ARPA funds. We are really focused on and encouraged to see applications that are focused on local and regional food systems for institutional markets, so that is hospitals, schools, universities, because we see the value in really strengthening those markets. There is a ton going on around the country, and so for us at USDA to invest in that is something that we see as very important.

Mr. BALDERSON. Okay. Thank you. My next question for you. You discussed at length the importance of the Specialty Crop Block Grant Program and how AMS has implemented and standardized national outcome measures to demonstrate the program's performance. Are there any changes that you think need to be made to the program in order to enhance the competitiveness of specialty crops in the United States?

Ms. MOFFITT. Yes, sir. As I was just mentioning to Representative Schrier, the Specialty Crop Block Grant, since its inception in 2006, has funded over \$880 million, 11,000 projects. A key part of that program is our partnerships with states, and so the money is actually allocated to the states and the states implement the program. And that is really important because the states can design the program to best suit the needs of their state specialty crop industry, so research, promotion, education, all of those things are already included and are key parts of that program. So, we see the value in that partnership continuing to strengthen our partnership.

We just made some updates, as I was also mentioning, on our performance metrics as well, so we are getting really good data back on how well the program is performing. And so those are new metrics in this current round of funding as well. So it is an important program, and we very much value that partnership with the State Departments of Agriculture in administering it.

Mr. BALDERSON. Thank you very much. And, Madam Chair, I yield back. Thank you.

The CHAIR. Thank you for your questions. At this time I recognize my good friend Congressman Carbajal for his line of questioning.

Mr. CARBAJAL. Thank you, Madam Chair, and thank you to all the witnesses for being here today and providing us with your testimony on these very important programs.

My district grows a variety of specialty crops, including strawberries, broccoli, cauliflower, avocados, cut flowers, and more. The success of these crops is in large part because of the hard work by our farmers and our farmworkers, but also because of the important research and innovative programs funded by the farm bill. It is important that programs under the Horticulture Title help bolster the production and competitiveness of specialty crops.

Under Secretary Moffitt, the fresh markets created at metro stations in Atlanta are the type of innovative programs we need to ensure all people, regardless [inaudible] have access to fresh fruits and vegetables. Can you walk me through what has made these markets successful and what support USDA would need [inaudible]?

Ms. MOFFITT. Yes, sir, so I don't think I caught the last part of your question, but I can talk a little bit about MARTA and what I saw as—

Mr. CARBAJAL. Let me repeat it for you.

Ms. MOFFITT. Thank you.

Mr. CARBAJAL. Can you walk through what has made these markets successful and what support USDA would need to implement similar programs in other states?

Ms. MOFFITT. Absolutely, yes, so what I saw in MARTA (Metropolitan Atlanta Rapid Transit Authority) was the community coming together to solve a problem and to look for solutions within their existing infrastructure that just needed more connections, so fostering that connection. So with MARTA's leadership but in very strong partnership with the Atlanta Food Bank and many, many other local organizations, as well as producers, I saw them coming together to identify local farmers who had product who were interested in selling it at those markets. I saw the opportunity as well, they utilized the space at their transit stations. They have carts there. And then of course in partnership with, and looking at the EBT Program, and many of the people who are purchasing fresh fruits and vegetables through the carts are using the EBT Program and the SNAP Program.

And so looking at all of those linkages, connecting the dots is really important, and that is where things like the Regional Food Systems Partnership Program and the Local Food Promotion Program, as well as the Farmers' Market Promotion Programs are really important because they build the capacity within the community to connect all of the dots together so that the producers who have the food are able to have access to new markets, as well as of course the people who are really in many communities that are nutrition-insecure have access to fresh fruits and vegetables. But it doesn't come naturally, and oftentimes I know as a former

farmer, we are busy farming our fields, and so, we don't know who is out there, so building the connections I think is very important.

The Specialty Crop Block Grant also does a very good job of helping foster those connections, as well as, as you talked about, research as well. And coming from the California Department of Agriculture, I saw firsthand through so many of the projects we funded the importance of research, as well as education and technical assistance and then promotion of getting products to market through that program as well.

Mr. CARBAJAL. Thank you. Moving on, another question for you, are cut flowers available at these markets? If not, do you think it is feasible to include them to improve the competitiveness of this specialty crop?

Ms. MOFFITT. Yes, the cut-flower industry is such an important industry I know in your district and in many areas around the country. I was there in February, so there weren't too many cut flowers there, but I do know that they are always looking at who are the local producers, what do they have, and the opportunities. So, I did see things like honey there and other products, and so, certainly, hopefully there are cut flowers available because it is such an important industry to our economy.

Mr. CARBAJAL. Thank you. It is incredibly important that we reduce food waste and find ways to support food recovery efforts, especially when we consider that one in ten Americans are food-insecure. Mr. Cosby, can you elaborate on some of the lessons learned from the Community Compost and Food Waste Reduction Pilot and what the compost is used for? Is data on waste diverted from landfills being collected?

Mr. COSBY. And thank you for that question. And, we are working very closely with a lot of these folks that have applied and received these grants. And from what we are learning is that there is a big need out there for compost, especially when you are getting into some of the situations where some of the areas have been abandoned or the buildings have been abandoned or we have some soils issues. And so folks need good, healthy compost to go ahead and help them raise these fruits and vegetables, so it has been great to watch that happen.

And, when we start talking about food waste reduction, we are working very closely with a lot of those grant recipients, especially like schools where food waste could be tremendous. And so we are trying to look for ways, how do we create an atmosphere where you are not wasting that food? And then if you do have that surplus, how do we make sure it gets to some of these facilities so it can be composted and turned back into productive soils? So we think those two opportunities are great, and it is working very well.

Mr. CARBAJAL. Thank you.

The CHAIR. Thank you very much.

Mr. CARBAJAL. I am out of time.

I yield back.

The CHAIR. The gentleman's time has expired.

The chair recognizes the gentlewoman from Louisiana, Ms. Letlow. Thank you very much for joining us for the hearing.

Ms. LETLOW. Thank you so much, Chair Plaskett, Ranking Member Baird, and to our USDA officials with us today. Thank you for

the opportunity to discuss and review horticulture and urban agriculture programs authorized by the farm bill.

As we all well know, agriculturalists are the cornerstone of food and fiber production in America. In my home district, many of the rural communities are fueled by the perseverance of our local agricultural producers, large, and small. Like many sectors of agriculture, niche and specialty crop farmers throughout Louisiana continue to face challenges, whether that be labor shortages, increased input costs, availability of risk management tools, or access to new market opportunities. That is why it is essential we are spearheading this conversation today.

Under Secretary Moffitt, as you know, the Plant Pest and Disease Management and Disaster Prevention Program and the National Clean Plant Network were originally established through the farm bill and have since been made permanent law and incorporated into APHIS Plant Protection and Quarantine's base budget. As we continue to hear, these programs provide critical funding to pest prevention, mitigation, and addressing emerging challenges for specialty crop producers. A hallmark of these programs has been the robust involvement of stakeholders in the affected specialty crop industries, particularly in deciding which activities to fund. Can you talk more about these programs, and what is this Administration's commitment to stakeholder engagement for these programs? And how do you plan to incorporate their input into project funding decisions?

Ms. MOFFITT. Yes, thank you so much, Congresswoman Letlow. And it is a pleasure to meet you and to be here today. Those programs that you described are really key and important programs to the work that the team at APHIS does. Just a few weeks ago when I was down in Georgia I also visited the dog training center there, and it is an important part. We see them when we are at airports, but they are also working behind the scenes at baggage facilities around the country and parcel facilities really to make sure that they are sniffing out and detecting any sort of fruits or vegetables that might be coming into the country that could have pest and disease. So those are things that are funded in part through those programs, very important and critical programs as well.

You asked about stakeholder engagement. Stakeholder engagement is essential to the work that we do. We do our best work when we are listening and learning and hearing from the people out in the field, the people with the expertise, and really adapting and serving those folks. And so stakeholder engagement is something that I am committed to. I know the team at APHIS also has a strong commitment too, and we look forward to the advisory committees and all of the work that we do to get feedback to make sure that our programs best serve the needs of the community that we are serving.

Ms. LETLOW. Thank you so much. I look forward to working with both you and Chief Cosby as we work towards the next farm bill. I yield back the remainder of my time.

The CHAIR. Thank you very much for your line of questioning. And I would like to ask the esteemed Congresswoman Pingree of Maine for her questions.

Ms. PINGREE. Thank you very much, Chair Plaskett. Thank you so much for holding this hearing. And I am not sure about the esteemed part, but I appreciate your confidence in me. So, Under Secretary Moffitt, we are so pleased to have you with our Committee today and to have you in the position that you have, so thank you so much for being with us.

And I just can't tell you how pleased I am that you made the announcement about the Origin of Livestock rule. I don't know that I have had a Committee hearing that I haven't had to bring that up and ask the USDA when something is going to happen, so the fact that we get to tell our constituents now that we are moving forward on this is going to make a huge difference, particularly right now when the dairy farmers, organic dairy farmers have been so challenged throughout the Northeast with losing a contract, so this is a really important time. I can't thank you enough.

And I am also glad to hear so many questions related to LAMP. I was really pleased to have a chance to work on that in the 2018 Farm Bill, so I appreciate some of the conversations people have been having about streamlining the process, making sure it is accessible. I hope we can continue going in that direction.

So one kind of quick question about this whole idea of how we support more resilient local and regional supply chains. I often hear about the need for affordable and accessible capital to develop infrastructure, and I am talking about things like food safety equipment, packing equipment, cold storage, similar infrastructure that are on farms and food hubs which are just so important in that domain. But a lot of times I have also heard that AMS rules around grantmaking prohibits AMS grants from investing in such badly needed food systems infrastructure. Do you think there is something we should be looking at when it comes to the 2018 Farm Bill and LAMP to make sure that this is a possibility and it is covered?

Ms. MOFFITT. Yes, thank you, Representative Pingree, and certainly it is an exciting day to be able to announce the Origin of Livestock final rule, as well as I look forward to working on implementing that. And I just want to thank you and other Members of Congress, as well as the Northeast dairy industry as a whole and the State Departments of Agriculture for engagement over the past 6 months on Northeast organic dairy issues. We announced the Dairy Business Innovation Center funding, and hopefully that is a big part of the solution, but we also know that Origin of Livestock is another piece of it, again, multiple solutions for a very large, beastly problem.

You asked about the LAMP Program being able to purchase equipment, and some of the much-needed things that we see, of course as producers are coming together to be able to aggregate, to do food hubs, those sorts of things are very, very important. We have been working with the team at AMS on the opportunities of what the grant funding can fund, and we continue to have those conversations about capacity is really important and what does that look like. So, we are happy to talk further with you guys, provide technical assistance, provide answers that you have about what we can and cannot fund and where are the opportunities there, so we look forward to further engagement on that.

Ms. PINGREE. Great, thank you. One of the things that was in your testimony—and I don't mean to spring this on you because I don't know that you are going to have a complete answer—but was around hemp production and the opportunities we created in the 2018 Farm Bill but then some of the challenges that our producers have faced. I have a bill called the Hemp Advancement Act of 2022 (H.R. 6645) that really deals with some of the statutory changes, the issues people have had around the THC threshold, use of DEA labs, 10 year ban on felons working in the field and getting licensed. So I know those are sort of specific, but what I often hear from the hemp producers when we are talking about those obstacles is just the need for more comprehensive support on marketing, on processing development. It just sort of breaks my heart that we opened up this opportunity, yet still most of the hemp that is used for clothing or for a whole variety of uses that could be an expansion area for us, not just the CBD part, but it is going to require a lot of support and engagement. And I don't expect you to have a thorough answer, but is that something we can sort of talk about and maybe look at in the next farm bill, or do you see some opportunities there for the USDA?

Ms. MOFFITT. Yes, absolutely. And, this is such an important and growing industry. I wouldn't say it is a new industry, but it is a newly, revived industry from a long time ago. And we do have an interagency working group at USDA looking at how hemp producers can access all of the funding and the funding that we do have at USDA and the programming that USDA has as well. I am happy to talk with you further about the questions that you have. And, certainly I know our team has been, we are aware of your bill and providing technical assistance and please do know our door is always open for that.

Ms. PINGREE. Great. Well, you are exactly out of time, I am exactly out of time, so thank you. I yield back, and I really appreciate your being with us today.

Ms. MOFFITT. Oh, thank you.

The CHAIR. Thank you very much for your questions as well.

And I want to thank the witnesses on our first panel for being with us today. Under Secretary Moffitt and Chief Cosby, thank you for your testimony and for responding to the questions that Members had. The Committee will take a brief 5 minute recess to allow our witnesses to depart and for our second panel of witnesses to take their seats or to come onto the Zoom screen. Thank you.

[Recess.]

The CHAIR. Okay. We are ready to begin on the second panel. And I want to thank you all very much for your patience. It had been my hope to be in the committee room. Personal reasons have me still in the district attending to family matters, so I am grateful for the ability that we have virtually to still conduct meetings and still engage in the people's business while also attending to the life eventualities that happen.

I want to call the Committee to order, and I am pleased to welcome our second panel of witnesses to the hearing. Our first witness for this panel is Ms. Laura Batcha, who is the Chief Executive Officer for the Organic Trade Association, which is critical to the discussion that we are having here this morning.

And to introduce our second witness, I am pleased to yield to our colleague from California, Mr. Panetta.

Mr. PANETTA. Thank you, Madam Chair. I appreciate this opportunity. But also it is a true honor this morning that I get to introduce our next witness for today's hearing, Brie Reiter Smith. I am proud to introduce Ms. Smith not only because she is from my district and she is actually a neighbor of mine, but I do believe that Ms. Smith knows exactly what it takes to grow, to harvest, to pack, to transport, and to sell a berry. Yes, based on her background, she understands the many challenges that go along with producing not just berries but all specialty crops and the difficulties from Mother Nature to our mandates to our markets to labor.

Now, look, with most people in agriculture, Brie will be the first to tell us about those challenges. But what makes her and her family very unique is that they also talk about, and more importantly they act about, coming up with solutions. Now, Brie is a fifth-generation berry farmer who, with her husband Brian, have a blueberry farm in Chile and a blackberry ranch in California.

Brie also serves as a Vice President of Product Leadership for the world's largest berry company, Driscoll's, where she is responsible for looking into the future of berry production and developing strategies to build the business that her family started in the late 1800s. It is a company that has a one-family philosophy and has got to a point where they work with thousands of families, thousands of berry growers across the world, so she deals with all types of farmers and farmworkers and deals with all types of problems but, more importantly, she also works hard to find all types of solutions.

As a California native, she received a degree from Cal Poly University and an MBA from Thunderbird School of Global Management. She brings with her a legacy of service in the agriculture industry and a wealth of knowledge that I know will benefit this Committee hearing today. She understands legacy but, more importantly, she understands and accepts the responsibility to not just uphold but also to further the legacy of not just her family but other families in agriculture.

For that, it is my honor to introduce to you Ms. Brie Reiter Smith, and I yield back.

The CHAIR. Thank you very much to my distinguished colleague from, as he deems it, the Salad Bowl district in California.

And it is my honor to also introduce our third witness for the panel, Mr. Marc Oshima, who is the Chief Marketing Officer and co-founder of AeroFarms. We are really glad to have you with us.

And our fourth witness is a dear friend of mine and an important person in the agriculture of the U.S. Virgin Islands, Nate Olive, who is the owner and operator of Ridge to Reef Farm. Ridge to Reef Farm is a 100 acre organic certified farm on the Island of St. Croix. Dr. Olive, Nate Olive has a Ph.D., is also the President, duly elected of the Virgin Islands Farmers Alliance, which strives to be a unified voice for farmers in the Virgin Islands. He is on the Island of St. Croix, which is my home island in the Virgin Islands of the United States, and I want to thank him for offering his time, his tireless dedication to farming and to the agricultural growth of the Territory, as well as to the young people and ensuring that we in

the Virgin Islands at least attempt to make a strive and effort to reverse the complete reliance on outside food production to sustain us.

To introduce our fifth and final witness for this panel, I am pleased to yield to the Ranking Member, Mr. Baird.

Mr. BAIRD. Thank you, Madam Chair. And it is my distinct pleasure to introduce Director Kettler to testify before us today. And Bruce is the Director of the Indiana State Department of Agriculture, and he currently serves as the Second Vice President of the National Association of State Departments of Agriculture. With over 30 years of experience across numerous sectors of the agricultural industry, Bruce has a deep understanding of the diverse needs of the industry and the important programs authorized in the farm bill.

At ISDA, Bruce is a tireless advocate for agriculture, working to promote environmental stewardship, enhance economic opportunities for Hoosier farmers, and grow the next generation of leaders.

In addition to his roles with the Indiana State Department of Agriculture and NASDA, Bruce is the Director of the Agribusiness Development for the Indiana Economic Development Corporation and serves on the Ohio State University President's Alumni Advisory Council and on the Dean's Advisory Council for the Purdue College of Agriculture.

Bruce, I am really honored to have you with us here today, and I look forward to hearing from you and share your testimony with the Committee. So thanks for being here, Bruce. I yield back.

The CHAIR. I thank the gentleman. I welcome you all today. We will now proceed to hearing your testimonies. You will each have 5 minutes. The timer should be visible to you, and it will count down to zero, at which point your time has expired.

Ms. Batcha, please begin when you are ready.

**STATEMENT OF LAURA BATCHA, CHIEF EXECUTIVE OFFICER
AND EXECUTIVE DIRECTOR, ORGANIC TRADE ASSOCIATION,
WASHINGTON, D.C.**

Ms. BATCHA. Chair Plaskett, Ranking Member Baird, and Members of the Committee, thank you for holding this hearing and inviting me to testify on behalf of the organic sector. I am Laura Batcha, CEO of the Organic Trade Association. Our members represent the entire organic supply chain, including growers, shippers, processors, certifiers, regional farmers associations, brands, and retailers in all 50 states.

Last year, organic sales in the U.S. grew by more than 12 percent, reaching a record high of \$62 billion. Today, more than 15 percent of produce sold, nearly ten percent of dairy and eggs, and more than seven percent of packaged food sold in the United States are certified organic, demonstrating the importance that consumers place on this sector.

Today, we released the results of a study by the firm Edelman that is an organic follow-on to their widely cited consumer trust barometer. What we found was that 89 percent of consumers say that the USDA should update the organic standards periodically, and 87 percent of consumers expect these updates to reflect evolving understandings about soil, climate, health, animal welfare, and more.

Yet, less than 45 percent of the general population gives USDA high marks today for the stewardship of the National Organic Program.

Organics is at a critical juncture and inflection point. We know that consumers have fueled the strong growth of the industry for over 20 years, but the marketplace is becoming more crowded with new certifications and label claims. What sets USDA organic apart from other private certification and marketing claims is that the standards are developed and enforced by Federal law and regulations. It is a voluntary regulatory program where the market rewards businesses and farmers who choose to opt-in and meet these strict standards. And participation in the program is an important opportunity to diversify farms, create sustainable practices and livelihoods.

For the last 20 years, organic standards have remained largely static. In fact, when it comes to organic practice standards, only one major rule has been implemented by USDA in the last 12 years—well, two. We have heard one announced this morning, so we appreciate that. Nearly two dozen other recommendations to improve the standards have been submitted to USDA by the National Organic Standards Board, the Federal Advisory Committee established in the Organic Foods Production Act of 1990 (Pub. L. 101–624). They all remain unimplemented. The very purpose of the Organic Act is to create uniform, robust standards for marketing organic products nationwide. Many of these recommendations address inconsistencies and lack of clarity in the existing regulations that have led to competitive harm and market failure. Others improve sustainability outcomes in organic production systems.

That is why OTA supports H.R. 2918, the Continuous Improvement and Accountability in Organic Standards Act, a bipartisan piece of legislation introduced by Representatives Peter DeFazio, Rodney Davis, Chellie Pingree, Ron Kind, Dan Newhouse, and Jimmy Panetta. The bill updates the way USDA would administer these standards and sets forth a future process by which the National Organic Program can adapt in a more timely and transparent fashion.

We applaud the announcement this morning by Under Secretary Moffitt that USDA is publishing the Origin of Livestock rule, 19 years in the making since that recommendation was handed off to USDA. While we are encouraged that USDA has started the process of moving forward on the regulatory backlog, in the next farm bill we would like to see this legislation be reintroduced with a focus on institutionalizing a more stable future for organic by restructuring the public-private partnership, investing in oversight and enforcement, and prioritizing continuous improvement.

Organic provides economic opportunities for farmers and businesses, creates jobs, and lifts rural economies while also utilizing sustainable farming practices that are proven to help mitigate the threat of climate change. There is an important opportunity to invest in conservation, technical assistance, as well as focused market development and infrastructure to address supply-chain constraints and increased domestic production of organic.

We look forward to working with Congress and Members of this Committee to advance organic in the 2023 Farm Bill. Thank you

for the opportunity to provide my testimony this morning to inform Federal policy, and I am happy to address any of your questions. [The prepared statement of Ms. Batcha follows:]

PREPARED STATEMENT OF LAURA BATCHA, CHIEF EXECUTIVE OFFICER AND EXECUTIVE DIRECTOR, ORGANIC TRADE ASSOCIATION, WASHINGTON, D.C.

[Chair] Plaskett, Ranking Member Baird, and Members of the Committee, thank you for holding this hearing and inviting me to testify on behalf of the organic sector on the upcoming farm bill. I am Laura Batcha, CEO and Executive Director of the Organic Trade Association (OTA), the membership-based business association for organic agriculture and products in North America. OTA is the leading voice for the organic trade in the United States, representing over 9,500 organic businesses across 50 states. Our members represent the entire supply chain including growers, shippers, processors, certifiers, farmers' associations, distributors, importers, exporters, consultants, retailers, and others.

Organic is an increasingly important part of American agriculture and represents one of the fastest-growing food and farming sectors in the U.S. and global marketplace. In 2020, U.S. organic sales grew by more than 12%, reaching a record high of \$62 billion. Today more than 15% of all produce sold in the U.S. is certified organic, nearly 10% of dairy and eggs are organic and more than 7% of packaged foods as well as grains are organic, demonstrating the importance consumers place on this sector.¹ Consumers are also driving demand globally, where the USDA organic label remains the gold standard. U.S. organic exports increased 8% in 2021.²

Organic in the Farm Bill

The farm bill provides critical support for the growing organic sector with many programs authorized to assist organic including the Organic Data Initiative, the Organic Research and Extension Initiative, the Organic Certification Cost-Share Program, the Environmental Quality Incentives Program Organic Initiative and more. Most importantly, every farm bill the Organic Foods Production Act (OFPA) the law that authorized Federal organic standards, is amended and updated to reflect the latest policy and oversight measures that are needed to ensure a strong and healthy U.S. organic sector.

The 2018 Farm Bill included the Organic Farmer and Consumer Protection Act, legislation that was championed by Members of this Committee that gave the USDA National Organic Program (NOP) more resources and authority to combat global fraud in the organic trade. This spring we anticipate implementation of these provisions when USDA releases a final rule on Strengthening Organic Enforcement.

The rule should close gaps and eliminate major fraud risks in the organic supply chain by requiring all entities that handle organic products including brokers, traders, importers, and exporters to obtain organic certification. For the first time, all imports of certified organic product coming into the U.S. will be accompanied by an electronic import certificate that will be uploaded to the U.S. Customs and Border Protection's Automated Commercial Environment System. I will note that the release of this final rule is past the Congressional deadline set for implementation which is going to further delay the electronic import certificate tracking system. The rule will also require certifiers to conduct mass-balance and trace back audits as well as increase unannounced inspections of organic operations. Moving forward all certified operations will have to develop an organic fraud prevention plan.

The Organic Foods Production Act and the Next Farm Bill

Looking ahead to the 2023 Farm Bill, OTA has engaged in an extensive outreach process to collect feedback from our members and other stakeholders on priorities. We hosted a series of in-depth workshops on the future of organic. Additionally, OTA's Farmers Advisory Council, a coalition that represents more than 8,500 organic farmers, held numerous working sessions to delve into the efficacy of current farm bill programs and outlined the most critical needs and recommendations of organic farmers. We will release our full farm bill policy platform early this summer. Today I will provide a preview of our top priorities.

Organic is at a critical juncture and inflection point. We know that consumers recognize and trust the USDA organic label, fueling the strong growth of the industry over the last 20 years. But the marketplace is becoming more crowded with new certifications and label claims and consumer preferences on how their food is pro-

¹ Organic Trade Association's 2021 Organic Industry Survey.

² FAS Global Agricultural Trade System.

duced are evolving and shifting rapidly. What sets USDA organic apart from other private certification and marketing claims is that the standards are developed and enforced by Federal law and regulations. It's a voluntary regulatory program that rewards businesses and farmers who choose to opt-in and meet strict standards through market premiums.

However, organic's greatest challenge and our biggest opportunity for the next farm bill lies in living up to the expectations that consumers and businesses have of the organic seal to continuously improve and advance the standards. When the Federal organic regulations were implemented in 2002, it was known that additional modifications and updates would need to be made later down the road. There was still a lot that needed to be worked out and as the industry sky-rocketed in popularity, emerging sectors also wanted the opportunity to become certified organic. Unfortunately, advancing and updating the standards regularly is not what has happened in practice and improving this process should be the major focus to support organic in the 2023 Farm Bill.

For the last 20 years the organic standards have remained static. In fact, when it comes to organic practices only one major update has been implemented by the USDA NOP, a final rule on livestock grazing and access to pasture. That was twelve years ago. It hasn't been for a lack of will on the private-sector's part. Industry and stakeholders have come together and agreed upon recommendations to improve the standards nearly two dozen times at the National Organic Standards Board, a Federal advisory board to the USDA that must be consulted on updates to the organic regulations. Some of those recommendations have been sitting on a shelf or in various stages of rulemaking limbo for more than fifteen years and they span everything from mushroom production, aquaculture, animal welfare, pet food, personal care, greenhouse standards and more.

In some cases, the recommendations are to create clear, enforceable standards for emerging sectors and in other cases some of the updates are sorely needed to address inconsistencies and lack of clarity of the existing regulations that have led to competitive harm and market failure. The very purpose of the Organic Foods Production Act is to create uniform, robust standards for the marketing of organic products. The failure of the government to keep pace with these expectations has stifled industry innovation, put organic businesses and farmers at a competitive disadvantage, resulted in varying interpretations and inconsistent application of the standards by certifiers, and led to declining consumer trust in the seal.

OTA supports H.R. 2918, the Continuous Improvement and Accountability in Organic Standards Act, bipartisan legislation introduced by Representatives Peter DeFazio, Rodney Davis, Chellie Pingree, Ron Kind, Dan Newhouse and Jimmy Panetta. The bill requires the USDA NOP to clear the backlog of stalled recommendations to update the standards, sets forth a future process by which the NOP must respond to industry recommendations in a more timely and transparent fashion, and requires the NOP to audit certifiers and ensure that new regulations and updates to the standards are being applied consistently. Regularly updating the standards was Congress' intent when the OFPA was included in the 1990 Farm Bill but that has not been fulfilled due to the administrative challenges at USDA. It is the role of Congress to amend the Act to make it very clear that standards development is a core requirement that must be followed through by USDA.

We are encouraged that USDA has started the process of moving forward on the regulatory backlog by taking public comment from stakeholders on priorities for implementation. However, in the next farm bill we would like to see this legislation be reintroduced with a focus on institutionalizing a more stable future for organic. The next farm bill should restructure the public-private partnership, invest in oversight and enforcement, and prioritize continuous improvement.

We believe the structure of the NOP should be updated to allow for prioritizing standards and market development *along with* maintaining strong compliance and enforcement. Specific funding and resources must be allocated for standards development and implementation at the NOP. There should be a clear statutory requirement for USDA to review and update organic practice standards beyond just the National List of allowed and prohibited substances used in organic.

Although progress has been made in recent farm bills to provide NOP with more resources, authority, and tools to increase enforcement and prevent fraud in the marketplace, there are still loopholes that remain. USDA's scope of authority must be expanded to combat the improper use of the term organic on uncertified products such as personal care, textiles, dietary supplements and businesses such as grocery stores, dry cleaners and restaurants. The fraudulent use of the term organic misleads consumers and hurts the USDA organic label and brand. The NOP's accreditation function should also be updated to align with best practices in third-party certification systems and auditing.

Continuous improvement is the bedrock of organic but it is not expressly required by the law or regulations. USDA must collaborate with accredited certifiers to advance the outcomes on farms, ranches, and facilities certified to the organic standards.

We know that this is critical to maintain consumer trust. OTA recently commissioned the firm Edelman to conduct a study on consumer perception of organic, an organic follow-on study to their widely cited consumer trust barometer. What they found was that 89% of consumers say that the USDA should review and update the organic standards periodically. 87% of consumers expect that the organic standards should be updated to reflect evolving understandings about soil, climate, health, animal welfare and more.

We look forward to working with this Committee to ensure that organic continues to have a bright, successful future by creating oversight and tools for continuous improvement in the next farm bill. This is essential for USDA organic to remain the gold standard in certification and marketing.

Other Core Priorities To Advance in Organic in the 2023 Farm Bill

In addition to making updates to the Organic Foods Production Act, there are also several other priorities that could advance organic in the next farm bill. The Committee can support growth and market development in the U.S. organic sector by providing funding and incentives for those seeking to transition to organic, increase processing and infrastructure capacity, and stabilize supply chains by facilitating more domestic production of targeted organic crops where market demand exceeds supply.

The next farm bill is an opportunity to increase conservation and technical assistance for organic and transitioning farmers. Organic agriculture is a regenerative system requiring practices that advance sustainability in agriculture like crop rotation, cover cropping, building soil health, increasing biodiversity, and reducing nutrient pollution. However, many agronomists, extension agents, NRCS staff, and farm consultants lack in the knowledge and understanding of organic systems making them ill-equipped to support organic farmers and those interesting in adopting organic practices.

There are also core farm bill programs that support organic such as the Organic Research and Education Initiative (OREI) and the Organic Certification Cost-Share Program. Robust funding for both of these programs is necessary to keep pace with the growth of the industry. Increased funding for the Market Access Program, Foreign Market Development Program and Technical Assistance for Specialty Crops will provide U.S. organic businesses with export opportunities and reduce trade barriers.

Last, not every problem requires more spending. There are several programmatic changes that can be made to existing farm bill programs to streamline access and reduce barriers for organic farmers. Improvements to organic certification cost-share, crop insurance, conservation, risk management and other farm bill programs are always ripe for consideration.

In conclusion, organic provides economic opportunities for farmers and businesses, creating jobs and lifting rural economies, while also utilizing sustainable farming practices that are proven to help mitigate the threat of climate change. Organic provides a safe, healthy choice to consumers, who are increasingly seeking out the trusted USDA organic seal on the food and products they purchase for their families.

We look forward to working with Congress and Members of this Committee to advance organic in the 2023 Farm Bill. Thank you for the opportunity to provide feedback to inform Federal farm policy. I'm happy to address any of your questions.

The CHAIR. Thank you very much for that.

Ms. Smith, please begin when you are ready.

STATEMENT OF BRIE REITER SMITH, VICE PRESIDENT, PRODUCT LEADERSHIP, DRISCOLL'S, INC., WATSONVILLE, CA; ON BEHALF OF SPECIALTY CROP FARM BILL ALLIANCE

Ms. SMITH. Can you hear me?

The CHAIR. Yes, we can.

Ms. SMITH. Perfect. Okay, thank you for the opportunity to appear before you on behalf of Driscoll's and the Specialty Crop Farm Bill Alliance. Mr. Panetta covered some of this, but I am going to stick to the script because I am a bit nervous. So at Driscoll's I am

the Vice President of Product Leadership. My team authors the 5 year strategic plans for each berry type, conventional and organic. These plans are allocated to hundreds of independent farmers who grow, pick, and pack our proprietary varieties of strawberries, raspberries, blackberries, and blueberries.

Driscoll's generally cools, handles, markets and sells the fruit, and then we split the proceeds with our growers. In addition to our farm in Chile, my husband and I also grow blackberries in Watsonville, California, where my family has been growing berries for over 125 years. My grandfather was one of the founders of Driscoll's. In addition to our home State of California, Driscoll's berries grow in Florida, Georgia, North Carolina, New Jersey, Oregon, and Washington.

Specialty crop production in the United States accounts for \$66 billion in farmgate value, about $\frac{1}{3}$ of all farm crop cash receipts. The specialty crop industry has changed tremendously to satisfy consumer demands, adapt to new technology, and compete in an increasingly global marketplace. We want to raise the importance of specialty crops today not simply as one more sector of the ag economy but as an important source of food to every American.

The specialty crop industry is united to advocate for a common set of priorities as Congress prepares to reauthorize the farm bill. A broad coalition of more than 120 specialty crop organizations known as the Specialty Crop Farm Bill Alliance represents the whole of the fruit, vegetable, and tree nut industry. The alliance has formed working groups covering each title of the farm bill, along with additional working groups to evaluate cross-title policy recommendations. Over the coming weeks, these working groups will evaluate existing farm bill programs and consider new policy proposals. The alliance will then form a single set of recommendations representing the collective views of the specialty crop industry.

I would like to highlight some of the programs our industry is currently using, as well as preview some areas of interest that are likely to come forward during the policy development process.

Research: The farm bill provides our industry with vital tools to address our substantial research needs. Our industry includes hundreds of crops, each with unique challenges, and the demand for funding under these programs consistently outstrips available dollars.

Trade: Farm bill programs both promote the export of America's specialty crops and help prevent unwanted plant pests from accompanying imported specialty crops. In an increasingly competitive global marketplace, these programs are more important than ever.

Nutrition: The farm bill authorizes the government to purchase and then donate a variety of non-price-supported commodities, including fruit, vegetable, and tree nut products, through USDA's domestic nutrition and food assistance programs. These donations help vulnerable Americans to eat a healthy diet and avoid hunger while also helping to balance supply and demand for various commodities in our sector. The importance of these programs was definitely magnified during COVID.

Natural resource management: The specialty crop industry strongly supports USDA's working lands conservation programs.

However, payment limits and eligibility requirements constrain the fruit and vegetable sectors' ability to access important benefits of these programs. As the produce industry moves forward with our farm bill recommendations, we want to work with the Committee to develop creative solutions that preserve policy objectives of these limitations while allowing us to participate fully in USDA's conservation programs. Addressing these impediments will only become more important as we work together to address climate change.

Disaster and crop insurance: The specialty crop industry has increasingly been impacted by natural disasters across the United States. The West has experienced the longest and deepest drought in some places in all recorded history. Producers across the South have been hammered by extreme weather events. Additionally, COVID severely disrupted our supply chains for retail and food service customers. These recent experiences have prompted our industry to re-examine risk management and commodity support programs.

And a final thought regarding labor. While I know this issue is not directly in the jurisdiction of this Committee or within the traditional parameters of the farm bill, I need to mention the ongoing and increasingly urgent need to address labor issues. While agriculture plays the critical role in maintaining a safe and secure food supply vital to our national security, a flourishing agricultural industry is crucial to the strength of rural America. Agricultural producers across the country need a legal and stable workforce to continue feeding American families.

Thank you for this opportunity to speak to you about the specialty crop industry, and I welcome any questions you may have. [The prepared statement of Ms. Smith follows:]

PREPARED STATEMENT OF BRIE REITER SMITH, VICE PRESIDENT, PRODUCT LEADERSHIP, DRISCOLL'S, INC., WATSONVILLE, CA; ON BEHALF OF SPECIALTY CROP FARM BILL ALLIANCE

Thank you for the opportunity to appear before you today on behalf of Driscoll's and the Specialty Crop Farm Bill Alliance.

At Driscoll's, I am the Vice President of Product Leadership. My team and I are responsible for the 5 year strategic plans for each berry type (strawberries, raspberries, blackberries, and blueberries) and each field type, meaning conventional and organic, in the Americas. Essentially, this is building supply (acres, varieties, growing practices, regions) to meet projected demand. The central plan for each berry is ultimately divided and allocated to hundreds of independent growers in our network who grow, pick, and pack our proprietary varieties. Driscoll's generally cools, handles, markets, and sells the fruit and then we split the proceeds with our growers. My husband, Brian, and I also grow blackberries in Watsonville, California, where my family has been growing berries for more than 125 years. My grandfather was a founder of Driscoll's. In addition to our home state of California, Driscoll's berries grow in Florida, Georgia, North Carolina, New Jersey, Oregon, and Washington. We have winter production in the U.S., Mexico, and South America for U.S. consumers, and farmers grow Driscoll's berries in Europe, Africa, Australia, New Zealand, and China to supply fresh fruit to consumers in those markets as well.

Specialty crop production in the United States accounts for \$66 billion in farmgate value which translates into about 33% of all farm crop cash receipts. The specialty crop industry has gone through tremendous change to satisfy consumer demand, adapt to new technology, and compete in an increasingly global marketplace. This is why we raise the importance of specialty crops today—not simply as one more sector of the agricultural economy, but as an important source of food to every

American. We hope specialty crops garner fair consideration and prioritization in each Congressional district as you develop the 2023 Farm Bill.

The specialty crop industry is united to advocate for a common set of priorities as Congress prepares to reauthorize the farm bill before it expires in 2023. A broad coalition of more than 120 specialty crop organizations, known as the Specialty Crop Farm Bill Alliance, represents the whole of the fruit, vegetable, and tree nut industry in the United States. The Alliance works to form common objectives that transcend different regions, commodities, and other interests, to support this vital source of food for American families. Driscoll's is a member of several specialty crop associations which in turn are members of this Alliance. I can assure you that the produce industry stands ready to work closely and collaboratively with Congress on the next farm bill.

Toward that end, the Alliance has formed working groups covering each title of the farm bill along with some additional working groups to evaluate cross-title policy recommendations. Over the coming weeks, these working groups will evaluate existing farm bill programs and consider new policy proposals on a wide range of topics throughout the farm bill. The Alliance will use this work product to form a single set of recommendations representing the collective views of the specialty crop industry.

I would like to highlight some of the programs our industry is currently using as well as preview some areas of interest that are likely to come forward during the policy development process.

Research

The farm bill provides our industry with vital tools to satisfy our diverse and expansive research needs. Through a combination of specific programs like the Specialty Crop Block Grant Program, the IR-4 program for pest management, and the Specialty Crop Research Initiative, along with other USDA resources, our industry is able to address research concerns of all shapes and sizes.

The produce industry is using Federal research dollars today to address pests and diseases and better prevent and respond to multiple types of food safety hazards across dozens of crops in multiple farming regions. We are also increasingly looking to Federal research programs to identify and develop technology for automation and mechanization. We access research funding to improve organic production, plant breeding, and enhance crop characteristics to improve yield under increasingly challenging climatic conditions.

Our industry includes hundreds of crops each with unique challenges.

As you can imagine, the demand for funding under these programs consistently outstrips available dollars.

Trade

Farm bill programs both promote the export of America's specialty crops and help prevent unwanted plant pests from accompanying specialty crops imported into the United States.

While the fruit and vegetable industry is not the primary user of the Market Access Program, many of our crops successfully use this program to gain access to foreign markets. In addition, our industry has used the Technical Assistance for Specialty Crops program to help American producers overcome technical barriers to trade imposed by foreign countries to exclude American made products from their markets.

Nutrition

The farm bill authorizes the government to purchase and then donate a variety of non-price supported commodities, including fruit, vegetable, and tree nut products, through USDA's domestic nutrition and food assistance programs. These donations help vulnerable Americans to eat a healthy diet and avoid hunger, while also helping to balance supply and demand for various commodities in our sector. During the COVID crisis those programs were used to help remove excess product from the system and provide a vital source of food to those in need.

Natural Resource Management

The specialty crop industry strongly supports USDA's conservation programs. They help producers across the country to better and more efficiently use our nation's natural resources, and for our industry's growers, these voluntary conservation programs help address a myriad of obstacles. For example, in my home state of California programs like the Environmental Quality Incentives Program (EQIP) provide critical assistance to upgrade irrigation systems and improve the efficiency of on-farm water usage, which is critical in the arid West.

Although we support these working lands conservation programs, payment limits and adjusted gross income eligibility requirements have a disproportionate impact upon the fruit and vegetable sector and our ability to access the important benefits of these programs. Our crops typically have a much higher cost of production, and hence return on investment, than other agricultural sectors. As the produce industry moves forward with our farm bill recommendations, we want to work with the Committee to develop creative solutions that preserve the policy objectives of these limitations while allowing this vital sector of the agricultural economy to participate fully in USDA's conservation programs. Addressing these impediments will only become more important as we work together to address climate change.

Disaster and Crop Insurance

And speaking of climate change, the specialty crop industry has increasingly been impacted by natural disasters across the United States. In my home region in the Western United States, we have seen the impacts of the longest and deepest drought, in some places, in all of recorded history. The West has not been alone in facing natural disasters over the last few years with producers across the South also being hit. In addition to natural disasters, our industry was impacted when COVID severely disrupted our supply chains for retail and food service customers.

These experiences, along with USDA grower assistance programs for trade and COVID initiated since the last farm bill, have prompted our industry to examine risk management and commodity support programs in a new light.

One aspect of the farm bill that the specialty crop industry looks to in times of disaster is the crop insurance program. Although many in the perennial crop industry growing trees and vines participate in Federal crop insurance, these risk management tools have not been embraced by the field produce sector. With few products available and even fewer that can be deemed "modern" in design, we will want to work with the Committee and USDA on ways to improve crop insurance to attract a larger percentage of the field produce industry—which represents the majority of specialty crop acres.

A Final Thought Regarding Labor

While I know this issue is not directly in the jurisdiction of this Committee or within the traditional parameters of the farm bill, I would be remiss if I did not mention the ongoing and increasingly urgent need to address labor issues. Agricultural producers across the country need a legal and stable workforce. Not only is agriculture's role in maintaining a safe and secure food supply vital to our national security, it is critical to the strength of rural America.

Without immigration reform, growers across the country will eventually face the predicament of closing operations or moving them abroad. These are not theoretical discussions. Growers struggle to secure the labor they need which means they gamble every year on getting enough labor to harvest crops or they make the choice to plow under the food they have grown for lack of labor.

The House passed a bipartisan immigration reform bill recently and I urge you to reach out to your colleagues in the Senate to take action. Closer to home I suspect that the specialty crop farm bill alliance will approach this Committee looking to see how the farm bill could be used to address labor needs in whatever ways this Committee can.

Thank you for this opportunity to speak to you about the specialty crop industry. I welcome any questions you may have.

The CHAIR. Thank you very much for your testimony, and I am sure we will have questions for you and the other witnesses.

Mr. Oshima, please begin when you are ready.

STATEMENT OF MARC OSHIMA, CO-FOUNDER AND CHIEF MARKETING OFFICER, AEROFARMS, NEWARK, NJ

Mr. OSHIMA. Chair Plaskett and Ranking Member Baird, thank you for the opportunity to speak about the significant role of both urban agriculture and controlled environment agriculture, also known as CEA, for the upcoming 2023 Farm Bill. I am Marc Oshima, Co-Founder and Chief Marketing Officer for AeroFarms, the leader in indoor vertical farming. I am also the Board Chair for the CEA Food Safety Coalition and a member of the FDA Romaine

Advisory Task Force and the International Fresh Produce Association's Grower-Shipper Council.

The U.S. imports $\frac{1}{3}$ of its vegetables and nearly $\frac{2}{3}$ of its fruit, and COVID-19 and now the war in Ukraine have put an even bigger spotlight on how fragile our food system is. We need new paradigms to help us build even greater food resiliency and security. CEA is one of these new paradigms and includes high-tech greenhouses and indoor vertical farms growing nutritious crops like leafy greens, tomatoes, cucumbers, peppers, and berries. CEA farms can be placed where the consumers are, helping cut out a complex supply chain and nourishing local communities all year round with fewer resources.

Since 2004, AeroFarms has been leading the way for indoor vertical farming with a mission to grow the best plants possible for the betterment of humanity. We can grow with up to 95 percent less water and 99 percent less land compared to traditional farms while using zero pesticides ever. We unlock plant science even further through having a totally controlled environment independent of sun, season, and weather. We use our knowledge of plants to be great farmers and then apply these capabilities to solve water challenges in agriculture. Our global headquarters are in Newark, New Jersey, with additional farms underway in Danville, Virginia, the St. Louis region, and overseas in Abu Dhabi, UAE. Our award-winning produce is found throughout the U.S. at top retailers and food service companies, and we are scaling rapidly to meet demand.

While leading with technology, we are also leading with a strong commitment to our communities. AeroFarms is a certified B Corporation with a transparent scorecard in environmental and societal factors by creating year-round jobs with fair wages and benefits. We have partnered with the New Jersey Reentry Program providing jobs to those previously incarcerated and offer second-chance opportunities. And to date, we have probably hired over 100 team members through this program.

We also create impact through our community farms where we install small indoor vertical farms in community centers, municipal buildings, and schools like Phillips Academy Charter School in downtown Newark, New Jersey, where we have had a working farm for over 10 years right in their dining hall, changing the students' eating habits.

AeroFarms has also helped to lead the broader industry by partnering closely with USDA. We are one of the founding companies for the Foundation for Food & Agriculture Research Precision Indoor Plants Consortium where we are working on next-generation crops. We also are one of the founding companies for the CEA Food Safety Coalition that has worked closely with FDA and CDC on the safety benefits of growing indoors.

The U.S. is leading agriculture innovation around the world, but we can do even more. We encourage you to promote competitive R&D programs so we can maintain a technological edge that favors innovation and partnership here rather than abroad. The upcoming 2023 Farm Bill offers a big opportunity to ensure that the entire agriculture industry, both rural and urban, is represented and provide innovative pathways for the future of farming. We believe

there are opportunities to do this in nearly every title, including nutrition, credit, rural development, and energy.

For today, we will focus on two key areas. First, within the Horticulture Title, we see an opportunity to expand the Local Agriculture Market Program and the Farmers' Market Promotion Program to include urban, CEA, and indoor vertical farming practices. Second, within the Research Title, we support increasing overall funding for the Urban, Indoor and Emerging Agriculture Production Research, Education, and Extension Initiative.

The 2023 Farm Bill is also an opportunity to incentivize innovation and create a level playing field. We can no longer afford to think of agriculture as exclusively rural or business as usual, but we need to create the fair market conditions that enable true progress and innovation. We should factor these considerations into our true cost of food and use policy to drive positive behavior establishing incentives for things like water conservation and land protection, and creating taxes to disincentivize the overuse of pesticides and fertilizers that create runoff and land degradation.

Fair competition also extends to labor and enforcing Federal minimum wage and benefits. We have the opportunity to raise performance standards and incentivize the right behavior that will be good for the industry, the environment, society, and the economy.

In closing, at AeroFarms we are proud to be leading through innovation to help elevate agriculture. Urban farming, CEA, and indoor vertical farming are about creating local jobs and increasing access to healthy produce all year round, but the impact that we can have on the broader agriculture industry is even greater. We are grateful for American leadership here and know how much more we can achieve if the 2023 Farm Bill is made to work for the entire industry.

Thank you for your time and consideration, and we look forward to addressing any questions. Thank you.

[The prepared statement of Mr. Oshima follows:]

PREPARED STATEMENT OF MARC OSHIMA, CO-FOUNDER AND CHIEF MARKETING OFFICER, AEROFARMS, NEWARK, NJ

Introduction

Chair Plaskett and Ranking Member Baird, thank you for the opportunity to speak to you today about the significant role of both Urban Agriculture and Controlled Environment Agriculture also known as CEA in the upcoming 2023 Farm Bill.

Biography

I am Marc Oshima, Co-Founder and Chief Marketing Officer for AeroFarms, the leader in indoor vertical farming. During my career, I have headed marketing for leading food retailers like *The Food Emporium* and *Citarella Gourmet Markets* and am passionate about improving our food systems and making them more sustainable and equitable. I am also the Board Chair for the *CEA Food Safety Coalition* and a member of the *FDA Romaine Advisory Task Force* and the International Fresh Produce Association's *Grower/Shipper Council*. I am honored to be here today.

Controlled Environment Agriculture

The macro pressures of a growing population, drought, loss of arable land, food safety and recalls, overuse of pesticides, farmer welfare, and food waste are challenging traditional agriculture more than ever. The United States imports 1/3 of its

vegetables and nearly ⅔ of its fruit,¹ and COVID-19 and now the War in Ukraine have put an even bigger spotlight on how interdependent and fragile our food system is. We need new paradigms to help us build a more resilient and secure food ecosystem here at home and around the world.

CEA is one of these new paradigms and includes high-tech greenhouses and indoor vertical farms like AeroFarms, growing key nutritious crops like leafy greens, herbs, microgreens, tomatoes, cucumbers, peppers, and berries. CEA farms can be placed where the consumers are, helping cut out a complex supply chain and ensuring a steady source of produce all year round. Other key positive advantages can include better quality, use of less water and land, no pesticides, year-round local job creation, addressing food deserts, and minimizing food waste. For indoor vertical farming specifically, we unlock plant science even further through having a totally controlled environment.

AeroFarms—Technology and Innovation

Since 2004, AeroFarms has been leading the way for indoor vertical farming with a mission to grow the best plants possible for the betterment of humanity. Our proprietary technology and innovation platform allows us to grow plants layer upon layer indoors, without sun or soil, and without any seasonal climate restriction. We can grow with up to 95% less water and 99% less land compared to traditional farms, while using zero pesticides, fungicides, herbicides, or insecticides ever. As a result, we are able to set higher standards for environmental stewardship and food safety. We also decrease the distance between food production and consumption, by building farms right where the people are in both urban and rural environments. We do all this by integrating a deep understanding of plant biology, mechanical design, environment controls, data analytics, operations, and plant genetics. We use our knowledge of plants to be great farmers and then apply these capabilities to solve broader challenges in agriculture.

Our global headquarters are proudly in Newark, New Jersey, with additional farms underway in Danville, Virginia, the St. Louis region, and overseas in Abu Dhabi, UAE. We have an extensive pipeline of farm development nationally and globally, and we are scaling to meet demand. Today, our award-winning produce is found throughout the country at top retailers and food service companies, and shoppers prize our high quality because it is more nutritious and flavorful. Our breakthrough work has been recognized with over sixty awards since 2011, including *TIME Best Inventions* and *Fast Company's World's Most Innovative Companies*. AeroFarms was also the inaugural winner of the *Global Sustainable Development Goals Awards* in the category of *Zero Hunger*.

AeroFarms—Social Impact

While leading with technology, we are also leading with a strong commitment to our communities. AeroFarms is a Certified B Corporation with a transparent scorecard on environmental and societal factors like creating year-round jobs with fair wages and benefits. We have partnered with the New Jersey Reentry Program where we were recognized in 2020 for our work providing jobs to those previously incarcerated and offering second chance opportunities for not just a job, but for dignity and well-being. We are extremely proud of this program and have hired over one hundred team members over the years.

We also create impact through our Community Farms program where we install small indoor vertical farms in schools and community centers. We have had one of our first Community Farms for over 10 years at the Philip's Academy Charter School in downtown Newark, NJ, where we collaborated with teachers to educate students about food literacy and agriculture and were able to actually change behavior to eat more healthy greens. Building on this success, we also launched the first ever municipal indoor vertical farming program with the City of Jersey City and the World Economic Forum's Healthy Cities and Communities initiative where we are placing ten farms throughout the community to provide access to healthy produce and help alleviate the stresses of food deserts.

Industry Leadership

AeroFarms has also helped lead the broader industry by partnering closely with USDA, including with the National Institute of Food and Agriculture (NIFA), the Agriculture Research Services (ARS), and the Small Business Innovation Research (SBIR) program where we have been the recipient of both Phase 1 and Phase 2, grants given our positive results. Over the last 6 years, we have had the opportunity

¹ <https://www.ers.usda.gov/data-products/foreign-agricultural-trade-of-the-united-states-fatus/u-s-agricultural-trade-data-update/>.

to speak at three *USDA Annual Outlook Forums*, including the last two, to share what is next in AgTech technology and innovation. We have worked closely with the Foundation for Food and Agriculture (FFAR) specifically on our ability to optimize leafy greens for nutrition and flavor. We were also one of the founding companies for their *Precision Indoor Plants (PIP) Consortium* where we work on next-generation crops and are the Principal Investigator for optimizing lettuces for indoor growing. AeroFarms was also one of the founding members of the CEA Food Safety Coalition that has developed a third-party certification standard and worked closely with the FDA and CDC to educate how indoor growing can provide a safer environment for growing food, with fewer food safety issues, compared to the field.

Urban Agriculture and Federal Farm Programs

The United States is at the forefront of leadership in agriculture innovation around the world. We encourage our lawmakers to promote competitive research and development programs domestically, so we can maintain a technological edge that favors innovation and partnership here, rather than abroad. Given the tremendous growth and need for CEA, support would include providing greater attention to these modern methods like CEA in Federal agriculture programs.

Federal policy and regulation have historically placed an emphasis on “rural” requirements for beneficiaries, for example, discounting the benefits that CEA can have in both rural and urban areas. Current guidelines also generally appear to support family ownership structures, carrying provisions such as personal guaranties of owners. We are supportive of more forward-looking provisions that can benefit modern approaches to agriculture with further potential for investment and job creation in our local communities.

Recommendations for the 2023 Farm Bill

The upcoming 2023 Farm Bill reauthorization offers an enormous opportunity to ensure that the entire agriculture industry is represented and provide innovative pathways for the future of farming in this country. We have studied the farm bill and believe there are opportunities to do this in nearly every title, including the sections on nutrition, credit, rural development, and energy. For today’s hearing, we will focus on the following suggestions to two specific areas.

- First, within the Horticulture Title, we see opportunity to expand the Local Agriculture Market Program (LAMP) and Farmers['] Market Promotion Program (FMPP) to include Urban, Controlled Environment Agriculture and Indoor Vertical Farming practices
- Second, within the Research Title, we support increasing overall funding for the Urban, Indoor, and Emerging Agricultural Production, Research, Education, and Extension Initiative.

These expansions would help encourage competition, while promoting the technology and innovation that forms the bedrock of our national ethos and is necessary to feed the growing population.

Other Opportunity Areas

The 2023 Farm Bill is an opportunity to incentivize innovation and create a level playing field. We can no longer afford to think of agriculture as exclusively rural or business as usual, but we need to create the fair market conditions that enable true progress and innovation. We live in a time with fewer available resources. We should factor these considerations into our true cost of food and use policy to drive positive behavior, establishing incentives for things like water conservation and land protection and creating taxes to disincentivize the overuse of pesticides and fertilizers that create runoff and land degradation. Fair competition also extends to labor and enforcing Federal minimum wage and benefits so that workers can earn a fair income and agricultural employers are no longer put at a disadvantage because of farmers who may pay below the minimum wage. A final area of reform concerns consumer welfare. We support all food producers, including small hyperlocal growers, to be held to the same food safety standards as larger scale growers with no exemptions, to help protect the health of American consumers and ensure a level playing field. The farm bill has the opportunity to raise performance standards and incentivize the right behavior that will be good for the industry, the environment, society, and the economy.

Closing

At AeroFarms, we are proud to be leading through innovation to help elevate agriculture in the United States and around the world. Urban farming, CEA, and vertical farming are about creating local jobs and increasing access to healthy produce all year round, but the impact that we can have on the broader agriculture

industry is so much more. We are grateful for American leadership here and know how much more we can achieve if the 2023 Farm Bill is made to work for the entire industry. We owe it to ourselves and the generations to come.

Thank you for your time and consideration.

Additional Content for Written Submission

AeroFarms is led by Co-Founder and CEO David Rosenberg, a clean-tech champion, who won the 2021 *3BL Responsible CEO of the Year Award*. As a member of the World Economic Forum, David co-founded and co-chaired the *Young Global Leaders Circular Economy Taskforce* and was a member of the World Economic Forum *Global IoT Council*. David was also a member of the U.S. delegation to the *B20 Sustainable Food System Taskforce*, which advises the G20. David was also honored to co-chair New Jersey Governor Phil Murphy's *Agriculture Transition Committee*.

The CHAIR. Thank you. The next witness will be Dr. Olive. Dr. Olive, you are recognized for 5 minutes.

**STATEMENT OF NATHANIEL "NATE" OLIVE, PH.D., OWNER/
OPERATOR, RIDGE TO REEF FARM; CO-FOUNDER AND
PRESIDENT, VIRGIN ISLANDS FARMERS ALLIANCE, INC.,
FREDERIKSTED, ST. CROIX, USVI**

Dr. OLIVE. Thank you. Good morning, Members of Congress, supportive staff, fellow testifiers, and the listening public. It is an honor to be here, truly. I am Nate Olive, and I am owner/operator of Ridge to Reef Farm, certified organic on St. Croix, and the President of the Virgin Islands Farmers Alliance. I am here today to share my own experience as well as that of other farmers from my area, as best as I can, in navigating Federal support in farming in the U.S. Virgin Islands. I sincerely hope that my input can help make a difference in improving the quality of life for farmers in the territory.

So I will start by telling you a little bit about the farm, although Delegate Plaskett did such a wonderful job that I don't have to say much about the Virgin Islands Farmers Alliance. Our mission as a farm is to help reverse the trend of food import dependency, which is greater than 98 percent for our Territory, through ecologically regenerative and culturally appropriate agricultural practices. We grow over 100 varieties of organic fruits and vegetables, and we also have pastured sheep and hogs that are not certified organic due to the lack of available, cost-effective, organic-certified feed sources.

The Virgin Islands Farmers Alliance is a grassroots domestic nonprofit with the purpose of providing a unified voice for farmers in the Territory. We have over 100 members across the Islands of St. John, St. Croix, and St. Thomas. And together, we coordinate farm-to-school activities, along with other co-marketing activities, conduct production research under a USDA Sustainable Agriculture Research Education Grant, and will be establishing a food hub storage facility for alliance members with the support of World Central Kitchen soon. We are very excited about that.

So as we meet today, there is a soaring demand and a broad base of support for agriculture in the Virgin Islands to rejoin the economic development of the Territory, but there are many challenges here that remain, largely due to our small population and land area, our distance from the mainland, and relatively large local government. Our insular geography greatly creates higher farm input costs in every way in comparison to our import market competition. Nearly all farms here are considered small farm operations, and the economic rules of efficiency and scale continue to work against us. So today, we are trying to find our footing, and like other rural areas, we can't reach our optimal potential without special considerations and support through the farm bill.

So now I am going to tell you about a few of the programs under the farm bill that we at Ridge to Reef Farm are engaged in. First of all, I say that we are not taking part in the Specialty Crop Block Grant Program because it is geared toward beginning farmers here in the Territory in this round, but we look forward to future rounds. And one of the most effective programs here has been the in NRCS EQIP conservation program. We have used this to dig wells, erect livestock fencing, establish rainwater catchments for irrigation, construct a high tunnel for tomato and cucumber produc-

tion. Many other farms have utilized this important program for similar purposes.

Some problems with the program are the reimbursement nature that makes it out of reach for a lot of small farms here without the capital to put up the money, the multiyear time frame that it takes from application to execution and reimbursement, and the cost-share. Costs here are higher than some of the cost-share figures that are anticipated. We end up, it is supposed to be 90 percent for some of the things. We only get 60 percent of the cost covered here in our special situation in the Virgin Islands.

Second, the USDA disaster recovery assistance program such as debris removal, the tree replacement program, those are instrumental—the fencing program, those are instrumental for many farmers, including Ridge to Reef Farm, after the disastrous effects of Hurricanes Irma and Maria in 2017, so thank you so much for that support. I would not be here talking with you without that. So that has been huge.

And another program that we are involved in is the Value-Added Producer Grant. We were the first in the Territory to receive that some years ago for a planning grant for agroforestry for our fruit share program.

Fifth, as I mentioned above, we participate in the federally funded Farm-to-School Program since it started in 2014 here in the Territory. And so we serve as an aggregation hub for the other farms. We send crops every week that are gathered by over 15 farms to the central school warehouse, and we would like to see a greater oversight in the award of the contracts so that they go to local farmers and not to import farmers to protect our market here, and that is why we formed the Virgin Islands Farmers Alliance to speak up mainly for that need, among others.

Other programs that we are participating in here is the NAP, the Non-insured Crop Disaster Assistance Program, after the hurricanes, the Livestock Forage Disaster Program, which we have had a lot of droughts in the past years. That has been important. The geographic disadvantaged farmer program, which helps cover some of the import extra costs but is not enough. And the USDA Rural Energy for America Program where we upgraded our solar. And there is more that I could list. But there is a complete list in my testimony that is submitted.

So a few suggestions that I have are to increase funding to farms directly instead of channeling through larger distributive local government programs; and two, to increase capacity of our local USDA offices to offer more on-farm support and grant writing help. As mentioned before by Ms. Moffitt, a lot of producers have difficulties with all the paperwork, and it is very preventative to engage in these programs, so we need more help from our office on that, and we would like them to get more support.

To raise the expected cost for EQIP conservation practices so that they are covering the actual cost of what it takes to get it here and install in the Virgin Islands. To remove barriers of program participation by removing the reimbursement nature of many programs like the EQIP and the Hurricane Disaster Programs, which we couldn't complete the fencing and other things because after the hurricanes we had no income to put up the—

[The prepared statement of Dr. Olive follows:]

PREPARED STATEMENT OF NATHANIEL "NATE" OLIVE, PH.D., OWNER/OPERATOR, RIDGE TO REEF FARM; CO-FOUNDER AND PRESIDENT, VIRGIN ISLANDS FARMERS ALLIANCE, INC., FREDERIKSTED, ST. CROIX, USVI

Good day, Members of Congress, supportive staff, fellow testifiers, and the listening public. My name is Nate Olive and I am an owner/operator farmer at the USDA certified organic Ridge to Reef Farm on the island of St. Croix. I am also the elected President of the Virgin Islands Farmers Alliance (VIFA). I am here today to share my own experience as well as that of other farmers from my area in navigating Federal support of farming in the United States Virgin Islands. Where appropriate I will also attempt to elucidate a little of the relevant experience of my other fellow farmers to the best of my ability and knowledge. I sincerely hope that my input can help make a difference in improving the quality of life for farmers in the U.S. Virgin Islands and beyond. I share the belief that a strong focus on building capacity of small and medium sized farms in our territory is ultimately the only way in the long run to strengthen and sustain a viable, secure, and sovereign local food system.

I will start by telling you a bit about Ridge to Reef Farm, our VI Farmers Alliance, and the general state of agriculture in the Virgin Islands from the farmers' perspective. Next, I will share some relevant experiences with Federal programs that fall under the USDA farm bill. Finally, would like to share a few suggestions that may help improve the Federal support of farmers in small insular rural areas like the Virgin Islands.

First, Ridge to Reef Farm is the only USDA certified organic farm on over 100 acres in the Virgin Islands and is among the most productive. Our mission is to help reverse the trend of food import dependency, which is greater than 98%, for our insular territory, through ecologically regenerative and culturally appropriate agricultural practices in the region. For 12 years we have maintained a diverse planting regime of over 100 varieties of organic fruits and vegetables. We also raise pasture-raised sheep and hogs that are not certified organic due to the lack of available cost-effective organic certified feed sources. Like all farms currently in the territory we grow for our local markets. Our primary markets include market stands, supermarkets, a Community Supported Agriculture membership program, and the territory's Farm to School program for which we serve as a multi-farm aggregation hub under contract with the VI Department of Education. In addition to crop sales we participate in agritourism activities such as tours, farm to table dinners, and the hosting of volunteer groups for farm stays, which are significant value-added part of our educational outreach and financial sustainability.

Next, the Virgin Islands Farmers Alliance (VIFA) is a grassroots domestic non-profit founded in 2018 and incorporated in 2019 to provide a unified voice for farmers in the territory. We started off as a collective of five professional farmers who regularly work together for the federally funded Farm to School program. After losing contracts created for our local market to foreign producers, we realized we had to band together to protect, advocate, and educate for our common local agricultural interests. Today we have over 100 members including farmers, farm family members, rising farmers, and farm supporters across the three major Virgin Islands of St. Croix, St. Thomas, and St. John. Together we coordinate Farm to School deliveries among other co-marketing activities, test various vegetable seed varieties under a Sustainable Agriculture Research and Education (SARE) grant, and will soon be establishing a food hub storage facility for Alliance members with the support of World Central Kitchen's Food Producer Network.

As we meet today, the state of agriculture in the U.S. Virgin Islands is again in its toddler phase. Agriculture was recently reborn here decades after the island shifted away in the 1960s in a top-down effort from an agrarian society towards heavy industry. At that time sugar cane was the central crop produced among many other speciality crops and grass-fed Senepol beef grown for local consumption and for export. After that period of time, small local farms could no longer compete with increasing low cost imports and most farms closed for good. Yet in the past 20 years, demand for locally produced fresh foods has steadily risen. Now, demand is soaring as price points and consumer demand have leveled out. There is a broad base of support for agriculture to rejoin the economic development of the Virgin Islands. Yet many challenges remain, largely due to our small population and land area, a relatively large local government that lends to a favor-driven political environment, and our insular geography that greatly increases farm input costs in every way in comparison to our import market competition. Nearly all farms here are considered small farm operations and the economic rules of efficiency and scale continue to

work against us. So today, local agriculture in the VI is energetically trying to find its footing so that it may mature into the grown-up industry that our people require. But like other insular rural areas, it cannot reach its optimal potential without special considerations of support through the farm bill.

Now, I will address our experience with USDA Farm Bill related programs:

First, one of the most effective programs has been the NRCS' EQIP conservation program. At Ridge to Reef Farm, we have used this program to dig wells, erect livestock fencing, establish rainwater catchments for irrigation, and construct a high tunnel for tomato and cucumber production. Many other farms have utilized this important program for similar purposes. The problems with the program are (1) the reimbursement nature of the program which is out of reach for most VI farmers. Even though there is a chance to get some of that money up front, it requires a short project completion deadline which is not feasible for projects that require significant input imports such as construction materials, (2) the multi-year timeframe from project application to approval for implementation, and (3) the anticipated cost-share ends up being a much lower percent because our costs are exponentially higher. For example, our high tunnel was supposed to be 90% but it ended up being around 60% of the Federal anticipated implementation value from higher shipping and construction costs common in the continental U.S.

Second, USDA disaster recovery programs such as debris removal were absolutely farm-saving after the impacts of hurricanes Irma and Maria in 2017—Thank you! I would not be speaking to you today without this program. Unfortunately, however, our farm was unable to complete the fencing recovery and fruit tree replacement programs that we were approved for. This is because we were unable to front the cost after being economically devastated by the disasters and did not have the means to pay up front for an unknown period of processing and eventual Federal reimbursement. The other complicating aspect was that producers were largely kept in the dark by the USDA about what disaster recovery costs would be reimbursed and at what rate. Without knowing complete program details including cost details, farmers were exposed to the risk of acquiring debt that we may not have reimbursed. Therefore, much of the funds made available for disaster recovery for us were left under utilized.

Third, while Ridge to Reef Farm is USDA certified organic, we remain the one and only in the territory. While it seems like a strong niche position, we would rather have more company for partnerships. The costs of establishing and maintaining organic certification is drastically higher on island territories and needs greater support in cost-share programs than what currently is offered. We simply would not be certified today without the Federal cost-share program which saves us \$750 a year on program related costs, which total approximately \$2,000 annually plus the unvalued administrative hours on our small farm. The primary reason for low participation in organic is geographic, since inspectors must travel by air and receive accommodations, meals, ground transportation, and other related costs.

Fourth, we were the first farm in the USVI to be awarded a Value-Added Producer Grant. This grant was to create expand our agroforestry plan into fruit shares on our CSA program. We received the grant to write a planning grant. After completing that project we were later denied the implementation grant and but we plan to reapply.

Fifth, as mentioned above, we participate in the federally funded Farm to School Special nutrition program since it started in 2014. We send crops every week that are gathered from local farms to the central school warehouse. We see a need for greater oversight on the award of these contracts to ensure that locally grown crops are given preference and contracts are executed with integrity.

Some other relevant programs that we have participated in are:

- Non-insured Crop Disaster Assistance Program (after 2017 hurricanes)
- Livestock Forage Disaster Program (usually drought related)
- Geographically Disadvantaged Farmer program (needs a boost, helpful but inadequate)
- USDA Rural Energy Program

Finally, I would like to share a few humble suggestions to strengthen the farm bill for farmers in insular areas:

- (1) Increase funding directly to farms instead of channeling through the local government. Be careful of funding that creates completion with the existing farming community with our small population.

- (2) Increase capacity of our local USDA offices to provide more on-farm support and grant writing/program application assistance. Also, reduce the amount of paperwork required from farms to participate.
- (3) Raise the expected costs for EQIP conservation practices so that cost-share percentages are on par with the rest of the country
- (4) Remove barriers of program participation by removing the reimbursement nature of many programs such as EQIP and hurricane disaster programs.
- (5) Establish a means for farmers to get individual health insurance policies, which are currently unavailable.

Thank you for your attention and support in promoting better food production in the USVI and other insular areas faced with the same challenges. I am happy to answer any questions you may have.

Sincerely,

NATHANIEL "NATE" OLIVE, Ph.D.

The CHAIR. Dr. Olive?

Dr. OLIVE. Yes.

The CHAIR. You have gone way over your time.

Dr. OLIVE. Okay, great.

The CHAIR. If you want to close out, and we will ask questions.

Dr. OLIVE. Yes, that is it. Thank you for your attention, and I appreciate it. I will yield back.

The CHAIR. Thank you. The last witness, Mr. Kettler, you are recognized for 5 minutes.

STATEMENT OF BRUCE KETTLER, DIRECTOR, INDIANA STATE DEPARTMENT OF AGRICULTURE; SECOND VICE PRESIDENT, NATIONAL ASSOCIATION OF STATE DEPARTMENTS OF AGRICULTURE, INDIANAPOLIS, IN

Mr. KETTLER. Good morning, and thank you, Chair Plaskett and Ranking Member Baird, for the opportunity to speak today. I really appreciate it.

My name is Bruce Kettler, and I serve as the Director of the Indiana State Department of Agriculture. I have over 30 years of leadership experience in the agriculture industry with knowledge of production agriculture, sales, and the agriculture supply businesses. Prior to joining ISDA, I spent 11 years at Beck's Hybrids and 17 years at Dow AgroSciences where I worked in a variety of roles, including sales, marketing, and public and industry relations.

In addition to my role as Director at ISDA, as Representative Baird mentioned, I also serve as the Second Vice President for the National Association of State Departments of Agriculture or NASDA. NASDA is a nonpartisan, nonprofit association that represents the elected and appointed commissioners, secretaries, and directors of the Departments of Agriculture in all 50 states and four U.S. Territories, including the U.S. Virgin Islands, Madam Chair. NASDA grows and enhances American agriculture through policy, partnerships, and public engagement.

I would first like to recognize the importance of the Agriculture Improvement Act of 2018. The 2018 Farm Bill was a unified bipartisan bill that secured a commitment to American farmers and ranchers while protecting the critical food and nutritional assistance programs for those who need it most. As I interact with farmers, our agricultural supply businesses, and industry leaders in Indiana, the word *uncertainty* keeps coming up time and time again.

It has replaced the word *resiliency* that was so often used during the pandemic.

Uncertainty sends chills down the spines of farmers as they attempt to make critical business decisions. Uncertainty impacts families in need of assistance with putting food on the table. And uncertainty disrupts the food supply chain, as we witnessed throughout the pandemic.

As the House Committee on Agriculture begins these hearings for the 2023 Farm Bill, it is vital that Congress provide certainty by delivering a forward-looking, fully funded farm bill and on time. If the pandemic and the recent events unfolding in Ukraine have taught us anything, it is that this farm bill and all future farm bills are an issue of national security.

State Departments of Agriculture play a critical role in food and agriculture policy in the United States. As regulators and advocates for the agricultural industry, NASDA's voice is unique between the nexus of the states and the Federal Government. NASDA members lead in areas ranging from food safety to resource conservation and promote agriculture locally and abroad.

As the state regulators and co-regulators with Federal agencies, NASDA members are actively involved in ensuring the safety of an abundant food supply, protecting animal and plant health, implementing conservation programs, and promoting the vitality of rural communities. In a time of increased risk and challenges for the agriculture industry, Federal legislation and regulations should work to promote economic stability while guaranteeing a safe and accessible food supply. This work must be a joint venture between the states and Federal Government. Looking forward, NASDA calls for a renewed commitment to cooperative federalism. It is critical that this partnership between states and the Federal Government recognizes and enhances the role of states in Federal policymaking.

In my written testimony submitted to the Committee, there are additional comments about Specialty Crop Block Grants, invasive species, the Food Safety Modernization Act (Pub. L. 111-353) and food safety education, the FIFRA Interagency Working Group, hemp, urban agriculture, and the Local Agriculture Marketing Program.

Agriculture producers, the rural economy, and communities of every size rely upon a forward-looking and fully funded farm bill. The farm bill must provide farmers and ranchers with a reliable safety net. The farm bill must provide consumers access to the safest and most affordable food supply. The next farm bill must remain unified, securing a commitment to American agriculture and critical food and nutrition assistance programs for those who need it most. In short, the next farm bill is an issue of national security.

Thank you for the invitation to address the Subcommittee today, and I look forward to answering your questions.

[The prepared statement of Mr. Kettler follows:]

PREPARED STATEMENT OF BRUCE KETTLER, DIRECTOR, INDIANA STATE DEPARTMENT OF AGRICULTURE; SECOND VICE PRESIDENT, NATIONAL ASSOCIATION OF STATE DEPARTMENTS OF AGRICULTURE, INDIANAPOLIS, IN

Good morning and thank you, [Chair] Plaskett and Ranking Member Baird, for the opportunity to speak today. My name is Bruce Kettler and I serve as the Director of the Indiana State Department of Agriculture (ISDA). I have over 30 years of

agricultural leadership experience and knowledge of production agriculture, sales and agriculture supply businesses. Prior to joining ISDA, I spent 11 years at Beck's Hybrids and 17 years at Dow AgroSciences where I worked in a variety of roles including sales, marketing and public and industry relations.

Indiana is the tenth largest farming state in the nation, and we have more than 56,000 farms. While our top commodities are corn, soybeans, livestock and dairy, we grow many specialty crops as well. We are #2 in popcorn, #3 in tomatoes, #4 in pumpkins and peppermint and #5 in watermelon.

In addition to my role as Director at ISDA, I also serve as the Second Vice President for the National Association of State Departments of Agriculture (NASDA). NASDA is a nonpartisan, nonprofit association that represents the elected and appointed commissioners, secretaries, and directors of the departments of agriculture in all fifty states and four U.S. Territories. NASDA grows and enhances American agriculture through policy, partnerships and public engagement.

As the state regulators and co-regulators with Federal agencies, NASDA members are actively involved in ensuring the safety of an abundant food supply; protecting animal and plant health, implementing conservation programs; and promoting the vitality of rural communities.

I. Introduction

As we begin today's hearing, it is important to first recognize the importance of the Agriculture Improvement Act of 2018 (2018 Farm Bill). The 2018 Farm Bill was a unified, bipartisan bill that secured a commitment to American farmers and ranchers, while protecting the critical food and nutritional assistance programs for those who need it most.

"Uncertainty" sends chills down the spine of farmers as they attempt to make critical business decisions. "Uncertainty" impacts families in need of assistance with putting food on the table. "Uncertainty" disrupts the food supply chain as we witnessed throughout the pandemic.

As the House Committee on Agriculture begins hearings for the 2023 Farm Bill, it is vital Congress provides "Certainty" by delivering a forward-looking, fully funded farm bill, on time. If the pandemic and the recent events unfolding in Ukraine have taught us anything, it is that this farm bill, and all future farm bills are an issue of national security.

II. Cooperative Federalism

State Departments of Agriculture play a critical role in food and agriculture policy in the United States. As regulators and advocates for the agriculture industry, NASDA's voice is unique in the nexus between the states and the Federal Government. NASDA members lead in areas ranging from food safety to resource conservation and promote agriculture locally and abroad.

In a time of increased risk and challenges for the agriculture industry, Federal legislation and regulations should work to promote economic stability while guaranteeing a safe and accessible food supply.

This work must be a joint venture between the states and Federal Government. Looking forward, NASDA calls for a renewed commitment to Cooperative Federalism. It is critical this partnership between states and the Federal Government recognizes and enhances the role of states in Federal policymaking. Due to the importance of Cooperative Federalism in advancing agriculture, we promote the following principles:

1. Advancing the role of states—as co-regulators and not simply stakeholders—in the Federal regulatory process
2. Ensuring Federal legislation reflects the unique role states serve in implementing Federal legislation
3. Increasing flexibility for state program delivery
4. Enhancing resources for states and no unfunded mandates
5. Supporting the roles and respecting the authorities of states.

III. Specialty Crop Block Grants

We at the Indiana State Department of Agriculture have administered the Specialty Crop Block Grant Program (SCBGP) since its inception in 2006 and we appreciate that the law gives this role to the states. Some of the program's greatest successes have been research focused in partnership with our land-grant university, Purdue. One such example is Dr. Krishna Nemali's 2017 project "Research-Based Extension Education Program for Increased Year-Round-Profitability in Hydroponic Lettuce Production" that was funded through the Specialty Crop Block Grant Program. Hydroponics are a specialized, expanding and capital-intense cropping system

and many Indiana growers lack access to training and updated research on this production method. This project conducted research on varietal trials, developed nutrient management strategies, and helped understand the effects of root-zone heating and supplemental lighting on profitability. In addition, the extension element of the program supported an annual Hydroponics Workshop and supported the development of educational materials for growers.

While the Specialty Crop Block Grant Program is effective in enhancing specialty crops throughout the state and nation, it is not without its challenges. One difficulty our team faces every year is answering the question, "What is a specialty crop?" The current definition is broad and creates confusion on which crops make the cut. Sunflowers are one example. As an oil crop they are deemed ineligible, but there is no guidance on if they are eligible within the category of cut flower products. The USDA list is helpful but not all-inclusive and sometimes it creates more questions than answers.

Another challenge of the program is finding proposals that meet the parameters laid out by USDA concerning increasing market access and promoting increased sales. Sometimes the goal is to simply sustain markets that might otherwise be declining. Often the best applications for funding are those from large universities who have grant writing resources, and these proposals are almost all tailored towards research or education. While this is important work, we see a need for both maintaining and enhancing market access for our specialty crop industry. Smaller groups and businesses are often the ones proposing market access projects but due to a lack of staff or experience with grants, they either don't apply or struggle to pull together a quality application. These organizations have the knowledge and ideas that would benefit their local specialty crop industry, but they don't have the same access to the program. We ask that the Committee consider allowing USDA to direct funds to be used for technical assistance for the grant application process, and that the grant parameters be expanded to address the current and future needs of the industry.

NASDA recommends increasing funding for the SCBGP while ensuring a flexible, locally responsive and state-led program.

IV. Invasive Species

Invasive species concerns vary from state to state and every year, new outbreaks of invasive species are found in the U.S. They threaten all types of crops as well as forestry, livestock, human health, and the environment. It's estimated that invasive species cost the U.S. economy \$21 billion per year, with agriculture being the sector hit hardest. In Indiana for example, the spotted lanternfly was recently discovered in Switzerland county. Our state has expended numerous resources to ensure it doesn't continue to spread and wreak havoc on our vineyards, orchards and hardwoods industry.

While many Federal and state programs are in place, the level of resources needed to combat the problem is nowhere close to being able to adequately deal with the issues at hand. NASDA has a long history of supporting and advocating for the Federal Government's role in preventing, eradicating or controlling invasive species and diseases. They also promote Federal-state cooperation leading towards the expansion of states efforts to identify, respond to, eradicate and control invasive pests and diseases. These collaborative efforts come through access to mandatory funding through the CCC, as well as pursuing discretionary appropriations for Federal and state early detection and rapid response programs, risk-based programs, emergency management, support for research and survey advancements and funding for management and control options.

NASDA supports an increase in baseline funding for the highly successful Plant Pest and Disease Management & Disaster Prevention Program and the National Clean Plant Network to provide additional tools for domestic invasive species issues. Bold action is needed to mitigate and prevent invasive species' catastrophic impact to farmers and ranchers.

V. FSMA and Food Safety Education

Our current food safety regulatory system is the shared responsibility and partnership between local, state, and Federal Governments. The Food and Drug Administration (FDA) is responsible for ensuring that domestic and imported food products are safe, sanitary, nutritious, wholesome and properly labeled. While FDA has primary authority in the food safety network, there is an entire system of complementary state and local laws working in harmony to protect our national food supply. Because all problems exist locally first, states often act as a lookout for emerging issues and can rapidly respond, often before such issues rise to the level of national concern, and before FDA takes action.

State Departments of Agriculture are the front line of protection for consumers when it comes to food safety. To support FDA's mission, the statute recognizes the necessity for Federal-state cooperation allowing state agencies to assume primary responsibility for the actual inspections, enforcement, training, and carrying out a wide range of other food safety regulatory activities. For example, FDA contracts with states to monitor medicated animal feeds and to investigate incidents of pesticide or drug residues in foods. Approximately 80 percent of domestic food safety inspections in the United States are completed at the state and local level.

Currently, 46 states, including Indiana, and one Territory have entered into cooperative agreements with the FDA to educate and/or regulate farms subject to the law based on a framework NASDA developed through its agreement with FDA. This model of "educate before and while you regulate" has been extremely effective in Indiana in bringing farms into compliance with the Food Safety Modernization Act (FSMA). NASDA also developed an OFRR program to foster a dialogue between the farmer and the regulator and/or educator about the requirements of the Produce Safety Rule. The program develops a cooperative relationship between the grower, educator and regulator and is helpful not only in implementing the Produce Safety Rule but also beneficial with responding to a food safety outbreak.

I encourage the Committee to continue prioritizing outreach and education. In order to meet the prevention goal of FSMA, funding for this program and continuing education (such as for educating farmers on the recently proposed water rule) will be vital.

NASDA recommends the Committee provide resources to assist producers in complying with the Food Safety Modernization Act. There are several other priority areas that would advance food safety on the farm that state programs are involved in that we think should be funded. We are in the process of developing specific recommendations and will provide more details to the Committee once we finalize our recommendations.

VI. FIFRA Interagency Working Group

As agriculture continues to grow and change, it is more important than ever for farmers to have adequate tools in their toolbox. Therefore, we supported efforts in the 2018 Farm Bill to establish a Federal Interagency Working Group to address the interrelation between the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Endangered Species Act (ESA). The working group provides a formalized opportunity for the five designated member agencies to come together to identify needed improvements to the ESA, with considerations in place for pesticide regulation. Ultimately, this collaboration provides a unique opportunity for EPA to implement FIFRA more effectively and efficiently, with science-based research and collaborative input. As we hear from farmers, growers and industry members every day, this type of collaboration and opportunity for improvement is needed in a world of ever-changing technologies and supply chain disruptions.

As the Committee considers additional oversight and legislation to further these goals, the Indiana State Department of Agriculture along with NASDA believes it is important to emphasize to the Committee that most of the individual state departments of agriculture serve as co-regulators with Federal agencies on numerous Federal environmental statutes, including FIFRA and the ESA. Consistent with the objectives of cooperative federalism, states must be involved early and thoroughly in all listing, determination and other ESA regulatory procedures, as they are valuable resources for data and have a greater understanding of local landscapes. As regulatory partners, Federal agencies should seek state agency involvement and consultation as the National Marine Fisheries Service and the U.S. Fish and Wildlife Services work toward the ultimate goal of de-listing species.

As guidance to the Committee, NASDA has established a comprehensive policy on ESA modernization efforts outlined below:

- NASDA supports the goal of conserving threatened and endangered species. Any program must also preserve private property rights and allow for a balance between agricultural production and species conservation;
- NASDA believes listing and de-listing decisions must be based on reasonable scientific criteria and sound science. Further, any decision-making in the petitioning, determination and listing processes should acknowledge and analyze the economic impact to landowners and the surrounding community;
- NASDA supports a greater role for states in implementing and enforcing the Act. NASDA also supports greater partnership between the states and the Services on gathering species and habitat data, the petition and determination processes, preparation of recovery plans, identification of recovery areas, and subsequent de-listing;

- NASDA supports voluntary incentive-based agreements with landowners for captive propagation, species population support programs, and alternatives to listings. Landowners should receive certainty from the Services that their cooperation in endangered species protection will not result in increasing demands and regulatory prohibitions on their farming or ranching operation;
- NASDA believes that implementation of the ESA should consider overall watershed and landscape health as a primary goal in the context of threatened and endangered species;
- The listing, designation of critical habitat, and implementation of recovery plans must utilize and solicit landowner feedback and public comment. NASDA supports transparency and extensive public input on the ESA listing, de-listing, exemption and recovery processes. Also, NASDA believes the ESA must work towards de-listing species while working with landowners. NASDA also supports ESA reform that includes the above tenets;
- NASDA believes EPA and the Services must establish a collaborative, transparent and streamlined consultation process for pesticide registrations. The process should include clearly communicated criteria between EPA and the Services, be based on best available science and eliminate any duplicative steps. Any decisions made between EPA and the Services should not place unreasonable requirements on registrants and producers; and
- EPA and the Services must include adequate time and robust opportunities for input from state departments of agriculture, who regulate pesticides in most states, and other impacted stakeholders. Regulatory decisions should be made in a timely manner that allows affected parties meaningful participation while addressing regulatory certainty.

VII. Hemp

Hemp continues to be a growing industry in agriculture, and since its inclusion in the 2014 Farm Bill, we have seen continued market development and interest at the state and national levels. According to the USDA National Hemp Report released in February of 2022, there were 33,480 acres of hemp harvested in the United States last year, with an estimated value of \$824 million. But there are areas of opportunity to improve our nation's hemp policy to ensure the longer economic viability of hemp.

NASDA supports the growth of the hemp industry, and this includes advocating for hemp to be considered both a specialty crop and an agronomic commodity in the 2023 Farm Bill. Adding hemp to the list of eligible crops within the Specialty Crop Block Grant Program would encourage more research and market development and help lay a strong foundation for the industry to build on. Also, amending the definition of hemp to allow up to one percent (1.0%) THC would provide needed flexibility and ensure more product gets off the farm and into the hands of a processor.

VIII. Urban Agriculture

Urban agriculture plays a valuable role in many states, including Indiana. It is often an opportunity for producers in urban areas to be entrepreneurs while gaining experience and contributing to the local food system. NASDA supports increased opportunities for urban agriculture through a big tent approach where all forms of food and agricultural production are essential. While there exist challenges in developing urban agriculture, including access to land and capital, this type of food production can diversify individuals' income sources, mitigate food deserts, and support community as well as economic development. NASDA supports the Office of Urban Agriculture and Innovative Production at the U.S. Department of Agriculture as authorized by the 2018 Farm Bill.

IX. Local Agriculture Market Program

The NASDA Foundation¹ is part of a Community of Practice Coordinating Organization that works with the USDA Agricultural Marketing Service (AMS) in providing technical assistance support on Local Agriculture Market Program (LAMP) grant opportunities for black, indigenous people of color (BIPOC), rural and other underserved communities. NASDA Foundation hosted webinars to provide resources and information on how to apply to the Farmers Market Promotion Program (FMPP) and Local Food Promotion Program (LFPP) grants. It is through this work that the NASDA Foundation discovered that many black, indigenous people of color

¹NASDA Foundation is the only educational and research organization that directly serves state departments of agriculture in all 50 states and four U.S. territories. NASDA Foundation is a 501(c)(3) nonprofit organization that focuses on education, outreach and research that galvanizes the agricultural industry.

individuals and organizations are intimidated by the USDA application process for grant funding. Due to the time, it takes the individuals to learn and apply for grants; black, indigenous people of color businesses, indicated that they do not have the organizational capacity to go through the grant cycle process. A post-technical assistance survey found that more than 77 percent of BIPOC businesses did not apply for a LAMP grant despite receiving technical assistance, with a majority citing the application processing was both too daunting and time-consuming.

X. Conclusion

Agricultural producers, the rural economy, and communities of every size rely upon a forward-looking, and fully funded farm bill. The farm bill must provide farmers and ranchers with a reliable safety net. The farm bill must provide consumers access to the safest and most affordable food supply. The next farm bill must remain unified—securing a commitment to American agriculture and the critical food and nutritional assistance programs for those who need it most. The farm bill is an issue of national security.

The CHAIR. Thank you very much to all of our witnesses for your questions. We will now take witness questions from the Members in order of seniority, as we did with the first panel. And I will start with my questions first.

Dr. Olive, I wanted to ask if you would share with us which USDA local farm system programs and other USDA programs have been beneficial to your farm or to farms like yours in the Virgin Islands?

Dr. OLIVE. Yes, thank you. Well, like I mentioned in my testimony, I mean, one of the biggest things has been the NRCS EQIP Program, which is the Environmental Quality Incentives and conservation program. So that has been, it really helped build capacity in a sustainable way for our farm and a lot of other farms. As we know, water is a huge issue in the Virgin Islands for all the farms, especially on St. Thomas and other areas in St. Croix and St. John, so these ways to establish with the expertise of the USDA and to help fund some of that have been really instrumental in our success. And after the hurricanes, the support that we received in the disaster programs, we would have lost a lot of farms without those. So, I would say that EQIP is a regular thing, and then the disaster recovery was huge as well.

The CHAIR. We have talked in this Committee quite a bit about supply chain issues and how that has been magnified during the pandemic. In the Virgin Islands, that is really a fundamental issue that has affected us for many, many years. Can you speak to how we on this Committee might support insular areas or isolated areas that have real issues not only in terms of having the correct amount of supplies coming in but also the cost of that and what that means to farmers as well?

Dr. OLIVE. Thank you for asking. In these times with supply-chain shortages, the feeling that people have in the states about getting things and costs rising is our everyday reality in the Virgin Islands. That is how it has always been in the Virgin Islands. And now we even have an additional cost on all the inputs that go into our farm from fertilizers to irrigation equipment, seeds, tractor parts. You wouldn't believe what I paid to get a tractor tire shipped here recently.

So I think what could happen is there is the geographic disadvantaged program through the FSA that helps cover a portion of receipts that we submit every year, and that pool is divided between all the applicant farmers. I have stopped doing it because

the pool seems too small, and honestly, it is not worth my paperwork to do that, so we need a larger pool of money for that disadvantaged program.

And we also need help with some up-front stockpiling of things in some way so that they can be made available to farmers in a quick way because the thing with farming is a lot of things are very time-sensitive, and when you need something, you need it now and it takes so long to get here. That is another cost that is not overtly financial but it ends up being that way. So more dedicated funding to insular areas in the Virgin Islands and all the other insular areas around.

The CHAIR. Thank you. Ms. Batcha, the USDA is reportedly finalizing three key and much-anticipated organic industry regulations under the National Organic Program addressing: one, transitioning dairy cows; two, livestock handling and poultry living conditions; and oversight and enforcement of NOP-certified products. Some of these proposals date back to the mid-2000s. We are really excited that that is actually happening. What is the importance of USDA finally finalizing these National Organic Program regulations to the U.S. organic industry?

Ms. BATCHA. Thank you for that. I can't underscore how important it is that these three rules are finalized. The first we heard of this morning in terms of Origin of Livestock being finalized, and then the other two rules you mentioned. But additionally, there are almost two dozen additional rules still in the pipeline. I think the thing that is important to remember is oftentimes these rules, as of the case of the two livestock rules and the import oversight rule that was authorized in the last farm bill, these regulations level the playing field for producers, so they are all playing by the same rules. If you are entering the marketplace, you know that other farmers, regardless of where they are in the country or on the globe, are following the same set of standards, so you can understand what the marketplace is expecting from you, and it is a fair, level playing field.

I think the other important thing is that as these standards have languished at USDA, it has driven private certification into the market and required producers and handlers to seek additional certification on top of their organic certification, which complicates their production systems, adds costs, and confuses the value of the seal in the marketplace. And they are having to do that to compensate for the standards not having been finalized. It also stalls opportunities in innovation. So if the playing field is not level globally, it disincentives U.S. producers to enter the market and produce some of these important crops domestically in the case of livestock feeds and other grains. So it impacts farmers at a very granular level in terms of cost and the playing field globally and across the country, as well as innovation in the marketplace and advancing organics, so I appreciate your question. Thank you.

The CHAIR. Thank you. Thank you very much.

I now ask my Ranking Member, my colleague Mr. Baird, for his 5 minutes of questioning.

Mr. BAIRD. Thank you, Madam Chair.

Director Kettler, your testimony calls attention to NASDA's support for the growing hemp industry through additional support like

including hemp in the Specialty Crop Block Grant Program. So in your time as Indiana's Director of Agriculture, I have known you to be a formidable force in bringing hemp to Hoosier farms as a means of crop diversification. As you have traveled the State of Indiana and talked to Indiana farmers, what do you find to be the most needed to address the policy troubles of hemp production?

Mr. KETTLER. Thank you, Representative Baird. I think first and foremost I hear a lot of people say they want to be included as a specialty crop and have available things like Specialty Crop Block Grants. They feel that it is new. They need some help to be able to get it off the ground and, frankly, to try to find the new markets that those grants oftentimes help people with as well.

One of the things in my written testimony we talk about including it in the farm bill more generally from a crop insurance standpoint, obviously not the jurisdiction of this Subcommittee, but I think the Specialty Crop Block Grants and allowing it to become a specialty crop is pretty critical. And in Indiana we consider that part of the economic development opportunity, so trying to bring in processors and people that can add value to the crop is important as well.

Mr. BAIRD. Well, thank you. And continuing on, support for the land-grant universities is included in the Research Title of the farm bill, and I would be remiss if I did not mention the important role that these institutions play in conducting cutting-edge research and educating our next generation of agriculturalists. So can you talk more about the land-grant system and how you work with it?

Mr. KETTLER. Yes, I would be glad to. Probably one of the biggest ways is through that Specialty Crop Block Grant Program. There is typically four or five applications made for that program into ours, so they do a lot of work there. We also work with leadership, and within the extension service to do a lot of programs and help. A good example, farmers' stress, mental health, we are working with Purdue Extension Service on that. There is also a lot of cooperation within, in that case, the College of Agriculture at Purdue, but we are also looking for ways as a department to work with other schools within the State of Indiana that may have other specialties. I am thinking particularly in the conservation area where we can rely upon the works that Notre Dame is doing or IU is doing or other schools within the state and finding ways for them to all cooperate together, and I think that is pretty important because very often they have areas of specialization that allow them to be able to work together and deliver a better product in the end.

Mr. BAIRD. That always helps in the implementation when you have cooperation across that, and I am glad you mentioned the economic development aspect of that.

So, Ms. Batcha, would you care to elaborate about that same thing, about your working with the land-grant universities and how you see that?

Ms. BATCHA. Thank you. One of the important programs that supports organic production systems is the Organic Research and Extension Initiative Program, so those are important research dollars. We administer a nonprofit organization called the Organic Center that covers science and does invest directly in science at

universities, increasingly at land-grant universities, and we also play a role in helping connect organic agriculture researchers across universities to coordinate and discuss and share research priorities with each other.

We are really fortunate that this year for the first time we have been able to work with the Foundation for Food and Agriculture to provide some matching grants for industry investment in organic research focusing on land-grant universities, so thank you.

Mr. BAIRD. So we have about 20 seconds left if any other witness would like to address that in 20 seconds.

Mr. OSHIMA. I would be happy to talk about the work AeroFarms is actually doing with traditional land-grant universities. It is part of our bigger collaboration that we do with industry. We think it is critical as we are writing this new playbook in agriculture that we work closely and thinking about what is needed from a curriculum standpoint, a training standpoint, and thinking about this new science, machine vision, machine learning, a new way of farming, and so we work closely with the universities both in terms of that training and development but also on dedicated research and collaboration.

Mr. BAIRD. Thank you. I am out of time. I could spend the rest of the afternoon with all of you, but I guess the Chair probably wants me to yield back.

The CHAIR. Thank you. At this time I would ask Ms. Pingree for her 5 minutes.

Ms. PINGREE. Thank you very much, Madam Chair. I appreciate your holding this hearing. And I really appreciate all of the witnesses' testimony today. Thank you so much for spending your time with us and really helping us to think forward about the farm bill.

I won't have a chance to dialogue with all of you, but I just want you to know we really will take in everything that you have had to say today and it is very useful to all of us.

So for Laura Batcha, I am glad to be here with you today to celebrate finally that rule moving forward, and I know how important it is to organic dairy, so thanks for the work that the Organic Trade Association has done to also push on that.

We are talking so much about the convergence between climate change and agriculture, and that will certainly be an important component of the farm bill, but I would love to hear from your perspective, from organic growers how we make sure that people understand the connection between what organic growers really have already done in terms of climate change, the critical practices that are so foundational to organic certification, and also what else do you think the USDA could be doing to make sure we make that connection and really ensuring that organic farmers are rewarded for what they are doing as we go forward thinking about our programs?

Ms. BATCHA. First, I want to thank you for all your strong leadership and support on helping get that Origin of Livestock rule across the finish line, so we really appreciate your leadership.

The climate-smart agriculture discussion is interesting because now climate-smart agriculture has become such a buzz. And I think when you think about organic agriculture and the requirements of the production standard to include fostering soil, biodiversity, cover

cropping, hedgerows, green manures, these are many of the same practices that are being looked at as the key tools to advance climate-smart agriculture. And they are embedded in the standards, and they always have been.

We have a group of members in town this week, 150 folks from across the country, and one of our farmer members from Montana said yesterday to USDA that climate-smart is the new buzz but organic has always been soil-smart, and that is built into what the production practices are all about.

I think it is also important that as we look at, for example, the pilot program that USDA is launching right now, we also have a built-in market reward and claim in the marketplace that can be leveraged in terms of helping the public understand the choice that you make with organic and how that ties to climate-smart agriculture. I think the things we are hearing from producers about any programs related to climate-smart agriculture and making sure, number one, that the early adopters are also rewarded in the system, the folks who have been doing this all along. Our research shows that on whole, organically managed soils have about 17 percent higher levels of sequestered carbon than soils as a whole in farms across the country, so they need to be included in the program and rewarded for their efforts over the last number of decades.

I also think there needs to be really good crosswalks with oversight in the paperwork and the certification in the farm plans that are required in organic so that there can be streamlined qualification for programs that USDA may roll out so the farmers don't have to start over again and re-demonstrate their climate-smart status.

I think we also have some creative ideas that may require some support from the Committee in the next farm bill that could bring the USDA seal more into the future and allow that seal to communicate directly some of these values of organic production related to climate.

Ms. PINGREE. Great. Well, thank you for all of that. I look forward to working with you and certainly with organic farmers in general and making sure that all of the things that you mentioned are included.

I don't have a lot of time, but, Ms. Smith, I really appreciate that you brought up one of the biggest challenges that we hear about, and that is labor and farmworker shortages. In the 30 seconds that I have left, do you want to just address a little bit more about what a challenge you see that as and how we should be doing more to address it?

Ms. SMITH. Sure. I mean, every year we kind of plant a crop that we assume the American population will want to buy from us, and every year we don't have enough people to harvest the right fruit that we have spent all this money investing in to grow. And so what we ultimately end up doing is leaving behind fruit from the end of an application or the end of the variety and just moving onto the next one. So, we have been feeling the labor shortage for years, but the demand is there, and so it is something we wrestle with and would really appreciate some support on creating a legal and stable workforce.

Ms. PINGREE. Well, thank you for that. We look forward to really working with you in addressing that. And the very idea that you are leaving fruit behind in the field is horrific from a food waste perspective and feeding hungry people, and then also for so many farms just balancing the budget and making sure it all works. So I need to yield back, but thank you again, everyone, for your testimony. I really appreciate it.

The CHAIR. Thank you. At this time, I would like to invite Congressman Panetta for 5 minutes of questioning.

Mr. PANETTA. Great, thank you, Madam Chair, and thank you for having this hearing, and thanks to all of our witnesses, those who are here in the room, those who are here virtually. I appreciate your testimony and information. That will definitely be used as we head into the Farm Bill 2023.

Laura, Ms. Batcha, good to see you again, as always. Based on the question that you just answered, you talked a lot about streamlining the regulations, but also in your testimony you talked about infrastructure capacity improvements. Can you elaborate a little bit more on the supply chain improvements, what they would do, what they might look like, and how they would bolster the organic industry.

Ms. BATCHA. Thank you for that. Nice to see you as well. When a farm transitions to organic, they have to transition their whole farm 3 years or the portion of their farm that they are bringing into organic, but they also have to develop new markets for their products. And the organic product off the farm has to be handled in a certified organic facility all the way through to the finished product, so if they grow their product on the farm, they have to be able to move that through the processing infrastructure that the commodities touch.

One of the challenges with increasing the amount of organic production at the farm level in the U.S. is access to those markets, whether or not it be livestock processing, grain milling, handling facilities, and especially for the small- and medium-sized operations to have those facilities close enough to the farm that it makes the transportation and the management of that process reasonable. So we are really looking at a regional approach that is commodity-specific that really looks at some of the bottlenecks in the supply chain and invests there. But it is just a requirement of taking the product all the way through to the marketplace.

Mr. PANETTA. Great. Thank you for explaining that.

Moving on to Ms. Smith, in your testimony you spoke about crop insurance. Now, obviously we on the Central Coast, based on the amount of natural disasters that we have been dealing with, especially in the last few years and what we will probably have to continue to deal with from wildfires to the lack of water with our drought, what we have seen is the desire to use Federal Crop Insurance Program. However, we don't see them as prolific as I think many of our producers here on the Central Coast would like them to be. Can you elaborate on how we could improve the crop insurance program and better incorporate our producers on the Central Coast in those types of programs to be able to use those type of programs?

Ms. SMITH. Thanks for that question, Mr. Panetta. So, I am unclear on what qualifies or doesn't qualify for crop insurance, but what I can describe are a few events that have happened in recent history in the Central Coast where no one secured any funding from the Federal Government. So one of those things would be we had this massive hailstorm last year, tore down millions of dollars' worth of tunnel infrastructure intended to protect crops. The crops were severely impacted, and the crop insurance didn't help with that in any substantial way, so that has been a really big one. We have had some heat events that are really unprecedented in the late summer months here on the coast, and again, millions of dollars—

Mr. PANETTA. Let me interrupt you if I may and basically ask what has been your understanding as to why producers on the Central Coast don't engage in the crop insurance programs as much as they should?

Ms. SMITH. So I think we all are on the Central Coast because of how temperate the climate usually is, so it might be just a lack of understanding of what they qualify for. It might be that it is perceived as arduous to secure funding. I really don't know. But what I am trying to say is this is kind of new that we would even need crop insurance or have these regular issues substantially impacting our crop, Mr. Panetta, so I don't know if it is just education or if it is that somehow we are not all qualifying or what, but I am happy to explore it and get back to you.

Mr. PANETTA. No, that is great. Thank you. And briefly, obviously I understand that Driscoll's entered into a new agreement with the private company up in south San Francisco in regards to indoor farming. You want to elaborate on that and maybe Mr. Oshima might want to talk about that as well.

Ms. SMITH. Yes, I think a lot of what Mr. Oshima described is the reasons why controlled environment agriculture is exciting to Driscoll's as well. We are very excited about our partnership. I was there yesterday, and there are ripe strawberries in there, so it is exciting. I think it really hits the mark on accessibility, reduces the vulnerability to supply chain issues, so we are excited, invested, and looking forward to what is there. But we are really learning right now.

Mr. PANETTA. We all are. Thank you, Madam Chair. I yield back.

The CHAIR. Thank you. And I want to thank all of the witnesses that were with us both in the first and the second panel, and particularly I thank my colleagues who participated in the hearing, as well as the staff.

Before we adjourn today, I invite the Ranking Member to share any closing comments he may have.

Mr. BAIRD. Thank you, Madam Chair. The things that we have heard here today I think are very important to the farm bill in 2023. I am thinking about specialty crops from the standpoint of fruits and vegetables being located closer to the population. We heard about labor. We heard about how the farm programs might tie into these specialty crops. And so in my closing thoughts I would just like to say that I really appreciate Mr. Bruce Kettler being here today and having the opportunity to be with him, and I yield back.

The CHAIR. Thank you to the Ranking Member.

As we close, it is important to emphasize that the provisions included within the Horticulture Title were critical to supporting American producers through challenging times. The ability for producers in these sectors to leverage programs in the title to face the challenges posed by the COVID-19 pandemic proved essential. It is clear that, as a Committee, we must build on these successes in order to continue to support our agriculture community.

To our producer and stakeholder witnesses, USDA Under Secretary Moffitt, NRCS Chief Cosby, thank you so much for your testimony.

I want to particularly thank those individuals on the second panel who provided their own on-the-ground expertise doing the work every day to support farmers, support producers, and support Americans who are eating the produce that they bring to the table.

As we look ahead to the next farm bill, I look forward to taking this feedback in order to better address the needs of our producers and stakeholders. And it is my hope that the Members of this Committee can work collaboratively to be able to support and advance the interests of American agriculture.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplemental written responses from the witnesses to any question posed by a Member.

This hearing of the Subcommittee on Biotechnology, Horticulture, and Research is adjourned.

[Whereupon, at 12:08 p.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY TERRY COSBY, CHIEF, NATURAL
RESOURCES CONSERVATION SERVICE, U.S. DEPARTMENT OF AGRICULTURE

Insert 1

The CHAIR. Thank you. I may not have time, Chief Cosby, for you to be able to answer this, but any written response that you could give would be appreciated. As you are aware, the 2018 Farm Bill established the Federal Advisory Committee for Urban Agriculture and Innovative Production to, “advise the Secretary on the development of policies and outreach relating to urban indoor and other emerging agricultural practices.” I understand that the Federal Advisory Committee held its first public meeting last week and was hoping if you could share with the Committee in written format or at different points if you may have this during the questioning the details of that first meeting. So thank you very much for that.

The Urban Agriculture and Innovative Production Federal Advisory Committee (FAC) was established with 12 members selected by the Secretary representing the breadth of the stakeholder community as spelled out in the farm bill. The inaugural meeting of the FAC took place March 23 and 24, 2022. The meeting forum had 1,430 people registered to attend, and 184 people registered to provide comments during the public forum. Secretary Vilsack, Farm Production and Conservation leadership, and National Institute of Food and Agriculture (NIFA) officials participated in the first meeting, which was recorded and is available at <https://www.usda.gov/partnerships/federal-advisory-committee-urban-ag>.

During the 2 day meeting, the Committee consulted on NIFA’s \$10 million Urban, Indoor, and Emerging Agriculture funding opportunity. The Committee also gave feedback on a draft of the updated Urban Agriculture Toolkit prepared by the Office of Urban Agriculture and Innovative Production. Members were also briefed by Farm Service Agency (FSA) and Natural Resources Conservation Service (NRCS) on the plans to establish USDA urban service centers to facilitate providing USDA services to urban producers.

During the public forum, members of the public weighed in about urban areas needing access to clean soil and climate smart agriculture practices; urban producers needing access to land and supply channels to boost their income and establish sources of local food access; the need to modify the services available to rural producers to suit smaller farms with higher costs of production; and how the process of signing up to receive services from USDA could be improved to make it less burdensome so it is not a barrier to urban producers receiving USDA services.

Insert 2

Ms. BROWN. Well, thank you very much. I know I am nearing the end of my time, but I do have one other question. And that is that we know in 2018 the farm bill directed USDA to establish the Office of Urban Agriculture, which is currently housed in NRCS. How are you working internally within the agency and externally across agencies like the Department of HUD to grow urban agriculture? And with that, I would yield back. Thank you.

The CHAIR. Thank you. I would ask the witness if he could respond to that in writing as time has expired at this time.

Within the Natural Resources Conservation Service (NRCS), we are working to grow urban agriculture by updating practice standards and payment scenarios to be better suited to urban and small farms. NRCS has encouraged state leaders to create urban subcommittees in state technical committees and allows State Conservationists to create an Environmental Quality Incentives Program (EQIP) set aside for urban agriculture. NRCS has also been working with the Office of Urban Agriculture and Innovative Production (OUAIP) to prepare trainings for NRCS field staff on how to better serve urban and small farms.

OUAIP’s Interagency Advisory Committee (IAC) has over 60 members representing 15 USDA agencies and meets approximately every other month to collaboration and coordination of urban agriculture work across USDA agencies. The group shares best practices for updating programs and services to suit urban producers, seeks input from other USDA agencies on OUAIP priorities, and updates members on urban agriculture relevant work across the Department.

OUAIP regularly collaborates with the Office of the Chief Scientist and the USDA Food Loss and Waste Liaison to include its Composting and Food Waste Reduction cooperative agreement accomplishments into the national United Nation sustainable development goals to reduce food waste at retail and consumer levels by 50 percent by 2030.

OUAIP also has revived the USDA-wide People's Garden Initiative (PGI) to promote food producing gardens with an educational component and is collaborating with the Office of Tribal Relations on amplifying and supporting their Sovereignty Garden Initiative, which educates youth about traditional indigenous planting practices.

OUAIP also holds regular meetings with other Federal agencies like the Housing and Urban Development (HUD) and the Environmental Protection Agency (EPA) and to share information and leverage existing Federal initiatives as it sets up urban service centers across the country. OUAIP is engaging with HUD at the Federal and regional level to identify networks of local stakeholders that can help spread the word about USDA services that will be offered from urban service centers, discuss how HUD's Community Development Block Grant Program can be leveraged to support urban agriculture initiatives, how urban agriculture can fit into community revitalization initiatives, and how HUD can help USDA establish relationships with local and city officials in communities USDA does not have a history of working. OUAIP holds regular discussions with EPA about how their Brownfields Program can facilitate urban soil testing and remediation as well as how state-level EPA offices can assist the urban service centers being stood up by connecting local producers to soil testing services.

SUBMITTED LETTER BY INTERNATIONAL FRESH PRODUCE ASSOCIATION, *ET AL.*

April 7, 2022

Hon. STACEY E. PLASKETT,

Washington, D.C.

Re: H.R. 2981, the Continuous Improvement and Accountability in Organic Standards Act

Dear Chair Plaskett and Ranking Member Baird,

The ability to continue to provide quality, affordable organic fresh produce is a priority for our organizations and the U.S. growers, packers, and shippers we represent. Today, we are alerting you to our strong concerns regarding the Continuous Improvement and Accountability in Organic Standards Act (H.R. 2918) in its current form.

Collectively, our organizations represent the majority of the fresh organic produce grown, harvested, packed, and distributed in the United States. We are strong supporters of the organic label, U.S. Department of Agriculture (USDA) National Organic Program (NOP) and actively participate in the National Organic Standards Board (NOSB) advisory committee process.

At the outset we want to acknowledge that the process by which organic standards are established can and should be improved upon. However, H.R. 2918 in its current form would make the process worse, not better. Specifically, this bill would further elevate the authority of the NOSB, a 15-person volunteer Federal advisory board, in establishing regulatory policy for a multi-billion-dollar industry—affecting tens of thousands of growers and millions of consumers. It is unrealistic to expect 15 volunteers to possess the expertise necessary to make informed public policy decisions regarding every production and handling method for every fresh fruit and vegetable grown across the country. Therefore, it is not surprising that throughout the history of the NOSB, appointees have largely not been representative of the broader organic fresh produce community. To illustrate our concern, in 2017, the grower appointees serving on the NOSB collectively represented less than 200 acres of organic production.

Congress recognized this when passing the Organic Food Production Act (OFPA) by making the NOSB an advisory committee and providing USDA with exclusive authority—following consultation with the U.S. Environmental Protection and/or U.S. Food and Drug Administration where appropriate—to set organic policy. If this bill were to become law in its current form, USDA would be required to justify—via rulemaking and in an expedited timeframe—agency's decisions regarding every recommendation of this voluntary advisory council, which the has limited scientific or production expertise and often a significant degree of advocacy bias.

USDA should not be forced to rush into regulatory action by, or be required to justify a decision to not act upon a recommendation from, an advisory panel. Government agencies are answerable to the public. Advisory panels like the NOSB are not.

We recognize that Federal advisory committees play an important role in shaping Federal policy. However, alarmingly, this bill would give the NOSB a role that goes far beyond advising USDA on policy, violates the spirit—if not the letter—of the Federal Advisory Committee Act (FACA). Title 6518 of OFPA states that the NOSB is subject to FACA, which is adamant that “the function of advisory committees should be advisory only, and that all matters under their consideration should be determined, in accordance with law, by the official, agency, or officer involved.”

FACA also emphasizes the importance of uniformity in the operation of advisory committees across both individual agencies and the government as a whole. This bill would place the NOSB in its own category among FACA’s serving Federal agencies—something we believe to be unwarranted and would result in unsound public policy.

The undersigned organizations do not oppose efforts to improve the process by which organic standards are established. We seek improvements to H.R. 2918, and are committed to working collaboratively with you and others to do so.

Sincerely,

International Fresh Produce Association
Fresh Produce Association of the Americas
Northwest Horticultural Council
Western Growers Association
U.S. Apple Association

CC:

H.R. 2918 Cosponsors.

SUBMITTED QUESTIONS

Response from Hon. Jennifer Lester Moffitt, Under Secretary for Marketing and Regulatory Programs, U.S. Department of Agriculture

Questions Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question 1. Under Secretary Moffitt and Chief Cosby, can you discuss the current nexus between horticulture and urban agriculture?

Answer. See Chief Cosby’s response below.

Questions Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question 1. As you know, Section 32 bonus buys are one of the most important tools in the toolbox to help specialty growers suffering from market imbalances. The goal of the program is to first help farmers and second support Federal feeding programs including school lunch and breakfast as well as food banks. We have heard from some commodity organizations that the timeline from when the request is made to AMS to when the product is purchased from the growers can in some cases take months if not close to a year. We are concerned that the program has grown unnecessarily bureaucratic in recent years as the Agricultural Marketing Service (AMS) negotiates with other agencies across the Department to quickly approve these requests. Can you provide the following information about the Section 32 Bonus Buy Program?

Answer. USDA utilizes Section 32 funds to assist industries impacted by market disruptions and other factors that create an oversupply situation and to encourage the consumption of these products among persons in low-income groups, largely through The Emergency Food Assistance Program (TEFAP).

The Section 32 approval process is as follows:

1. Industry representatives request a purchase under Section 32 authority or AMS economists identify possible oversupply situations and initiate contact with industry representatives.
2. AMS economists conduct an economic analysis of the specific commodity’s market to independently verify the existence of a market problem. AMS’ assessment is also verified by USDA’s Office of the Chief Economist.

3. If the economic determination justifies a need (*i.e.*, a surplus of product), AMS works with the Food and Nutrition Service (FNS) to determine pack sizes and timeframes in which product can realistically be distributed.
4. AMS submits a request package through the clearance process for final approval by the Secretary.
5. If approved, AMS announces the program and works with FNS to implement.

During the Section 32 request approval process, AMS works closely with industry, FNS, and the Agency's technical experts to design a purchase program which will accomplish the goals of the program to remove product from the market in a timely manner and to feed hungry Americans.

Question 1a. Average timeline from when the bonus buy request is submitted to when the commodities are purchased? In the event where this timeline is over 6 months, please provide justification for such a delay.

Answer. There are many factors that affect the timeline from when the bonus buy request is submitted to when the commodities are purchased. First, data must be available to conduct the economic analysis, and there are situations where obtaining this data from industry has taken some time. Second, if the product requested is a new product, specifications must be developed that meet the industry need and ensure competition among producers, as well as provide a product that TEFAP recipients can effectively distribute and utilize. Finally, the approval process can be made complicated when two or more industry representatives make requests that are inconsistent, and AMS must reconcile the differences before the approval process can begin. Delays in Section 32 purchase decisions can occur for a variety of reasons, however, AMS generally strives to process a Section 32 request from receipt of the request to announcement of a purchase within a 1 to 2 month period. We are not aware of a timeline that exceeded 6 months.

Question 1b. Steps the Agency is taking to ensure over-supply challenges in specialty crop markets are being addressed in a timely fashion.

Answer. AMS economists maintain good working relationships with many suppliers and industry groups for the purpose of understanding and monitoring market conditions throughout the year. These relationships have resulted in a more proactive process by which the economists identify possible oversupply situations and initiate contact with industry representatives. Additionally, AMS consistently communicates to industry representatives the critical need to connect early and often if an oversupply situation is anticipated, so the process can begin in a timely fashion to meet their needs.

Question 1c. How decision-making authority is granted between AMS and FNS on when and where to purchase specialty crops through the Section 32 Bonus Buy Program.

Answer. AMS has the authority to initiate and execute a Section 32 bonus purchase upon approval from the Secretary. AMS works closely with FNS to determine the pack sizes and timeframes in which product can realistically be distributed to TEFAP recipients. Once approved, FNS collects orders from TEFAP state agencies, and AMS conducts all procurement activity.

Question 1d. How the Department factors in demand for bonus buy purchases and what weight is given to demand factors *versus* farmer/grower support.

Answer. Farmer/grower support is a critical factor in the Section 32 purchase program. However, TEFAP recipients must be able to distribute and utilize the product effectively, and decisions regarding pack sizes (smaller pack sizes preferred) and delivery timeframes are based on demand from those TEFAP recipients.

Question 2. As domestic specialty crop producers are growing increasingly vulnerable to cheaper foreign imports, what is the Department doing to harness the resources of the Federal Government to support them? How is AMS working both with other agencies and Mission Areas within USDA and outside the Department, such as through USTR, to ensure specialty crop producers have the full support of the Federal Government to reverse this trend? What gaps do you see in existing Federal programs that should be addressed in the upcoming farm bill that would better utilize existing resources?

Answer. One of the ways that USDA is supporting domestic specialty crop producers is the Local Agriculture Marketing Program (LAMP), which is authorized under the Agricultural Improvement Act of 2018 (Farm Bill) (Pub. L. No. 115-334). The Agricultural Marketing Service (AMS) administers three of the four programs authorized under LAMP: The Farmers Market and Local Food Promotion Programs (FMLFPP) and the Regional Food System Partnerships (RFSP) program. In 2021, USDA invested \$90.2 million through 203 grant projects to help local and regional food entities strengthen and explore new market opportunities for U.S. food and ag-

ricultural products, including but not limited to specialty crops. The Rural—Business Cooperative Service, under Rural Development, implements Value-Added Producer Grants, which helps agricultural producers enter value-added activities to generate new products, create and expand marketing opportunities, and increase producer income.

AMS also administers the Specialty Crop Block Grant Program (SCBGP) to enhance the competitiveness of specialty crops. The below links provide additional information on the Fiscal Year 2021 SCBGP awards: *

*Specialty Crop Block Grant Program Fiscal Year 2021 Description of Funded Projects—Farm Bill (usda.gov)*¹

*Specialty Crop Block Grant Program FY21 Grants to the States (usda.gov)*²

The Fiscal Year 2022 Request for SCBGP applications closed on May 3, 2022. AMS expects to announce awards by the end of September 2022.

In addition, AMS announced the approval of nearly 20 specialty crop Section 32 requests, including for fresh grapes, fresh and frozen peaches, fresh nectarines, fresh plums, raisins, dried sweet cherries, almonds, and great northern beans for Fiscal Year 2022. From Fiscal Year 2018 to Fiscal Year 2021, AMS supported domestic specialty crop producers through purchases of over 6.4 billion pounds of specialty crops valued at \$5.9 billion. All AMS purchases for domestic and international nutrition assistance and food aid programs must be 100% grown and processed within the United States or its territories.

AMS works closely with the Food and Nutrition Service (FNS) on all of these purchases. For example, AMS partnered with FNS to introduce a mixed fresh produce product for food banks in The Emergency Food Assistance Program in Fiscal Year 2021, purchasing nearly 20.0 million pounds of various fresh specialty crops valued at \$13.0 million.

USDA stands ready to work with the Committee on identifying the best utilization of resources for the specialty crop sector as you deliberate the 2023 Farm Bill.

Response from Terry Cosby, Chief, Natural Resources Conservation Service, U.S. Department of Agriculture

Questions Submitted by Hon. Bobby L. Rush, a Representative in Congress from Illinois

Question 1. Chief Cosby, could you provide me a detailed orientation on the phenomenon of urban agriculture in our country, including what the USDA is doing to optimize urban agriculture?

Answer. First, I will start by sharing that this is not a recent phenomenon. In fact, the first organized urban agriculture effort supported by the United States Government occurred during the Panic of 1893, a serious economic depression that caused high unemployment and distress on farms. As a relief measure the Mayor of Detroit, Hazen Pingree, formed an Agricultural Committee and tasked them with finding vacant lots for citizens in need of food assistance to grow their own food. In 1894, 975 families grew potatoes, beans, squash, cucumbers and more on 430 acres of 'Pingree's Potato Patches'. The produce they grew that year was valued at \$14,000 which is equal to \$438,225 today. By the 1900s, economic conditions in the country improved and the program tapered off.

Throughout the following years Americans have turned to urban agriculture during times of war and economic stress to feed themselves and their communities. In recent years, urban agriculture has been revived by communities facing food related illness and food insecurity. Today urban agriculture is influenced by many considerations, including sustainability, environmental stewardship, food security and accessibility, community empowerment, and cultural diversity. The current urban agriculture movement is still using vacant lots for food production, but it has also expanded to hydroponics, aquaponics, container gardening, rooftops, and commercial food production.

No two urban production systems are the same, but urban agriculture operations are often characterized by intensive management strategies (many different fruits and vegetables produced each season), less automation with more labor performed by hand, and controlled environments (*e.g.*, high tunnels, low tunnels, hydroponics, shipping containers, nurseries, container gardens, *etc.*), highly diversified cropping rotations, and small footprints (.05–.25 acres).

* **Editor's note:** the linked documents are retained in Committee file.

¹ <https://www.ams.usda.gov/sites/default/files/media/SCBGPDescriptionofFunds2021.pdf>.

² https://www.ams.usda.gov/sites/default/files/media/2021_SCBGP_GrantstotheStates.pdf.

Many urban production systems are also social enterprises. They support the triple bottom line: people, profit, and the planet—they are striving to produce food to feed their communities. Food sovereignty and food justice are frequently at the heart of these operations.

Over the years, NRCS has taken steps to improve conservationist's ability to serve urban and small acreage clients. NRCS had its first urban conservation district in Washington, D.C. in 1962. Other efforts were also made through programs like Resource Conservation and Development (RC&D) and urban conservation action plans in the 1990s and early 2000s. In 2010 the agency adopted high tunnels as a conservation practice standard to address issues with excessive wind and sun and provide season extension options.

The Conservation Stewardship Program offers a \$1,500 annual minimum payment, facilitating small and urban producers' participation in programs.

USDA is working to support urban agriculture through the Office of Urban Agriculture and Innovative Production (OUAIP). OUAIP's Interagency Advisory Committee (IAC) has over 60 members representing 15 USDA agencies and meets approximately bimonthly to collaborate and coordinate the urban agriculture work across USDA agencies. OUAIP also recently stood up a Federal Advisory Committee to give the Director of OUAIP and Secretary Vilsack advice on better serving urban producers.

To demonstrate USDA's commitment to serving urban producers, NRCS and the Farm Service Agency (FSA) are working together on plans to open new brick and mortar urban service centers in several locations selected for pilot Urban County Committees (UCOCs). FSA and NRCS have been working with local stakeholders and local USDA staff to identify locations for service centers within each city that will be accessible and welcoming to local urban and innovative producers. These urban service centers will offer local urban producers a suite of USDA programs and services available to urban agricultural areas (*i.e.*, programs where eligibility is not restricted to rural areas) and will be tied into various relevant USDA regional efforts with overarching goal of created strong local food systems.

OUAIP is working across USDA to produce an updated and improved version of the Urban Agriculture Toolkit. The new Toolkit will be comprised of several quick-reference guides, an at-a-glance publication highlighting key resources, and website enhancements to both *Farmers.gov* and *USDA.gov*. OUAIP also developing training materials to educate and prepare USDA staff to serve new types of customers in urban areas. OUAIP has also been working on developing outreach materials to explain to new urban customers how to access USDA services.

USDA also has several funding opportunities available to support urban producers and projects. OUAIP offers an Urban Agriculture and Innovative Production (UAIP) competitive grants program to support projects that promote community gardens and nonprofit farms, provide job training and education, and develop business plans and zoning for urban agriculture, with priority given to communities lacking access to fresh and healthy food. Since OUAIP started, this program has funded 31 awards totaling just over \$7.9 million. Additionally, OUAIP's Composting and Food Waste Reduction cooperative agreement pilot program funds local government projects to develop and test strategies to increase compost and reduce food waste. Since the Office started, this program has funded 37 awards totaling just over \$3 million. This spring, OUAIP will announce the opening of these two funding opportunities (competitive grants and cooperative agreements) for FY 2022. The National Institute of Food and Agriculture (NIFA) is preparing to open a \$10 million Urban, Indoor and Emerging Agriculture competitive grant program.

Organizations working on urban agriculture are also eligible to apply for NRCS Equity Conservation Cooperative Agreements and there is a priority set aside for urban producers in the Conservation Innovation Grant (CIG) program. The Office of Community Food Systems (OCFS) awarded four grants to urban agriculture projects worth over \$300,000 through its Farm to School Program. These grants served seven public schools and over 50,000 students. Funds also supported other activities such as weekly experiential learning opportunity, multiple community urban farms, and community partners (Los Angeles Leadership Academy; Kid's Food Basket Grand Rapids, Michigan; Common Threads, Chicago, Illinois; and Urban Ventures, Minneapolis, MN).

Question 2. Under Secretary Moffitt and Chief Cosby, can you discuss the current nexus between horticulture and urban agriculture?

Answer. Horticulture is at the heart of urban agriculture. The major difference between agriculture and horticulture is that agriculture is inclusive of plant cultivation and animal husbandry while horticulture only includes plant cultivation. As animal husbandry may be incompatible with urban zoning, many urban farms focus more on plant cultivation.

As part of a Food System Transformation effort, USDA is working to build stronger and more resilient local food systems, and that includes supporting the breadth of agricultural practices used across the county, including horticulture.

Urban farms and community gardens, which are supported by OUAIP's USDA-wide People's Garden Initiative (PGI), play an important role in transforming our food system by addressing food and nutrition access and creating more robust local food systems. Many low-income urban areas lack grocery stores and access to nutritious food, such as fresh fruits and vegetables. Research shows that people who have access to fruits and vegetables eat more of them, and that children who garden are more likely to eat fruits and vegetables and have greater knowledge about nutrition and healthy eating habits. Eating a diet high in fruits and vegetables is associated with a decreased risk of many chronic diseases, including heart disease, stroke, high blood pressure, diabetes, and obesity. USDA's MyPlate recommends that everyone fill half their plate with fruits and vegetables.

OUAIP has also supported horticulture by providing funding for the Forest Service to complete work on three Urban Agroforestry Outreach Projects which included tree and ornamental shrub planting.

Response from Bruce Kettler, Director, Indiana State Department of Agriculture; Second Vice President, National Association of State Departments of Agriculture

Question Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question. Director Kettler—In your opening statement, you mentioned a philosophy you called “Cooperative Federalism” in conjunction with your written testimony, I can think of several of these policy areas, where cooperation between government agencies or state, local, and Federal Governments is likely lacking and compounding issues. Could you speak further about your thoughts on Cooperative Federalism and its impact on Hoosier farmers and Indiana agriculture?

Answer. June 14, 2022

Congressman James R. Baird,

As mentioned in my testimony, cooperative federalism is the idea that each level of government partners in the policy-making process. As the tenth-largest farming state in the nation, the Indiana State Department of Agriculture (ISDA) partners with many groups at all levels of government. These partnerships are integral to delivering good government service to Hoosier farmers and taking Indiana agriculture to the Next Level.

For example, in 2018 ISDA collaborated with the Indiana Department of Health (IDOH) and Purdue Extension to create Safe Produce Indiana, a unique partnership designed to bring enforcement, education and outreach on the Produce Safety Rule of the Food Safety Modernization Act (FSMA) at the state level. By working together, ISDA, IDOH and Purdue Extension leverage strengths to “educate before and while we regulate”. We provide training opportunities and outreach on the requirements of FSMA and through the National Association of State Departments of Agriculture's (NASDA) programming, we offer On Farm Readiness Reviews (OFFRs) which serve as a mock inspection for growers who are preparing for their first inspection. Without this cooperative approach, I firmly believe that Hoosier produce growers would be at a severe disadvantage.

Additionally, ISDA's Division of Soil Conservation (ISDA-DSC) is a prime example of cooperating across local, state, and Federal agencies, as well as private and nonprofit organizations to extend resources to Hoosier landowners and farm operators. Many of ISDA-DSC's staff work in USDA Service centers or local soil and water conservation offices. This approach gives Indiana Conservation Partners the ability to extend equipment, data, software, personnel, funding, and programs to private lands conservation efforts. Indiana is a leader in the nation when it comes to working lands conservation and therefore is a competitive space for new programs and funding opportunities.

I can attest, both in my professional experience in the private-sector and now in my role in the public-sector, that cooperative federalism ensures that government works for the people. States have a valuable role to play in the policy making process and by working together with the Federal Government, we can ensure effective, efficient and quality programs and service.

BRUCE KETTLER,
Director,

Indiana State Department of Agriculture.

A 2022 REVIEW OF THE FARM BILL
(ENERGY—RENEWABLE ENERGY OPPORTUNITIES IN RURAL AMERICA)

TUESDAY, APRIL 5, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: David Scott of Georgia, Costa, Adams, Spanberger, Hayes, Delgado, Brown, Rush, Sablan, Kuster, Bustos, Plaskett, O'Halleran, Carbajal, Lawson, Craig, Axne, Schrier, Pannetta, Thompson, Austin Scott of Georgia, Crawford, LaMalfa, Davis, Allen, Rouzer, Bacon, Johnson, Baird, Jacobs, Balderson, Cloud, Mann, Feenstra, Miller, Moore, Cammack, Fischbach, and Letlow.

Staff present: Lyron Blum-Evitts, Emily German, Chu-Yuan Hwang, Ashley Smith, Paul Balzano, Patricia Straughn, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. The Committee will come to order. Welcome, I want to thank everyone for joining us today at this important hearing entitled, *A 2022 Review of the Farm Bill: Energy—Renewable Energy Opportunities in Rural America*. So after brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open for questions.

And I want to say right off the top, such a welcome to my dear friend, the Under Secretary for Rural Development, the Honorable Xochitl Torres Small. Welcome, a great friend and a great Member, and you are doing a great, great job.

After brief opening remarks, Members will receive testimony from our witnesses, and then we will be open for questions. So let me begin with my opening statement.

I want to say again how important this hearing is and all of the ones that we have had as we review our present 2018 Farm Bill and as we prepare for the 2023 Farm Bill. We have these hearings so we on this Committee can hear from our participants so we can find out what is working and what is not working as we prepare our 2023 Farm Bill.

And today's hearing will cover the various farm bill provisions that cover energy production and energy efficiency, and I am looking forward to the discussion on how renewable energy production can provide new revenue streams for our agriculture producers and our rural economies and also how energy efficiencies can help lower input costs, which is so important.

And I want to start by highlighting a troubling trend to me and some of the Members on our Committee that I want to mention to you. Following the creation of the Energy Title in the 2002 Farm Bill, each farm bill after that has cut mandatory spending available for the title. Only 20 percent of the funding for Energy Title programs were mandatory in our most recent farm bill.

And let me just be clear maybe for some of the folks at home that may not know the difference here, mandatory money in the farm bill is money you can count on, money that is guaranteed to go into the program. And discretionary money is what it says. It is *discretionary*. You may get it and you may not. And so that is very important. And this is a significant problem since many of our Energy Title programs ultimately have not received any discretionary appropriations.

And I want to be clear. For the upcoming 2023 Farm Bill we need to consider what the needs are for our agriculture and forestry sectors, as well as our rural small businesses in terms of their potential role in producing renewable energy.

We also know that there is a tremendous interest from rural areas in undertaking energy efficiency efforts to help their bottom lines. And that is what we want to do. Our farmers like these programs, and they deserve greater certainty. Time and again, we have heard the positive developments that have come from work on renewable energy production and how much value is added to rural communities from these advancements.

We also need to review the needs for upgrading and investing in long outdated infrastructure in our rural communities. Our rural communities need our help, and we are determined to get the help that is needed for our rural communities. That would be resulting in lower energy costs and improvements to resiliency, security, and efficiency of our rural electric co-ops and their systems in the face of new cybersecurity threats and these terrible, awesome, dramatic weather events.

I am looking forward to hearing from our panel of distinguished witnesses today about all these opportunities and more, so fasten your seatbelts. We are in for a great hearing.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM GEORGIA

Good morning, and welcome to another important hearing in our work to review the 2018 Farm Bill and prepare for the 2023 Farm Bill.

Today's hearing will cover the various farm bill provisions that cover energy production, and I'm looking forward to looking deeply into how renewable energy production can provide new revenue streams for agricultural producers and the economies of their communities.

I want to start by highlighting a troubling trend—following the creation of the Energy Title in the 2002 Farm Bill, each farm bill after that has cut mandatory spending available for the title. Only 20 percent of the funding for Energy Title programs was mandatory in our most recent farm bill.

Let me clarify for the folks at home that mandatory money in the farm bill is money you can count on, money that is guaranteed to go into a program, but discretionary money needs to be included in an appropriations bill.

This is a significant problem since many energy title programs ultimately have not received any discretionary appropriations. I want to be clear: for the upcoming 2023 Farm Bill, we need to consider what the needs are for our ag and forestry sectors as well as our rural small businesses in terms of their potential role in producing renewable energy. We also know that there is a tremendous interest from rural areas in undertaking energy efficiency efforts to help their bottom lines.

Our farmers like these programs, and they deserve more certainty. We have heard time and again the positive developments that have come from work on renewable energy production and how much value is added to rural communities from these advancements.

We also need to review the needs for upgrading and investing in long outdated infrastructure in rural America, resulting in lower energy costs and improvements to the resiliency, security, and efficiency of our rural electric co-ops and their systems in the face of new cybersecurity threats or dramatic weather events.

I'm looking forward to hearing from our panel of distinguished witnesses today, about all these opportunities and more. I now recognize the Ranking Member for any opening remarks he may have.

The CHAIRMAN. And with that, Ranking Member, I turn it over to you.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, thank you, Mr. Chairman. And I am going to echo you in you hearing our witnesses to today's hearing. I look forward to hearing your thoughts and your perspectives as we look at the Energy Title. This was a title that I was proud to serve on the subcommittee that had the responsibility for that when I first came on this Committee. This is a title that really never had a baseline but had incredible importance.

I am always excited to talk about energy. Pennsylvania's 15th Congressional District is really the original energy district, and I know I don't see any of my friends from Texas in here, so they will take exception to that later, but it really is. We are steeped in a diverse history of energy production. Pennsylvania 15's coal fueled the Industrial Revolution for democracy to be able to win World War I and World War II. We are home to the nation's first-ever commercial oil well, the Commonwealth's only ethanol plant, and the oldest continually operating oil refinery in the United States.

More recently, America has become the world's largest producer and exporter of natural gas while at the same time reducing U.S. emissions. The Appalachian Basin alone, which includes the Marcellus and Utica Shale, represents the third-largest producing region in the world behind Russia and the rest of the United States, and we are incredibly proud of our role in powering not only the Commonwealth's economy but also the nation, our allies abroad, and the globe.

And I want to start this hearing with a proposition that I think should underpin our discussion today: access to affordable energy is access to freedom, both political and economic. One need look no further than the nations of Europe who are shackled to Russian energy and Putin's pipelines. Without sufficient energy resources of their own, they have lost the freedom to dictate their own foreign policy. Despite our common democratic values, they are forced to pour money into Russia to protect their citizens from the devastating costs of losing access to affordable, reliable energy. This is

what an all-of-the-above energy plan is about. It is about making sure everyone in America who needs energy has access to reliable energy when they need it.

Rural communities are no different. Rural electrification in the 1930s, 1940s brought new jobs, new technology, and new opportunities to millions of people. And today, as we continue to build and improve our nation's electric grid, expand access to energy, and deploy smart, renewable resources on farms and in communities, the USDA energy programs continue to bring new opportunities and economic growth to rural America.

But the expansion of new sources of renewable energy—ethanol, solar, wind, biogas, and more—cannot be done at the cost of every traditional source of power. We simply do not have the capacity to replace the energy from fossil fuels overnight. When expanding our production of renewable energy, we must ensure sufficient energy resources exist and remain to power the baseload needs of our nation and our economy.

But we don't need to look to Europe to see the damage insufficient energy resources can cause. We have seen it firsthand right here in our own country. At best, limited access to energy resources means increased energy prices, increased prices for those with too little to sacrifice their other needs so they can devote an ever-larger share of their income to procuring the electricity and the fuel that powers modern life. At worst, limited access to energy resources means arbitrary and indiscriminate energy rationing like the gas lines of the 1970s or the rolling blackouts of a California summer.

These are arbitrary, manmade crises and the predictable outcome of policies grounded in wishful thinking and naïveté. These are experiences we should carefully consider before we commit the United States to a policy of slow energy asphyxiation. Our farmers need access to diesel fuel, propane, fertilizer. These are all products of American-produced energy. Failure to provide sufficient, accessible, affordable, and reliable energy for the needs of our citizens will rob them of opportunities and options and the freedom to choose among them.

Fortunately, that doesn't need to be our fate. We can promote renewable energy in smart and sensible ways so economic growth and emission reductions complement one another. In particular, many of the projects funded through USDA's energy programs, including the Electric Loan Program, REAP, RESP are all tools to help communities and businesses diversify and expand their energy options, promote energy efficiency, and strengthen our energy resiliency. And I look forward to learning about the growing opportunities for renewable energy in rural America and how expanding our nation's energy portfolio can bring dividends to us all.

And with that, thank you, Mr. Chairman. I yield back.

The CHAIRMAN. Thank you, Ranking Member.

The chair will request that other Members submit their opening statements for the record so witnesses may begin their testimony and to ensure that we have enough time for all of our questions.

Our first witness is our former colleague here in Congress and our former Member of our Committee, who made such great contributions in her service on the Agriculture Committee, the Honorable Xochitl Torres Small, the Under Secretary for Rural Develop-

ment at the United States Department of Agriculture. Under Secretary Torres Small, we are so happy to see you. And, as I said at the outset, your service on the Committee was just tremendous and, as I also said to you, I am hopeful that perhaps one day you might decide to come back and join us again. I really appreciate you.

She is accompanied today by the Administrator of USDA's Rural Business—Cooperative Service, Dr. Karama Neal, and the acting Administrator of the USDA's Rural Utilities Service, Mr. Chris McLean. Welcome to the both of you as well.

So now, Under Secretary Torres Small, we want you to begin when you are ready.

STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.; ACCOMPANIED BY KARAMA NEAL, PH.D., ADMINISTRATOR, RURAL BUSINESS—COOPERATIVE SERVICE, USDA; CHRIS McLEAN, LL.M., J.D., ACTING ADMINISTRATOR, RURAL UTILITIES SERVICE, USDA

Ms. TORRES SMALL. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to discuss the state of energy and the bioeconomy in rural America and the United States Department of Agriculture Rural Development's role in supporting both.

As we discuss this topic, it is essential to recognize that we are talking about people and communities in transition. It is not lost on me that I am speaking to you today as a New Mexican whose public education was funded by the energy production that continues to fuel our state. I am honored to know parents who put their kids through college from the money they earned working in the Permian Basin and continue to be inspired by the hard work and innovation that occurs across New Mexico's energy sector.

In this room today we can talk about transition, but across rural America, people are living it. And in many places they are driving it. A young person working in energy today could be working in solar or wind while their grandparents were experts in fossil fuels because this transition has been happening for at least a decade.

Like all transitions, this one has bumps. There is disagreement, and there is pain. There is also consensus and innovation and increased efficiency and job creation. And I want to talk about all of these things. In particular, I hope to highlight what rural co-ops are doing in this space. But before we dive into that, I hope we can begin with an agreement, that the hard work and ingenuity that came out of rural America before renewables should be honored and valued. It powered this country for over a century, contributed significantly to American prosperity as a whole, and continues to be an important part of America's energy portfolio today. I am grateful for that contribution, and I know all of you are as well.

At Rural Development, our goals for energy are straightforward: reliable, affordable, and clean. When communities lean into clean energy, as so many are already doing and have been doing for years, the resulting economic prosperity is clear. It is powerful. Jobs are created. Consumers save on their energy bills, and new markets are formed. I am emphasizing rural electric co-ops today

not only because they are a great partner but because I think they are ahead of most of us in the way they think about clean energy.

For example, we recently awarded a \$6 million loan to Roanoke Electric Cooperative in North Carolina. Roanoke is going to use this loan to help their members pay for energy efficiency improvements from insulation to electric water heaters, as well as electric charging systems. This builds on the work of a program that the co-op started as a pilot in 2015.

So far, about 650 co-op members have received retrofits and are enjoying an annual savings of \$600 per year. In other words, co-ops got this energy efficiency ball rolling 7 years ago, and now USDA is helping to keep it moving and helping these co-op members to continue and increase their savings. We are also hoping to help pass these lessons on to other communities.

Now, that example was in the millions of dollars, but innovation and energy use is often best showcased by its smallest projects. I am thinking of 3 Porch Farm in Comer, Georgia, a sustainably grown flower and fruit farm owned by Steve and Mandy O'Shea. Steve and Mandy's business is known for its presence at farmers' markets in Atlanta, Marietta, and Athens. They are also known for their flower arrangements in weddings and other events. They keep their flower arrangements cool in a solar-powered design studio, and the farm runs its vehicles on recycled vegetable oil. These energy choices are a key part of Steve and Mandy's vision and philosophy for their business. When I think about Steve and Mandy, I am again grateful for the innovation, hard work, and leadership of the people in rural communities when it comes to energy.

I look forward to working with all of you to incentivize more innovation and support the rural people who power our country, who create good jobs in their communities, and who increase the security and resiliency of our energy economy.

Thank you, and I look forward to your questions.

[The prepared statement of Ms. Torres Small follows:]

PREPARED STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to come before you today to discuss the state of energy and the bioeconomy in rural America, and the United States Department of Agriculture Rural Development's role in supporting both. Energy production has long been a backbone of rural jobs, economies, and livelihoods. It is deeply rooted in the social and fiscal fabrics of rural communities and has contributed significantly to American prosperity as a whole.

But, as the future of our human health and economic output increasingly require a robust response to climate change, market demands are shifting from fossil fuels to cleaner sources of energy. The burning of fossil fuels is the primary cause of climate change,¹ and consumers are looking for cleaner options to power their businesses, homes, and schools—with forty percent of consumers preferring renewable energy in 2019 compared to twenty-five percent in 2018.² By 2026, global renewable energy capacity is set to rise more than sixty percent above 2020 levels, accounting for nearly ninety-five percent of total global power capacity increases.³

Rural communities are pivoting energy production models to respond to these market shifts, but not without challenges. Fossil fuel assets are deep, and continued

¹ <https://ugc.berkeley.edu/background-content/burning-of-fossil-fuels/>.

² <https://www.businesswire.com/news/home/20190422005350/en/Consumer-Demand-for-Clean-Energy-Significantly-Increases>.

³ <https://www.iea.org/news/renewable-electricity-growth-is-accelerating-faster-than-ever-worldwide-supporting-the-emergence-of-the-new-global-energy-economy>.

financing and operation of historic investments by energy producers contribute toward general community reluctance to shift to new sources of energy. I believe this shift is not only possible but will be catalyzed by ensuring that rural America is at the table. Rural communities are resilient and incredibly innovative. Their expertise, skillsets, and decades of experience in energy industries will be invaluable in the transition to clean energy.

Rural Development is poised to be a dependable partner in this transition. Rural Development does not regulate U.S. energy entities but rather can provide incentives and expertise by way of deep ties in rural communities, and long, trusted relationships with rural electric cooperatives and producers. The transition to clean energy can be beneficial for utilities, customers, producers and rural communities alike. It can contribute to energy grid security, the fight against climate change and extreme weather in rural areas and provide savings for customers and producers. I look forward to working with Congress to support clean energy and the bio-economy in rural America.

Energy Security

Consumers across the United States depend on uninterrupted and affordable availability of energy sources every day. This means energy systems that are secure against cyberattacks, resilient enough to withstand extreme weather, and insulated against global conflict. Yet, just as we have seen across the global supply chain, the United States' energy system is rigid, fragile, and susceptible to disruption that has an immediate and sharp impact on families' budgets.

Putin's war on Ukraine is removing millions of barrels of oil from the global supply, one of many factors driving the highest price that consumers have ever paid at the pump.⁴ Economists expect retail fuels prices to rise to \$4.50 per gallon by April⁵—underscoring that the energy supply chain is consolidated, inflexible, and highly susceptible to shocks that have a direct impact on consumers.

Cyber security risks are on the rise in the energy sector, with bad actors increasingly targeting U.S. energy assets. In 2021, a Russian ransomware attack on the Colonial Pipeline caused the company to shut down the pipeline for the first time in history. The shutdown of the pipeline, which provides forty-five percent of fuel across the East Coast, had immediate, far-reaching impacts. In Washington, D.C., eighty-seven percent of gas stations went dry.⁶

Millions of Americans feel the effects of climate change each year when their power goes out, like in Texas, when uncharacteristically severe winter storms swept the state in early 2021. Almost seventy percent of customers served by the Texas state power grid experienced an outage.⁷ Those who lost power were without electricity for an average of forty-two hours in subzero temperatures. As these power outages demonstrated, our aging electric grid needs urgent modernization, including more smart grid technology and more transmission lines.

Rural Development is taking steps to address energy security internally but is also working to partner across the energy sector to address resiliency broadly. USDA and the Department of Energy (DOE) have a memorandum of understanding between the two Departments as required by the 2018 Farm Bill, which has spurred enhanced coordination and cooperation on energy and electric issues. USDA and DOE have engaged in productive consultations on cybersecurity and continue to work to leverage each's funding to support grid reliability. It should also be noted that many rural communities rely on energy services purchased by their rural municipal or cooperatively owned utility through agreements with the Power Marketing Administrations. This cost-based clean energy, largely generated at Federally owned hydropower facilities, is an important contributor to rural energy security and stability, both economically and operationally.

As part of the Biden-Harris Administration's work to prevent electric system failures from weather events like last winter's power outages throughout Texas and to protect the grid from ransomware and other cyber-threats, USDA created a new division to help increase the security of the nation's electric grid. The Grid Security Division, in Rural Development's Electric Program, aims to increase Federal collaboration to protect the nation's electric grid from service disruptions and outside attacks and is keenly focused on electric grid security. It informs rural-serving electric utilities of USDA's ability to finance utility investments in cybersecurity, grid secu-

⁷<https://www.texastribune.org/2021/03/29/texas-power-outage-ERCOT/>.

ity, fire prevention, reliability and resilience. It also works closely with industry groups and other stakeholders on critical infrastructure security policy.

Rural Development also finances investments that will help utilities manage loads to ensure system reliability and security through the Electric Loan Program. In Fiscal Year 2021, Rural Development financed \$5.1 billion for ninety-two projects under the Electric Loan Program, including \$102 million in Smart Grid projects. These projects range from building solar farms in rural areas to financing cooperatives as they lay fiber backbones and power lines. These projects will help improve quality of life and support good-paying jobs, transition to a clean energy economy, and keep the United States poised to lead the global economy. Rural Development will continue to work to make rural electric infrastructure stronger, more sustainable, and more resilient than before.

New Markets & Climate Resilience

Clean energy can also be a catalyst for economic development in rural America. Cleaner power options—like wind, solar, and biofuels—provide new market opportunities for producers and small businesses, reducing energy costs for consumers and supporting skill-based jobs in rural communities.

When rural communities lean into clean energy transition, the resulting economic prosperity is evident. Rural Development recently financed a \$95 million guaranteed loan to Prairie State Solar in Perry County, Illinois. The loan supported a 600 acre solar photovoltaic farm to deliver and sell its electrical output to a service area that meets rural eligibility requirements. The output of the project is sold to Wabash Valley Power Association, an electric generation and transmission cooperative that provides wholesale power to twenty-three distribution cooperatives in Illinois, Indiana, and Missouri. The project created roughly 200 local construction jobs, powers approximately 15,000 rural households, and provides permanent employment for between three to five people. At the time, the project doubled the statewide solar capacity in Illinois and contributes millions in tax revenue for the state without requiring additional public infrastructure or services.⁸ This kind of opportunity stimulates real economic development—good paying jobs, lower costs for consumers, and revenue for other public services—all while harnessing rural innovation to tackle the climate crisis.

The Biden-Harris Administration has been clear about its commitment to addressing climate change, and the Rural Utilities Service Electric Program has made great strides in reducing the carbon intensity of its loan portfolio. This has been accomplished by eliminating new coal-fired generation projects and increasing investment in renewable energy projects providing clean, sustainable electricity to rural communities, particularly solar energy. From 2010 to 2020, the carbon intensity of this portfolio measured in pounds of carbon dioxide emitted per megawatt hour of electricity generation decreased by twenty-five percent. This represents a reduction of seventy-six million tons of carbon dioxide.

Biofuels and BioPreferred[®] also present an opportunity for blenders, manufacturers, and businesses to participate in climate-smart initiatives while creating new markets for producers and rural businesses. Under the CARES Act, Rural Development will make available up to \$700 million in payments for eligible biofuel producers for unexpected market losses resulting from COVID-19. This funding will restore renewable fuel markets affected by the pandemic, maintain a significant biofuels marketplace, and help agricultural producers maintain and create more viable markets for products that supply biofuel production, such as corn or soybeans. Rural Development will also soon make \$100 million available to increase the sale and use of higher blends of bioethanol and biodiesel by expanding the infrastructure for renewable fuels derived from U.S. agricultural products. Grants will be available for refueling and distribution facilities covering the cost of installing, retrofitting, or otherwise upgrading infrastructure required at a location to ensure the environmentally safe availability of fuel containing bioethanol blends of E15 and greater or fuel containing biodiesel blends of B20 and greater. Biofuels—which can be a carbon-neutral product—absorb carbon dioxide as inputs grow, offsetting emissions and creating a cleaner fuel option. In 2020 biofuels supported 62,000 direct jobs across the country, \$35 billion in economic output and \$19 billion in household income.⁹ Ethanol also displaced more than 500 million barrels of cruel oil in 2021, contributing to efforts to protect America's energy independence.¹⁰ Advanced biofuels have the potential to de-carbonize the hard to electrify modes of transportation such as

⁸ <https://www.kfvs12.com/story/37669426/perry-county-solar-project-to-bring-jobs-boost-solar-capacity-in-il>.

⁹ <https://ethanolrfa.org/ethanol-101/why-is-ethanol-important>.

¹⁰ <https://ethanolrfa.org/ethanol-101/why-is-ethanol-important>

aviation, marine and rail. USDA is a lead agency, along with Department of Energy and Department of Transportation, supporting the government wide Grand Challenge to produce 3 billion gallons/year of Sustainable Aviation Fuel reducing aviation GHG emissions by 20% by 2030. Additionally, Rural Development provides significant support for biobased products industry, which accounts for a value-added contribution to the U.S. [e]conomy of \$470 billion and employs more than four million people.¹¹ Biobased products are derived from plants and other renewable agricultural, marine, and forestry materials and provide an alternative to conventional petroleum-derived products while providing new markets to producers. The 2002 Farm Bill created the BioPreferred® Program, which identifies and seeks new markets for biobased products, spurs economic development, creates new jobs, increases the use of renewable agricultural resources through a voluntary labeling program and a Federal procurement preference. In 2018 Farm Bill Congress deepened its commitment to biobased markets by requiring the Department of Agriculture and the Department of Commerce to jointly develop NAICS codes for renewable chemical and biobased product manufacturers. Rural Development is coordinating with Federal partners to implement this provision. Biobased products have the potential to reduce greenhouse gas emissions by an estimated twelve million metric tons of carbon dioxide equivalents per year.¹²

The biofuels and biobased products sectors are success stories—demonstrating that efforts to combat climate change go hand in hand with strong economic development, particularly in rural communities.

Rural Energy Efficiency

Rural Development also plays a role in increasing energy efficiency in rural communities—initiatives that reduce the carbon footprint of construction, processing, and production, as well as slashing costs for consumers. These costs are particularly important for low-income communities, where households often pay as much as thirty percent of their income on energy costs.¹³ In many cases, energy efficiency is not just a climate issue but an equity issue.

The Rural Energy Savings Program, a relending program, provides zero interest loans to utilities to relend to residential, commercial, and industrial consumers for energy efficiency investments. The Rural Energy for America Program—which also serves biofuels and clean energy production—gives producers and businesses a hands-on way to participate in climate-smart practices while also cutting energy costs. Among other uses, REAP can provide grant and loan funding directly to producers and businesses to make energy efficiency improvements. In some cases, applicants have used funding to purchase new, more energy-efficient equipment on the farm—like the first new grain dryer purchased since 1980—which reduces overall energy usage and cuts input costs for producers. In other cases, applicants used funding to replace doors and windows in a facility to better insulate their business and reduce heating bills. Since January 2021, Rural Development invested \$687 million in REAP projects like these, all which play a significant role in tackling the climate crisis. In that same period, Rural Development projects resulted in greenhouse gas emission savings of 1.4 million metric tons of carbon dioxide annually for the life of these projects.

These programs demonstrate strong successes in the fight against climate change while also helping cut energy costs and increase efficiency for producers and rural businesses. Yet, there is still work to do. Often, these programs are cumbersome and difficult to apply for, particularly for underserved communities who are grappling with structural barriers like lack of access to capital, technical assistance, or capacity to navigate Rural Development’s resources.

To more equitably serve customers and deliver programs, USDA recently announced and held the first meeting of an Equity Commission, which is charged with evaluating USDA programs and services and recommending how we can reduce hurdles to accessing them. Rural Development is also looking for creative ways to provide capital and technical assistance to communities that historically have not had resources like REAP. We know that investments in our boots-on-the-ground staff help communities navigate not only Rural Development resources but those across the Federal family. Rural Development can provide resources to both help tackle the climate crisis and cut costs for families, businesses, and consumers—these benefits

¹¹ <https://www.usda.gov/media/press-releases/2021/07/29/usda-releases-economic-impact-analysis-us-biobased-products>.

¹² <https://www.usda.gov/media/press-releases/2021/07/29/usda-releases-economic-impact-analysis-us-biobased-products>.

¹³ <https://www.aspeninstitute.org/blog-posts/rural-clean-energy-innovation/>.

should be felt by all and underscore the importance of delivering programs equitably.

Conclusion

These programs demonstrate remarkable success in the fight against climate change while also helping cut energy costs and increase efficiency for producers and rural businesses. Rural residents know what works for them, and they know what tools they need to adapt to changing circumstances and build a more resilient future.

Rural Development is poised to meet and expand our commitment to energy and the bioeconomy in rural America. I look forward to working with this Committee to support this mission.

The CHAIRMAN. Thank you, Under Secretary Torres Small, for your very, very nice testimony.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. Each of you will be recognized for 5 minutes each in order to allow us to get to all the questions, as many as possible. And again, please keep your microphones muted until you are recognized in order to minimize background noise. And I want to start off by recognizing myself for 5 minutes.

Under Secretary Torres Small, in the submitted testimony of Mr. Cherrier, who we will also hear from on the next panel, recent backlogs in the RUS loan approval process were noted due to declines in staffing at RUS and effects of the COVID-19 pandemic that led to a drop-off in volume of projects needing loan approval review. Can you discuss the status of those backlogs and any progress that has been made, and how has this backlog affected electric cooperatives' abilities to secure financing necessary for these local rural projects?

Ms. TORRES SMALL. Thank you, Mr. Chairman, for that question. And it is crucial that we identify really what our greatest resource at Rural Development is, and that is its people. And I have been working hard to make sure they have the support that they need to get the job done, and in the midst of COVID-19 there were a lot of challenges to make that happen, whether it was the coordination that has to happen during environmental reviews and reaching out to other areas during that time and other agencies, and as well as Native American sovereign governments, also, as we do some of the additional work when it comes to responding quickly to energy needs. To speak more about some of the work that has been done internally to make sure that we are targeting our staffing resources more specifically, I will defer to Administrator McLean.

Mr. MCLEAN. Well, thank you very much. At the Rural Utilities Service during the COVID period there were delays in part due to emergency procedures adopted in the environmental review process. But in June of last year I repealed those emergency procedures. We have also been dealing with a rebuilding of our staff. Amidst the pandemic and immediately before, we had a number of senior employees retire and other employees take other jobs, and the budgetary constrictions limited our hiring ability during that time. But we are in very strong rebuilding mode right now in terms of rebuilding our staff. We are hiring some excellent talent, particularly in the environmental review area, hiring new archaeologists

to be able to fill in and lining up some surge capacity with contract support.

All that being said, we also redeployed our staff in matters to be able to deal with projects that we had in the pipeline. And I am very pleased to report that, despite the challenges we faced over the last fiscal year with capacity constraints of staffing, the Electric Program turned in its third consecutive year of investments exceeding \$5 billion. So it was a very, very strong year for the Electric Program. And as we move forward and as times return to more normal operations, hopefully with the pandemic in the rearview mirror, we look forward to being able to find further areas of streamlining and continuous process improvements to make the customer experience that much better.

The CHAIRMAN. And now tell me about your ability to secure the necessary financial help that you need and also how we here in Congress can be helpful to you in securing this financial help?

Ms. TORRES SMALL. Chairman Scott, thank you so much for that question. And as you know, the President's budget was recently released where they identified opportunities for increased staffing investments. We certainly know that resources are limited but are grateful for your support for Rural Development and are eager to continue that dialogue.

The CHAIRMAN. Thank you very much. And with that, I will now yield to you, Ranking Member, for your questions.

Mr. THOMPSON. Well, thank you, Mr. Chairman. Madam Under Secretary, thanks again for you and your team being here, it is much appreciated. Always good to see you. And first of all, I just want to say I appreciate your opening comments reflecting on growing up in New Mexico, another great energy-producing state, and the impact that that had on helping to fund public education and just raise the economy for folks.

And I wholeheartedly agree with your written testimony that Putin's war in Ukraine is removing millions of barrels of oil from the global supply, which is impacting the prices that consumers are paying at the pump and driving up inflation. That is just impacting every community and every family. Unfortunately, there is little we can do about Putin's reckless criminal adventurism, his genocide that he is conducting on a peaceful country. But, when it comes to energy prices which impacts agriculture in all communities obviously, urban, suburban, and rural, the Biden Administration has willfully chosen to take millions of barrels of oil from the global supply. And this Administration has blocked key pipelines, withdrawn land from production in Alaska, your home State of New Mexico based on Federal lands, Federal waters, and imposed costly new rules and regulations to hamstring domestic energy production.

And if the loss of millions of barrels of oil from the global oil supply from Putin's war, which I think we all agree is wrong and driving up prices for consumers, then the question I have to ask is why is the loss of millions of barrels of oil from global oil supply by President Biden's reckless policy not also driving up costs for consumers? And how can it be that supply constraints caused by Putin are bad, but the supply constraints caused by President Biden and Vice President Harris' Administration are harmless? I don't know

if you want to respond to that or not. I will give you the opportunity.

Ms. TORRES SMALL. Thank you so much, Ranking Member Thompson. And I deeply appreciate you bringing up Putin's war against Ukraine. I know that all of us are inspired by the bravery of Ukrainians, and I certainly keep them in my prayers.

It also has informed both our immediate challenges and our long-term challenges when it comes to the need for energy independence. Recently, I was in Alaska and I saw what energy dependence can look like. And some of the islands off the shore in Alaska, 100 percent of their energy production comes from diesel. And they are looking at potentially quadrupling their energy bills or kilowatt hour expense because of their reliance on diesel.

So as Rural Development, our key opportunity here is to invest in some of the solutions that local communities are looking at to build that energy resiliency both in terms of a local supply in the short-term and in terms of more resilient cleaner supply in the future.

Mr. THOMPSON. I appreciate that for the long-term. We always should be looking over the horizon of what is next, but we have a crisis right now, and it is a crisis that is driving up food prices to the point where we are going to be faced with increased—certainly around the world, hopefully not in our country, but we will have inflation here that is going to make it difficult for people to get access to the food that they need. But around the world we are going to have by this fall increased hunger, starvation, and death through famine. And so one of the things—so there is an immediate need here.

I would hope, in terms of your role with rural economic development and looking at the big picture—and quite frankly I am really proud of RUS and what we have for USDA in the energy space, that we could be a voice with the rest of this Administration. It is time to open up American resources. That is a solution for the fertilizer issue with natural gas development. And so that is something that could be done with the stroke of a pen. That doesn't take anything more than a second for the President to be able to do.

And Madam Secretary, I appreciate your focus on the importance of ethanol to the rural community as well, but I am troubled by the Administration's insistence on massive subsidies to spur the adoption of electric vehicles. That is a whole additional issue I am not going to have any time to get into, so we need to look at the total footprint of these electric vehicles and are they really a solution for climate. But once again, thank you for your leadership, and I hope you will use your influence to communicate. We have an immediate crisis here, and our farmers and American families could benefit from reversing some really detrimental policies that have helped to escalate these fuel prices. So thank you. Thank you, Mr. Chairman.

The CHAIRMAN. And thank you, Ranking Member. Your points are right on target.

The gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Mr. Chairman, and thank you for hosting today's hearing. And to our witnesses, thank you very

much for being here. Ranking Member Thompson, thank you as well.

You all bring a wealth of knowledge to an issue critical to curbing climate change and maintaining our energy independence. The pandemic has shown us that our rural communities desperately need investments in broadband infrastructure and small utility authorities. The farm bill has much to offer rural America. Although I represent an overwhelmingly urban and suburban district, I acknowledge the essential role the Members of this Committee must play.

As the chair of the bipartisan HBCU Caucus, last week we celebrated the conclusion of a fifth successful HBCU STEAM Day of Action where, over the course of 5 days, hundreds of private-sector, nonprofit, and university participants engaged with a bipartisan, bicameral group of legislators who advocate for HBCUs. And as you may know, all of our 1890 land-grant institutions are based in rural America, priming these HBCUs as the best potential partners for the Department. So can you discuss the Department's plans for 1890 institutions on climate resiliency and climate-smart initiatives?

Ms. TORRES SMALL. Thank you so much, Congresswoman Adams. It is wonderful to get to see you. And I deeply appreciate your comments about how we both share roles in this challenge and recognizing the rural and urban connection that is crucial to addressing some of these challenges.

When it comes to 1890s institutions, one of my immediate thoughts is the conversation we were just having about staffing and the future of the Rural Development workforce. I think the increased partnerships we can have with these institutions, the more we can diversify our staff and invest in the next generation. And I certainly see, as we continue to expand our long-standing work in these institutions, it also provides an opportunity for a future pipeline.

To talk a little bit more about some of our work with these institutions, I will defer to my colleague, Administrator Neal.

Dr. NEAL. Thank you so much for that question and for your interest in 1890s institutions. I think there are two things I think we can highlight here. One, we heard Under Secretary Small talk about staffing. We have been pleased to host 1890s fellows within our ranks and to make sure that they get the training and that they can contribute to the work that we are doing throughout rural America and through RBCS and Rural Development more broadly. So we have been excited about that and look forward to opportunities to extend our engagement in 1890s fellows programs.

In addition, we work throughout the Department to look for opportunities for cooperative agreements, and we have seen that particularly in the food sector and some of the work we have done there with some of our colleagues across the Department, and we look for additional opportunities to partner with HBCUs because of the talent and the opportunities that they can provide in the work that we are doing. Thank you.

Ms. ADAMS. Great. Well, thank you. So, Madam Under Secretary, what can the agency do to leverage dollars available in the IJJA for rural America to ensure that 1890s can play a role in this sec-

tor? Because, the Infrastructure Investment and Jobs Act (Pub. L. 117–58) allocated close to \$2 billion for schools and institutions in rural areas.

Ms. TORRES SMALL. Thank you so—

Ms. ADAMS. Go right ahead.

Ms. TORRES SMALL. Thank you for the question, and I am excited to follow up with your team as well to make sure that the specifics of some of the work that can be done with HBCUs we can follow up because so often it is about looking at specific HBCUs and where their strengths are and how we can best align those efforts. I see HBCUs as a clear opportunity for capacity in rural communities, so making sure that there is an institution that is focused on the work that is happening in their area and how we can better connect them. So I think there is a great potential when we look at the bipartisan infrastructure law to continue to invest in those partnerships.

Ms. ADAMS. Okay. Well, great. And thank you so much for that. I have just a few seconds. So any options for small- and medium-sized farmers to help produce renewable energy in their operations?

Ms. TORRES SMALL. Oh, that is such an exciting question, and I think it is a crucial part of how Rural Development shows up in this space, having those relationships with rural communities to invest in Rural Energy for America Program investments, for example, is a key place where we can support rural producers and their work to make their operations more energy-efficient.

Ms. ADAMS. Great. Well, thank you. Mr. Chairman, I am going to yield back.

The CHAIRMAN. Thank you. And now the gentleman from Georgia, Mr. Austin Scott, is now recognized for 5 minutes.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. And, Madam Under Secretary, I appreciate your time. I am sorry that I am not there in-person. Like many, I am juggling multiple hearings this morning.

I want to go back to what the Ranking Member said about part of your testimony and blaming the increases in prices in the U.S. on Putin's war in Ukraine. And I want to make this clear. The price of fertilizer, the price of diesel, the input prices for agriculture had gone up well in excess of 50 percent before Putin ever invaded Ukraine. And it is a little—in fact, I will tell you it is very disingenuous for President Biden and the Biden-Harris Administration to continue to use the war in Ukraine as an excuse for why the input costs are so high when he took more oil off of the markets with his policies than has come off because of the Russian sanctions. And so I want to just make that clear. I mean, the input cost for the farmer had gone up well in excess of 50 percent before Russia invaded Ukraine, and that is because of the bad policies of the Biden-Harris Administration.

And with that said, Madam Under Secretary, you mentioned that these new sources of energy are reliable, they are affordable, but the fact of the matter is every morning in America farmers wake up and they are going to fire up a couple hundred horsepower diesel tractor in most cases to farm, and I am just extremely concerned about the increasing number of factors that are impeding

the ability of our farmers, input costs especially, to produce the food and fiber that we all depend on. Now, knowing that the increased cost of fuel increases the cost of food, what is your agency doing to help reduce the cost of inputs in agriculture?

Ms. TORRES SMALL. Thank you so much, Congressman, for your question and your recognition of the complexity of the impacts currently that folks are facing both when it comes to at the supermarket or at the gas pump, the challenges that we face from COVID, from war, and other challenges that we face, especially relating to the supply chain.

When we look at Rural Development, our opportunity really is to support farmers and rural communities who are grappling with these challenges, whether it is working to provide more offerings within a market like expanding investments in the food supply chain or whether it is working to also create more energy independence from a REAP side and more energy efficiency.

To talk a little more about the work that we have been doing in the food supply chain, I will defer to my colleague, Administrator Neal.

Dr. NEAL. Thank you for the opportunity to speak about that. I think one of the things that is really important is to recognize, we in the United States are a net exporter of food, and so we are in a good position to feed ourselves. We recognize there have been price increases and there have been some challenges there, so we are supportive of and helping implement the Administration's action plan around creating a fairer, more resilient, more competitive meat and poultry supply chain. We have seen that work both in terms of meat and poultry but then also in terms of the broader food supply chain. Under Secretary Torres Small mentioned our food supply chain work. We have a Food Supply Chain Guaranteed Loan Program, which is already receiving applications to support activities throughout the middle of the food supply chain so that folks have access to capital to build their businesses, to help to support the aggregation, the distribution, the wholesaling, the various kinds of activities that are important to get food and food products from the farm to the table so that people can eat and have the food that they need at an affordable rate.

And so those are just a couple of the kinds of things we are doing. There is a significant amount of work that is happening throughout the Department. Rural Development, RBCS has some of those activities but not all of them, and we are excited to work in partnership with our colleagues throughout the Department to make sure that those programs are effective, are doing the kinds of things that we want them to do, and are making a difference both for the producers who are growing those foods, growing those food products, and also for the consumers who are all of us who need those food products.

Mr. AUSTIN SCOTT of Georgia. Well, I think there is a very serious disconnect between what the Biden-Harris Administration believes is good policy and what is happening at the grocery store. I don't see how anybody who shops for groceries could believe in any way, shape, form, or fashion that what Biden and Harris have done through their Administration is helping the American consumer with regard to their grocery bill. So I look forward to the

continued discussion, but I am someone who is worn out with the Biden-Harris Administration using the war in Ukraine as an excuse for inflation inside the United States. I yield back.

The CHAIRMAN. Thank you, Mr. Scott. And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is now recognized for 5 minutes.

Ms. SPANBERGER. Thank you so very much, Mr. Chairman. Thank you for holding this important hearing on our Energy Title programs in the farm bill. And certainly it is unfortunate that the Secretary of Energy isn't here because I am sure she would have great responses and comments to make about the more than 9,000 oil leases that are currently out there that industry is choosing not to tap into for the prior gentleman's comment. And certainly we know that in the month since the Russian invasion of Ukraine, fertilizer prices are 40 percent higher than they were before the invasion, clearly making a strong and obvious connection when you have one of the largest producers of not only fertilizer but necessary components of fertilizer engaging in an aggressive war against a neighbor. Certainly, that has made major disruptions to the supply chains, not to mention truck driver shortages and other challenges.

But what we are here today to talk about are not all of these other contributing issues. We are here to talk about the real importance of programs that allow for us the security, affordability, and production of energy at home. Certainly in the context of global instability and supply chain bottlenecks, we can see that there are positive programs that can be so vital to rural America, to our farmers and producers, and that is why, while I have advocated for measures that provide immediate relief to the price at the pump such as multiple releases of crude oil from the Strategic Petroleum Reserve, these USDA programs that we are here to talk about are what can provide long-term solutions to increase energy independence, reduce pollution, and increase efficiency, all while saving money for our rural communities.

So, Secretary Torres Small, I would like to begin with you because in your testimony you talked about the Rural Energy for America Program, the REAP program. I have been a strong supporter of the REAP program, and I was very proud when provisions from my REAP Improvement Act (H.R. 4162, Rural Energy for America Program (REAP) Improvement Act of 2021) were included in legislation that recently passed—well, last year passed out of the House. But this bipartisan legislation would not only—the REAP Improvement Act would not only dramatically increase annual funding for the program to \$250 million but also would take steps to improve accessibility for rural communities and create additional flexibility for applicants. For example, the bill would expand eligibility for farmer co-ops, reduce burdensome cost-shares for farmers and agribusinesses, and create a fund for underutilized technologies, including biodigesters or biofuel-related infrastructure.

So when we are talking about REAP, Under Secretary, it is consistently oversubscribed and under-funded, leaving many producers and agribusinesses to be pretty frustrated with the backlogs in the program. This is despite an impressive record. In the last 6 years,

REAP has leveraged more than \$300 million in public investments to stimulate more than ten times that amount in private investments, right? So \$300 million public investment, ten times that amount private investment, delivering more than \$4 billion in energy efficiency and renewable energy projects for rural America.

So I know I don't have to convince you of the value of this program, but I was hoping that you might be able to expand for the Committee on how we might be able to improve this program in the 2023 Farm Bill, what sort of resources would be needed to meet the actual current demand for REAP assistance, and what would you have us know as we head towards the farm bill?

Ms. TORRES SMALL. Thank you so much, Congresswoman Spanberger, for your investment in rural communities. You truly, with your focus on REAP, have the farmers' back. And I am grateful to continue this dialogue about how we can better support those farmers as they implement energy efficiency opportunities in the way rural folks know best, whether that is updating a grain dryer that hasn't been updated since the 1980s to make it more efficient or whether that is investing in making biodiesel more energy efficient in their production. So there are great opportunities here, and I really appreciate your focus on ways to make it more accessible, streamlining the application process, for example, and ways to include other partners. You are absolutely right it is oversubscribed. And when we look at grants, it was about \$40.5 million in grants that were allocated and then another \$30 million in the wings waiting to be funded, which we didn't have the money for.

So to speak a little bit more about this program, I will defer to Administrator Neal.

Dr. NEAL. Yes, I am always happy to talk about our REAP program. And it provides both grants and guaranteed loans for a variety of purposes, for renewable energy systems, for energy efficiency projects, just for a variety of those kinds of things. And so we look forward to sort of figuring out how to make this program more modernized as we think about our staffing, making sure that there is support for the kinds of environmental reviews and other kinds of support that are required for the effective administration of this program.

And of course, as we heard, we have had a record year. Not only are our grant funds expended, we also had a record year for our guaranteed loan programs previously. And so we know that there is significant interest in this program, and we welcome your interest and continued support of the work.

The CHAIRMAN. Thank you.

Ms. SPANBERGER. Thank you, Mr. Chairman.

The CHAIRMAN. And now the gentleman from Arkansas, Mr. Crawford, is recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman. I want to associate myself with the comments of Mr. Austin Scott and our Ranking Member as well just to reiterate this problem with issues like fertilizer and so on. I was getting calls about this, this time last year. So this problem with inputs and supply chain issues didn't just materialize as a result of Vladimir Putin.

But that said, Madam Secretary, I am wondering if you can talk about what your plans are. I know that rural America can play a

pretty important role in developing renewable energy, but I wonder if you can explain how rural Americans are supposed to deal with how they might power, for example, a 300 horsepower tractor in the production of food and fiber to feed and clothe our population, as well as being important in the global marketplace?

Ms. TORRES SMALL. Thank you, Congressman Crawford. And I certainly recognize the importance that we have to work together on these challenges, knowing that there is no one simple silver bullet that fixes everything but rather that we have to invest in the places where we are seeing innovation happen on the local scale. And that is where Rural Development really shines. We are not in the regulation space but we are in the investment space, in the incentivizing space. So when a farmer or a rural community has an idea about how to expand their energy independence, we are there to support, whether it is through the Rural Energy for America Program or whether it is through investments when it comes to our utilities and utility-scale investments. So there is a lot of work that has to be done in this space, and Rural Development is really pleased to be there to support the local vision for their community and how to best diversify the energy economy.

Mr. CRAWFORD. Well, I appreciate your comments, but you really didn't answer my question. I am wondering what does a farmer do today when we are seeing policy developed that is so focused on renewable energies? Are they to put solar panels on top of their 300 horsepower tractor? Or how exactly does that work? Or are they going to use electric tractors that are powered by wind turbines? We have large-scale ag operations across the country that our people rely on for food and fiber. And I just don't think it is realistic to think that you are going to focus almost exclusively on renewables and at the same time expect farmers to be able to produce at the scale that we need them to with regard to how we actually produce our food and fiber. So let's try it again. What are your plans for our current farmers who produce on large-scale operations to feed and clothe 350 million people in this country and overseas as well?

Ms. TORRES SMALL. Congressman Crawford, I deeply appreciate your focus on farmers and how to best support them and also recognize—I think it was Ranking Member Thompson who said although we need to invest in renewable energy, that transition will not happen overnight. I, in my opening comments, talked about New Mexico and recognizing the diverse energy industry that is there and the work that happens right now when it comes to tractors or beyond that rely on a diversity of fuels.

But as we look to the future, there is a key opportunity here to support biodiesel, to support opportunities to make that production or that use of energy more efficient. And that is the way Rural Development can help incentivize those investments and to make them accessible to people across rural America.

Mr. CRAWFORD. Thank you. Can you talk more about your Grid Security Division? What outreach has been conducted with stakeholders? And I would also like to hear about the types of critical infrastructure security policies that you have developed.

Ms. TORRES SMALL. Thank you, Congressman Crawford. I think this is another great place where we can work together. When I

served in Congress, I was on the Homeland Security Committee and certainly recognize the importance of cybersecurity. We also recognize the need to invest in grid security across the board whether it is extreme weather, as well as other challenges to make sure that our energy is resilient.

To speak a little bit more about the creation of the Grid Security Division, I will defer to my colleague, Administrator McLean.

Mr. McLEAN. Thank you very much. And thank you for that question. The Rural Utilities Service took to heart this Committee's endorsement of the 2018 Farm Bill of the provisions that highlighted the importance of cybersecurity, in particular in grid security. And you are correct we did create a Grid Security Division. And we have also just last week reminded our borrowers that the RUS is ready, willing, and able to be able to finance cybersecurity investments, grid security, physical security investments, as well as fire prevention investments, including emergency and response vehicles, security vehicles, drones, software, even though traditionally those types of investments would have been categorized as operational expenses rather than capital expenses. But we determined that it was critically important that finances be made available for those purposes, and we continued our long-standing process of having every borrower who comes to RUS for a new loan or an additional loan to be able to give us a risk assessment and emergency response plan. So we take cybersecurity very seriously. We are working closely with our colleagues in the Department of Energy and trying to make funds available to rural electric service providers to be able to strengthen and harden the grid.

The CHAIRMAN. Thank you. And now the gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations is now recognized for 5 minutes.

Mrs. HAYES. Thank you, Mr. Chairman, and thank you to Under Secretary Torres Small for being here today, we are thrilled to have you back in the Congress.

Last year, USDA announced that it would be investing \$464 million into projects to build and improve renewable energy infrastructure and to help rural communities, agricultural producers, and businesses lower energy costs: \$115,000 went to Connecticut through the Rural Energy for America Program, including four projects in my district worth over \$43,000. These funds were awarded for solar power installation and technology improvements that will result in cost saving of over \$15,000 each year.

This program is critical to small farms and agricultural businesses in my district. Their profit margins are exceedingly tight and only getting tighter with inflation and input costs. While the producers and operators in my district are ahead of the curve in climate-smart and energy-smart policies, the REAP program helps them to get the funding they need to install energy efficient technology.

While small- and midsize farms in my district are doing much better on these energy-smart practices, historically, midsize and small farmers are hesitant to undertake conservation practices because of the negative economic impact it can have on their operations. Can you tell us today, how is REAP able to deal with this,

and is there a need to adjust title II programs to allow smaller producers some up-front assistance on these types of projects?

Ms. TORRES SMALL. Congresswoman Hayes, thank you so much for that question and for really looking out for farmers and their ability to both make investments in renewable energy work immediately for their bottom line and invest into the future. That is certainly our goal at Rural Development. And one of the keys to that is making sure that REAP is accessible both in terms of the application process and trying to find ways to simplify that process but also recognizing the large backlog of applications that are certainly out there.

I think you are absolutely right that we can find ways to make the application process easier, and part of that is the technical assistance. Rural Development is unique in a lot of ways, but one of it is its presence on the ground. We have 47 state offices, over 450 offices throughout the United States, and so being able to provide that technical assistance is one component of that.

To speak more on this, I will defer to Administrator Neal.

Dr. NEAL. Yes, thank you so much for the opportunity to talk about this. I mean, one thing that is important is, obviously with REAP, we have both guaranteed loans and grant programs as well. Two-thirds of the grants are for less than \$20,000, so that is really the bulk. So when we are thinking about small operators or small projects at least, much of that need—or the program is more sensitive to that need given that $\frac{2}{3}$ of the grants are for those projects under \$20,000. So that is something we are thoughtful about. Of course, we recognize that there are certainly unfunded projects, applications that are submitted that might be high quality but that are not able to be funded, given the amount of funds that are available. So we look forward to additional support for that program so that additional need can be met.

Mrs. HAYES. Thank you so much for that. I spend much of my time on this Committee advocating for small- and medium-size farmers because those are the people in my district, and I want to make sure that the work that we are doing on this Agriculture Committee includes all farmers and the entire agricultural community.

In my district, UConn Extension does an amazing job to educate farmers on renewable energy options for their farms. What role can the extension services play in educating farmers on the benefits of energy efficiency options in their operations, and what are some of those options for small- and medium-size farmers?

Ms. TORRES SMALL. Congresswoman Hayes, that is such a great question. One of my favorite visits so far was in Florida where I got to meet with the extension service and talk about how our programs could support the people, the farmers that they were talking to every single day, making sure that we are working throughout USDA to be able to better assist and be there for farmers in the spaces they need most. We are certainly interested in continuing to work to get information out through extension services and also get feedback through extension services in order to find ways to make our programs more accessible.

Mrs. HAYES. Thank you, Under Secretary Torres Small, and I have to tell you, you have to get to Connecticut to visit our exten-

sion programs. It is amazing to see the investment that they have in young people and building up the next generation of our agricultural producers.

Mr. Chairman, that is all I have. I yield back.

The CHAIRMAN. Thank you. And now the gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. Thank you, Mr. Chairman. I appreciate it. Under Secretary Torres Small, good to see you again. Thanks for being here. Of course the topic of renewable energy in the ag sector is extremely important, and there are a lot of facets we need to continue to look at here. So I think I would like to first lead off, when we leave out on the overall grid, the overall renewable portfolio, we have to recognize that hydroelectric power that is so abundant in many parts of our country has to be recognized as truly renewable. And if it rains, it renews. And we are looking for the concern being carbon dioxide, and we also have to recall that nuclear power is a carbon-free source of generating electricity.

But shifting gears here to things a little more centric towards the farm bill and agriculture in general, as you know, my area of my district and a lot of the western states have a massive amount of biomass available, sort of forested areas, as well as ag waste from orchard prunings and other waste products that are a byproduct of agricultural operations. So putting biomass at the top of the heap here would be very important as a means of producing electricity and other forms of power that can be, other forms of energy that can be derived from them as well.

So looking at the landscape since the 2018 Farm Bill where the extension was made in the community, what energy and what innovation program which provides financial assistance for the installation of wood energy systems, how are we doing as far as new facilities coming in place or being in plants that will be coming online soon as a result of this farm bill, Energy Title back from 2018? Are we seeing much happening on that in order to use some of this wood product that, again, we are so overabundant in western states and my district to put that waste product to work for us instead of being the next million-acre fire in our forests?

Ms. TORRES SMALL. Congressman LaMalfa, it is always wonderful to see you, and I really appreciate your thoughtful question about the different types of renewable energy and how we can diversify that portfolio. When it comes to woody biomass, there is a program within the Forest Service which isn't within Rural Development's direct purview, but we will be happy to connect you on some of the opportunities there related to the Forest Service and their woody biomass program. In addition, the B&I Guaranteed Loan Program may be accessible in terms of a loan, a guaranteed loan for some of those investments, as well as REAP if the program qualifies.

To speak a little bit more about the way Business and Industry Guaranteed Loan Program works, as well as REAP, I will defer to my colleague, Administrator Neal.

Dr. NEAL. Thank you. I really appreciate that question. I think one of the things that we do is we try to look for the ways of which we can make the dollars go farther, and guaranteed loans are a way of doing that. And so the Business and Industry Guaranteed

Loan Program provides up to 80 percent guarantees on loans of up to \$25 million typically and can be used for a variety of rural small business purposes, including things like what you may be suggesting there.

In addition, the REAP program supports a variety of technologies. The solar work is predominant, but that does not mean these other projects are not competitive. They certainly are. And so we welcome those applications as well through both the REAP Grant Program and the REAP Guaranteed Loan Program. So I think there are a number of opportunities there to be thoughtful about this work to help advance the kinds of technology there.

The other piece I would mention, too, is what is typically often called the section 9003 Program, the Biorefinery, Renewable Chemical, and Biobased Product Manufacturing Assistance Program.

Mr. LAMALFA. Well, let me reclaim my time. I am sorry. The existence of the programs is positive, is good, but how will they be implemented into actually getting facilities built or at least on the way to being built to utilize these materials and turn them into energy? How well are we doing since the 2018 Farm Bill has extended that initial program in other areas?

Ms. TORRES SMALL. Thank you so much, Congressman LaMalfa. And I think that this is a good fit for the section 9003 Program in terms of the large-scale investments that may be necessary, so I will defer to Dr. Neal on that.

Dr. NEAL. Yes, I would appreciate, and we certainly would welcome the opportunity to share more and to research and get back to you about any particular projects that are specific in terms of woody biomass that have been used in section 9003. I don't have that data on me right now.

Mr. LAMALFA. I guess my bottom line when you get back to me is what is actually being built or what is far along in the planning stage that we can count on then coming online? That is what I am looking at. So thank you. I will yield back.

[The information referred to is located on p. 527.]

The CHAIRMAN. Thank you. And now the gentlewoman from Ohio, Ms. Brown, is now recognized for 5 minutes.

Ms. BROWN. Thank you, Chairman Scott and Ranking Member Thompson, for holding this hearing today. Under Secretary Torres Small, it is great to see you again so soon after your visit to Cleveland last month, and thank you to your colleagues Dr. Neal and Mr. McLean for being here as well.

It is no longer a luxury to have access to fast and reliable broadband internet service; it is a necessity. From virtual classrooms to telehealth doctor visits, being able to utilize high-speed internet is needed by everyone, regardless of where they choose to live. In the 2018 Farm Bill, there was a specific set-aside in the Smart Utility Authority for construction of broadband infrastructure for underserved non-rural areas like much of northeast Ohio. As we look to the next farm bill, how widespread has the Smart Utility Authority been utilized, and what changes might be needed, going forward?

Ms. TORRES SMALL. Congresswoman Brown, thank you so much for your focus on broadband. And certainly within the context of energy there is a clear nexus there in terms of opportunities for

utilities to utilize that broadband as well to make sure their energy is most efficiently used, as well as to provide it across the country through, for example, rural electric co-ops.

To speak more specifically about the program, I will defer to my colleague Administrator McLean.

Mr. MCLEAN. Well, thank you very much, and thank you for that question about Smart Utility Authority. It is one of the great innovations of the 2018 Farm Bill, and I am delighted to report that in the RUS Electric Program we have utilized that authority about ten times since its creation to be able to devote up to ten percent of a project cost for retail provision on broadband. And we are seeing electric service providers leveraging their smart grid investments and to use the Smart Utility Authority to kick it up a notch and increase that investment to be able to provide the retail provision of broadband. This is in addition to the wonderful support that Congress has given RUS in the ReConnect Program and our Broadband and Telecommunications Loan and Grant Programs. And we have just a tremendous response to our last funding round, which we are now evaluating. So we are grateful for Smart Utility Authority. It has been very useful, and we look forward to its further availability.

Ms. BROWN. Thank you for that. One further question on this. How do you think the USDA Office of Rural Development can work with other agencies to bridge the urban-rural digital divide so that no one is left behind?

Ms. TORRES SMALL. Congresswoman Brown, that is such an important question as we see the multiple ways that Congress has chosen to invest in closing the broadband gap. We see Rural Development as a key partner in that work, recognizing that we will only achieve this through true collaboration. And what Rural Development brings to the table really is an expertise in rural areas, a connection to some of the most likely providers like rural electric co-ops, for example, or our local telecoms, also finding opportunities to be able to assist when it comes to working in Indian Country, for example, and our long-standing relationships in areas that don't always get the service that they need.

To speak a little bit more to that coordination, I will defer to Administrator McLean.

Mr. MCLEAN. Yes, well, thank you very much. And there is extremely strong coordination between the Federal agencies that were entrusted with broadband responsibilities, both in the Rescue Act, as well as the bipartisan infrastructure bill. So the NTIA, National Telecommunications and Information Administration, part of the Department of Commerce, the Federal Communications Commission, and the Rural Utilities Service have a long-standing memorandum of understanding where we collaborate with each other, share data, try to make sure that our programs feather in with each other. And we work closely as well with the Department of the Treasury, who had American Rescue Plan Act of 2021 (Pub. L. 117-2) authority to be able to support broadband and are working across the Federal agencies and look forward to working even more with states as our sister agencies are releasing broadband funds for state investment.

Ms. BROWN. Thank you. Mr. Chairman, with that, I yield back.

The CHAIRMAN. Thank you very much. And now the gentleman from Illinois, Mr. Davis, is recognized for his 5 minutes.

Mr. DAVIS. Well, thank you, Chairman Scott, Ranking Member Thompson. Xochitl, great to see you again. Congratulations, Madam Under Secretary. I look forward to working with you.

I am glad we are here talking about this issue. However, I do think a timelier and more appropriate title for this hearing would be the energy crisis every family in America is experiencing because of the Biden Administration's misguided inflationary energy policies. I appreciate the opportunity, though, to discuss energy policies with all of you.

Gas 2 years ago was \$1.97 on average. Now, it is \$4.17. That is an increase of over 100 percent. This is proof that our USDA energy programs are more important now than ever but also proof that this Administration, I don't believe, is utilizing them well enough. As ag input costs continue to rise, prices at the pump continue to rise, and inflation continues to decimate rural America, I am disappointed that once again we aren't discussing the issues that matter most right now to our producers and our families right here in this Committee. We need to do better.

This Administration promised our ethanol and biofuels producers the world during the campaign and has failed on every single point. And, in turn, gas prices continue to soar and our farmers are left behind. Last week, I sent a letter with several of my colleagues on this Committee asking the Biden Administration to prioritize domestic energy production, including making permanent year-round E15. And again we asked the President to simply uphold the law and reverse its course on the proposed cuts to the RVOs, renewable volume obligations. To make matters worse, funding from the CARES Act (Pub. L. 116-136, Coronavirus Aid, Relief, and Economic Security Act), which was enacted over 2 years ago, included funds to provide pandemic-related economic relief to ag producers of all types.

In December 2020, the omnibus extended explicit authority to the Department to provide this relief to biofuels producers. In December of 2021, a year into the Biden Administration, the Department finally announced a \$700 million biofuel producer program to provide economic relief to our producers to restore renewable fuel markets affected by the pandemic. And yet, amid what I would consider a fuel crisis on top of an inflation crisis, the producers who can help decrease our fuel costs immediately are still being left behind and have yet to see any of these funds as we in Congress have directed.

I don't understand why this Administration has such an aversion to rural America, especially given the rising gas prices related to the ongoing conflict in Russia and the ban on oil imports on top of existing and misaligned ban on drilling in the United States. But regardless, Madam Under Secretary, my question is why have our biofuels producers still not seen any of these funds?

Ms. TORRES SMALL. Congressman Davis, I deeply appreciate your focus on rural America and your shared belief that USDA has a vital role in making sure that we are addressing these challenges from the increased cost at the pump to supporting local markets and biofuels. I am eager to make sure that we are delivering those

\$700 million, recognizing that the application closed in February, and so we will be focused on getting them out late spring or early summer. I look forward to keeping in touch with your office to make sure that you receive up-to-date information on that.

In addition, as we look at what the investments are to take on the challenges recovering from COVID-19, it is also about making sure that, as you mentioned, that fuel is more accessible across the country. And Rural Development's opportunity there really is the HBIIP (Higher Blends Infrastructure Incentive Program) program, making sure that we have the technology on the ground to get out that higher blend of biofuels. And so we are also proud to have invested \$100 million in the HBIIP program, and that will be happening in the spring, the applications for that.

To speak a little bit more about the biofuels program and the emphasis there, I defer to Administrator Neal.

Dr. NEAL. Yes, this is an important issue, so I really appreciate the question and your interest in this important work. We are excited about the opportunity and really welcome the opportunity to help people have choices at the pump, to help supplement the current fuel with all kinds of things, additional kinds of activities like biodiesel, like ethanol through the programs that we just heard the Under Secretary talk about, the Biofuel Producer Program, the HBIIP program, which is going to provide the infrastructure that is necessary. These are the kinds of things that help make sure that our energy stream is reliable, that it is affordable, that it is clean, that it is accessible to people. And so that is really the work that we are doing through these programs. We look forward to opening this program to making the announcements very soon for the Biofuel Producer Program and to opening the Infrastructure Incentive Program as well.

Mr. DAVIS. Well, I certainly look forward to those announcements. You can sense my frustration, the frustration of a lot of rural Americans. But I do support Rural Development, and I really look forward to working with both of you and seeing those announcements soon. Thank you. I yield back.

The CHAIRMAN. Thank you. And now the distinguished gentleman from Illinois, Mr. Rush, is now recognized for 5 minutes.

Mr. RUSH. I certainly want to thank you, Mr. Chairman, for this outstanding hearing this morning. Madam Under Secretary, it is such a delight to have you back in the Congress before this Committee, and you have really made us all very proud of you in terms of your work for the Biden Administration and for the American people.

As chair of the Energy Subcommittee of the Energy and Commerce Committee, I am continually concerned about the impact of any new costs on our nation's farmers and, specifically, the energy costs as it relates to minority farmers and consumers. I think that they have been too often overlooked. In your testimony, you mentioned that energy efficiency in rural communities can explicitly be an equity issue in addition to a cost issue. Explain what you mean by that.

Ms. TORRES SMALL. Congressman Rush, would you mind just restating the last part of your question? I just want to make sure I answer it correctly.

Mr. RUSH. Okay. Can you talk about how energy costs disproportionately burden certain rural communities more than others and how investments in energy efficiency will help to reduce those inequities?

Ms. TORRES SMALL. Thank you so much, Congressman Rush. And it is such an honor and joy to get to see you on this Committee. I really appreciate your question about how the cost of energy can disproportionately impact rural communities and how investment in renewable energy can also greater impact the work that is done across rural America. So when you are looking at travel to rural areas, if you are driving hours to get somewhere or if you are trying to, for example, construct homes and so having to lug large amounts of equipment to rural areas, the impact of energy can be incredibly high. And so it can impact rural areas in a way that is even greater than perhaps the impact in urban areas. Likewise, when we can create and support local markets that are supporting diverse energy sources, it gives us an opportunity to impact rural areas in a similar way.

Mr. RUSH. Thank you so much.

Ms. TORRES SMALL. Did I answer your question?

Mr. RUSH. Yes. Thank you. Let me ask you another question, Dr. Neal, this question. First of all, I am so delighted that one of the missions of the USDA's Rural Business—Cooperative Service is to include the effectiveness of programs serving cooperatives. Can you discuss these programs, whether the programs are only open to rural communities, and what best practices have you developed to [inaudible] millions to cooperatives under your jurisdiction? And additionally, is there severe need for more cooperative arrangements in rural and minority farming communities?

Ms. TORRES SMALL. Thank you so much, Congressman Rush. I will defer to Administrator Neal to speak to the work that is done specifically to cooperatives and how Rural Development is working to invest in that.

Dr. NEAL. Thank you. We are really proud of our heritage of supporting cooperatives for I think over 100 years at this point, and so we continue that and are excited to continue to have the Rural Cooperative Development Grant Program, the Socially Disadvantaged Groups Grant Program that specifically support cooperatives, in addition to the technical assistance that we provide through our cooperative services branch. I think it is important to note that many of our programs are also open to cooperatives, very intentionally open to cooperatives. We designed, as an example, we mentioned earlier today the Food Supply Chain Guaranteed Loan Program that was specifically designed to include and be inclusive of cooperatives in that program. And so we want to make sure that cooperatives have access to all the kinds of programs, although there certainly are some specific activities that are specific to cooperatives.

I would like to say, if I may, just one other thing, too. The Rural Energy for America Program was the pilot program at USDA for the environmental Justice⁴⁰ project, and so I think that is one of the ways when we think about our REAP program is now serving as a model throughout USDA and to some extent throughout the Federal family of how to measure those kinds of impacts. And we

are pleased to sort of understand how that disproportionate impact of energy cost can be remedied through programs like REAP and other kinds of things that are out there.

Mr. RUSH. Thank you very much, Mr. Chairman. I yield back.

The CHAIRMAN. Thank you very much. And now we recognize the other distinguished gentleman from Georgia, Mr. Allen, for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman. And, Under Secretary, I have to be honest with you because I feel the frustration and the pain and suffering of the American people. I don't know how this Administration sleeps at night with what is going on in this country. You had two of the top CEOs of both BlackRock and J.P. Morgan, and they have stated that this economy, that we currently have unprecedented risk dealing with the current economy. I don't have a crystal ball, but I do come from the business world. And the dashboard looks very bleak in this country right now. And of course that is probably one of the reasons that Putin took the risk he did, because we are very, very vulnerable. And it is sad. It is very sad for this country.

And do you know that right now there is a diesel shortage in Europe, and the Ukrainians aren't even going to be able to plant because they can't get diesel fuel, and we can't even help them because we are going to have a shortage in this country? I mean, folks, we have to wake up and realize what is at stake here. I mean, our very survival as a nation could be at stake here. There are adversaries out there that want to take our way of life away from us. And you are helping them. I don't understand it.

But let me just ask you this. Two years ago we were energy-independent. We were helping Europe with LNG. We weren't sending \$75 million a day to Russia for oil to finance their war against the poor Ukrainians. Would you be in favor of releasing the energy economy in this country to avert the possible devastation of our economy? Would you be in favor of that, or are you still going to hang with, well, the government is going to keep spending money to explore alternative energy, and in the meantime we have no country left. I mean, where are you on that?

Ms. TORRES SMALL. Congressman Allen, I recognize that you disagree with the Administration in many places, but I hope that we can share—

Mr. ALLEN. I don't disagree with the Administration. I am telling you what every corporate executive, every business in this country is talking about. This Administration is going to destroy the country.

Ms. TORRES SMALL. I wake up every single morning thinking about how I can better serve rural America, and I think that is something that we share. And so when it comes to addressing the challenges that are immediate, making sure that we are supporting farmers, that we are supporting local, rural economies in the ways they best know how, Rural Development is there to help incentivize that, to provide some of the financing that is crucial to do that work. And when it comes to taking on the long-term risks for our society, when it comes to taking on the long-term risks for our energy resiliency, Rural Development is also there to invest in the opportunities and the innovation that we see across rural America.

Mr. ALLEN. So like what are we going to do about energy?

Ms. TORRES SMALL. So we are investing both in the immediate needs when it comes to supporting biofuels, when it comes to supporting local markets for renewable energy. Also, the long-term—

Mr. ALLEN. The only thing that is going to save this country is to unleash our energy economy. That is the only thing that is going to save us. Are you for or against that?

Ms. TORRES SMALL. Now, sir, when it comes to Rural Development—

Mr. ALLEN. I am not talking about Rural Development. I am talking about everywhere. Yes, it is going to affect rural America for sure, but I need a yes or no from someone who represents this Administration. Are you going to let this country absolutely fall apart, destroy the country when we have the opportunity to remove all the pain and suffering just by unleashing our energy economy like the previous Administration did?

Ms. TORRES SMALL. Congressman—

Mr. ALLEN. Yes or no.

Ms. TORRES SMALL. Congressman, I am not clear on what the question is.

Mr. ALLEN. You are not clear? Okay. Say, for instance, if we don't unleash our energy economy, it is going to destroy our nation. That is the crystal ball I see. That is what these executives are saying. So would you be for unleashing—would you advise the President to unleash our energy economy, everything we have, to fight Putin and the rest of the world and to survive as a nation?

Ms. TORRES SMALL. So, Congressman, from my standpoint in Rural Development, we are working to unleash every opportunity we have in energy resiliency both to address the short-term and the long-term risks that we face.

Mr. ALLEN. Okay. Well—

The CHAIRMAN. Thank you very much. Thank you, Mr. Allen. And I can assure you I have spoken with the President on his priority for rural America, and I assure you they are moving very aggressively.

And now, the gentleman from Arizona, Mr. O'Halleran, is now recognized for 5 minutes.

Mr. O'HALLERAN. Thank you, Mr. Chairman and Ranking Member, for organizing this important meeting today. I also want to thank the witnesses for their participation today, for helping this Committee prepare for the upcoming farm bill.

So, first of all, I would like to get a couple of issues out of the way. Liquefied natural gas, we are the largest exporter in the world starting the end of this year. There are only two other countries that are even close. We have 11 million acres right now of oil and gas leases available, and in the time that those leases have been available out there, the industry itself since 2014 has contributed or invested \$650 billion in 2014. They are down to investing between \$300 and \$250 billion a year now. They have to invest money on the leases that they have to produce the oil and gas that are necessary for us today. And corporations throughout this country are not.

We are undergoing tremendous inflation right now, but it is because of a pandemic for 2 years. It is because of a war that is going

on now. It is because the rest of the corporations in America are investing in America. And that is what we have to do, work together to invest in the future of America.

And with that, I will go to the other part of my testimony.

Under Secretary Torres Small, welcome, great seeing you, and I look forward to seeing you in my district in a couple weeks. I know you have deep expertise working with rural southwestern communities and understand the impact a single plant closure can have on our economies. Coal plants across the West are scheduled to shut down within the next 5 to 10 years across America, and most of those are in rural America. Within the transition, we must not forget about the hardworking rural communities that currently depend on coal plants for good-paying jobs.

Over the last few years, northern Arizona has been coping with the Navajo Generation Station closure, NGS, as one of the largest plants in the West. It generated 65 percent of the Hopi Tribe's budget and a large portion of the Navajo Tribe. We are expecting several more coal plant closures like this in northern Arizona over the next decade. There needs to be an acknowledgement in America that rural and urban depend on one another. It is not just one or the other, and that is important.

Why in rural? Well, that closure is a regional closure. It is not a town or city closure. It is a closure for the school districts, the fire districts, the community colleges, the healthcare industry, and cities and towns throughout that region. It is imperative that we help these regions out in a larger context.

And so I just hope that we start to acknowledge that here in the Committee. I know we care, all of us, about rural America, but we also have to show that we care. And so far, we have taken baby steps in that.

Under Secretary Torres Small, how can we ensure we are adequately supporting rural communities as fossil fuel employers shut down and they seek to attract new employers, often in the renewable energy space? Are there specific farm bill programs that should be strengthened? Thank you.

Ms. TORRES SMALL. Thank you so much, Congressman O'Halleran, and for your question about the impact—well, for your question but also for your focus on communities. As markets transition and change, specifically with coal, we have seen Rural Development have a key role in this place both in terms of investing in new projects and electricity generation in nearby areas. But also one of the key factors for Rural Development is recognizing there are multiple facets of an economy, so focusing both in terms of creating jobs from an energy space but also what other local markets are out there that Rural Development can help invest in.

To speak to the energy piece and how we can work to make sure we are investing in renewable energies in rural communities that have had a history of energy production, I will defer to Administrator McLean.

Mr. McLEAN. Well, thank you very much. And thank you for mentioning the Navajo Tribal Utility. It is one of the longest-serving relationships that the Rural Utilities Service and our predecessor Rural Electrification Administration has had and a relationship in water and telecommunications, as well as energy. And one

of the projects we are very pleased to approve was a very major investment in Navajo Tribal Utility last year, a \$235 million loan. And Navajo Tribal Utility is also one of those ten projects I referenced that utilizes Smart Utility Authority to be able to leverage their investments on electric smart grid investments to be able to extend broadband to the Tribal community. And they are also a good example of seizing the future because we have also made major investments in their solar operations, and they are looking for ways to export power to urban areas so that urban-rural mix and linkage is really evident there. And so we are grateful to this Committee for section 317 of the Rural Electrification Act, which allows us to invest in renewable energy projects that serve rural and non-rural customers, as well as hydro projects.

So the Navajo Tribal Utility is managing a very difficult adjustment, but it is doing so, optimistically, with a view towards the future.

Mr. O'HALLERAN. The Chairman's eyes are on me. I am going to have to yield back. Thank you very much.

The CHAIRMAN. And thank you. And now the gentleman from Nebraska, Mr. Bacon, is now recognized for 5 minutes.

Mr. BACON. Thank you, Mr. Chairman.

During the Presidential campaign, this President multiple times said he was going to be hostile to the fossil fuel industry of our country. He said he was going to cut fracking, he was going to reduce natural gas production, he was going to stop new leases on Federal lands, and he did this on the first day. So I have to respond to some of the comments made here on this.

Two-thirds of the gas prices have gone up before the Ukraine invasion. Now, we have to be candid. The Ukraine invasion exacerbated what is going on here, but $\frac{2}{3}$ of this had already occurred. I can tell you the fossil fuel industry in our country knows they have a hostile Administration, and they have responded accordingly because they can't trust that their investments can be protected. And so I think that is as much of the backdrop here.

With that said, I want to recognize the Under Secretary. Thank you for being here. Congratulations on your position. And, as you know, we have typically multiple hearings at once, so I have had to step in and out, so if I repeat any of this, I apologize. But it is good to see you. Thank you for your leadership.

I will tell you, the numbers, I think the second most popular position or issue right now in our district is American energy independence. I would say inflation is probably the number one issue, but they are related obviously when you talk to—most folks in our district want energy independence. We want an all-of-the-above approach. They are not hostile to solar or wind, but they also know they need natural gas. They are looking for all of the above. They also want American innovation to contribute to that.

With that said, I have met with the biofuels industry today, whether it is the corn producers, the soybean producers, or many of the folks who are in it, and they said that the Administration has not been keen on their industry in the biofuels or ethanol, that they feel like they are last place on this whole pecking order. What is your take on this? Because that is their impression. I heard it straight from them. They feel like they have no voice in this Ad-

ministration, and they feel like they are last in the pecking order. How would you respond?

Ms. TORRES SMALL. Congressman Bacon, I know that Secretary Vilsack, as well as President Biden, are focused on the diverse portfolio that we need to be energy-independent and resilient. And biofuels is a key part of that. And I hope that the biofuels industry feels like they have a strong voice in Rural Development because we have been focusing a lot of energy to making sure—pun intended—to making sure that we are investing in that exact type of local market that really creates resiliency both when it comes to energy but also on the ground.

When I was in Iowa getting to see Elite Octane, for example, and the work they were doing, their use, their reliance on a REAP grant to make their production more effective and efficient, I was really impressed by the work that they were doing and the impact that that was having on the community where I spoke with young engineers who were able to stay in their hometown because of that local economy.

To speak a little bit more about some of the programs that we have to support biofuels, I will yield to Administrator Neal.

Dr. NEAL. Thank you. I appreciate the opportunity to speak more about this.

Mr. BACON. Thank you.

Dr. NEAL. We have a real commitment to homegrown biofuels in large part because they provide an opportunity to diversify our sources of fuel but also because they help support the producers in exactly the kinds of ways that we heard from the Under Secretary. So we see there are a number of opportunities there. We want to be able to support those through our variety of programs both for our producers but also for the technology and also for getting it to market as we think about the infrastructure necessary, for example, for higher blends to be available—

Mr. BACON. If I may just do a follow-up. I appreciate the words you are saying. I have just talked to like ten of these leaders from different, whether it is producers, corn, soybeans, and that is not the feedback I am getting, at least as of this morning. So I can't remember the date, I think it is June where the E15 mandate goes away. What are we doing? What is our response to that? Because I think that is really looming large on this industry, what is going to happen.

Ms. TORRES SMALL. Congressman Bacon, that is a really good question. And so when it comes to the science of the determinations about RFS, EPA is in charge of that. Rural Development has a key opportunity to make sure that we are supporting the business side of biofuels. And so as we look to this spring both where we look at the disbursement of that \$700 million in terms of impact from COVID-19 and then also opening the applications for the \$100 million for the HBIIP program, I hope that we will be able to work hard to be there on the business side for biofuels.

Mr. BACON. I will just close with my last few seconds. Forty percent of our corn goes to ethanol, so this is huge, so this is such an important part of the Midwest economy. So I appreciate your commitment to that, thank you. I yield back, Mr. Chairman.

The CHAIRMAN. Thank you. And now the gentleman from California, Mr. Carbajal, is now recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman. And thank you to my friend and former colleague, Under Secretary Torres Small, for your testimony and to Dr. Neal and Mr. McLean for being here today. It is great to hear about USDA's commitment to fighting climate change and the steps already being taken. My district has already felt the devastating effects of climate change from severe droughts to intense wildfires. Investing in renewable energies and transitioning away from fossil fuels is crucial in mitigating the effects of climate change. I represent the rural communities, and you are right that rural communities need a seat at the table.

Under Secretary Torres Small, can you walk me through Rural Development's process in identifying rural communities with the potential to lean into clean energy transition? What kind of outreach does Rural Development do, and how can Congress help ensure every rural community knows about these programs?

Ms. TORRES SMALL. Congressman Carbajal, it is so wonderful to see you. And I deeply appreciate your question about how we make sure that the programs within Rural Development, the opportunity within Rural Development, are truly reaching rural communities across the country. It is one of our special assets that we have 47 state offices and over 450 offices with people on the ground committed to that program delivery. And we talked a little bit today about the reinvestments that we have made in terms of staffing, which we certainly see as our greatest resource on the ground.

And there is still work to do in terms of increasing that outreach. We are identifying places that we haven't reached out to in the past or communities that haven't received any type of Rural Development investment for the last 5 years. How do we now expand to make sure that no matter how small your community is or if you don't have a grant writer, which is the vast majority of the places where we work, that we are still reaching those communities and supporting their work through technical assistance?

To speak about the outreach that is done on the energy side, I would love to actually tap in Administrator McLean to talk about that.

Mr. MCLEAN. Great. Well, yes, thank you very much. And we are very, very excited about the growth we have seen at the Rural Utilities Service in renewable projects, more between Fiscal Year 2020 and 2021. We more than doubled our level of dollar investments from just over \$100 million to nearly \$200 million, a 50 percent increase in megawatts in the portfolio. And so renewable energy is taking off really across the country, and we are seeing that, as you say, Congressman, leaning into that, that communities are doing that.

Also energy efficiency is another great inflation-fighter and very friendly to the environment because it takes traditional fuels 3 units of energy to produce 1 unit of electricity. If we could save 1 unit of electricity, we are saving 3 units of energy. And we are seeing programs like the Rural Energy Savings Program working with rural electric cooperatives and other utilities to be able to encourage relending for energy efficiency as being a real positive.

The last fiscal year we were able to finance 16 individual solar projects at RUS, a microgrid project and a hydroelectric project, all growing the portfolio for renewables. And we are seeing interest grow. Our pipeline is filling with additional projects in that arena as well.

Mr. CARBAJAL. Thank you. Under Secretary Torres Small, the need to invest in renewable energies is becoming more important than ever as it will allow the United States to be more energy-independent, and we have seen global oil costs skyrocket because of the Russian attack on Ukraine. Can you expand on how biofuels can play a role in our national energy independence? How should we be weighing investments in different renewables through USDA programs, and how can we continue supporting the deployment of renewable energy sources in rural communities?

Ms. TORRES SMALL. I really appreciate this question because it shows how complex our energy portfolio is and will need to continue to be. There are all sorts of different energy uses, whether it is transportation or whether it is electricity, whether it is manufacturing. And the way that we invest in that is going to require different answers. And so a vital part of that is investment in biofuels, especially as we look at transportation, and that is why Rural Development has worked so hard to invest in those programs.

And because we are out of time, I will just say HBIIP and \$700 million for COVID-19 impacts are certainly a big place where we are doing that work.

Mr. CARBAJAL. Thank you. I am out of time, Mr. Chairman. I yield back.

The CHAIRMAN. Thank you. And now the gentleman from Indiana, Mr. Baird, is now recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman. I appreciate the opportunity to be here. I appreciate all the Under Secretary and the staff being here.

As we are all feeling the pain when we fuel up at the pump, we see the increasing prices, and it just seems to me that now would be a bad time to remove some of the choices in our fuel supply chain. And by that I mean what is going to happen or what has happened when we do not correct for the Reid Vapor Pressure and provide for year-round use of E15 ahead of the June 1st deadline and sales cut off. So what is USDA and the broader Administration feel about doing or correcting this situation?

Ms. TORRES SMALL. We are focused on making sure we are delivering for the biofuels industry in the way Rural Development best knows how. So although we are not the decision-maker on some of the decisions you recently noted, we have a key opportunity to be there for biofuels producers in a few different ways. So we have talked a little bit about the \$700 million, applications closed in February, payments should be coming online in late spring or early summer, as well as the investments in the technology that brings those higher blends to communities, so having the right gas pumps, for example. And the HBIIP program is the one that best can be there for communities in doing that work, so the investment of \$100 million there.

In addition, the first biofuels production that I visited were recipients of REAP. And I think there is a really unique opportunity to align there where we are making the production of biofuels more energy-efficient and more economical in and of itself, whether it is a high-tech grain producer dryer to process for a biofuels plant or whether it is a low-tech but a replacement for a really old grain dryer on the farm that is making that work more energy-efficient and affordable for the farmer.

To add some additional comments on the work for biofuels, I will defer to Administrator Neal.

Dr. NEAL. Thank you. I appreciate that question. I think one of the things I will just sort of highlight in addition to some of the comments that have been previously made is thinking about the variety of feedstocks that is available to go into biofuels. And I think what is one of the places where when we look at our work in REAP, when we look at our work in the section 9003 program, I think about biorefineries, what are the variety of feedstocks that are available that producers, frankly sometimes it may be even waste that can be used to turn waste or other kinds of feedstocks into fuel, into energy for the kinds of needs that we have.

And so I think as we—in addition to thinking about supporting businesses through difficult times like we are doing with the Biofuel Producer Program, supporting producers as they grow the kinds of feedstocks that we need intentionally for the development of biofuels, as we think about the support of various technologies through REAP or through the section 9003 program, I think it is also important to consider how a variety of different feedstocks from a variety of sources can be commercialized into production of biofuels, again, diversify the types of fuels that are out there and provide for more choices for people as they get where they need to go.

Mr. BAIRD. Well, thank you for that. I really appreciate being able to look at different opportunities and make sure we bring all of those along at the same time.

I do want to switch gears and look at another opportunity just to get a feel for how you and the Administration feel about it. But I am talking about methane digesters. They can really be used to turn a problem into an asset. And so I just want to know how the Administration feels about using methane digesters attached to livestock industry. A lot of those are terribly expensive. And so is there anything that you feel we could put in the farm bill that would help move that process forward?

Ms. TORRES SMALL. Congressman Baird, thank you so much for that question. It is something we haven't had a chance to talk about today but I think it is a really exciting investment. Both the Administration as well as of course Secretary Vilsack have expressed significant interest when it comes to methane digesters. And recognizing that there is a large gamut, whether it is a smaller digester or some of the bigger-scale ones that we are starting to see interest in now, there is key opportunities for them.

And to speak a little bit more about that, I will defer to Administrator Neal.

Dr. NEAL. Yes, thank you. We are excited about the work that so many are doing with anaerobic digesters. Part of what we see

is this can be funded through our REAP program but also through the section 9003 program, so, again, to accommodate the variety of sizes of different projects that are out there, I think that is important to have a variety of different choices of programs out there to support that work.

One of the things that has also been interesting to track and to note is how the products from those digesters are being used. So in addition to seeing projects that might sell methane to produce electricity, we are also seeing things where they are selling gas directly to the pipeline, and then we are also beginning to see, particularly with some of our section 9003 projects, places where there are digesters that are being used to make renewable chemicals. That is where we see a lot of opportunity in the renewable chemical sector.

Mr. BAIRD. Thank you.

The CHAIRMAN. And thank you so much. We are trying to get to everyone. I appreciate that.

And now the gentlewoman from Washington, Ms. Schrier, is now recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman. And hello, Under Secretary Torres Small. It is wonderful to see again, and thank you again for taking the time to come out to Washington State in February to meet with my constituents and farmers.

And I want to talk with you today about the Rural Energy for America or REAP program. REAP is an incredibly important program for farmers and businesses in Washington State and my district. And for the most part the program works well, but I would like to flag a few key issues and ask how we can make this program more effective.

First, I know the program is significantly oversubscribed throughout the country. In Fiscal Year 2021, there was \$1.1 million in grant requests from Washington but only \$752,000 or 65 percent of those, was allocated.

Second, I have heard concerns about REAP providing only reimbursements and covering only 25 percent of project costs, and that is an outlier. This can be a real equity barrier for smaller producers who may not be able to put up 100 percent of the project costs up-front or get a loan to be able to cover those up-front costs. And compared with similar programs, 25 percent of the cost-share seems low. I know some of this may fall to Congress, but in order to serve more applicants and accelerate the adoption of renewable energy projects, I think we should look to increase this cost-share rate and increase the total funding available in the REAP program.

Finally, I am concerned about farms and businesses in peri-urban and ex-urban areas. Case in point would be the farm that you and I visited together. Folks in Pierce County in my district are geographically not far from cities like Seattle and Tacoma, and thus may be excluded from participation. But the areas we live in, as you saw, practically speaking, are quite rural. And this will continue to be an issue as kind of urbanization encroaches on rural areas.

So a question, Under Secretary Torres Small, I just want to ask how we can make REAP easier for folks to use, and is there a way

that we can incorporate these peri-urban and ex-urban farmers and businesses in the program?

Ms. TORRES SMALL. Thank you so much for your careful attention to farmers and their needs and how we can best serve them through REAP. It certainly is something we are eager to provide technical assistance on as you look at the farm bill, recognizing that REAP is one of the most popular programs, and so that over-subscription that you mentioned, certainly we see it on the ground when folks are interested in the program. Also, when it comes to the cost-share piece, which really depends on the demographics of the application, and for that I will defer to Administrator Neal. And then also the access piece both when it comes to where something is located but also in terms of how do we just make it easier with the application process, which is something we are focusing a lot of attention on.

So to speak more specifically to that, I will defer to Administrator Neal.

Dr. NEAL. Thank you again for the opportunity to speak about this. Just a couple things I would share. I think, one, in addition to providing technical assistance to make sure that folks are able to submit the applications, they feel comparable with that and they can submit ideally a competitive and high-quality application, as we heard from Under Secretary Torres Small, I think we are looking at ways we can streamline the application process, make it more modernized. I think there are some ways that that can be done so that that not only makes it easier for the applicants but also frankly makes it faster, more efficient for us, for our team at RBCS to review those applications and score those applications. So we are looking at opportunities for that.

We certainly welcome the opportunity to talk with you all, provide technical assistance around how the program could be structured in terms of cost-share and those kinds of things. And, as we think about the definitions of *urban* and really of *rural* and what that includes, we try to be very intentional around that to stay in the lines of where our authority is and so, again, we welcome the opportunity to follow up with you if you have particular questions about that.

Ms. SCHRIER. I would love to follow up about that just because if our goals are to support family farms and to support renewable energy sources, reducing geographic limitations would be fantastic.

I have 22 seconds remaining. I just want to mention the importance of including hydropower in USDA energy programs. The Pacific Northwest produces some of the cleanest, most affordable energy in the country, and as a Northwesterner, I would like to see that included.

So thank you, and I yield back.

The CHAIRMAN. Thank you, Ms. Schrier. And now, the gentleman from Ohio, Mr. Balderson, is now recognized for 5 minutes.

Mr. BALDERSON. Mr. Chairman, thank you very much. And, Madam Under Secretary, thank you again for being here.

My first question is, as you mentioned briefly in your testimony, the 2018 Farm Bill mandated coordination between USDA and the Department of Energy on energy security issues. Could you expand

on this coordination and what are some of the results that this has yielded?

Ms. TORRES SMALL. Thank you so much, Congressman, for that question. And it is certainly something that we are focused on. We entered into in MOU with the Department of Energy in 2019 and actually have an upcoming meeting to further flesh out the opportunities there. But there are some key opportunities, whether it is looking at electric vehicles, for example, and the opportunities of joint investments and work there. Identifying priorities when it comes to cybersecurity is another potential that we have been looking into.

And to speak to some of that additional work, I will defer to Administrator McLean.

Mr. MCLEAN. Yes, thank you very much. And, yes, thank you. The 2018 Farm Bill provision on the Memorandum of Understanding between USDA and DOE have been very productive. We have had numerous conversations, coordinations in particular areas about cybersecurity, renewable energy, de-carbonization, quantification of de-carbonization, going forward, and in terms of also the agenda to be able to finance charging stations in rural areas where we think that we can leverage our loan programs against the grant programs that the Department of Energy has.

We notice, too, that the Department of Energy had a number of grant programs that will be eligible for applications among rural electric cooperatives, in particular out of the infrastructure bill, and we look forward to working with the Department of Energy to help leverage those resources with our borrower constituency and our stakeholders as well.

Mr. BALDERSON. Okay. Thank you both very much. Under Secretary, my next question is I have met with several energy producers in Ohio that operate some renewable energy programs. While they say that renewables such as solar are great supplements, they go on to say that a complete transition to renewables would be unattainable and will make it impossible to serve all their customers. I think everyone on this Committee on both sides of the aisle knows that it is unrealistic to fully transition rural America to renewables as quickly as this Administration would like to. Can you discuss the specific challenges that such a transition will have on rural America and America's farmers?

Ms. TORRES SMALL. Yes, I think Rural Development has a unique perspective of this in a few ways, one of course working with farmers and recognizing the impacts of energy dependence in rural America, as well as some of the opportunities when it comes to energy diversification in rural America, but also when it comes to our long-standing work in electricity and working with rural electric co-ops and some of the efforts that they have made to diversify their energy portfolio.

And so to speak a little bit more about that work and our unique perspective there, I will defer to Administrator McLean.

Mr. MCLEAN. Yes, thank you very much. And of course Rural Utilities Service's predecessor Rural Electrification Administration has a long-standing relationship with cooperatives and rural service providers in the State of Ohio. And one of the more exciting things that is happening in the industry is in the area of beneficial

electrification where we are almost considering it as rural electrification 2.0 where we are able to see the transformation of carbon-dependent machinery, transportation, industrial uses, switching over to electricity. And so the application of time and of technology, investment, and incentives I think will be able to get us to that transition, but we are also seeing a lot of dedication from the good people who do provide that energy in the State of Ohio and elsewhere, again, many of them longtime customers of our agency.

The CHAIRMAN. Does the gentleman yield back?

Mr. BALDERSON. Yes, Mr. Chairman, I thank them, and I yield back my remaining time. Thank you.

The CHAIRMAN. All right, thank you. And now the gentleman from California, Mr. Panetta, is now recognized for 5 minutes.

Mr. PANETTA. Great, thank you, Mr. Chairman. I appreciate this opportunity, and thank you for holding this important hearing.

Dr. Neal, Mr. McLean, thank you very much for being here. You have to understand, though, it is going to be a lot of sentiment directed at Under Secretary Xochitl Torres Small because of how beloved she was as a Member of Congress and how good it is always to see her on Capitol Hill. So, Madam Under Secretary, welcome back. You are always welcome on Capitol Hill. Thank you for being here.

I just want to talk to you about your testimony and what you addressed as energy security. You talked about a relationship between the USDA and the Department of Energy specifically dealing with funding on grid reliability. Let's focus on that right now and the partnership that you mentioned in your testimony. How is that going? Has it proven successful? And is there anything that we in Congress can do to support you and to support that relationship for grid security?

Ms. TORRES SMALL. Congressman Panetta, it is a joy, as always, to see you, and thank you so much for your kind remarks and for your focus on this partnership, which I think is really important and exciting. The first thing that you did, which the Congress did which I think was very helpful is requiring it in the 2018 Farm Bill. It got us to work in terms of that MOU. It got us to work in identifying the places where we can work together.

And the focus on reliability, certainly, from your experience in California, is crucial as we look to make sure that we have good ways to monitor electricity delivery, for example, under threats of extreme weather, also as we look at that reliability when it comes to cybersecurity, and that is why also our investments in the Grid Security Division has been crucial in Rural Development.

To speak a little bit more about that MOU, I will defer to Administrator McLean.

Mr. MCLEAN. Thank you very much. And yes, thank you for mentioning the relationship with the Department of Energy under the MOU. It has been a very productive and worthwhile engagement. We look to the Department of Energy for their scientific leadership, their innovation, and their demonstration projects. What we do at the Rural Utilities Service is we deploy the proven technologies. So those of you who know, Washington, D.C., we share 12th Street. The Department of Agriculture and the Department of Energy are next-door neighbors, and we look at that MOU

as to being the bridge across 12th street to be able to take the innovation that the Department of Energy is working on, the technology advancements that they are working on and bringing to the marketplace, and bringing it across into implementation in rural America through the financing that we can provide at the Rural Utilities Service.

Mr. PANETTA. Okay.

Mr. MCLEAN. And with relationship to those grant programs the Department of Energy has, we would be delighted to be able to leverage our loan programs to be able to stretch them out to get further activities financed in rural areas.

Mr. PANETTA. Okay. Thank you. And let me move on to my next topic if I could, Madam Under Secretary. Look, obviously, administering Rural Development programs, especially in California and in my district, we struggle because the designation of *rural* based on population density. And it impedes our ability for our communities and our farmers and ranchers to benefit from many of these programs. Madam Under Secretary, can you discuss the further need to revisit the definition of *rural* if you can and elaborate on how the current definition limits investment in rural economies?

Ms. TORRES SMALL. Congressman Panetta, thank you so much for your advocacy for your constituents. And I recognize the challenge that often the specifics of each program can have on the delivery and how each of your communities can access them. So Congresswoman Schrier also recently recognized this in terms of REAP. We stand poised to do what Congress tells us to do in this area and to provide all the technical assistance you might need as you address any challenges when it comes to accessibility to our programs.

Mr. PANETTA. Great. I look forward to working with you on that and many other issues as we approach the 2023 Farm Bill as well. Thank you for being here. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentleman from Kansas, Mr. Mann, is recognized for 5 minutes.

Mr. MANN. Great. Thank you, Mr. Chairman. And, Madam Under Secretary and our other panelists, thank you for joining us here this morning.

I represent the big 1st of Kansas, which is one of the largest ag-producing districts in the country. Last year, we did over about \$10 billion in ag products, something that those of us in the district are very, very proud of. In Kansas we have around a dozen ethanol plants and biodiesel plants combined. The majority of those are in my district. And I think everyone would agree that these investments have been huge for rural economic development over the last few decades. It has been jobs. It means increased demand for corn and sorghum, which improves the base, which dramatically, immediately impacts main street and all of our rural communities. It also provides wet and dry distillers grain that are then fed in feedyards all over the district.

Two weeks ago, I took Ranking Member Thompson, welcomed him to the district, we toured a feedyard, toured an ethanol plant, the largest ethanol producer in the district. And frankly, I would say that people in my district and the ethanol industry are baffled and frustrated by this war that they feel is being waged. And I

agree with them on liquid fuels. We have seen the price of fuel increase, and that is the big part in my view on what is driving inflation, not the only thing but it is the biggest thing that is driving inflation and increasing the overall cost of things. The answer is right under our feet here in America and it is also growing in our fields all over the country today.

A specific thing I think we could do right away would be year-round E15, which would increase demand, would provide some certainty for the market. So I guess my first question is: what is the Administration's position on year-round E15? Is that something that you support?

Ms. TORRES SMALL. Congressman Mann, thank you so much for that question and for your interest in the wide gamut of biofuels and ethanol and the opportunities across the board that they present. When it comes to E15, the decision-maker really is the EPA, and so Rural Development doesn't work in that space. We are focused, like you are, on the business side of the work that can be done there, and so we have talked about the programs that might support some of the production that is happening in your district. The piece that we haven't talked very much about is the BioPreferred Program, and I would love to discuss that with you as well as some point.

Mr. MANN. I would love to do that as well.

There seems to be this movement towards more electric vehicles. A term we say in our district is *you can't plow with a Prius*. I mean, the bottom line is we need diesel fuel, we need it today, and that is not going to change anytime soon. I guess a specific question is what can we do to make the cost of diesel fuel less so that operating this equipment that exists on our farms all over Kansas and around the country, we have to figure out how we can decrease the price of diesel fuel to make these operations more economic. Any thoughts on that?

Ms. TORRES SMALL. When it comes to Rural Development, I think the opportunities are investing in biodiesel, like you said, and how do we make sure that we are investing in new technologies to expand the impact that ethanol and biodiesel can have.

Dr. Neal spoke briefly about the section 9003 program, which is about the innovations that are available within biofuels and how we can continue to support that so that, as we face continuing challenges when it comes to our energy supply, we will have those technologies to respond to.

Mr. MANN. Great. And my last question, in what ways do you see how bioenergy can help the U.S. regain our energy independence? We were energy-independent. We are not anymore. That is absolutely in my view an immediately fixable problem. And what do you think is bioenergy's role to play in that?

Ms. TORRES SMALL. When COVID-19 hit, I think we recognized that energy independence can mean a lot of things. It certainly means how do we produce energy locally that we have access to, but it also recognizes a global impact when we look at pricing and the markets globally. And so when I think about energy independence or energy dependence in communities like Alaska where they are reliant on diesel fuels for 100 percent of their energy, electricity production, the way that we can respond to that is creating a more

diverse energy portfolio, and biofuels are key part of that. I think that is how we work together to invest in that.

Mr. MANN. Yes, I agree. Well, thank you for being here. And in my view, America is the freest country in the history of the world in large part because we have never had to rely on another country for our food. We also can be in a situation where we do not have to rely on another country for our energy, and we need to quickly return to that. It is right below our feet, growing right in our fields today, and I think our policies should reflect that. So thank you for being here. With that, I yield back. Thank you.

The CHAIRMAN. Thank you, Mr. Mann. And now the gentleman from New Hampshire, Ms. Kuster, is now recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman, and thank you, Under Secretary Torres Small, for returning to our Committee to talk about the Energy Title of the farm bill and how rural America is transitioning to clean energy.

And I want to thank you again for your trip to New Hampshire, broadband and clean energy, that was such a great success. We so appreciated you coming to visit the solar array in Franklin, New Hampshire, that is being developed with low-interest loans from the Rural Utilities Service. And as you know well, this kind of strategic investment from USDA in clean energy supports our rural communities and the economy around us.

As our nation transitions toward a clean-energy future, there is no question that rural America has a critical role to play in leading this charge. And I might say we will be less dependent on foreign sources of energy and less dependent on fossil fuels overall. This energy evolution of course includes wind, solar, hydropower near and dear to my heart—I think it is a *dam* good idea—but also wood energy as well. And it is especially key for New Hampshire as we are the second-most forested state in the country. Many Granite Staters, including my husband and myself have turned to woodstoves and wood pellet stoves and heaters to keep our homes and businesses warm during the winter. Wood heat is not only cleaner than fossil fuel alternatives, but it is energy that is grown locally in New England where we tend to be at the very end of the pipeline. Wood heat creates demand for low-grade wood, and keeping that market viable helps our family foresters stay in business.

And to that end, last year, I joined Congresswoman Pingree to introduce legislation to double funding for the Community Wood Energy and Wood Innovation Grant Program and the Biomass Program in Rural Development's portfolio are critical as well.

Madam Under Secretary, can you elaborate on how wood energy fits within USDA's Rural Development energy portfolio and how your programs enhance wood energy projects?

Ms. TORRES SMALL. Thank you so much, Congresswoman Kuster. It is lovely to see you again. And I really appreciate your question for a few reasons. One is that it shows how much looking at the local opportunities on the ground can also help us address our energy opportunities and challenges. And so when it comes to woody biomass, you certainly mentioned some of the programs within NRE (USDA Natural Resources and Environment) that can help provide support. And Rural Development stands poised to con-

tribute to how we can stack those opportunities. So if there is a woody biomass funding coming from the Forest Service, we might be able to also support those efforts through a B&I guaranteed loan, for example, or some other support.

And so to speak a little bit more to that, I will defer to Administrator Neal.

Dr. NEAL. Sure, thank you. So there are a couple things I would say. One, as we heard, there are opportunities sort of within our larger space for businesses just for business development. So we think about the Business and Industry Guaranteed Loan Program and other kinds of places that are not specific to the energy sector but can certainly contribute there and be supportive of the businesses in that sector.

In addition of course there are programs that we have that are specific to the energy sector, specific to fuels. And we think about opportunities in REAP, opportunities in section 9003. In these places, I mentioned earlier that REAP has 70 percent of the applications and the awards there for grants are in solar, but there are other categories of technology that are absolutely competitive, and we welcome those applications. And in fact in some cases, depending on what the pool of projects is, there may even be discretionary points or other kinds of things awarded for underrepresented technologies so that those kinds of technologies that are often very competitive can make sure that they can get access to that funding as well.

Ms. KUSTER. Great. I am going to try to get one more quick one in. You talked in your testimony that there is more that we can do to improve USDA's rural energy programs by making applications more accessible and expanding technical assistance. Is USDA looking at steps to address this internally? And is there potential action that we in Congress need to take in the next farm bill to help streamline?

Ms. TORRES SMALL. Oh, Congresswoman Kuster, thank you so much for asking that question. It is one of the things that I am most interested in when it comes to Rural Development. I know I am in a rural community when I am talking to a group of people who care deeply about their home but none of them are grant writers. So we are working hard to identify the regulatory challenges that make applications more difficult, also just some of our standard practices that sometimes can make applications more difficult and also want to work with you if there are legislative barriers as well if you have technical questions on that.

Ms. KUSTER. Great. Nice job with the clock. Thank you so much. Again, we are so proud of you. And with that, I yield back.

The CHAIRMAN. Yes, thank you very much. And now the gentlelady from Louisiana, Ms. Letlow, is now recognized for 5 minutes.

I think we are in the process of getting back in touch with Ms. Letlow. Mr. Feenstra, would you mind carrying on? You are recognized for 5 minutes.

Mr. FEENSTRA. Thank you so much, Chairman Scott and Ranking Member Thompson. And, Madam Under Secretary, it is nice to see you again.

In your testimony you speak to the importance and the effectiveness of E15. I really appreciate that. I really do. In fact, you say that ethanol displaced more than 500 million barrels of crude oil in 2021, which contributed efforts to protect America's energy independence, and that is amazing. And in Iowa, one out of every two rows of corn go to ethanol. And sometimes we forget about this, but we also have distillers grain that comes out of ethanol. Some people say we are using energy instead of food. That is very incorrect.

But I want to get back to you. We have talked about year-round E15, and I am just wondering, what can Rural Development do to help this E15 process to go year-round, and is there anything that you can do for the Administration or with the Administration to make this happen?

Ms. TORRES SMALL. Congressman, thank you so much for your question and just for your attentiveness throughout the hearing. I have seen you here and present and engaged the whole time, and that means—I know how valuable your time is. And I also appreciate your focus on biofuels. When I was in Iowa, I actually visited a biofuels producer that had an agreement to send their distillery grain to New Mexican cattle companies, so I recognize the impacts there across the board.

And your question about E15 is really important. When it comes to the work that Rural Development does, we focus on that business side of things, so we are not the scientists determining when. We are not the courts determining when, if E15 can be used, but we want to make sure there is the technology on the ground to do that. And so the HBIIP program is crucial to get those gas pumps that can handle that fuel all across rural America to make it more accessible.

Mr. FEENSTRA. Well, thank you. Thank you so much that. And you mentioned the \$700 million program for biofuels that was authorized through the CARES Act over the last 2 years. Can you sort of in generalities provide an update on the program, sort of on the accounting side, how much money has been spent already and in essence how much is left if you somewhat know that?

Ms. TORRES SMALL. Yes, no, I appreciate the question because we have been working to get the money out the door, and we took some time to get it right. We issued a notice, identified some challenges with how we were measuring the impact that COVID-19 had on corn growers and other producers of biofuels, and so we shifted. We pivoted based on feedback that we got. And so applications closed in February, and we are expecting payments to go out in late spring or early summer.

And to speak a little bit more specifically about those pivots, I will defer to Administrator Neal.

Dr. NEAL. Yes, thank you so much for mentioning that. I appreciate your mention of dried distillers grains in your question. That was in fact one of the pivots that we recognized. Initially, the program was specifically for those who had experienced losses due to ethanol production. We recognize that many of those firms had multiple streams of income, right? They were selling the distillers dried grains, they were selling CO₂, they were doing other things as well, and they had contracts to do that, and they wanted to make sure that they were able to meet those obligations. And so

we recognize that even though those companies were operating at a loss, they were still producing, but they were operating at a loss so that they can meet these other contracts. We wanted to make those pivots in place, put those pivots in place so that those kinds of firms could be in general eligible for this. And so on January 28th we published an amendment to the NOFA in response to that kind of feedback to open up that program and, again, make it responsive to what we are hearing from folks who are in this sector.

Mr. FEENSTRA. Well, thank you so much. And as you both know, it is so important for the Midwest to have biofuels. And I get really concerned, obviously. I want year-round E15, and if you could pass that along to the Administration.

But I was in a budget hearing on Monday, last Monday, and there is not one word about biofuels in the Administration's budget, and I get really concerned about that, as how serious is the Administration. And I know you can't answer that. But I will say thank you for all the Rural Development's help. I have seen it so much in my rural communities, and I greatly appreciate all the efforts. Thanks again. I yield back.

The CHAIRMAN. Thank you. And now the gentleman from Florida, Mr. Lawson, is now recognized for his 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman and Ranking Member, for this hearing. And, Madam Under Secretary, I don't want to sound redundant, and this was something you answered a little bit earlier on. And I am saying it has been well-documented that many of the USDA conservation programs have applications that are sometimes very technical, very time-consuming. Because of this, an unequal number of large operators are benefitting from these programs while small and socially disadvantaged farmers and producers struggle to apply. How is the Rural Energy for America Program able to deal with this? Should we allow smaller producers some up-front assistance to work on these projects?

Ms. TORRES SMALL. Congressman Lawson, that is such a helpful question. And what I really appreciate about it is that you recognize that accessibility of our programs really is about equity, making sure that no matter who you are in rural America, you have access to these programs. If you don't have a grant writer, you still have access to these programs. And also Congress has done a really interesting job acknowledging that in recent funding as well, so if you look at the ReConnect Programs, additional component for technical assistance and administrative fees, that has been helpful. It was also available in some of the ARPA programs, as well as in proposed legislation with BBB, recognizing that a key part of the programs are the people that help deliver it and making sure that we are able and poised well to do that in a way that is accessible to everyone. So as we look at the farm bill and the ways to make REAP more accessible, recognizing that it is already oversubscribed, but we want to make sure it is equally accessible to folks really eager to provide technical assistance on that.

Mr. LAWSON. Okay, thank you. And, Madam Under Secretary, I have been on the Agriculture Committee almost 6 years now and because I have a lot of rural areas and I have always believed that agriculture is the springboard for everything that we have in society. As you know, there are several renewable energy programs

that have been included in the farm bill and that receive little or no appropriation over the last couple years that I have been on. From your perspective, is Congress missing any key opportunity for funding these special programs? We talk about them all the time, but we don't fund them, and I just wanted to know your perspective on it.

The CHAIRMAN. Good question.

Ms. TORRES SMALL. That is a great question, and we certainly—it is our job to fulfill what Congress asks us to fulfill, so I do want to make sure and communicate that. But as we recognize ways that we are reaching communities, we certainly see places where communities are asking for more, right, where we are tapped out and are happy to communicate that to Congress as you make your decisions in terms of funding.

The other piece there, it is not just about funding but it is also about flexibility. So how do we take a bigger program and make sure that it speaks to a lot of different potential local ideas so we can respond and support that?

To speak a little bit more to that, I will defer to Administrator Neal.

Dr. NEAL. Sure. I appreciate that question. It is an important topic. And I will maybe address that by thinking about maybe one program in particular, the Rural Energy Pilot Program, which is a pilot program that offers grants and financial assistance for rural communities as they develop their role to further develop renewable energy in their communities. One of the things I think that is really important about this program is it is driven by community partnerships, so it is really about what that community recognizes in terms of their assets and how they want to proceed in terms of their renewable energy future.

And so that program, the letters of intent are actually coming up due on April 19th, and so we look forward to receiving those, and then there will be a second round. And part of what we think is good about having that two-step process is that that allows opportunity for feedback on that first letter of intent. You need to see sort of what is the thought, are there ways to strengthen this, how to make this align better with what the program priorities are and so that we would be able to get that feedback back and then, if they choose, submit a full completed application by the July 18th deadline.

So as an example of how these kinds of programs can operate, I think REPP provides that, and we are, again, very pleased to see how that program—we have already had significant interest and look forward to seeing more of that.

Mr. LAWSON. Okay, thank you. This is great information. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentleman from South Dakota, Mr. Johnson, is recognized for 5 minutes.

Mr. JOHNSON. Thank you, Mr. Chairman. I would just note, having watched the Under Secretary today, it is a reminder of why so many of us enjoyed working with her, just a great passion for service, and our country is lucky to have your continued service, ma'am.

I watched with interest Mr. Carbajal's discussions of energy security. And as we look toward the next farm bill, are there particular aspects that this Committee should keep in mind that together we can do to try to further energy security for this country?

Ms. TORRES SMALL. Thank you so much, Congressman Johnson, for your hard work and the opportunity to collaborate on this because I think there are some great places where obviously we will follow Congress's lead and investment in this. But when we look at resiliency, I think it really breaks down into a few things, right? It is being able to deliver electricity even in the face of extreme weather, right, and how do we make sure that both our energy generation, as well as our energy delivery is resilient in that manner. It is also resilient to cybersecurity, so recognizing that electricity is one of the only utilities that requires certain investments in cyber utility, and Rural Development has responded to that by allowing that to be included in the loan portfolio to prepare for some of that cybersecurity that is necessary. And then it is also about making sure that we are ready for the challenges of the future when it comes to diversifying our energy portfolio.

I do want to make sure there are a few more specifics for you, and so I will defer to Administrator McLean.

Mr. MCLEAN. I think that, again, we have been very grateful for the strong support the Committee has shown the Rural Utilities Service and—

The CHAIRMAN. Excuse me, Mr. McLean, we are having a little difficulty. Turn your microphone on.

Mr. MCLEAN. My apologies.

The CHAIRMAN. Thank you.

Mr. MCLEAN. Any investment in infrastructure, whether it is water, telecommunications, broadband, electricity, is investments in reliability because that investment in infrastructure is more reliable, more efficient, safer, cleaner, more reliable than what it is replacing. And that is why there is a continuing need for the programs that this Committee has so valiantly provided for over the years and we hope will provide for into the future.

And as we move towards this transition, we are all about adding to the capacity of energy production, whether it is through new and renewable sources with the addition of technology and innovation and addition of transmission capacity in order to move power from where it is generated, often in rural areas, to where it is needed sometimes in the suburban and urban areas as well.

Mr. JOHNSON. So then maybe to shift gears a fair amount, I am just curious if any of you are hearing much from Members of Congress or other stakeholders about the new Carbon Utilization and Biogas Education Program, and what are you hearing?

Ms. TORRES SMALL. I love the curiosity. I think that is absolutely crucial because we have a lot of work that we are doing in the Bio-Preferred space, and I want to make sure that we are coordinating on that effort. So to speak a little bit more to that, I will defer to Administrator Neal.

Dr. NEAL. Yes, thank you for that question. I specifically want to talk to you just a little bit about the interagency working group on biogas, which we are working on along with Department of Energy and various others across the Federal family. There is signifi-

cant opportunity there. That group has identified several priorities, things like standardizing digestive composition as a commodity that is recognized across the country, enhancing the ability to forecast emission reductions from anaerobic digestion, and reduction of regulatory barriers that might exist in that space. So thinking about that interagency working group and how all of these agencies within the Federal family can collaborate intentionally around the future for digesters and what the opportunities that technology presents I think is a real opportunity, and we are excited to be engaged very practically in that working group.

Mr. JOHNSON. And I know it is early yet, so I wouldn't imagine that you have fully fleshed-out themes you are hearing, but are there certain things that are percolating up that people are particularly interested in and excited about, concerned about?

Ms. TORRES SMALL. Administrator Neal?

Dr. NEAL. Sure, yes, I think really it is some of those key priorities that we have identified that I just shared, things like standardization, understanding what the impact of digesters are, sort of recognizing—I think there is a very significant opportunity in recognizing the broad role of digesters, so sometimes we think a lot about gas products, but there are other kinds of products, things like renewable chemicals and those kinds of things that I think are going to be very important in the biobased sector as well. So there is a broad range of things, and that working group is well-positioned to make progress in all of them.

Mr. JOHNSON. Thank you. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from Minnesota, Ms. Craig, is now recognized for 5 minutes.

Ms. CRAIG. Thank you so much, Chairman Scott, and thank you to the Ranking Member. I want to also say thank you to the Under Secretary for coming back in front of us to talk about your important work at USDA and for your colleagues being here as well.

Given rising fuel prices and energy prices, we know this is impacting the budgets of working families across our nation. It is my view that we need to be focused on immediate and impactful solutions that decrease energy prices, as well as increase U.S. energy independence. That is why I have been so focused on increasing the availability of U.S.-produced renewable biofuels, and it is why I support the Renewable Energy for America Program.

First on biofuels, E15 back in Minnesota is selling anywhere from 15¢ to 45¢ cheaper per gallon than traditional gasoline right now. Multiple studies have shown that it reduces GHG emissions by more than 40 percent compared to traditional gasoline. We could replace every barrel of Russian oil with biofuels. But Minnesotans and Americans across the country are at risk of losing access, and this is so important in the Midwest, to this renewable fuel this summer if no action is taken soon to permit year-round sales of E15. That is why I led a bipartisan letter to the President last week with six bipartisan co-chairs of the Congressional Biofuels Caucus urging him to permit year-round sales using authority outlined in the Clean Air Act.

Madam Under Secretary, I know you and Secretary Vilsack have been strong proponents of renewable biofuels within the Administration, so thank you for your leadership on that. Two questions for

you on the topic. Can you give us any update here today on the perspective that you and the USDA leadership team are sharing with your counterparts within the Administration when it comes to allowing summer sales of E15?

Ms. TORRES SMALL. Thank you so much, Congresswoman Craig, for your advocacy for the biofuels industry and for your home. And certainly it was evident when I visited your district recently just to see how committed the entire community was to being part of a solution when it comes to energy resiliency. And so it was very inspiring for me to see that on the ground.

And when it comes to the work that Rural Development does for biofuels, recognizing that it is and this time has reinforced that, a crucial component of our energy independence. And so the way we can support that is through the support of getting the technology on the ground to best deliver those biofuels and those higher blends of biofuels, as well as addressing some of the impacts that biofuels producers experienced in the midst of COVID-19.

Ms. CRAIG. Well, we certainly hope you will pass it along within the full Administration, as well as the EPA, that Minnesotans are about to see fuel costs go up if the Administration doesn't act now, and we have an opportunity to act now.

Along the infrastructure lines, can you give us a little bit of an update on the status of the \$100 million infrastructure grant program that USDA announced in December of 2021? And can you share an update on the \$700 million for biofuels producers in particular?

Ms. TORRES SMALL. We have been working hard on this, and I really appreciate you bird-dogging it to make sure that it is delivered to the people who are working hard to fuel our country. So when it comes to the \$100 million, that we expect to see before the end of spring, getting the application process open. And when it comes to the \$700 million, as you know, the application closed at the end of February or within February, and so now we are working to get those payments out late spring or early summer.

Ms. CRAIG. Great. And so thank you so much for your work on that important issue. As you all know, rural America plays a role in increasing rural energy and energy independence via the REAP program. So quickly, Madam Under Secretary, as you know, REAP supports producers through a bunch of different funding pools. With year-over-year changes in renewable energy system installment costs and recent inflationary pressure, does USDA believe it makes sense to increase that minimum funding pool threshold?

Ms. TORRES SMALL. It has been clear throughout this hearing just how interested folks are in REAP, and we see that on the ground, too. One of the things we have talked about is how it is oversubscribed, so any changes in terms of who can access and how much money can be used would certainly impact the broad pool of applicants. But I think there are a lot of ways we can work and follow Congress' discretion in terms of how they want to allocate those funds.

Ms. CRAIG. Well, thank you so much. That answer will certainly help this Committee address possible changes ahead in the next farm bill. And with that, Madam Under Secretary, thank you for being with us. And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, Ms. Craig. And now the gentlelady from Minnesota, Mrs. Fischbach, is now recognized for her 5 minutes.

Mrs. FISCHBACH. Thank you, Mr. Chairman. And just building a little bit, Ms. Craig was talking about some of the biofuels and the ethanol from Minnesota. But, obviously gas prices are high, and I think it has been touched on a bit. I think maybe even maybe Mr. Davis had touched on it a little bit. But, what I am really interested is how to solve those high gas prices. And I think that biofuels is really a no-brainer in terms of providing domestically produced fuel, easing the price shocks at the pump, and I think even Congresswoman Craig had mentioned the difference in the price and reducing greenhouse gas emissions. And ethanol does provide, it reduces emissions, the infrastructure is there, and it really does need to be—just as a side note, really does need to be part of that discussion as we talk about renewable fuels. And sometimes I think it is forgotten, so I always like to mention that a little bit.

But, Madam Under Secretary, what do you think is biofuels' role in reducing the price of gas?

Ms. TORRES SMALL. Congresswoman Fischbach, thank you so much for that question. And I deeply appreciate your comment that you are focused on how to best solve these challenges. I think Rural Development is a crucial partner in that and specifically in supporting biofuels. When it comes to decreasing the cost at the pump, having access to that energy independence is crucial, and certainly we see that when it comes to the production of biofuels, but also in terms of those long-term risks that we were talking about earlier and that you mentioned in terms of reducing emissions.

To speak more about how biofuels can contribute both to the affordable component of energy as well as the resiliency, I will defer to my colleague, Administrator Neal.

Dr. NEAL. Thank you. I appreciate the opportunity to speak on this. I think one of the things that is important is for us to think—and Under Secretary Torres Small mentioned this as well, to think on the short-term basis and the long-term basis. And so we are thoughtful about programs like the Biofuel Producer Program, which is going to make sure that businesses that have been involved in this sector can continue to be productive, can continue to operate and function in the very near-term through those payments that will be coming in the early summer.

In addition, we are investing in those kinds of technologies that make those fuels accessible to consumers and to businesses through programs like the HBIIP program, the Higher Blends Infrastructure Incentive Program, making sure that those infrastructure investments are in place, and then, again, thinking a little bit even more long-term is thinking about those technologies and what are the kinds of places where we can have a variety of technologies that, for instance, take advantage of a variety of feedstocks to make sure that those fuels, that we have options for fuels, going forward. So that could include the program like the REAP program or the 9003 Program where, again, we are looking at technologies that are commercial technologies but may benefit from some addi-

tional support to make sure that those projects get off the ground and are successful.

Mrs. FISCHBACH. And, Dr. Neal, maybe just you mentioned the payments, and I know that you had an exchange with Congressman Davis about the timing of the payments, if they are coming out. I think you said late spring and then maybe even in your response to me you said summer. And I guess maybe if you could explain to me just a little bit about what is the holdup? What is taking so long?

Ms. TORRES SMALL. Thank you so much. Just to emphasize that a lot of it has been being responsive to the industry, recognizing that there were pieces of the industry that we needed to learn a little bit more about in order to best support folks who were impacted by COVID-19 and really appreciate that feedback and that dialogue.

And go ahead, Administrator Neal, in terms of additional—

Dr. NEAL. Yes, no, I appreciate that. That is exactly why, as you mentioned earlier, we had submitted an amendment to the notice in January to address exactly that kind of feedback, so recognizing, for example, that there were firms that operated, produced ethanol, they produced it at a loss so that they could meet contracts that they had for other kinds of products like dried distillers grains, like carbon dioxide, those kinds of things. And we wanted to make sure that those kinds of firms were also eligible for this program, so we made those changes in response to the comments that we got, that kind of feedback. It does take a bit of time to make sure that we go through and evaluate those applications. And I don't really want to call it a holdup. We just want to be diligent and want to make sure that we are responsive and responsible in the administration of this program.

Mrs. FISCHBACH. All right, thank you. And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you very much. And now the gentlelady from Illinois, Mrs. Bustos, who is also the Chair of the Subcommittee on General Farm Commodities and Risk Management, you are recognized for 5 minutes.

Mrs. BUSTOS. Thank you very much, Mr. Chairman. And I also want to say thank you to our Under Secretary Torres Small, great to see you. Also thank you to Dr. Neal and Mr. McLean for getting together with all of us. Also, I want to say thank you for highlighting the fantastic renewable energy work that is going on in my home State of Illinois.

I know you have gotten a lot of comments about E15. I will just join in real quickly, I don't have a question about it, but I want to promote year-round E15, very, very important to rural America. It is very, very important for a lot of reasons. I know Congressman Feenstra addressed it, Congresswoman Craig addressed it, so I just want to add on to show my support for that as well.

So let me get into a couple questions here. The President's budget request for 2023 that was just released last week included \$300 million for rural electric co-ops so they can transition from their infrastructure of fossil fuels to more renewables. And I will start with our Under Secretary and of course if Mr. McLean has anything to add, please do. But can you speak to the economic impact that this

transition could have on rural America and also what sorts of new opportunities would this sort of robust, sustained investment bring about?

Ms. TORRES SMALL. Congresswoman Bustos, thank you so much for that question. It is something we have been talking a lot about and are very eager to continue to do this work. As you know, there was a larger proposal in Build Back Better that also has to do with our work with rural electric co-ops and how we can best support them in their work to advance renewable energy. When it comes to this investment, it is really an opportunity to showcase the impact that we can have when it comes to debt restructuring and loan modifications, and so we are excited to dive into that.

And to speak a little bit more to that, I will defer to Administrator McLean.

Mr. MCLEAN. Yes, thank you very much. And thank you as well. I want to highlight we are very, very proud of the work that we are doing in Illinois, major renewable projects in Prairie State and Dresser, very big solar projects. And I think it is an exciting glimpse of what the future is and what the transition can lead to.

But for rural electric cooperatives, as consumer-owned businesses, there aren't shareholders or investors to be able to absorb the cost of transition, so the resources proposed in the President's budget and proposed in the reconciliation bill are going to be very valuable, and we are going to put them to work as best we can to be able to facilitate that transition to be able to address those stranded investment costs that rural electric cooperatives uniquely face precisely because it is the consumers that are the owners of those business units.

Mrs. BUSTOS. Very good. So let me get back onto this popular topic that you are hearing from the Midwestern Members of Congress here on about. So, Under Secretary Torres Small, in recent years, the USDA has stood up and implemented the Higher Blends Infrastructure Incentive Program. If you could, can you give us a bit of an overview of how this program was used by applicants and how that compares to USDA's goals for the program? And second, in retrospect, are there any changes to the program that the USDA would suggest should the program be continued through the farm bill?

Ms. TORRES SMALL. Thank you very much, Congresswoman Bustos. And to speak to that, not coming from the Midwest, I had to really learn what this infrastructure needed to look like to deliver the higher blends. But it truly is making those higher blends accessible across the United States through the technology, if it is the gas pump that is necessary to deliver it or beyond.

So we have learned a lot from previous iterations of HBIIP, and we are applying some of those tools in this next phase, which will come online in the late spring. The applications will open. And to speak a little bit more about what we have learned, I will defer to Administrator Neal.

Dr. NEAL. Thank you for the opportunity to speak on that. And I think part of what we have learned is through—this is now the third iteration of this program that we have had. And one of the things is thinking about how it is administered. It has been administered sort of through the states and it has been administered na-

tionally, and we have learned what the administrative costs are frankly for this program as well, making sure if there are environmental reviews, other kinds of support that are needed, to make sure that the funds are deployed effectively and appropriately, and we want to make sure that we are able to do that. And we have seen from the other iterations of the program what is necessary, and we are preparing to do that with this version of the program currently.

Mrs. BUSTOS. Okay, thank you. Since I have a minute left, I am going to try to squeeze this in. Congresswoman Craig talked a little bit about the Renewable Energy for America Program that we call REAP. I want to drill down a little bit deeper. We have seen that it can be successful in serving different kinds of agricultural operations in different regions in the country. Mr. McLean, I am going to address this to you. Are there any changes that you would recommend be made to ensure that the program is accessible and useful for farmers, rural utilities, and small businesses?

Ms. TORRES SMALL. Congresswoman, if you don't mind, I am going to pass that over to Administrator Neal.

Mrs. BUSTOS. Okay, sounds good. Thank you.

Dr. NEAL. No, I appreciate the opportunity to talk about that. I think REAP has been a popular and a long-standing program, and we definitely see opportunity for improvements. I think some of the kinds of things we would love to have, again, obviously more financial support because it is a very popular program. We have unfunded grants applications, some of which are very high quality we would love to be able to fund and we are not able to do so. We had a record year for the guaranteed loan program so, again, there is opportunity there. We also want to make sure that the program is administered well and modernized with increased flexibility and modernize our programs. And so we think there is opportunity in terms of the application process, providing technical support and assistance through our staffing. That, again, I think would make a real difference in the availability and accessibility of this program.

Mrs. BUSTOS. Thank you, Dr. Neal. My time has expired, and I will yield back.

The CHAIRMAN. Thank you. And now the gentlelady from Florida, Mrs. Cammack, you are now recognized for your 5 minutes.

Mrs. CAMMACK. I appreciate that. Thank you, Mr. Chairman, and thank you to our guests and witnesses for appearing here today.

I echo the sentiments of several of my colleagues. Quite frankly, this is a very frustrating exercise because the real issues that are impacting rural America today are not being addressed here in this hearing. And so I have to voice that on behalf of my constituency and my producers, who many are suspending their operations because the cost of fuel has skyrocketed, and it is just no longer a viable option under these current circumstances when the price of diesel is over \$5 a gallon, \$5 a gallon. In fact, it was \$5.19 yesterday in my district. When it is that and we are now having a conversation of renewable energy opportunities in rural America, I think that screams how out of touch Washington, D.C., and this Administration is when it comes to the needs and wishes of the constituents that we represent.

But I digress. I am going to just jump right into a supply chain question, Madam Under Secretary. This isn't our first rodeo with the enormous potential that we are talking about as it relates to renewable energy. But the future that this Administration seems intent on foisting on rural America, one that is really dependent on raw materials like copper, nickel, cobalt, lithium, all of which will require increases in production if this Administration's version of low-carbon future is to come to fruition.

So at this time, the lion's share of lithium refining occurs in China, and a significant portion of the world's polysilicon, which is used to make the solar panels. This comes from the region which is under fire for gross human rights violations. Now, China is committing genocide, and this is something that is indisputable. There are numerous reports tying the companies extracting the polysilicon to power this Administration's bright, beautiful future to slave labor.

Madam Under Secretary, what is your plan to protect rural communities and businesses from being exposed to these risks and evils in what they deem a future energy supply chain? And more broadly, what is the Administration's plan to increase extraction and refining of these raw materials domestically?

Ms. TORRES SMALL. Congresswoman, thank you for your question and for your focus on rural communities because when it comes to Rural Development, the work that we do is not the regulation side in terms of mining or in terms of production but more in terms of incentives, incentives for communities so they can identify what their opportunities are for energy resilience, what their opportunities are when it comes to affordable energy, as well as their opportunities when it comes to a clean energy future.

And so Rural Development works hand-in-hand, whether it is with a rural electric co-op on the electricity side or whether it is a farmer when it comes to REAP or a Value-Added Producer Grant, for example. We are focused on responding to those local insights and how we can best support them in those efforts.

So to speak a little bit more about the electricity diversification, I will defer to Administrator McLean.

The CHAIRMAN. Mr. McLean, again, would you turn on your microphone?

Mr. MCLEAN. Apologies, Mr. Chairman.

The CHAIRMAN. We all want to hear you. Thank you.

Mr. MCLEAN. Apologies. It is critical about building those very industries in the United States and not only looking for sources of those critical materials but finding ways to recover them from recyclable materials. And it is an across-government initiative, not highly focused at Rural Development, but we are aware of supply chain issues and are dealing with them as we roll out investments in rural electric infrastructure.

Mrs. CAMMACK. So I only have 35 seconds, so I would love to do a follow-up on that, but I have to get to this second question because, quite frankly, the title of this hearing today is about rural America and renewable energy opportunities in rural America, keywords to me being *rural America*, which, again, I feel this Administration is woefully out of touch with. These are folks that their energy sources come from diesel primarily when you are talking

about equipment. What are we doing to make sure that the cost of diesel and biodiesel is a viable option for these operations today?

Ms. TORRES SMALL. When it comes to diesel, I just left Alaska where 100 percent of some places' reliance on energy is produced through diesel generation. And so the importance that we have in terms of making diesel more affordable but also making other energy opportunities available is crucial. And so we will continue to work whether it is through HBIIP, whether it is through the 9003 Program to advance biodiesel opportunities, or whether it is through the CCC payments and the \$700 million, we will continue to look to partner with you to make those more accessible.

Mrs. CAMMACK. I appreciate that and yield back. Thank you.

The CHAIRMAN. Thank you. And, clerk, may I check with you to make sure? I think we are all clear. There are no more questions from Members. And so thank you.

I want to just thank you, Under Secretary Torres Small. What an informative, articulate, knowledgeable, and very helpful testimony that each of you have given. And I want to thank you. I want to thank also your Administrator Neal, excellent. Thank you for your testimony. And Administrator McLean, thank you for your testimony.

And I want to thank my wonderful Members. As you can see, the depth of the questions that they have asked of you and your help let you know that is number one on this Committee, one of our major objectives is to make sure we take care of rural America. I am so proud that our Committee has launched now. We have taken a bold step in getting I think now it is \$68 billion in total to finally bring rural broadband to America. I am proud of our Committee's work.

And, as we move forward with our farm bill, your information has been so helpful in helping us to make sure we put together a great farm bill and that the interests and the challenges that we face with rural America are inclusive in our 2023 Farm Bill.

And so, Under Secretary, again, thank you. And now that you have concluded all of our questions in such an excellent way, we want to excuse you. But please, we have another panel. Don't go far. We will bring our second panel on in 5 minutes. And in order to allow you all to exit and have our other panel come in, we are going to take a 5 minute recess. And we will be right back with our second panel. Thank you, everyone.

[Recess.]

The CHAIRMAN. This Committee will now come to order.

Our first witness for our second panel today is Mr. Andy Olsen, who is a Senior Policy Advocate for the Environmental Law & Policy Center.

Our second witness today is Mr. Bill Cherrier, who is the Executive Vice President and Chief Executive Officer of the Central Iowa Power Cooperative, testifying on behalf of the National Rural Electric Cooperative Association.

And our third witness today is Dr. Patrick Gruber, who is the Chief Executive Officer of Gevo, Incorporated.

And our fourth and final witness today is Mr. Jay McKenna, who is the Chief Executive Officer of Nacero. And I hope I got everything reasonably correct and pronounced appropriately.

So let us begin, Mr. Olsen, when you are ready. You can begin your testimony.

STATEMENT OF ANDREW “ANDY” OLSEN, SENIOR POLICY ADVOCATE, ENVIRONMENTAL LAW & POLICY CENTER, CHICAGO, IL

Mr. OLSEN. Thank you. Good afternoon, Chairman Scott, Ranking Member Thompson, and Members of the Committee. I am Andy Olsen, a Senior Policy Advocate with the Environmental Law & Policy Center, or ELPC. Thank you for inviting me to testify today.

The ELPC has been involved in the Rural Energy for America Program since 2002, working with farm and energy groups around the country. The ELPC is a member of the Ag Energy Coalition, which leads with us in supporting REAP and other Energy Title programs. We have learned a few lessons along the way.

REAP has always enjoyed bipartisan support perhaps because it serves every agricultural sector and has reached every state. REAP helps lower costs and generate new farm income. And REAP is popular. Demand for grants and loan guarantees exceeded funding by an average 4.5 times over the past 10 years. Over 20,000 REAP awards have been made on a competitive basis since 2003. Since 2014, REAP leveraged over \$7 billion in private investment. REAP benefits the nation with more clean energy, stronger rural economies, and a healthier environment. Farmers and ranchers and rural small businesses of all types use REAP to harvest the wind and the sun to power their operations. They use energy efficiency to cut energy costs and waste. Biomass energy is also included in REAP, as well as hydropower. Rural electric cooperatives use REAP in their own facilities, as well as their members' facilities. Rural grocers use REAP to stay in business with better refrigeration, lighting, and other technologies that serves the whole community.

However, significant changes are needed to update REAP to help the country face challenges, which we call REAP 3.0. The 2023 Farm Bill should strengthen REAP to help de-carbonize energy sources and electrify energy usage. Reducing climate risks and increasing climate resilience increases our national security, especially among food producers. Climate risks are grave, but we can confront this clear and present danger.

American farm groups recognize the threat of climate change and the need to act. Climate change is already a market factor as commodity buyers seek a lower carbon footprint, and REAP helps farmers deliver. REAP provides U.S. agriculture with the means to respond to climate disruption, while also taking part in the clean energy economy.

To build on success, we recommend strengthening the Energy Audit and Renewable Energy Development Assistance Program within REAP. We have seen over and over that outreach and education efforts result in more projects. For example, the Mississippi and Iowa Farm Bureaus led effective REAP education and assistance programs that helped poultry growers, corn and bean growers, and many others to cut energy waste and costs. In Nebraska, outreach efforts resulted in hundreds of irrigation efficiency improvements that replaced diesel motors with efficient electric motors and

often improve water efficiency to boot. REAP can contribute to the Congressional goals of retaining and recruiting young people in farming, as well as doing right by historically underserved producers. REAP 3.0 proposes adding 25 percent to the cost-share for these agricultural producers.

To improve access, REAP should be further simplified and include a streamlined rebate option for pre-approved technologies such as energy efficiency and smaller-scale renewables. Raising the threshold of the lowest tier in the three-tier application system would include more producers. To build on REAP's success, significantly increased funding is needed because now existing funds are spread thinly across the country. With additional funding, REAP can help agriculture in rural communities to adopt more climate solutions.

We encourage Congress to substantially increase REAP mandatory funding to accelerate clean energy and energy efficiency investments across rural America. Consumers, including farmers, need reliable energy information on equipment to make informed choices. A farm ENERGY STAR program based on the EPA's ENERGY STAR would provide performance data and standards and drive technology improvements by product manufacturers. We recommend creating a reserve fund for underutilized renewable energy technologies in REAP to support a full range of clean energy options. The ELPC appreciates the bills that would strengthen and update REAP led by Representatives Pingree and Spanberger.

With the adjustments described above and others, Congress can provide a major upgrade to REAP 3.0 to serve many national purposes with one program. My written testimony provides more detail and also mentions opportunities to improve other Energy Title programs.

Importantly, America has the talent and the resources to overcome the many daunting challenges we now face. Now more than ever we need the American can-do spirit and to work together for the future of our country and people and ensure that rural America can play a leading role. We can do this. Thank you.

[The prepared statement of Mr. Olsen follows:]

PREPARED STATEMENT OF ANDREW "ANDY" OLSEN, SENIOR POLICY ADVOCATE,
ENVIRONMENTAL LAW & POLICY CENTER, CHICAGO, IL

In support of the Rural Energy for America Program

Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. I am Andy Olsen, a Senior Policy Advocate with the Environmental Law & Policy Center (ELPC), the Midwest's leading environmental legal advocacy and sustainability innovation organization. Thank you for inviting me to testify this morning.

ELPC has been involved in the creation and continuation of the Rural Energy Program for America Program (REAP) since 2002. I have worked on rural energy since 2004 when I traveled the country talking about REAP with farm groups, REAP recipients and others. ELPC is also a member of the Ag Energy Coalition which leads with us in supporting REAP and other Farm Bill Energy Title Programs. We've learned a few lessons along the way.

The Rural Energy for America Program (REAP) has always enjoyed bipartisan support. It serves America in many ways and can help the country cope with rising energy costs, climate risk, and rural economic growth. REAP is broadly beneficial; it serves every agricultural sector and has reached every state in the union. And with smaller farms struggling under dire conditions, REAP helps to lower costs and generate new farm income.

REAP is a popular program with demand for grants and loan guarantees exceeding funding by an average 4.5 times over the past 10 years. Over 20,000 awards for grants and loan guarantees have been made on a competitive basis since 2003. Since 2014 REAP leveraged over \$7 billion in private investment in rural America.

Some examples of how REAP serves the country:

- Farmers and ranchers of all types have used REAP to harvest the wind and the sun to power their operations and have used energy efficiency to cut energy costs. In the process, agriculture becomes more resilient to energy disruptions.
- Corn growers have used REAP extensively to modernize and reduce energy waste.
- With REAP many syrup makers now use low energy molecular sieves to reduce costs of heating sap.
- Rural electric cooperatives benefit from REAP in their own and their members' facilities with an emphasis on efficient energy use.
- Greenhouse growers have found REAP valuable for cutting energy waste and costs.
- Local grocers have embraced REAP to better compete and to stay in business with better refrigeration, lighting and other technologies. Keeping doors open for local grocers and other locally owned small businesses helps the entire community.

By providing grants and loan guarantees to agricultural producers and rural small businesses for energy efficiency and renewable energy, REAP invests in rural America's future. Energy efficiency helps producers protect profitability by providing a hedge against rising energy costs. Renewable energy stabilizes energy costs over the long term. Many producers have used REAP to implement farmer-owned energy systems in rural areas. We can do more to substantially accelerate and broaden clean technology deployment.

REAP benefits the nation with more clean energy, stronger rural economies and a healthier environment. Modernizing energy technologies also helps retain and recruit young people to farming.

Significant changes are needed to update REAP to help the country face present challenges, which we call "REAP 3.0."

The 2023 Farm Bill is an opportunity to expand and strengthen REAP to help de-carbonize energy sources and electrify energy usage. This has already happened for years under REAP and we can do more with program enhancements and increased funding. Reducing climate risks and increasing climate resilience increases national security—especially among food producers. The risks are grave but we can overcome them, pulling together to confront this clear and present danger.

American farm groups recognize the threat of climate change to our future and the need to act. Climate change is already a competitive factor in commodity markets as buyers increasingly seek goods with a lower carbon footprint. REAP helps farmers lower their carbon footprint and meet market demand. REAP and other Energy Title programs provide U.S. agriculture a seat at the table to help confront and adapt to climate disruption while taking part in the clean energy economy. It's why the USDA identifies REAP as a top program for confronting climate change.

We've seen over and over that outreach and education efforts result in more projects. For this reason, we recommend strengthening the Energy Audit and Renewable Energy Development Assistance program (EA/REDA). EA/REDA provides grants to institutions such as universities, states, and rural electric cooperatives to provide these services and can serve more people better if funds were made available to nonprofits such as Energy Districts. To operate on the scale needed the EA/REDA set aside should be raised and program funds should be available year-round. Applications addressing both energy efficiency and renewable energy in one project should be eligible to implement more projects. To bring more projects to fruition, technical assistance should be explicitly added as a function.

Some examples from the states of effective education and outreach:

- From the early days groups such as the Mississippi Farm Bureau promoted REAP to help poultry growers to increase their profit margins with energy efficiency. Poultry groups use and strongly support REAP to this day.
- The Iowa Farm Bureau led a very effective education and outreach program that helped farmers use REAP for wind power, energy efficiency and solar.
- In Nebraska outreach efforts have resulted in hundreds of irrigation efficiency project improvements that replace diesel motors with efficient electric motors and often improve water efficiency.

REAP can contribute to the Congressional goals of retaining and recruiting young people in farming as well as doing right by historically underserved producers. REAP 3.0 proposes adding 25% to the cost-share for these agricultural producers to advance on these goals and better serve the nation.

REAP can reach more producers if we continue to simplify the application process. To further expand the reach of REAP, a streamlined rebate option would aid smaller operators and reduce the application burden. A REAP rebate would only be used for pre-approved technologies such as energy efficiency and smaller scale renewables. The rebate program would serve more qualified parties due to a simplified application and reduced application costs.

The Committee can also simplify REAP applications by a simple adjustment in the three-tier application system added in the 2014 Farm Bill. Under the three-tier application system small projects, defined as grants of \$20,000 and lower, have less complex application requirements. Given the time that's passed, experience gained and improvements in energy technologies, we recommend raising the threshold for the lower tier to \$50,000. This will reduce application complexity for more farmers, ranchers and rural small businesses.

To build on REAP's success, increased funding is needed to reach more agricultural producers and rural small businesses. REAP is popular and demand regularly exceeds funding. Existing funds are spread thin across the country and additional funding will help build more rural projects. With additional funding, REAP can provide more climate solutions while helping agriculture and rural communities to adapt to, and prosper in, a low carbon future.

We encourage Congress to substantially increase REAP mandatory funding from \$50 million to, at least, \$500 million per year, via budget reconciliation. Funding should include an up-front investment of \$1 billion to accelerate clean energy and energy efficiency investments across rural America. With higher funding the cost-share for grants should be 50% for all projects, commensurate with other USDA programs. Such funding levels are supported by a broad range of nearly 200 stakeholders. If this is not accomplished via reconciliation, the Ag Committees and appropriators should expand REAP funding via the annual appropriations process and the upcoming farm bill.

Consumers, including farmers, need reliable information on energy equipment to make informed choices. A "Farm ENERGY STAR" program based on the EPA's ENERGY STAR program would accelerate development and deployment of energy efficient technology. The program would provide performance data and standards, baseline energy use by sector, technology, product, *etc.* This focus will also help to drive technology improvements by product manufacturers.

We, along with the Ag Energy Coalition, recommend creating a reserve fund for underutilized renewable energy technologies in REAP to support a full range of clean energy options for farmers and rural small businesses. Done right, the fund would grow markets that drive energy-saving innovation and lower costs for key technologies.

ELPC appreciates the bills that would strengthen and update REAP submitted by Rep. Pingree and Rep. Spanberger. Rep. Spanberger's bipartisan REAP Improvement Act strengthens REAP resources and advances key concepts we need now for a significant REAP upgrade. Rep. Pingree's Agriculture Resilience Act provides important program innovations and funding vision.

Other Energy Title programs provide similar benefits. The Ag Energy Coalition recommends changes to the Biorefinery Assistance and Bio-Preferred programs as follow:

- The Ag Energy Coalition recommends the Biobased Markets Program would be more effective with additional funding, directed outreach to small biobased businesses, options for cost-share grants, creation of a minimum requirement for agency biobased contracts, and lower minimum purchase price thresholds.
- The Ag Energy Coalition recommends the Biorefinery Assistance Program be strengthened by making explicit that USDA must award loan guarantees to proven commercial enterprises with strong applications, with fewer constraints for first of their kind technology ventures and by making the program feedstock neutral with a minimum greenhouse gas performance measure and consideration for making sustainable aviation fuel a higher priority.

REAP is the "Rural Energy for America Program." An important part of that is the "for America" part and REAP does serve the nation in many ways. With the adjustments described above, and others, Congress can provide to the American people a major upgrade to REAP 3.0 to serve many national purposes with one program.

America has the talent and resources to overcome the many daunting challenges we now face. One resource we need to tap used to be called the “American can-do spirit.” Now, more than ever, we need that spirit and to work together for the future of our country and people and ensure that rural America can play a leading role. We can do this!

The CHAIRMAN. Thank you. And now our second witness today is Mr. Bill Cherrier, who is the Executive Vice President and Chief Executive Officer of the Central Iowa Power Cooperative, testifying on behalf of the National Rural Electric Cooperative Association. Mr. Cherrier, please begin when you are ready.

STATEMENT OF WILLIAM “BILL” CHERRIER, EXECUTIVE VICE PRESIDENT AND CHIEF EXECUTIVE OFFICER, CENTRAL IOWA POWER COOPERATIVE, DES MOINES, IA; ON BEHALF OF NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION

Mr. CHERRIER. Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to testify today. On behalf of Central Iowa Power Cooperative, we sincerely appreciate the Committee’s interest in rural energy issues.

CIPCO is a generation and transmission electric cooperative in its 76th year of service providing electricity to member cooperative systems across Iowa. As a not-for-profit electric provider, CIPCO is committed to maintaining a system that provides safe, reliable, and affordable energy.

I have three main themes in my testimony today. First, Rural Utilities Service loans are critical for affordable, reliable power to rural America and will be an important financing tool to help us maintain in these changing demands.

The ongoing energy transition must be inclusive of all energy sources, both clean renewable technologies and traditional baseload power sources that provide reliability. Incentives to support this transition should be accessible to all electric utilities.

Third, the USDA is a key partner for our not-for-profit electric cooperatives to serve our communities and provide benefits well beyond electrification.

Going back to the RUS, CIPCO and electric cooperatives rely on RUS for loans and capital. They fund our major system investments, generation, and technology. While we have all refinanced and mortgaged loans at some point in our lives, RUS loans cannot be refinanced. Significantly higher interest rates make it challenging for co-ops to reinvest in the system and keep rates affordable.

Only Congress can change this situation, and there is a bipartisan support for passage of H.R. 2244, the Flexible Financing for Rural America Act. This allows RUS electric loans to be refinanced without penalty. This essential step allows co-ops to focus on long-term stability, rates, and reinvestment in their communities.

Second, CIPCO’s diverse generation portfolio consists of wind, solar, hydro, landfill gas, natural gas, coal, and market purchases. Our portfolio has evolved significantly with wind energy growing from four percent in 2010 to 30 percent in 2021 and coal dropping from 58 percent to 29 percent during that same period.

CIPCO is also investing in solar energy. Just recently, we had the Wapello solar site for 100 megawatts commissioned, which sup-

plies energy to 18,000 homes and businesses. And Independence Wind for 54 megawatts was also commissioned. Those were both done in 2021.

Intermittent resources such as wind and solar must continue to be complemented and supported by always-available resources like coal and natural gas. System reliability depends on the ability to blend intermittent resources like wind and solar with firm, flexible, and dispatchable electric capacity.

Unfortunately, the Federal tax credit structure prevents not-for-profit electric cooperatives like CIPCO from taking advantage of the tax benefit to directly build and own wind and solar generation assets. The direct pay incentives would level the playing field for all the electric providers, allowing equal access to a diverse power supply mix. We would have much more reliable participation among electric cooperatives with direct pay incentives.

Finally, electric cooperatives were built by and belong to the communities that they serve. Through USDA's Rural Development and Loan and Grant Program, CIPCO works with local businesses and community groups to create jobs in rural areas. In 2020, CIPCO secured \$8.7 million in ten loans and grants to support the development and expansion of local Iowa businesses and services, including small businesses in industrial, professional services, and healthcare fields. CIPCO is dedicated to delivering 24/7 energy that is affordable and reliable to our Iowa households, businesses, farms, and communities, there are nearly 900 electric cooperatives across the country with similar community-focused missions for the areas that they serve.

As this Committee considers reauthorizing the farm bill, we look forward to continuing to work with you toward a shared goal of improving life in rural America. Thank you.

[The prepared statement of Mr. Cherrier follows:]

PREPARED STATEMENT OF WILLIAM "BILL" CHERRIER, EXECUTIVE VICE PRESIDENT AND CHIEF EXECUTIVE OFFICER, CENTRAL IOWA POWER COOPERATIVE, DES MOINES, IA; ON BEHALF OF NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION

Introduction

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to testify. On behalf of Central Iowa Power Cooperative's (CIPCO) member-owners, we sincerely appreciate the Committee's interest in rural energy issues.

My name is Bill Cherrier, and I am the Executive Vice President and CEO of Central Iowa Power Cooperative (CIPCO). CIPCO is a generation and transmission (G&T) electric cooperative in its 76th year of operation providing electricity to member cooperative systems across Iowa. CIPCO serves nearly 300,000 rural and urban residents and more than 13,000 small and large commercial and industrial accounts.

Electric cooperatives return excess revenues to our consumer-members. CIPCO is dedicated to efficient, cost-effective operations and has returned more than \$120 million to our member distribution systems since its inception. This commitment to cost-effective measures has created steady, affordable electric rates at a time of great change in the energy industry.

As a not-for-profit electric provider, CIPCO is committed to judiciously maintaining and growing a system that supplies safe, reliable, and affordable electricity around the clock. I offer the Committee a few key points based on CIPCO's experience and that of many other electric cooperatives:

- Rural Utilities Service (RUS) loans are critical to providing affordable, reliable power to rural America.
- The ongoing energy transition must be inclusive of all energy sources and incentives to support this transition should be accessible to all electric utilities.

- USDA is a key partner with not-for-profit electric cooperatives to serve our communities and provide benefits well beyond electrification.

Access to Capital Through USDA Rural Utilities Service

As urban areas began to electrify in the early 1900s, rural areas were being left behind. Rural community members recognized that the economics of the electric business were not working in their favor, so communities banded together to form electric cooperatives with the goal of powering rural homes, farms, and businesses. Using low-cost Rural Electrification Administration (REA) loans, cooperatives successfully electrified rural America and continue to provide reliable, affordable power to 42 million consumer-members in 48 states.

Rural Utilities Service (RUS)

Today, Rural Utilities Service (RUS) loans are as critical as they were in the early days of electric cooperatives. Cooperatives rely on RUS loans for basic investments in poles and wires, but also to invest in new technology to make their systems smarter and more efficient. As not-for-profit, consumer-driven entities, access to capital is one of our greatest challenges. Our obligation to provide our members safe, reliable, affordable electricity is only achievable if we have access to the resources to build necessary infrastructure. RUS loans meet this critical need.

The RUS Electric Loan Program relies on an annual appropriation from the agriculture appropriations bill. We are grateful for this Committee's support for robust funding and believe this strong support is recognition of the value of this financing to rural America and the reliability of electric cooperatives as borrowers. In fact, the RUS electric loan program generates revenue for the Federal Government—approximately \$214 million in FY 2021.

Loan Repricing

Roughly 500 electric co-ops hold approximately \$43 billion in RUS Electric Loans. Unlike a typical home mortgage, most of these RUS loans cannot be refinanced to take advantage of lower interest rates without penalty. As a result, many electric cooperatives still hold RUS debt with significantly higher interest rates than today's low rates, with few options for relief.

Only Congress can change this situation and there is bipartisan support for passage of the H.R. 2244, the Flexible Financing for Rural America Act, to allow RUS electric loans to be refinanced without penalty. This essential step will give co-ops the flexibility to best manage their financial circumstances while focusing on cooperatives' long-term stability and that of the communities they serve. Refinancing to today's rates could return billions in interest savings back to rural communities in the coming decades. An electric cooperative with typical RUS debt could save \$2 million per year in interest payments if it was to take advantage of current rates. Giving electric co-ops the flexibility to refinance existing RUS loans will enable them to meet the evolving needs of their consumer-members and continue their work as partners in the community's long-term economic future.

Loan Approval Backlog

Electric cooperatives have experienced a significant slowdown in the processing of work order approvals for recent projects. There are two primary reasons for these delays: (1) RUS lost experienced environmental staff to retirement in 2020 and a significant amount of institutional knowledge was lost, and (2) little work was done by electric cooperatives in 2020 due to COVID. Subsequently, RUS has faced a significant increase in the number of projects that need environmental reviews. Some electric cooperatives were under contractual deadlines for their projects that forced them to abandon RUS financing even though it was more costly to do so. RUS has made progress in training new staff and the backlog of approvals has been reduced. We are hopeful that RUS can continue to reduce this queue and expedite the loan approval process going forward.

Maintaining Reliability While Reducing Emissions

As a generation and transmission cooperative, CIPCO provides electricity to member distribution systems through owned assets and long-term power purchase agreements (PPAs)—contracts with third-party companies that own and operate the generation. CIPCO's diverse portfolio consists of wind, solar, hydro, landfill gas, natural gas, coal, and market purchases.

CIPCO's generation portfolio has evolved significantly with wind energy growing from 4.1% in 2010 to 29.9% in 2021 and coal dropping from 58.4% to 29.3% during that same time period. CIPCO is also investing in solar energy, including the 100 megawatt (MW) Wapello Solar LLC PPA and the 100 MW Coggon Solar LLC PPA scheduled for completion next year. Additionally, the 54 MW Independence Winds

PPA came online in 2021. At this time, CIPCO sells the Renewable Energy Certificates (RECs) associated with wind and solar purchases to further offset wholesale costs for member systems.

As we look to the future, intermittent resources such as wind and solar must continue to be complemented and supported by always-available baseload resources like coal and natural gas. System reliability depends on the ability to blend intermittent sources like wind and solar with firm, flexible, and dispatchable electric capacity. For this reason, CIPCO recently invested \$85 million in our existing Summit Lake generation plant, adding efficient reciprocating-natural gas engines that serve peak electric demand. This investment complements our intermittent wind and solar resources while ensuring the baseload generation necessary to meet the 24/7 power needs of Iowans and businesses in CIPCO's service territory.

Parity for Financial Incentives

As electric cooperatives across the country diversify their generation portfolios, it is critical that policymakers work constructively with industry to achieve these objectives while maintaining the exceptional reliability and affordability that American families and businesses expect and deserve. The Federal tax-credit structure prevents not-for-profit electric cooperatives like CIPCO from taking advantage of the tax benefit to directly build and own wind and solar generation assets. For cooperatives to reap any benefit from this transition, they must work with third parties that develop and own these assets. Direct-pay tax incentives would level the playing field for all electric providers, allowing co-op member systems and member-owners down the line to have equal access to a diverse power supply mix.

Rural Energy Savings Program (RESP) and Rural Energy for America Program (REAP)

Through additional partnerships with USDA, electric cooperatives are able to bring energy efficiency measures to their members, many of whom would not be able to afford these improvements. The Rural Energy Savings Program (RESP) offers low-cost financing to electric cooperatives for the purpose of implementing energy efficiency projects at their members' homes. We support continued growth of this program. However, we have found that the administrative burden at small electric cooperatives with limited staff can sometimes hinder opportunities to expand home energy efficiency programs. As a result, we also support a proposal to allow a small portion of a RESP loan to be used for administrative costs.

Additionally, the Rural Energy for America Program provides loans and grants to develop renewable energy systems and implement energy efficiency measures. Electric cooperatives have used REAP grants to partially finance community solar projects.

Consumer Benefits Beyond Electrification

Rural electric cooperatives were built by and belong to the communities they serve. Given this legacy of putting people before profits, they are much more than electric utilities in these communities. With USDA as a key partner, CIPCO and other electric cooperatives across the country are investing in their communities, including closing the digital divide, supporting business growth and expansion, and developing smarter community infrastructure.

Rural Economic Development Loan & Grant Program (REDL&G)

Through USDA's Rural Development Loan and Grant Program (REDL&G), CIPCO works with local businesses and other community groups to create jobs in rural areas. The program represents a mutually beneficial partnership between USDA, rural electric cooperatives, and local communities. In 2020, CIPCO secured \$8.7 million in ten loans and grants to support the development and expansion of local Iowa businesses and services, including small businesses in the industrial, professional services, and healthcare fields.

Broadband and Smart Grid Connectivity

USDA's Broadband Programs are essential to the rural communities we serve. More than 200 electric cooperatives are engaged in providing or deploying broadband to their consumers and up to 200 more are exploring the feasibility of providing broadband service independently or in partnerships. Affordable and reliable high-speed internet is critical for the health and growth of rural communities, providing connections for healthcare, telework, education, economic development, and so much more. Beyond connecting our students, families and businesses, fiber optic capabilities increasingly support enhancements to the electric grid. Smart grid technologies, often financed through the RUS electric program, provide electric cooperatives the ability to increase energy efficiency, reduce consumer bills and labor

costs, and improve the overall electric system performance. Federal investment will continue to be important in our efforts to close the digital divide. We urge Congress to provide the oversight needed to ensure that federally funded broadband projects are built to the highest quality standards and will stand the test of time.

Preparing for Electric Vehicle Growth

The market for electric vehicles is expanding rapidly and electric cooperatives across the country are working with the communities they serve to address electric vehicle charging needs. While electric cooperatives see opportunities for load growth, off-peak charging to flatten electric demand peaks, and increased engagement with their communities, there are also potential hurdles that we must navigate to ensure a smooth transition that retains the affordability and reliability of electricity.

As detailed in a letter submitted by CIPCO's national trade organization, the National Rural Electric Cooperative Association (NRECA), to the Committee in advance of your recent electric vehicle hearing, planning for nationwide access to charging is complicated and charging solutions may look different in rural areas than urban centers. Consumer behavior, for example, will vary. Many urban drivers will commute to and from work and charge their vehicles at home. While commuters exist in rural areas, we will also see vehicles driving *through* our communities, including delivery and freight vehicles, drivers traveling long distances for work or vacation, and fleet warehouses. Co-ops will need to shape and manage the electric demand and supply for EVs around system needs and capacity, whether that includes upgrading grid infrastructure, securing additional capacity, or implementing price signals to balance the demand for electricity.

The Federal Government can help facilitate this transition by providing financial support and technical expertise for EV charging infrastructure, including grid infrastructure. Access to data projecting EV penetration, particularly in rural areas, to help plan grid investments to match the growth will also be essential.

Conclusion

CIPCO is dedicated to delivering 24/7 energy that is affordable and reliable to Iowa households, businesses, farms, and communities. Nearly 900 electric cooperatives across the country have similar community-focused missions for the areas that they serve. As this Committee considers reauthorizing the farm bill, we look forward to continuing to work with you toward our shared goal of improving life in rural America.

The CHAIRMAN. Thank you, Mr. Cherrier. And now our third witness today is Dr. Patrick Gruber, who is the Chief Executive Officer of Gevo, Incorporated. Dr. Gruber, will you begin when you are ready?

STATEMENT OF PATRICK R. GRUBER, Ph.D., CHIEF EXECUTIVE OFFICER, GEVO, INC., ENGLEWOOD, CO

Dr. GRUBER. Thank you, Chairman Scott, Ranking Member Thompson, and all the Members of this Committee for the opportunity to provide testimony about renewable energy.

Gevo is in the midst of commercializing drop-in hydrocarbon fuels. It is the next-generation jet-fueled gasoline and diesel fuel. Net-zero hydrocarbon drop-in fuels are what the marketplace is interested in, and so that is what we are all about.

Now, in order to achieve net-zero fuels and chemicals, you need to do two things. One is replace the carbon by which that fuel is made and then replace the fossil-based energy that is used in the production process. Now, here is a concrete example. We are in the midst of designing our first world-scale net-zero fuel plant up in Lake Preston, South Dakota. We call it Net-Zero 1. It is expected to be operational in 2025. The total projected financed installed cost is expected to be about \$900 million. It will take in about 35 million bushels per year of climate-smart corn. This is low-till/no-till corn. It will produce about 430 million pounds of protein and feed products. It is a very large amount, 30 million pounds of oil,

and 50 million gallons of net-zero jet fuel, 10 million gallons of gasoline and diesel fuel will all be products from this plant.

Now, we are doing something unusual up there. We want a net-zero footprint. We don't want to use the grid electricity and natural gas if we can avoid it. Consequently, we are designing Net-Zero 1 to be off the grid. We are planning on building a 60 megawatt wind farm and an onsite water treatment anaerobic digestion plant that produces enough biogas to offset the need for fossil-based natural gas. We will also make green hydrogen. Lake Preston's future is going to be that it is a green energy hub.

The lessons we are learning up in our net-zero designs apply to other existing ethanol plants. If we can de-carbonize their energy, we can add jet fuel and hydrocarbon production to those facilities as well. It is fundamentally about renewable energy and displacing fossil-based energy and natural gas.

We believe that we can achieve a net-zero footprint because we use the Argonne GREET model to measure lifecycle emissions. Now, GREET is special because it takes into account the whole of the lifecycle all the way from capturing the CO₂ through growing practices and land use and energy used in production and the burning of fuels. We can get to a net-zero or even negative carbon footprint for these fuels, and that is measured at the tailpipe of a jet engine, which is amazing.

We could drive the CI score down further if we use carbon capture and geological sequestration techniques or, get this, simply by using no-till corn, it would drive the footprint to be minus 30 across the whole of the lifecycle even after the fuel is burned if we had used renewable energy production along the way.

Now, climate-smart agriculture, it makes a lot of sense. At Gevo, we intend to set up a business system that financially rewards farmers for using more sustainable ag practices. We think farmers should be paid for their corn and then be rewarded for the benefit of providing all of us in capturing carbon or improving sustainability through production processes. We had a press release about that today working with Farmers Edge, talking about how to use that data. It is available. We are going to figure out a way to monetize it and pay farmers for doing a good job.

Because we get paid by lowering carbon scores, improving the carbon emissions, eliminating fossil-based carbon, there are lots of carbon-accounting models used around the world. We need to use the best. That is the Argonne GREET model. It is the gold standard. It is the foundation for others. It has the most current scientific data. It is the most complete model. There is a model in Europe called the EU REDII. It is the standard model. It follows the GREET model closely. So does Canada's model. The California model uses GREET, but they simplify the agricultural inputs with averages for crops. Now, the RFS model follows GREET kind of the way California does, but it hasn't been updated in roughly 15 years or so.

There is a new model on the horizon called CORSIA (Carbon Offsetting and Reduction Scheme for International Aviation). It is partially developed in a national model, but it is an outlier. It doesn't allow for sequestration, nor does it take into account better land management practices or better agriculture practices.

Now, since Argonne GREET is the foundational model for all the other models used around the world, we would like to see it used in policy here in the U.S. We would like to see improvements in the data for it, and USDA has a large role to play in making that happen down to the field level.

The USDA and farmers have done a terrific job of helping to improve agriculture and rural economies over the last 30 years. As I go around the world and talk about biofuels, I wish the rest of the world understood this. They don't. It is not food *versus* fuel.

The CHAIRMAN. You are right.

Dr. GRUBER. We can do both if we do this correctly and pay attention to it—

The CHAIRMAN. Correct.

Dr. GRUBER.—and count things accurately and just be transparent in the data. That is what we want to do. Thank you very much.

[The prepared statement of Dr. Gruber follows:]

PREPARED STATEMENT OF PATRICK R. GRUBER, PH.D., CHIEF EXECUTIVE OFFICER,
GEVO, INC., ENGLEWOOD, CO

Thank you, Chairman Scott, Ranking Member Thompson, and all the Members of this Committee for the opportunity to provide testimony about renewable energy. I am honored to share Gevo's perspective.

I am here to talk about renewable resource-based fuels, chemicals and plastics made possible in part by climate-smart agricultural practices and access to renewable electricity and gas. Gevo's primary emphasis is sustainable aviation fuel because of the market demand. We have the ability and technology to produce net-zero footprint fuels, that are expected to help lower greenhouse gas emissions. Technologies have advanced: from renewable carbon, it is now possible to make drop-in gasoline, diesel, and jet fuels, as well as many plastics and synthetic fibers. If the fossil raw materials are replaced with renewable carbon, and the energy used for production is renewable, then it is possible to eliminate the fossil-based footprint from the products even accounting for the whole life cycle from carbon capture, through production, and ultimate burning.

Whenever we are trying to solve problems, it is always good to start with fundamental data. This chart from the U.S. EPA (Environmental Protection Agency) shows U.S. greenhouse gas emissions.

Burning of Fossil Energy Creates the Vast Majority of GHG Emissions in U.S.

We can catalyze improvements in agriculture and food production, renewable energy infrastructure and production

U.S. Greenhouse Gas Emissions by Economic Sector, 1990–2019

Source: U.S. EPA’s Inventory of U.S. Greenhouse Gas Emissions and Sinks, 1990–2019; <https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks>.

Source: <https://cfpub.epa.gov/ghgdata/inventoryexplorer/>.

In the U.S., roughly 75% of greenhouse gas emissions come from fossil fuels used in transportation, electricity production, and industry. Roughly 10% comes from agriculture, which includes land use changes, energy used in production of crops, and emissions from animals. The big problem is fossil-based energy in all its forms. We need to replace it. Since we need renewable carbon for making Sustainable Aviation Fuel (SAF), chemicals, plastics, and other hydrocarbon fuels and photosynthesis is the most cost-effective way to capture renewable carbon. We must pay close attention to what is done in agriculture. There is a fundamental belief that we have: when using agricultural land, priority must always be on food first. Always. When talking about food, it is nutrition that is most important. Nutrition is about protein. Land should be used to produce protein. Using corn as a feedstock, large quantities of protein and carbohydrates are produced as well as some oil. Protein and oil need to go to the food chain, carbohydrates, that have little to no nutritional value, make sense to use as feedstocks for fuels, chemicals, and plastics.

How To Achieve Net-Zero SAF: Eliminate Fossil Based Energy and Capture Renewable Carbon

As calculated by Argonne GREET model.

To drive SAF to a net-zero carbon footprint we need two things: sustainably produced renewable carbon, and renewable energy for the production processes. We be-

lieve the entire lifecycle must be accounted for, audited, and reported—from field to combustion. This means capturing data at the field level, being specific about the agricultural practices used in production of crops, being specific about land use changes, about changes to soil carbon, about the sources of energy used in manufacturing. Collecting and reporting factual data is what enables proper decision making. In the industry we talk about fossil-based GHG reductions as Carbon Intensity Score reductions or simple CI for short.

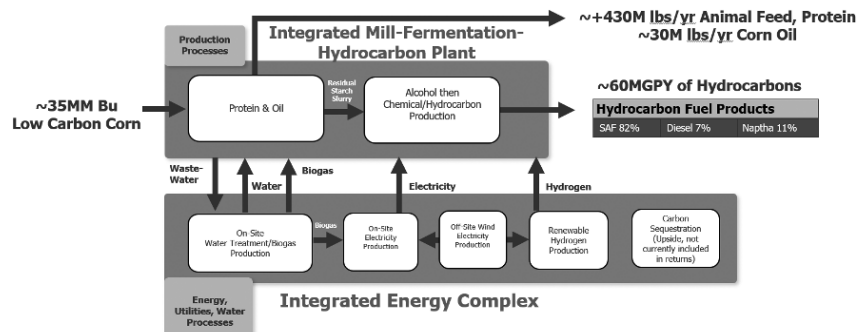

A real example can make this all more concrete: We’ve been developing the concept of a Net-Zero manufacturing plant for SAF. A Net-Zero plant is one that can produce net-zero GHG footprint products. We call the first plant Net-Zero 1 or NZ1. NZ1 is planned to be built in Lake Preston South Dakota, a town of 700 or so people. We’ve already proven that the technologies work; we are in the middle of engineering it. We expect it to be operational in 2025. The total installed, financed cost is currently projected to be about \$900 million dollars. (I suspect we are about to dramatically improve the lives of the people in and around Lake Preston). NZ1 currently is planned to take in 35 million bushels of climate-smart corn (produced with low till or no till technologies), separate the protein and oil sending it to the food chain, and using the carbohydrate to feed a fermentation to produce an intermediate ethanol feed which then goes into the hydrocarbon chemical plant to make the fuel. We expect to produce about 430 million pounds of protein products for animal feed and the food industry, about 30 million pounds of corn oil, and 60 million gallons per year of hydrocarbon fuels products, with the vast majority being SAF. NZ1 is being designed to be “off the grid”. We don’t want to use grid electricity, it’s too dirty, nor do we want to use natural gas for the same reason. NZ1 will have what we call an “energy complex” as part of the project. This would include a 60 megawatt wind farm, and our own water treatment plant, that produces enough biogas to offset the need for fossil-based natural gas. We also plan to produce green hydrogen with excess wind capacity. The investment in renewable energy is in the range of another couple hundred million dollars, and currently is planned to be deployed by partners. It’s the integration of the energy complex into the production processes, optimizing the entire system for driving the CI score down that enables a net-zero end product.

Net-Zero 1*: Being Engineered Now—Expected To Be Operating in 2025

*One site, Multiple “Off-the-Grid”** integrated plants: Mill, Protein, Oil, Chemical, and Hydrocarbon Plant*

Projected Net-Zero 1 Project EBITDA: ~\$150–\$200M/yr (Based on current assumptions)***, ~\$900M Total Capex (financed and installed)

Site: Lake Preston, SD

* Currently planned for Lake Preston, SD volumes of inputs and products to change.

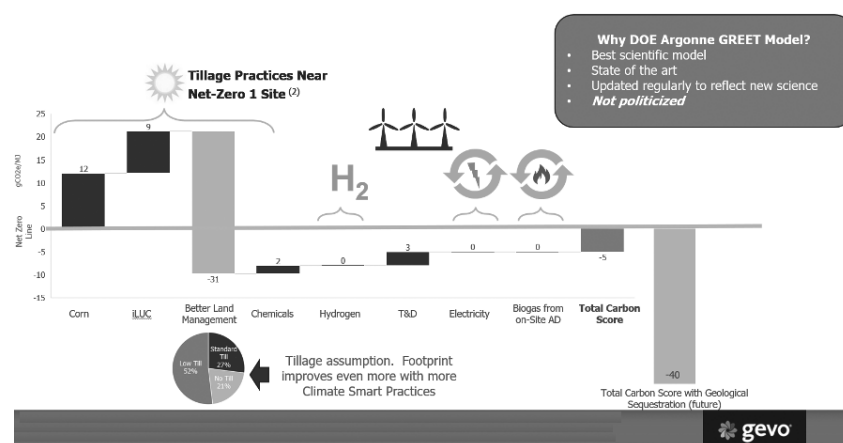

** The plant would be connected to the grid to supply energy to the grids, and also to take energy from the grids if needed. The plant is being designed to be self sufficient for its energy between what can be generated on-site and from the planned off-site wind farm. Gevo may also bring RNG to the plant from its RNG project. The financial projections on this slide are based on certain assumptions such as corn price, oil price, protein price, carbon value, and others that can change. The financial projections are also

based on current engineering and design work completed to date which work has approximately a plus/minus 50% error bar.

*** Estimated based on current assumptions, including those around future commodity pricing and future environmental benefit credit values, and preliminary engineering work.

So how do we measure GHG's and improvements? We use the Argonne GREET model. It is the most scientific and vetted model. It is the basis for all models used around the world today to count carbon through the full lifecycle. Using this GREET model, this is what the greenhouse gas emissions look like for our products produced at an NZ plant.

Net-Zero Project GHG Sources (Base Case)

Note: Gevo is actively working with Argonne to publish GHG values for Net-Zero 1 and future plants.

- (1) Better management defined by Argonne on average as low farming CI, and sustainable farming practices like cover crops.*
- (2) Depending on corn portfolio Gevo has, $-31\text{gCO}_2[\text{e}]/\text{MJ}$ value shown here will vary between 0 and -62 . On average Gevo is assuming a conservative portfolio that mainly sources low-tillage corn.

[The] calculation includes land use, climate-smart ag practices for growing corn, and renewable resource-based energy inputs allowing our NZ1 total carbon intensity score to be reduced to approximately negative 5. It is possible to drive the footprint even lower: our business system could capture more carbon in the soil, or we could capture the CO₂ emissions from the plant and geologically sequester them. If we were to use geological sequestration, then the CI score would drop further, potentially to negative 40. Keep in mind this is after it's been burned as jet fuel. The SAF in a tank at our plant would be negative 90 or more CI score. It is literally renewable energy in a tank and can readily be transported with existing infrastructure. The renewable energy can be used for engines as discussed so far, or even be used to feed generators to produce low GHG electricity. We also plan to make chemicals that go into plastics and durable goods. Using a NZ business system, the CI score of chemicals we could supply would be expected to be strongly carbon negative, so long as they aren't burned at their end of their life. We plan to sell primarily jet fuel, some gasoline and diesel fuel because these products have clear value in the marketplace. Chemical products and materials markets generally aren't valued for CI score reductions yet.

* **Editor's note:** there is no reference (1) in the chart, it has been reproduced herein as submitted.

Which of These Fields Has a Better Sustainability Footprint?

Roughly 50% of crop land uses low till or no till.
 If everyone used no till, we'd save 2% of Total US GHG emissions⁽²⁾
 With further advances in soil science, even more is possible

- (1) Assumes renewable energy is used in manufacturing and calculated using Argonne GREET.
- (2) Thompson, N., *et al.* (2021) "Opportunities and Challenges Associated with 'Carbon Farming' for U.S. Row-Crop Producers", Purdue University Center for Commercial Agriculture. Accessed on August 12, 2021 at <https://ag.purdue.edu/commercialag/home/resource/2021/06/opportunities-and-challenges-associated-with-carbon-farming-for-u-s-row-crop-producers/>. Image available on same site, powered by Bing, GeoNames, Microsoft, and TomTom.

For the sake of our land, food production, and carbon reduction: Agricultural practices are incredibly important to get right. Right now, only 50% of the cropland uses no till or low till practices. According to Purdue University, if everyone used low till or no till, we'd could save about 2% of the total greenhouse gas emissions of the United States—just through agricultural alone. With more advanced techniques, it could be possible to capture even more carbon in the soil. We intend to set up a system that rewards farmers for using climate-smart agricultural practices. Low till and no till allow the root systems of crops to remain intact and that means nutrients stay in the soil, water is retained, and it takes less chemicals per unit of product produced. It's a win all the way around for farmers who can make more money by producing and selling products that provide food, fiber, and sequester carbon simultaneously. Programs should be designed to recognize and reward these practices through the value chain.

Given the yield improvements in corn we don't see a need to increase the amount of land used for farming. Consider that with the projected yield improvements in corn by 2040, approximately 5 billion gallons of SAF could be produced, along with about 35 billion lbs of protein for the food chain with no land use change. If we decarbonized existing ethanol plants with renewable energy and our NZ concepts, then that ethanol capacity could at least in part be converted to SAF production, giving a market to ethanol amid a long run shrinking gasoline market.

Because carbon accounting is critical to success, we must have accurate, fact-based measurements of carbon throughout the whole life cycle. The GREET model is the go-to standard. It has the most current scientific data, it's the most complete with the most up to data. I congratulate the USDA and the DOE for collaborating effectively in putting the agriculture data into GREET.

Argonne GREET Model Is the Go To Standard for Continuing Carbon

This graphic reflects current regulations as of March 2022.

On this chart you see a variety of models for counting carbon. All of these are based on the GREET model as a starting point. EU REDII is the standard European model for measuring carbon and it follows the GREET model through the full lifecycle. Canada does as well. The California model uses GREET, but they simplify the agricultural segment by using averages for corn and soybeans, not considering climate-smart ag practices, at this point. They would need to see specific data to make a change, I think. CORSIA is interesting in that it's a newer international model that doesn't allow for sequestration nor does it incentivize or account for better land management practices or better agricultural practices. It appears to be a biased model in my opinion, at least in these areas. As policy is developed, we would like to see the GREET model be the standard for domestic carbon accounting. Updated facts and science are what the GREET model uses and is the reason so many rely on it.

The USDA has done a terrific job of helping to improve agriculture and rural economies over the last 30 years of my career, I wish that people could better understand this. The USDA is right on track with programs that promote climate-smart agricultural practices, counting carbon, and re-powering our rural communities, especially enabling access to renewable energy.

To facilitate wider adoption of these practices, farmers need to have access to advanced equipment to help them lower their footprint, in addition re-instating the Rural Re-Powering Program is critical to producing net-zero hydrocarbons and in making carbon negative chemicals and materials for durable goods. Continued research at universities focused on soil science, how to improve agriculture, and measure more accurately what is happening at the field level, will help farmers adopt practices to improve their footprint. New net-zero products require the deployment of new capital and any programs that help defray the cost of that capital are welcome, so long as they are feedstock neutral, technology neutral and stand on merit.

We appreciate the work that the USDA and the DOE have done on GREET. Going forward we think it is important for additional harmonization of models and data for counting carbon. We'd like to see program funding for measuring carbon to build out a National CI calculator, and more comprehensive systems for field to fuel tank accounting. These programs will harness the might of the U.S. agricultural system to positively impact climate change, sustainability of agriculture, energy security, and our food supply.

FUELS AND MATERIALS CAN BE MADE FROM RENEWABLE CARBON

BURNING OF FOSSIL ENERGY CREATES THE VAST MAJORITY OF GHG EMISSIONS IN US

We can catalyze improvements in agriculture and food production, renewable energy infrastructure and production

U.S. Greenhouse Gas Emissions by Economic Sector, 1990-2019

Source: <https://cfpub.epa.gov/ghgdata/inventoryexplorer/>

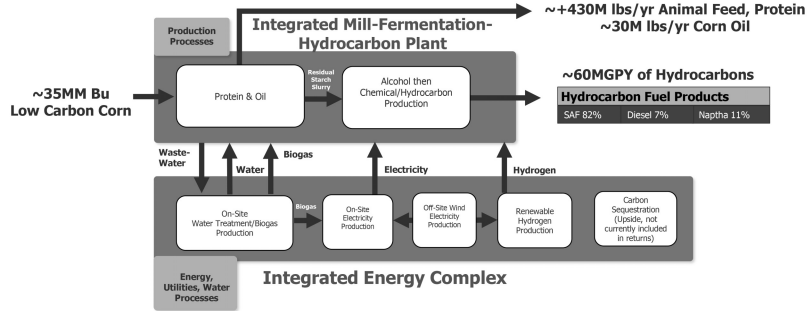

**HOW TO ACHIEVE NET-ZERO SAF:
ELIMINATE FOSSIL BASED ENERGY AND CAPTURE RENEWABLE CARBON**

As calculated by Argonne GREET model

NET-ZERO 1*: BEING ENGINEERED NOW--EXPECTED TO BE OPERATING IN 2025

One site, Multiple "Off-the-Grid" integrated plants: Mill, Protein, Oil, Chemical and Hydrocarbon Plant
 Projected Net-Zero 1 Project EBITDA: ~\$150-200M/yr (Based on current assumptions)***, ~\$900M Total Capex (financed and installed)
 Site: Lake Preston, SD

*Currently Planned for Lake Preston, SD. Values of inputs and products are subject to change. **The plant would be connected to the grid to supply energy to the plant, and also to take energy from the grid if needed. The plant is being designed to be self-sufficient for its energy between what can be generated on-site and from the planned off-site wind farm. Gevo may also bring RNG to the plant from its RNG project. The financial projections on this slide are based on certain assumptions such as corn price, oil price, protein price, carbon price, and others that can change. The financial projections are also based on current engineering and design work completed to date which work has approximately a plus/minus 50% error bar. ***Estimated based on current assumptions, including those around future commodity pricing and future environmental benefit credit values, and preliminary engineering work.

NET-ZERO 1 PRODUCT GHG SOURCES (BASE CASE)

Note: Gevo is actively working with Argonne to publish GREET values for Net-Zero 1 and future plants.
 (1) Better management defined by Argonne as low farming CI, and sustainable farming practices like cover crops.
 (2) Depending on corn portfolio Gevo has, the iLUC values shown here will vary between 2 and -40. Our average Gevo is assuming a conservative portfolio that mainly sources low tillage corn.

WHICH OF THESE FIELDS HAS A BETTER SUSTAINABILITY FOOTPRINT?

Roughly 50% of crop land uses low till or no till.
 If everyone used no till, we'd save 2% of Total US GHG emissions⁽²⁾
 With further advances in soil science, even more is possible

(1) Assumes renewable energy is used in manufacturing and calculated using Argonne GREET

THIS GRAPHIC REFLECTS CURRENT REGULATIONS AS OF MARCH 2022

WHAT CAN THE USDA DO?

- Assist development of "Climate Smart Agriculture"
 - Help farmers access equipment that enables
 - Fund unbiased research on capturing carbon in the soil
- Assist development of rural green energy
 - Electricity
 - Alternatives to fossil based natural gas
- Continue to work with DOE so the GREET model has the most current data
- Help, if possible, defray the cost of the new capital that is required

The CHAIRMAN. And thank you, Dr. Gruber. And now our fourth and final witness today is Mr. Jay McKenna, who is the Chief Executive Officer of Nacero. Mr. McKenna, please begin when you are ready.

STATEMENT OF JOHN J. "JAY" MCKENNA III, CHIEF EXECUTIVE OFFICER, NACERO, INC., HOUSTON, TX

Mr. MCKENNA. Thank you, Chairman Scott. There we go. Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee, for holding this important hearing. My name is Jay McKenna, and I am the cofounder, CEO, and President of Nacero, a Houston-based company that is developing large-scale facilities to make affordable, low, and net-zero lifecycle carbon footprint gasoline from 100 percent domestic natural gas and renewable natural gas.

Nacero will be the affordable climate solution for everyday drivers. Our gasoline will be retail-ready, ethanol-blend compliant, and usable in today's cars and trucks without modification. We will make it possible for everyday American drivers to economically reduce greenhouse gas emissions and strengthen American energy independence without having to change their behavior, buy a new car or truck, or pay more at the pump. Now, I want to emphasize this point. Nacero's fuels will drop directly into America's pipes, pumps, cars, and trucks without any modification.

For a little bit of context, Americans drive about 3.2 trillion miles per year, 3.2 trillion miles a year. This is equivalent to 500 roundtrips between the Earth and Pluto, the Earth and Pluto. That represents $\frac{1}{2}$ of an entire lightyear that we Americans drive annually. Now, we do it in vehicles that stay on the road for an average of 12 years or more, likely longer now, given our path to a longer economic recovery post-COVID and a lot of the problems facing everyday Americans today. As long as these vehicles stay on the road, we need to do everything we can to make a better fuel with a lower lifecycle carbon footprint.

We at Nacero are building multiple large-scale modern manufacturing facilities that will use proven technology that incorporate carbon capture and run on 100 percent renewable-sourced power. Our gasoline made from natural gas will have $\frac{1}{2}$ the lifecycle scope 1, 2, 3 footprint *versus* traditional crude oil refining to make everyday gasoline. By incorporating renewable natural gas into our process, we can take that lifecycle carbon footprint all the way down to net-zero because capturing fugitive emissions is 80 times more potent from a greenhouse gas perspective over 20 years than normal combustion activities that produce CO₂.

The first of these facilities, a shovel-ready plant located outside of Odessa, Texas, will have the capacity to produce 1.4 billion gallons per year of this low- and net-zero carbon footprint gasoline, which is about the amount able to serve 4.5 million everyday Americans. It will support thousands of construction and operating jobs and generate \$25 billion for the local, regional, and state community. This plant alone will displace the need for us to import around 200,000 barrels a day of crude oil, interestingly equivalent to the amount that the U.S., prior to the invasion of Ukraine, imported from Russia. This plant in west Texas alone will displace the need for that amount of imports. We plan to break ground later this year and look forward to building additional facilities across Texas, Pennsylvania, and the rest of the United States.

America's farming community has much to gain with Nacero. We plan to be a major new consumer of renewable natural gas from dairy, swine, poultry, food waste, and landfill gas projects, materially growing demand for these critical resources. We forecast that each of our manufacturing plants would enable 100 new RNG anaerobic digester projects to be built, stimulating billions of dollars of additional new capital investment, creating thousands of jobs in rural America, but most importantly, generating substantial and recurring new income streams for the farming community. This is not pie-in-the-sky. The technology is proven, the market is there, and consumers are interested in low-carbon solutions.

With Nacero, everyday drivers, especially those in farming communities and rural America, can play a critical role in making real climate progress while in parallel ushering a new era of domestic energy security. Now more than ever we need large-scale solutions that can help reduce prices at the pump while in parallel allowing us to achieve our climate goals.

I appreciate the opportunity to speak to the Committee today and look forward to answering your questions.

[The prepared statement of Mr. McKenna follows:]

PREPARED STATEMENT OF JOHN J. "JAY" MCKENNA III, CHIEF EXECUTIVE OFFICER,
NACERO, INC., HOUSTON, TX

Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee for holding this important hearing. My name is Jay McKenna, and I am the co-founder and CEO of Nacero Inc., a Houston based company that is developing large-scale facilities that will make affordable, lower and net-zero lifecycle carbon footprint gasoline from 100% domestic natural gas and renewable natural gas.

Nacero will be the affordable climate solution for everyday drivers. Our gasoline will be ethanol blend-compliant and useable in today's cars and trucks without modification, thereby making it possible for everyday American drivers to economically reduce greenhouse gas emissions and strengthen American energy independence without having to change their habits, buy a new car, or pay more at the pump.

I want to emphasize this point. Nacero's fuels drop directly into America's pipes, pumps, cars, and trucks without modification.

Americans drive 3.2 trillion miles per year, the equivalent of 500 round trips from Earth to Pluto, using vehicles that stay on the road for an average of 12 years, and potentially longer now given our longer road to economic recovery. As long as these vehicles are on the road, we need to do everything we can to make a better fuel with a lower lifecycle carbon footprint.

We are building multiple large-scale manufacturing facilities that will use proven technology and incorporate carbon capture and 100% locally sourced renewable power. Our gasoline made from natural gas will have ½ the lifecycle Scope 1, 2, and 3 carbon footprint of gasoline made from traditional crude oil refining. Incorporating renewable natural gas will bring lifecycle carbon footprint of our gasoline to net-zero.

The first of these facilities, located outside of Odessa, TX will have the ability to serve 4.5 million everyday drivers, support thousands of construction and operating jobs, and generate \$25 billion for the local and regional community. We plan to break ground later this year and are looking to build additional such facilities across Texas and the United States.

America's farming community has much to gain. We plan to be a major new consumer of renewable natural gas from dairy, swine, poultry, food waste, and landfill gas projects, materially growing demand for these critical resources. We forecast that each of our facilities could support RNG demand from 75–100 new digester units, stimulating billions of dollars of new capital investment, creating thousands of new skilled jobs in rural America, and generating substantial new income streams for the farming community.

This isn't pie in the sky. The technology is proven, the market is there, and consumers are interested now more than ever. With Nacero, everyday drivers, especially those in farming communities and rural America, can play a critical role in making real climate progress while, in parallel, ushering a new era of domestic energy security and economic prosperity.

I greatly appreciate the opportunity speak to the Committee today and look forward to answering your questions.

[ATTACHMENT]

Lower and Net-Zero Lifecycle Carbon Footprint Gasoline from 100% Domestic Natural Gas and Renewable Natural Gas

It takes two barrels of crude oil, much of which is imported,¹ to make one barrel of gasoline.² The other barrel becomes byproducts, some of which have renewable alternatives, others of which have no market in the U.S. Using domestic natural gas to make gasoline avoids the production of crude oil refinery byproducts as well as the carbon drag associated with importing crude oil to make gasoline and exporting byproducts that cannot be sold here. Together they cut Scope 1–3 emissions for the production of gasoline by half.³ Integrating carbon capture and renewable power and substituting renewable natural gas (RNG) from farms and landfills for conventional natural gas can take the Scope 1–3 lifecycle carbon footprint of gasoline made from natural gas to net-zero.⁴

Compressed natural gas (CNG) has demonstrated the potential to put biomethane to beneficial use, to the benefit of both farmers and the environment. Gasoline has the potential to greatly increase its use because gasoline can be used in all cars and trucks without modification of the vehicle or the distribution network. Opening access to everyday drivers will increase demand for RNG while continuing to include ethanol and biofuels in our energy mix.

Nacero's first facility, a shovel ready, 93,000 barrel per day natural gas and renewable natural gas to gasoline manufacturing facility in Penwell, Texas, 8 miles east of Odessa, could double demand for agricultural biogas and support billions of dollars of investment in 75 to 100 new digesters and the additional farm income they would produce.

This scalable approach to lower and net-zero lifecycle carbon footprint gasoline also holds great promise for American energy independence and greenhouse gas reduction. Nacero's Penwell facility alone could reduce crude oil import demand by 200,000 barrels a day (the amount the U.S. imported from Russia prior to the embargo),⁵ and avoid up to 50 million tons per year of lifecycle CO₂e emissions.⁶

The technology is proven,⁷ the pipelines are in place, and construction and operation will create thousands of jobs and add billions to local economies.⁸

The CHAIRMAN. I thank each of you very much. I tell you, we are certainly fortunate to have the wealth of knowledge that you all have expressed just in your opening statements here.

And our Members, several of whom are online, they will be coming and going, but we are all very thankful that you all are here. And just from your opening statements, you all have certainly exposed how magnificently great this issue is. And we welcome you.

And we will recognize Members in order of seniority and alternating between Democrats and Republicans and each will be recognized for 5 minutes in order for us to get all of our questions in. And your lights will light up with a yellow light when you have 60 seconds to go. And I can't thank you enough. And just from what

¹ <https://www.eia.gov/tools/faqs/faq.php?id=727&t=6>.

² <https://www.eia.gov/tools/faqs/faq.php?id=327&t=9>.

³ See report by Trinity Consultants dated March 2, 2021, commissioned by Nacero, Inc., the developer of the Penwell project, which found that the Scope 1–3 emissions of a natural gas to gasoline facility with a 93,000 bpd gasoline production capacity would have a 25mm metric ton per year lifecycle carbon footprint and that a crude oil refinery of equivalent gasoline production capacity would have a lifecycle carbon footprint of 56M metric ton per year. <https://www.datocms-assets.com/41690/1617418475-carbon-savings-report.pdf>.

⁴ Nacero estimates that a 23/77 RNG/NG feedstock mix will bring the Penwell facility to net-zero.

⁵ <https://www.reuters.com/business/energy/us-imports-russian-oil-refined-products-2022-03-08/>. A 93,000 bpd gasoline refiner would consume 208,000 bpd of crude oil, as noted in the Trinity report and supported by EIA's crude-to-gasoline ratio (footnote 2).

⁶ <https://www.motortrend.com/news/gasoline-so-clean-its-like-swapping-to-11-million-evs/>.

⁷ <https://www.topsoe.com/processes/synthetic-fuels/methane-rich-gas-to-gasoline>.

⁸ The Bureau of Business Research, IC2 Institute, The University of Texas at Austin, "Economic Assessment of Nacero's Planned Investment: State of Texas, Permian Basin, and Ector County Impacts, 2022–2077," (2021). The Bureau of Business Research estimated \$27.8Bn GDP impact to the regional economy through all construction and operational activities. EPCs bidding the project are currently estimating 1500 concurrent construction jobs and 350 operating jobs.

you have just shared with us lets us know how opportunistic this is but also how challenging and complex this issue is.

And we on this House Agriculture Committee are quite capable of rising to the occasion to make sure that the information that you are bringing to us is incorporated into our 2023 Farm Bill. This is an historic time because we are crossing so many divides and moving into so many new frontiers, none more so than in our energy and how we are going to protect our planet.

So, Members, please, take care, keep your microphones muted so we can expedite our time and minimize any of the noise.

I now recognize myself for the first 5 minutes.

And I tell you, I don't know where to start. But I think I will start with you, Dr. Gruber, because I represent in my area the world's busiest airport. And I want to just ask you a couple of questions in terms of the investment in sustainable aviation fuel manufacturing that your company Gevo is developing. Can you tell me about that, and the nation wants to know and certainly my airport, which is the world's busiest, would like to just hear from you to discuss the novelty of this project and what factors have been of primary consideration in developing the plans for this project and what has to happen to make sure that this project is in operation as planned by 2025. I think that is your deadline. So can you share with us this extraordinary opportunity?

Dr. GRUBER. Sure.

Thank you for the question. We love Delta Airlines.

The CHAIRMAN. Yes, I do, too. I do, too.

Dr. GRUBER. And they are one of the leading companies. They actually walk the talk. And I am really proud to work with them. We have an off-take contract for them for 75 million gallons per year of sustainable aviation fuel. It is a take-or-pay kind of contract. That means that they are helping us with financing indirectly in that they are promising to buy the product if we make it. That allows us to go get commercial financing and that we have to turn up with the equity, which I think we already have on our balance sheet. So that is a great case. And I think that others in that alliance will also sign up. We have many other deals with other airlines as well.

We love the forward thinking of that airline, and aviation fuel is one of these things that I think everybody understands that when you are doing it with jet fuel, it has got to work in every—it is drop-in, works with every engine, every plane, no mistakes. It is super certified and all the rest.

The way that we make these fuels and what we think about is that we want it to be scalable. How do you make something large soon? We like carbohydrates as a feedstock. Now, carbohydrates obviously can be—they are the part when we grow stuff, it is the part that adds to calories. It is not nutrition. So corn is nice because you can separate the protein from the carbohydrates. The protein is all about nutrition, and oil. That goes to the food market. You take the things that will make us fat, we use them instead to make jet fuel.

There are other technologies that the USDA has funded and worked on which allow additional feedstocks, carbohydrate-based feedstocks in the future. And the technique is to take the carbohydrates, making an alcohol out of them, take the alcohol, and turn

it into jet fuel. That means that every ethanol plant in theory could go ahead and make jet fuel if we added on that unit of operations. The trick is—and this is where it is really important—you have to de-carbonize the energy and lower the footprint. All of us in industry have the same problem fundamentally in that we have to take grid electricity, grid natural gas. We need more biogas, we need renewable electricity for everybody, and that drives the footprint down and makes things more scalable.

The CHAIRMAN. Now, you are saying this will come on in 2 years, just 2 years from now. Are you on track to do that?

Dr. GRUBER. Yes. We are on track to do that. So by 2025 we should be producing, and then it is a question of how we scale up further and who we work with. We have oversold multiple plants already, and so it is all about getting them all financed and built. And the thing is, it is like every time you see us appear with somebody, you know there is going to be either renewable energy around us being deployed in rural America and/or sequestration. And so it is pretty darn interesting for what it means because, think about it, we are putting up a big wind farm, big biogas plants, we have an RNG facility we built, and we are going to make green hydrogen. The Mayor of Lake Preston said to me, “Pat, would you guys consider putting up EV stations because then people can drive those Teslas up here and we could have a hotel business.” He is right. We can do things like.

The CHAIRMAN. Well, that is phenomenal. Mr. Cherrier, you may have heard Under Secretary—I don’t know if you were here when Under Secretary Torres Small commented on electric vehicles. And our House Agriculture Committee had a hearing on that recently where we heard from energy providers and car dealers, convenience stores, and renewable fuel providers, among others, to get their take on the EV infrastructure needs in rural America. And I would like to know if your cooperative has considered making investments in electric vehicles in the infrastructure? And has there been interest in making these investments from rural communities in your area, state officials or otherwise?

Mr. CHERRIER. So we do make investments in the electric infrastructure and have promoted electric vehicles [inaudible] electric vehicles—excuse me.

The CHAIRMAN. Is your microphone on?

Mr. CHERRIER. I had my microphone off. I apologize.

The CHAIRMAN. All right, good.

Mr. CHERRIER. We do support and promote electric vehicle infrastructure. We do own electric vehicles ourselves to really understand them and how they operate. We have supported quite a few electric vehicle charging stations. Our members have programs so that their consumer members can actually install them at home. Our understanding is roughly 90 percent of charging will be done at the home, and we have programs that directly influence that. But we also have commercial chargers that are available for fast charging, so it is extremely important to allow electric vehicle use.

The CHAIRMAN. And you know that is so important right outside next to my district in Georgia we have a new electric vehicle plant going into operation. I think it is Rivian. Rivian, right. And so that

is one of the reasons why I wanted to have this electric vehicle hearing, because it is going to make a profound impact.

And now just before I go to Mr. Scott—and I know I am over time a bit—but may I ask, Mr. McKenna, you raised a very important point there. You said, I believe, 3.2 trillion miles a year. What does that say about—what are the pros and the cons? What is the negative or positive impact? I mean, 3.2 trillion miles per year of automobiles just in our country.

Mr. MCKENNA. Correct. Correct, Mr. Chairman. Yes, just in America. At Nacero the way that we really internalize that is that we have to be thinking about all-of-the-above solutions. That is such an enormous amount of challenge but also opportunity. Electric vehicles, biofuels, many different types of low-carbon solutions all have to happen in parallel.

One of the things that is really critical to us in thinking about addressing such a large challenge is affordability. And I think today in this hearing obviously this topic will come up. I think we are all seeing and feeling the pain at the pump right now. But affordability, affordability, affordability is critical to making a large-scale impact. And so in order to tackle the 3.2 trillion and de-carbonize that entire sector, industry, lifestyle, it really has to be all-of-the-above solutions.

The CHAIRMAN. Wow, this is very profound. The gentleman from Georgia, Mr. Austin Scott, I apologize for taking a little more time, but as you can see, this is some very profound information coming to us. And as we are developing our energy policies for this farm bill, this is one of the most challenging areas that we have to make sure we get it right.

The gentleman from Georgia, Mr. Austin Scott, is now recognized for his 5 minutes. Thank you.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. And, Mr. Cherrier, I have a couple of quick questions for you. You mention your frustration with the loan approval backlog at USDA. Could you talk about that issue a little bit and what are the consequences of delays in loan approvals for electric cooperatives?

Mr. CHERRIER. So, as I understand your question, you want to know about the USDA REDL&G program?

Mr. AUSTIN SCOTT of Georgia. The backlog, yes.

Mr. CHERRIER. Oh, okay. So the RUS backlog that we have been experiencing. I can tell you last year it was an issue. We were working hard to get some very large loans approved through the RUS. We did work closely with the RUS, and I can tell you that with the additional staff that they have hired, they have greatly expedited and reduced their backlog quite a bit. I can also tell you we just recently received \$70 million from the RUS just last month and completing the large loan that we were trying to get accomplished. So we appreciate the efforts and applaud the efforts of RUS. And we also encourage them to continue to work on that to facilitate the new loans coming up and requests that they have.

Mr. AUSTIN SCOTT of Georgia. Okay. One of the other things that you mentioned on the loans is the ability to refinance legacy higher interest rate loans without penalty and the flexibility to do this. What are the reasons that they are giving you for not allowing you to refinance and any additional thoughts on that?

Mr. CHERRIER. I guess I have not heard an abundance of reasons why that is not allowed, but I can tell you that investor-owned utilities in the corporate world have the ability to consistently do that. Public power utilities with their public debt have the ability to consistently refinance and have been able to reduce their cost of service as a result. We appreciate the ability to work with the RUS, but that has been a barrier. But it also requires an act of Congress to get that changed. So I have not heard anything specifically that it shouldn't happen, and we have received a lot of support for implementing that.

Mr. AUSTIN SCOTT of Georgia. All right. Thank you. Mr. Olsen, the Environmental Law & Policy Center, I know that you advocate for renewable energy projects. One of the issues that we are facing—and we had this discussion earlier this morning—is the technology that we need, the raw materials that we need to manufacture the batteries and other things that are necessary for a shift require a tremendous number of rare-earth minerals. And one of our concerns is the dependency on foreign suppliers of rare-earth and critical minerals. It is my understanding that you all are partnered in some cases with organizations that are working to restrict mining of copper and other rare-earth minerals, and I would just like to give you the opportunity to speak about that. And we need these minerals, and we don't want to be dependent on China or other countries that are our adversaries for these minerals. So how do we obtain these minerals if we are not able to mine for them inside the United States?

Mr. OLSEN. Thank you, Congressman Scott, for raising that question. First, I want to clarify that to my awareness I am trying to think ELPC, Environmental Law & Policy Center, has not opposed mining projects in my memory. I have been there about 19 years now. So there is that. But you do raise a point. The transition to clean renewable energy will require a lot of different resources that we will have to find on the marketplace. And there is a lot of concern about some of the providers in China and some of the working conditions there that people face. And I am very happy to hear that many of the solar and battery companies, when they learn that their providers engage in unfair or exploitative labor practices, that they back out of those arrangements and find better ones, so that is great.

And also, it is important for us all to keep in mind that one of the best resources that we have is our technological know-how in this country. And we do have the current battery technology that is in the market today is lithium-ion batteries, but there is a lot of development underway, concerted effort to come up with other different batteries, technologies as well that would have less need for some of these rare-earth minerals that you speak to.

Mr. AUSTIN SCOTT of Georgia. So my time has expired. I was told—and I apologize if I am not correct—that you all were objecting to some mining that was going on in Michigan. I again just want to say when we talk about the environment, we are talking about the environment as a whole. I do not believe that cutting down forest lands to put up solar panels is a good return on investment for the environment.

With that said, Mr. Chairman, I appreciate the witnesses and I yield back.

The CHAIRMAN. Was there someone who wanted to comment to that? Dr. Olsen, was that you?

Mr. OLSEN. Oh, yes, I just want to say in his last point about cutting down forests to put up solar farms, that he makes a good point, that especially in terms of the carbon balance in the atmosphere, that that is a very problematic approach to siting solar farms. And, we ask developers not to do that. And, our forests are great mechanisms for trapping carbon and storing it, especially the older trees and stands, and we need to protect those. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, very good point there. I agree with you.

And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is now recognized for 5 minutes.

Technical adjustment for Ms. Spanberger. We will get back to her.

Let us go then to the gentlewoman from Washington, Ms. Schrier, is recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman. And thank you to our witnesses as well.

Earlier this morning, I asked and talked a little bit about the Rural Energy for America Program, the REAP program. And I would like to continue the discussion around improving access to that program. As this Committee started its review of the 2018 Farm Bill with an eye toward improvements that could be made next year, one of the topics that I have heard about is the complexity of applications and the need to improve access to USDA programs by streamlining these processes and these applications. And I hear that from farmers. I also hear that from conservation districts who often are charged with helping with these applications.

Mr. Olsen, regarding the fundamental importance of involving agriculture and rural communities in addressing the climate crisis, I co-chair the SEEC (Sustainable Energy & Environment Coalition) Climate and Agriculture Task Force, along with my friend and colleague Representative Chellie Pingree. I am also a cosponsor of Representative Pingree's Agriculture Resilience Act (H.R. 2803), which creates opportunities to directly enable agriculture to reduce greenhouse gas emissions and sequester and prepare for increasingly challenging weather conditions. And one of the provisions in that bill is focused on improving and expanding the REAP program through streamlining and increased funding. It specifically authorizes and directs USDA to develop pre-approval techniques for technologies and products that have already been demonstrated to work and then could be pre-approved. And I am curious what you think about this pre-approval or pre-approved products list and streamlined application idea.

Mr. OLSEN. Thank you, Representative Schrier. Those are great points. And thank you for your work on the Agricultural Resilience Act and the SEEC coalition that you mentioned.

You make great points that we need to continue to streamline the REAP program. The USDA has made progress in this over the years, but there is more progress yet to do. They need to strike a balance between the sound stewardship of public funds, as well as making the program simple to access for farmers and rural small businesses. And by having a pre-approved list of technologies, as you described, that allows simplification in a lot of ways.

So what we have seen in the states for some of the clean energy programs is that they have a rebate program for certain technologies that they have already vetted and that they qualify and they are sound technologies. And then they are able to do a rebate form that dramatically reduces the complexity of the program. We think that there is a role for that in REAP, and that would be a really good way to go.

In the 2014 Farm Bill, the REAP program was given a three-tier application system with the lowest tier being for the smaller dollar amount grants, and those would have the least complexity, and then the second tier and then the third tier. It is now 2022, and we suggest moving the threshold up for the lowest tier so that more producers can fit into that lower complexity application system.

Ms. SCHRIER. I think that is a great idea, and it opens us up to more of the small family farms that we are looking to support and bring into these programs. And I love the idea of having pre-approved techniques, technologies. We have a program called Sustainable Farms and Fields in Washington State that essentially compensates farmers for practices that are known to sequester carbon. And this seems like the same kind of thing where you reward or support or prove the technology and could streamline the process. So thank you for your attention to this. I appreciate your input, and I yield back.

The CHAIRMAN. Thank you. And now the gentleman from Iowa, Mr. Feenstra, is recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Mr. Chairman. It is great to have you all here today. And I heard your testimony. My district happens to be the home to more ethanol biodiesel plants than anywhere in the country. I have the largest Congressional district with the most ethanol and biodiesel plants, which is really exciting. So we are looking at a lot of different things to go zero-carbon emissions. And the development of carbon sequestration is one of those projects that is on the radar for us in several pipelines coming through Iowa.

Dr. Gruber, what does carbon capture and storage mean for the broader bioeconomy and the competitiveness of our nation's farmers and biorefineries under this new carbon-focused marketplace that we are living in?

Dr. GRUBER. Thank you for the question. Carbon sequestration has tremendous potential. The idea of it is you capture CO₂ and you geologically sequester it. That is one way of doing it. In Decatur, Illinois, where ADM is, they have been operating a site for over 10 years. And the technique works really well. And so it is worth about, in carbon score terms, 30 to 35 carbon points, so that means if an ethanol plant was in the 70s, now they are in the 40s for their overall footprint. It is a big deal for them. And so it is a

worthy thing. It needs to be developed over time. We believe it has potential. We want to see it available to as many people as possible because this greenhouse gas problem is really big. All solutions are required. This is a practical one, and it is valuable in the marketplace. People want the lower carbon fuels, so it has tremendous potential. It does require pipelines. It does require really good work around the geological sequestration and all the rest.

Mr. FEENSTRA. Yes, I really look forward to that for our ag producers because I really think they can directly benefit from this. It just gives them another added value to that output.

Mr. Cherrier, thank you for being here today. It is so nice and always good to see an Iowan here. It is great that you could come. You mentioned in your testimony that electric cooperatives have experienced longer wait times for RUS workorder approvals for recent projects. Can you walk us through what kind of impact this has on cooperatives' ability to plan for the future? Also, how does it impact your member-owners at the end of the line?

Mr. CHERRIER. So the financing delays that we experienced in the last year through the RUS caused us to borrow from other sources at a higher rate in the meantime. By having that delay, it increases our project costs. It could actually potentially delay project costs or projects if there are no other sources other than the RUS to borrow from. So those delays can be very costly. But again, we have seen RUS working towards improving that, and we have seen some improvement in that process in the last year, but I think more work needs to be done yet.

Mr. FEENSTRA. Yes. And then the same with that, given that cooperatives are not able to benefit from renewable energy tax credits, I have talked to you about this earlier, how would CIPCO benefit from direct pay incentives, and what results would Congress expect to see if we would create such incentives for electric cooperatives?

Mr. CHERRIER. Well, currently, the only effective way to do renewable projects is to actually monetize the tax credits. So we have to do that through a third-party developer, so we can't own the wind farm or solar directly. It has to be done through a development group that would own and operate the plant. By having these direct credits, we can actually invest in them ourselves. We can better plan for it, we can own it, we can reduce the cost of it, and we can lower the risk of the project itself. So, as a result of that, we will see not just lower costs for the cooperatives but we will see a lot more development among the cooperatives with renewables.

Mr. FEENSTRA. Yes, I just think it is a no-brainer. I mean, just thinking about the co-ops and we have quite a few in Iowa, I mean, this gives them great incentive to go down these paths.

So, Mr. Olsen, your testimony discussed the benefits of REAP program. However, it is my understanding that the blender pumps do not currently qualify for this program. Can you please share your insights on why this is?

Mr. OLSEN. Sure. Okay. I would be happy to. Thank you. Yes, blender pumps were included for a time in the REAP program about 10 years ago, and they weren't actually explicitly included in the legislation because they actually convey the renewable energy. They don't produce it. And REAP is for renewable energy systems

that produce renewable energy. And so as a result of that effort by the USDA, they have now developed other blender pump programs I understand. I took my eye off that ball when it got out of REAP. And I understand that they are moving forward with that. So, what also happened as a result of that was fuel dispensing of all types was taken out of REAP, including for RNG, and for EVs as well.

Mr. FEENSTRA. Yes, yes. Well, I thank you for those comments. And each one of you, thank you so much for being here. It is very important that we get to hear this information, and I am very grateful. I just look out to the future, especially in the Midwest and Iowa. We have a lot of great things to offer, energy independence in our area. Thanks again. I yield back.

The CHAIRMAN. Yes, you are absolutely right, Mr. Feenstra. This is a vitally important hearing. And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is recognized now for 5 minutes.

Ms. SPANBERGER. Thank you very much, Mr. Chairman. I appreciate this hearing, and I apologize that I had some technical difficulties when you first called on me.

Mr. Olsen and Mr. Cherrier, thank you so much for being here today. And I ideally have questions for both of you, but I would like to start with Mr. Cherrier. Sir, in your testimony you mentioned the need for Federal financial support and technical expertise for EV charging infrastructure in rural communities. Can you further elaborate on why we must ensure the USDA and the Federal Government are specifically focused on rural deployment of EV charging infrastructure? And what risks do you see that we might encounter if the grids in our rural communities don't receive the Federal investment that would make those rural EV charging stations fully deployed or accessible?

Mr. CHERRIER. Well, first of all, what is going to be seen, what we believe we will see in rural America is it lagging behind the urban areas in electric vehicle deployment. So anything we can work and do through Rural Development is absolutely critical. The electric vehicle infrastructure is going to be very important. We are going to want to encourage electric vehicles as they are available, but being able to have homes, farms pre-wired for it in advance of that, making it simpler and easier to do is actually critical to the deployment of electric vehicles because when somebody purchases a vehicle, the first thing they are doing is looking for a charging station. They don't know where to turn or what to do, and it dramatically increases the expense of the vehicle to put that kind of infrastructure in there. And then the type of charger, how fast they need it to charge is going to be critical.

Ms. SPANBERGER. And you talked about the fact that this is overall, just really important, but, I introduced the Electric Vehicle Charging Infrastructure for Farmers Act (H.R. 6390) alongside my colleague Republican Member Congressman Rice from South Carolina. And the bill would expand REAP to include electric vehicle charging infrastructure as an eligible expense under the program. Now, certainly, I am an advocate for additional funding to REAP overall, but I do think that a failure to address these basic infrastructure needs for charging in rural communities really will lead

towards a future where communities will be left behind when we talk about sort of any level of infrastructure, be it broadband connectivity, previously electricity, previously running water. Could you just comment a little bit about sort of what this means economically if we put ourselves on a path towards this potential divide, assuming you agree with the pretense that we are looking at creating a divide if we don't make these investments?

Mr. CHERRIER. Well, anything we can do to accelerate the adoption of electric vehicles like that to encourage the chargers out there I think is absolutely critical. The charger programs have worked effectively. We have been rebating on those programs for quite a few years now and have some uptake but not a lot of uptake yet. It is still—

Ms. SPANBERGER. And what is the benefit if there is one to a rural community to having this sort of uptake into the future?

Mr. CHERRIER. I am sorry, could you repeat that question?

Ms. SPANBERGER. Sure. And what would be the potential benefit to a rural community of having this uptake in the future of this technology?

Mr. CHERRIER. I think you are going to see a lot more from changing out the transportation infrastructure in the rural communities to economic development of the rural communities. You are going to have a lot more growth in rural areas when you have that kind of infrastructure available and being encouraged by Congress.

Ms. SPANBERGER. Thank you. And, Mr. Olsen, in the time I have left, I certainly want to thank you and the Environmental Law & Policy Center for your support of the REAP Improvement Act, another piece of legislation focused on the REAP that I have worked on. As you noted, REAP is a program focused on making our rural communities more energy-independent, resilient, efficient, all while reducing the cost to consumers. And you called for dramatically increasing the size of REAP's budget moving forward and reducing some of the cost-shares for applicants. Could you just elaborate on how expanding funding for REAP would benefit rural communities and farmers?

Mr. OLSEN. Yes, thank you very much, Representative Spanberger. The answer to your question is multifaceted. REAP currently, as administered by the USDA, they do an allocation every year of the funds, and they make sure every state has an allocation of funding. And that is a very fair approach and it kind of grew out of the history of some states grabbing the lion's share of the program in the past. But the result of that is that the funds wind up getting spread very thinly across the country and so some of the larger projects cannot be accommodated within REAP anymore as they used to be. And so that is a concern. And also there are many other uses, as you have brought up potentially for REAP and many others have brought up where it can help with the energy transition our country needs to undertake.

And REAP, as it serves every state—and it can serve every agricultural sector, just has tremendous potential right now to help agriculture and rural America to be at the table in this clean energy transmission and to have a role in the clean energy economy. But, it is like the line from *The Right Stuff*, “No bucks, no Buck Rogers,” and what goes into the program goes out in terms of education and

outreach and also funding. And we need that funding. We need that commitment of very significant funding to help the country deal with the challenges we face.

Ms. SPANBERGER. Thank you. Mr. Chairman, thank you for the extra time. I yield back.

The CHAIRMAN. Thank you, Ms. Spanberger. And now the gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. All right. Thank you, Mr. Chairman. I appreciate the time once again here.

Let me pose questions to Mr. Cherrier. You mentioned the importance of preserving baseload generation capacity, which I wholeheartedly agree with. Baseload reliable 24/7 power is pretty much invaluable. In California we have a lot of hydroelectric dams that have been a very long-time reliable source of 24/7 baseload power. Now, even with the situation, as good as they are, when we have a drought situation, we can have not the water available to turn the turbine. We had that happen on one large dam last year, the Oroville dam finally for the first time ever. So that is a factor.

But how is baseload electricity capacity different when you look at renewable resources in general here, when you look at baseload being able to be pretty much reliable 24/7 *versus* a lot of other so-called renewables.

Mr. CHERRIER. Well, I would say the baseload or fossil resource is absolutely critical to our operations. We have experienced times where renewables have not been available. We just recently in 2020 had the winter storm Uri, the polar vortex, where we were hitting temperatures below 20° at which the wind turbines will no longer operate, so we had no wind available. We had very little solar available, and we relied very heavily on our coal and natural gas plant during that period of time. And that is really what kept the lights on for us at that time. So it is critical for system reliability, especially through a very long transition period that we are going to be experiencing.

Mr. LAMALFA. Yes, it makes sense to me. How would biomass as another fuel that is controllable by human activity *versus* wind or sunlight, how would that play in as a possible part of the portfolio using forest products or ag trimmings, or things like that? How would you look at that as a baseload?

Mr. CHERRIER. Well, biomass is part of the all-of-the-above strategy. As I mentioned earlier, CIPCO has landfill gas, which is very similar to what you are doing with biomass fuels. I think the biomass fuels can be a productive part of the portfolio. It is reducing the slag in fuels that are probably eventually turning into methane and can be used to put on the system and actually reduce greenhouse gases.

Mr. LAMALFA. Or turned into the next forest fire fuel, too, yes. Okay. Thank you. Look, one more thought is talk to me about the difficulty of exchanging 1 megawatt of baseload for a megawatt of renewable power? What are the challenges there of basically converting a baseload 24/7 power to one that is considered part of the renewable?

Mr. CHERRIER. Yes, well, the real issue is we don't get one for one, so if it is a wind farm, you are lucky to get 20 percent of that counted as capacity. So if you have a 100 megawatt wind farm, you

might get a capacity credit of maybe 20 megawatts. And it isn't necessarily reliable. So that runs into an issue. We have a little more opportunity with solar because it is available during the day during our peak loads, but when those aren't available, it doesn't get counted. So we have to have a certain amount of baseload or total capacity available to the utility, whether the renewables are available or not. And there is no reliable alternative to these other backups right now of fossil fuels. It is just the way the world is today, and new technology may change that in 10 or 20 years, but that is where we are today.

Mr. LAMALFA. All right, thank you for those answers. Mr. McKenna, Nacero's mission is to prove that cleaner doesn't have to cost more I think is what was said earlier, so really, how is that looking when you have consumers facing their really high at-the-pump prices? What are the barriers to expanding this marketplace in order to have it maybe need not cost more? How is that going?

Mr. MCKENNA. Thank you, Congressman. So, in short, when we say clean doesn't have to cost more, really what that means is to be able to take low-cost, low-carbon feedstocks and convert those into everyday fuels. The ability for us to do that while integrating—

Mr. LAMALFA. What kind of stocks would that be? What are those stocks?

Mr. MCKENNA. Excuse me?

Mr. LAMALFA. What are those stocks?

Mr. MCKENNA. The feedstocks are natural gas, captured flare gas, renewable natural gas. So widely available 100 percent domestic feedstocks that we would be converting into drop-in fuels. The thing that is unique about Nacero is that we can do it at scale, which is really what drives down the cost of production for us. As we see it, the way that you actually modulate and manage price at the pump is by adding new sources of supply, diverse sources of supply into the system. And we think that with our business we will be able to hopefully help moderate longer-term some of reliance on foreign crude oil and traditional refining to improve the prospects for consumers.

Mr. LAMALFA. Good answer. I better yield back. Thank you for that, Mr. McKenna.

The CHAIRMAN. Thank you very much. And now the gentleman from Florida, Mr. Lawson, is recognized now for 5 minutes. Mr. Lawson, you may be on mute.

We will come back to Mr. Lawson.

The gentleman from Indiana, Mr. Baird, is recognized for 5 minutes. Mr. Baird?

Mr. BAIRD. Thank you, Mr. Chairman. I am here.

The CHAIRMAN. Good. Good to have you here.

Mr. BAIRD. Thank you. I appreciate that. I appreciate the hearing, and I appreciate you putting this together.

I have had other commitments here during this panel, so I didn't get to hear everything, so please correct me if it has already been covered. But, Mr. Cherrier, the one I asked the Under Secretary that was on earlier in the hearing with regard to livestock producers and leverage the methane digesters, and we have some of those in my district back in Indiana. I have been interested in that

kind of production or process for a long time. So producers have an opportunity to use that kind of technology, but it is often almost prohibitive because of the cost trying to get in. So I guess I am just asking you your perspective about the use of methane gas in the livestock industry to generate methane fuel.

Mr. CHERRIER. Well, natural gas is a form of methane gas. I think it is a great fuel that can be used and depends on where, I guess, the source comes from depending on its carbon impact, but we use natural gas very much as a reliability fuel and to be used when the other lower-cost renewables are not available. So I think it is absolutely critical. And the more we have available, the more it can be utilized, the more that can be captured and used to burn and used for power, the better.

Mr. BAIRD. Well, thank you. And I assume that you, by saying you are interested in natural gas, if we can do it through the use of livestock and food waste and all that sort of thing, you really don't care because it is natural gas anyway, and that has the same properties as that that comes out of the ground.

So, Mr. McKenna, changing gears here little, you seem to be doing a lot of—your company seems to be doing a lot of valuable work in low-carbon fuel, and that is a turnkey in its ability to reduce the carbon footprint, and every effort seems to be very similar to the improvements that biofuels offer. So how does your company perceive the lack of parity in government programs and incentives used with the electric vehicle industry compared to that of the turnkey low-carbon liquid fuels?

Mr. MCKENNA. Thank you, Congressman, great question. So when we are looking at the opportunity ahead of us, one of the things that we see with our business is the ability to utilize a huge amount of existing infrastructure, pipelines, storage terminals, pumps, and then existing vehicles to be able to help drive the energy transition and accelerate low-carbon solutions. I think when we are looking at the electric vehicle sector, we really see the investments that are being made in battery technology and charging and actual vehicle manufacturing themselves as purely complementary to what we are looking to do.

One of the unique aspects of our business which we really think is a total gamechanger here for the country is the ability to offer our products to consumers at really cost-competitive prices. So whereby certain consumers have the income or the faculty to go move into electric today, many folks across the country don't. What we have found is that many folks across the country, however, do want to do something better for the planet. So what we are looking to do is offer these low-carbon solutions to everyday drivers at cost-competitive prices. Scale is one piece that helps drive that. We don't have to invest in new pumps or new pipelines. The other piece of this is the ability to leverage and utilize existing vehicles on the road today.

Mr. BAIRD. Well, thank you very much, and I see I am down to about 45 seconds, so I yield back, Mr. Chairman.

The CHAIRMAN. All right, thank you. And now we will reach back for Mr. Lawson of Florida. You are recognized now for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman. And I welcome all the witnesses to the Committee.

And in Florida we have about 130 active dairy farms ranking us number one in the whole Southeast in dairy products. As you know, Mr. McKenna, digesters are quite expensive to install and implement on a dairy farm. Do you envision smaller regional collaborations, cooperative dairies to afford and achieve economy-of-scales to produce biogas? Does your company have any effort underway to assist dairy farmers so that you can have access to biogas?

Mr. MCKENNA. Thank you, Congressman. That is a great question. So where we really see the big gap in the market right now is for a new business or a new sector to come in to create substantial new demand so that new demand can drive and enable the construction of new anaerobic digester projects.

A couple of the things that we think the government can do to help support this effort is to be able to offer support during the construction phase. So simplifying and lowering the barrier for entry for folks that are looking to invest and build and operate these anaerobic digesters have access to capital.

The second piece that we really support as a business is longer-term incentives once these facilities come into operation that are all performance-based. Many of the programs that are offered by USDA and also other agencies support construction but also long-term operations. Ultimately, at the end of the day what you need is a business like ours which is the ultimate buyer of renewable natural gas. So all three of those things really have to work in concert for substantial growth to really happen.

Mr. LAWSON. Thank you very much. Mr. Olsen, in your testimony you mentioned the importance of simplifying the Rural Energy for America Program application process to include pre-approved technology. Can you explain in more detail what current technologies, programs could be pre-approved at this time?

Mr. OLSEN. That would be great. Thank you for that good question. The pre-approval process would allow the USDA to test and vet technologies before they are included in REAP under the pre-approved list. The kind of technologies that would be involved would be the smaller scale technologies which can be used by smaller farmers as well, small operations. And those would include a range of energy efficiency technologies. And pretty much anytime we use energy, if you look around in the room you are in, there is a way to use that energy more efficiently, to cut the energy waste that is built into the products, and that, frankly, has been built into a lot of the buildings and the infrastructure that we have today.

And so we envision that this could be put together in a package by USDA that would be available. So, we have a problem right now with small farms struggling and many failing these days in the country, but they would be able to cut their cost with energy efficiency and then also to use renewable energy as well. So the poultry growers across the South have used REAP for these purposes, and it has allowed them one of the rare opportunities they have as contract growers to increase their profit margins.

Mr. LAWSON. Okay, thank you very much. And, Mr. Chairman, with that, I yield back.

The CHAIRMAN. All right, thank you, Mr. Lawson. And now I would like to recognize our distinguished hard-working Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for his 5 minutes.

Mr. THOMPSON. Thank you, Mr. Chairman. You forgot to mention good-looking.

The CHAIRMAN. Good-looking all the way.

Mr. THOMPSON. No, Mr. Chairman, I appreciate you, and I really appreciate all of our witnesses on this important panel, this important hearing where we look at energy.

Energy is a significant cost, right? I look at energy as a cost and an opportunity for American farmers, and so I really appreciate the perspective that you all bring.

I want to kind of touch on the importance of drop-in fuels. And, Mr. McKenna, your company is producing drop-in renewable fuels. What does this mean for the consumers of the fuels that you are producing?

Mr. MCKENNA. Thank you, Ranking Member Thompson. So what this means is that at the end of the day you will be able to drive your 10 year old pickup down the road and make a consumer-based choice of whether to purchase a lower-carbon version of gasoline or the traditional old-school style of gasoline. What we think is a really important piece of unlocking not only American energy independence but really the horsepower of the American consumer is to be able to offer these products at cost-competitive prices so that anyone, regardless of their income level or how much money they have in their bank account, can participate in the clean energy transition.

When we say drop-in, the reason why that is really, really important is it does not matter what type of vehicle you own, how old it is. It is now flipping it technically from a carbon liability into a carbon asset. And so we think that is the ticket to broadening participation across the clean energy transition regardless of who you are.

Mr. THOMPSON. Well, it sounds like one big advantage for you and consumers and quite frankly the Federal Government is that the existing system of fuel distribution from pipelines to service stations can continue to be utilized with low-carbon and carbon-neutral fuels that you will be producing. What is the impact of not having to rebuild energy distribution systems from the top down or for everyone to have to buy a new car to facilitate lowering emissions?

Mr. MCKENNA. Well, the benefit is that you can really use \$5-\$6 trillion worth of investment that Americans have made over the years in vehicles and the underlying infrastructure to distribute fuels to everyday drivers. I think when we are thinking about what that means to the farming community specifically, that means that capturing renewable natural gas from agricultural facilities and landfills and food waste processing can tap into that multiple trillions of dollars' worth of sunk investment. What we really see at Nacero is being one of the lenses through which the farming community can tap into frankly the \$400+ billion a year liquid fuels industry. And, to be able to pair those two is what we think really

is going to drive new demand for renewable natural gas. So we think it is a very system-connected solution.

Mr. THOMPSON. Good. Well, Dr. Gruber, you are working on similar technology, I believe. Anything to add?

Dr. GRUBER. Yes, I agree with the comments that Jay had about the drop-ins and the benefit of the infrastructure and all the rest. And we are all about making the drop-ins. That is the focus. And when you make them, they really do need to be cost-competitive at the marketplace, and that is the game afoot. And the thing that people don't realize, these technologies exist already. We have just got to go deploy them. So when you think about it like this. Cash cost of production, it is on par with petrochemical stuff already. We have to pay for new capital to go build new capacity to build plants. That is the issue. And so now there is green value in the marketplace because of the variety of programs or from customers' perspectives, and that helps then to make it cost-competitive and we can go build things.

Mr. THOMPSON. Well, thank you. Mr. McKenna, part of your plan is to produce green gasoline relying on capturing methane from the anaerobic digesters. Can you talk, with a little bit of time left here, a little more about the impact that expanding the deployment and use of digesters will have in rural communities? And specifically, any thoughts on how do we do this, looking at—well, Pennsylvania, the average dairy size herd must be maybe 85 cows now. I am not sure where it is at today compared to California where you are measuring in thousands and tens of thousands. There is economy-of-scale. How does that work?

Mr. MCKENNA. Well, you hit the nail on the head, Ranking Member, is it comes down to economy-of-scale and overall footprint. I mean, one of the most important things about really completely changing the game on how much of these effectively free resources is captured comes down to partnerships with local natural gas distribution companies, companies like ours that are actually purchasing that captured renewable natural gas, but doing so in a manner that be albeit a little bit blunt. So thinking about this on a much more mass scale approach to facilitate a reduction in cost of capital, cost of borrowing, USDA programs help facilitate much of this.

But being able to be programmatic about how these anaerobic digesters are rolled out, I think one of the challenges right now that we hear when we talk to developers and farmers across our business is installing and developing each of these facilities is not only costly but it is also very manual because each contract has to be structured, and there is a lot of different moving pieces. So if there are ways that broad-based, performance-based programs that the Federal Government can use to be able to facilitate a much more blunt approach to growing the industry, we think over the long haul that is going to make it much easier for farmers to participate in some of these programs and, frankly, at the end of the day earn more income off of these projects so it is not just third-party developers that are taking the lion's share of the profitability.

Mr. THOMPSON. So obviously—and I have visited a lot of these digesters actually in different parts of the country even in my role as Ranking Member in my rural American agriculture visits. And

obviously they work really well where you have larger farms, you have the herd size to be able to provide that feedstock. It is a wonderful technology actually. But it seems to me this also works if you have a central digester someplace, whether it is with a company providing it or a cooperative or whatever fashion, and that digester serves perhaps—well, the size of our farms in Pennsylvania can be 30 or 40 farms who provide that daily feedstock. And what a blessing that is when the storage of that manure on the farm has always been a liability to either a small or large degree. It now becomes an asset. Whoever thought we would see a revenue stream off the manure, which is great for American farmers, but it is great for energy production as well. And so it is exciting, and this Energy Title is a really important part of the farm bill.

I do want to just for the bigger picture, I would just ask President Biden, his Administration, we are so desperately in need of affordable diesel fuel, we need propane, and we desperately need fertilizer right now. With the stroke of a pen, he could increase and open up more of our domestic American production today and do it in the name of an emergency because we are in a crisis. It is not COVID, but it is a food security crisis because of inflation. Inflation has sort of been self-imposed by the Administration with some of the actions, but it has been compounded by Vladimir Putin. And we have people around the world by this fall that are probably going to be experiencing—will certainly be experiencing hunger, starvation, and death by famine. And if we can provide the tools that our American farmers need, we can increase our yield. And I like to think of it this way. For every bushel an American farmer can provide above and beyond what they normally do, that may be a life saved somewhere else in the world.

So with that, Mr. Chairman, I yield back.

The CHAIRMAN. Well, thank you. And I want all the Members to know votes are coming up, but if there are others that want to bring in additional questions while we have the panel here, this is an important panel. And, Ranking Member, I want to make sure that we have time for your remarks, closing remarks before you have to go to the floor and then we have to adjourn.

This has been very profound. One of the real issues we certainly have to deal with here is our rural communities. Every time there has been a real serious movement of infrastructure in the history of our nation, the rural communities have been left behind. When we had electricity—see, I grew up—I was born in the country on a farm over in Aynor, South Carolina. If anybody knows about South Carolina, you know that is rural. And that convenience store, that one little store, there wasn't any grocery stores. The furthest we had to go was to Conway or Myrtle Beach to try to get to a grocery store.

The point I am making is that we do not and must not make that same mistake that we made with water, no running water until a while, no plumbing. And then we come with no electricity. We had to do candlelight. It is always left behind. And I am very worried about this when it comes to this revolution in electric vehicles. And that is why I had a hearing on this to open this up. And it is a good thing I did because here you have electric vehicles. Where are they going to get fuel? The culture of our country here is the con-

venience store. That is the gas station. And even on the byways, you have a culture of where to go and how to get your vehicle moving.

And so when we had this hearing, I thought everything would go well, but I find out that the convenience stores don't make the electricity. It is the power companies. And so the electric power companies, I had my good friends from Southern Company, Georgia Power here, and now there is a conflict as to where these folks are going to get the electricity, the electrical charging stations when the electric companies now are objecting. They want their own facility. They don't want to cooperate with the convenience stores. It is things like this that we are going to have to deal with.

The other one—and I would love for your comments on that because here we are dealing with this at a time where we are fashioning this new farm bill that will go into place and last 4, 5 years, 5 years. So what we put into place and we are at this revolutionary period where we are supposed to be moving electric vehicles where nobody has given thought to the infrastructure that needs to go in there. No one is giving thought to what are we going to do with the power companies that don't want to have these charging stations at convenience stores. They want their own. What do we here in Congress do? What kind of legislation do we put in place to deal with it?

And then we go to the whole climate change issue, and there are two ways in which we get into this carbon sequestration. You have some companies that want to bring the farmers in and compensate them on the amount of carbon they sequester when they don't even have the technology in the rural areas connected to the internet because of a lack of rural broadband to compensate that. And one company Bayer does the one thing that seems to be successful, and they do it with covered crops and no-till farming and compensate the farmers on that.

So what I am saying is before we end this, can you all give us some instructions, some of the things we need to do that we can incorporate in this farm bill to make sure that these rural communities who produce our food, our fiber, shelter from forestry are connected properly? And even right now we push so hard to get internet, and finally we got the money with a great bipartisan bill, but the money is sitting over there with the FCC. And then you have conflicts within the local Governments down there that they don't want to handle this themselves and don't want the USDA, which is in the best position because if it wasn't for the USDA, we wouldn't have been able to get the electricity down to them.

So I don't want to end this, but you all are at the apex of helping us to be able to design and deal with these issues because we need to address them in a way that we secure our rural communities to be connected. It is one thing to say we are going to have these electric cars. Where are they going to get them? We in the urban areas, we don't have to worry about that, just like we didn't have to worry about the electricity or running water.

So I just wanted to get that out. We are going to have to deal with it. What can you share with us in these next few moments? And, as I said, if there are any other Members that want to chime

in here, we have a few minutes before we go to vote that could help us with these challenges. Yes, Dr. Gruber.

Dr. GRUBER. Well, you are on much of the right track. Increased investment in the rural infrastructure for energy is crucially important. We just built an RNG plant. We had 20,000 cows. And you know what, we had to finance it ourselves. It just simply would have taken too long and too complicated to use any other money. We would love to work with more dairies and we think all manure should be turned into RNG. That is what should happen. We also need electricity, the work that you all are doing with all the wind farms you are telling me about and all the rest. It is a real—we are going to generate real energy in the center part of the country in the rural economy. We are not going to generate renewable electricity in cities. It is going to be out in the other places. So how do we get it from one place to another? How? How will that happen really?

We all can make renewable resource-based fuels, hydrocarbon, diesel fuel. Earlier, the conversation was about what we do about diesel fuel for tractors? We can solve that problem, no problem, it's cost-effective as well. That is straightforward. But we need the rest of the infrastructure developed to pull that off.

We see that there is a very important thing that has to be done around the carbon in the soil. Why doesn't every farmer who wants to do no-till have access to no-till equipment? Because that is the barrier. Where do they get the money? I have this poor guy named Jordan. We had him do the farming on some of our land near one of our plants, and Jordan said—I asked him, well, how come you are not doing no-till? He has got beautiful corn but—well, I inherited the farm from my father, and I can't afford the equipment. Well, I want to help Jordan. I think we should be helping people because that matters for cash and carbon in the soil. It allows them to make more money on their fields.

So you are on the right track. You have to count carbon, too, and document, and the USDA should be publishing data that is real fundamental around the benefits of agriculture because it is not well-understood across the world. And that creates complications in food policy.

Mr. OLSEN. I will just—

The CHAIRMAN. Thank you. Yes, sir.

Mr. OLSEN. Thank you, Mr. Chairman. Those are some very important thoughts and questions. A couple thoughts for you. You mentioned that the monopoly utilities insist that any power going through a charger has got to come from them. And, we wound up with monopoly utilities in this country because, historically, the bigger they got, the cheaper the cost was and they were natural monopolies. Well, a lot of that has changed now, and we really need to think twice before we extend those monopolies into new areas of our economy, to new energy systems.

We see also in Wisconsin an attempt by the monopoly utilities to monopolize EV charging as well, and there they say that you can't even put up your own panels, solar panels or wind turbines or what have you and use that for the EV charging. So they are really trying to control energy policies through exerting that mo-

nopoly, and we need to challenge that monopoly. And I hope our Representatives in Congress will do that.

Certainly, the financing for the charging systems is very important, and there are many programs in place through USDA which could be adopted for that. It might be REAP, it might be a part of the RUS or something similar to that. But that would help more people get into the market.

And throughout this hearing I have been thinking about the history of the cooperatives and with broadband and we needed cooperatives in the first place because the monopoly utilities did not want to extend lines into the country where there was a low number of customers per mile of line, distribution line, and so that is why, to raise the standard of living, we needed to create the Rural Electrification Administration, which was done.

Also another point raised earlier was what are some of the benefits to rural communities from electric vehicles? And just one that leaps to my mind is that it costs a lot less to fuel and operate an electric vehicle than an internal combustion engine. And so the people who would be able to take advantage of electric vehicles then would see lower cost for operation and so forth.

And may I address a point that came up earlier this morning?

The CHAIRMAN. Yes, please.

Mr. OLSEN. Thank you. A couple Representatives mentioned that their constituents are encountering problems with non-rural agriculture producers not being able to qualify for REAP. And back in 2009 that issue was resolved. That was a problem back then, but Secretary Vilsack—and I have a letter from him I would be happy to share—but Secretary Vilsack took action to make sure that all agriculture producers, regardless of location, qualify for REAP. So we need to make sure that the word gets out to all the Rural Development offices across the country and that any agriculture producer qualifies. Thank you, sir.

The CHAIRMAN. Yes, thank you. I think, Mr. McKenna, you had—

Mr. MCKENNA. Yes, I think one of the things, Mr. Chairman, that you hit on was an interesting challenge within I will say the broader clean economy, which is being able to connect the activity in farm communities around renewable natural gas capture with improving the resilience of those communities over the long haul with the fuels generated from the capture activity themselves. So rather than taking renewable natural gas and moving it all across the country that exposes those farming communities to higher energy prices, programs that may be of interest are—could be designed to be able to say for those communities that are undergoing that anaerobic digester activity are companies that are bringing those fuels back to those communities in a very circular local economy fashion.

Things like that that are performance-based incentives to help businesses and cooperatives and other folks do those low-carbon clean economy activities but also not just for the benefit of the global planet but for those local communities by increasing fuel production and sales locally, that helps create the right level of self-sufficiency and resilience I think that is going to help those communities over the long-term. So it is not just about capturing the

value of those low-carbon products but just making sure that those products end up being sold in the gas stations down the road from the farm or the cooperative in the communities where the underlying activity is taking place. It is a little bit of a novelty.

The CHAIRMAN. Yes, absolutely. And was there anyone—yes, Mr. Cherrier.

Mr. CHERRIER. Chairman Scott, you made some really good points about rural Iowa—or rural America. I think in terms of rural Iowa, but it is really about rural America.

The CHAIRMAN. Yes.

Mr. CHERRIER. And rural America was left behind with the energy transition 100 years ago where we were using kerosene lamps on the farms, where we did not have electricity until the rural co-ops came along.

The CHAIRMAN. And the national Rural Electric Act (Pub. L. 74–605) which put USDA in charge of that.

Mr. CHERRIER. Yes. REA changed it all for rural America.

The CHAIRMAN. Yes.

Mr. CHERRIER. We are seeing the same thing, opportunities with broadband today and the ability to invest. And there is a rural-urban divide yet on broadband access, and it affects the economic development of every single small community and farm in the U.S. when they don't have that access.

The CHAIRMAN. Yes.

Mr. CHERRIER. I would also tell you, you have the opportunity right in front of you today with the direct pay tax credits to make a huge difference for rural America on renewables. I can tell you CIPCO has kept our prices very low by adding renewables, by having on a larger scale access to those credits and using economies-of-scale for our solar farms. Our solar costs about a fraction of what it costs to put on rooftop solar and other ones and implement it at a very, very low cost, and our members have had low and declining prices as a result of that, so that is one thing we can do there.

The CHAIRMAN. And you called it direct payment credits?

Mr. CHERRIER. It is the direct pay credit. I believe it is under H.R. 2244—no, I am sorry, that is the other one. But, yes, there is direct pay tax credits where, today, co-ops cannot take advantage of those. The only way we can do it is through a third-party. So the investor-owned utilities, the urban areas have a distinct advantage on that over the rural co-ops today.

The CHAIRMAN. Yes, and—

Mr. CHERRIER. What a difference that would make.

The CHAIRMAN. Yes, one of the first challenges is how do we deal with these power companies who control the electricity with fore-going being able to partner with the convenience stores, which provide not just the gas but the groceries for our rural areas. Our rural areas don't have these big supermarkets that we have in the urban areas. I mean, it is just that simple thing.

Mr. CHERRIER. Mr. Chairman, we work with our small stores to have charging stations there. I also can tell you 90+ percent of the charging in rural America for electric vehicles is done at home or on the farm, so enabling that, because they are not going to be running out to a store to charge, they are going to be doing it where they park their vehicle 99 percent of the time, which is—

The CHAIRMAN. So how do they do that on the farm? I mean, they can put a charging station, but how do they hook up with the power company who provides the juice?

Mr. CHERRIER. It is very simple. The electric cooperative already has power to the farm. It is simply adding a level 1 or level 2 charger to the farm. And all they do is whenever they are on the farm is, anytime they can, have it plugged in. The utility then is directly connected to the vehicle, and it can either be charged or it can be discharged to help out the cooperative, too. That is how this market is going to evolve.

The CHAIRMAN. Well, tell me, let's look at the Southern Company. The Southern Company is the largest power source covering most of where we produce our food in the southeastern United States, Alabama, Florida, Georgia. It is all connected there, even going into Louisiana. And so they have said to me in our hearing that they don't want this relationship. They want to be in control of all the charging stations. So what must we do here in Congress? I mean, we can hash these out. We have time to do it, but you see the unique challenges that we have.

Ranking Member, I know you have to say something, and they are about to call votes, right?

Mr. THOMPSON. All right. All right.

The CHAIRMAN. I am sorry.

Mr. THOMPSON. Mr. Chairman, well, first of all, thank you for this hearing, and thank you to all the witnesses for your testimony once again. I just wanted to follow up with—I agree with you. The no-till, Dr. Gruber, you were talking about no-till and how important it is to have access to that new technology. Two things: Number one, we need the bill that this Committee passed unanimously on rural broadband to be on the House floor because it is a bill that addressed the digital divide.

The CHAIRMAN. Yes.

Mr. THOMPSON. And that connectivity is such an important part of precision agriculture, which is energy-efficient agriculture. It ties right back into what we are talking here.

I also wanted to point out if you are not familiar with it, check it out. Mr. Cherrier, it is actually one of your Members of Congress, Dr. Ashley Hinson—or Dr.—Congresswoman Ashley Hinson—

The CHAIRMAN. Yes.

Mr. THOMPSON. I just made her a doctor I guess. But Representative Hinson has the PRECISE Act (H.R. 2518, Producing Responsible Energy and Conservation Incentives and Solutions for the Environment Act). That is a part of a number of pieces of legislation that are conservative climate solutions, and it supports access to that precision agriculture equipment. I also point out the SUSTAINS Act (H.R. 2606, Sponsoring USDA Sustainability Targets in Agriculture to Incentivize Natural Solutions Act of 2021), which helps to generate more resources for programs like that. It creates a public-private partnership. That is a bill that I am leading, but it is a broadly supported bill that I am looking forward to getting both of those before the Committee here because I think it speaks to what we do.

And finally, when it comes to the energy sector, I want to celebrate what agriculture does for a healthier environment and a

healthier economy in terms of—and that is a marriage. It has always been kind of a rocky marriage between the ethanol industry and the petroleum industry. And I have both. I have Pennsylvania's only ethanol plant, but I also have the oldest commercial oil well drilled anywhere in the world in 1859. And that is a marriage that needs a little marriage counseling. Those two come together because the solution to climate is not electric vehicles. We heard that in the hearing that the Chairman put together.

The CHAIRMAN. Yes, we did.

Mr. THOMPSON. And electric vehicles are actually an attack on rural America. What it would do if they would actually take off and get anywhere close to the number of electric vehicles that President Biden would like to see, it would wreck the rural economy when you look at the ethanol industry and the oil industry actually. That is all rural America.

Whereas what we are doing—but I am very proud of what those two branches of the energy family tree are doing together to reduce emissions today. They have made for a healthier environment. It is a big part of why the American farmer, rancher, and forester are the number one champions for a cleaner environment, for reducing emissions of greenhouse gases and sequestering greenhouse gases. And those two branches of the energy family really contribute to a very healthy rural economy. And without a healthy rural economy, every American is going to wake up in the cold, dark, and hungry.

So thank you for this hearing, Mr. Chairman. I appreciate it.

The CHAIRMAN. Well, thank you, Ranking Member, and I thank our distinguished panel. You guys have really opened us up with some valuable information. We want to stay in contact with you because, as you see, we have to address these unique challenges dealing with energy and climate change and the impact that these two intersect with our most important industry, which is food. You can do without a lot of things, but you cannot do without food. And where is that food produced? In the rural areas. And we have to do better with making sure we bring rural America along with us as we are moving with all these new technological changes.

And so thank you all very much. We appreciate it, and it has been very helpful, and I am sure we will be calling on you a little bit more as we get into fine-tuning our farm bill because we have to—I think this is the most dynamic area of it. The future of our food security is at stake. And we have the capacity with drawing up this 5 year farm bill to put the kind of resources, the kind of money in to make sure rural America is dealt with at the front point of the spear, going forward.

So we thank you very much, and I want to thank our staff with Anne Simmons and Ashley Smith and all the fine ladies and of course my chief of staff, thank you all very much, and God bless you.

I have to say this. Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions posed by a Member.

This hearing of the Committee on Agriculture is now adjourned.
[Whereupon, at 2:55 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY HON. XOCHITL TORRES SMALL, UNDER
SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE

Insert

Mr. LAMALFA. Well, let me reclaim my time. I am sorry. The existence of the programs is positive, is good, but how will they be implemented into actually getting facilities built or at least on the way to being built to utilize these materials and turn them into energy? How well are we doing since the 2018 Farm Bill has extended that initial program in other areas?

Ms. TORRES SMALL. Thank you so much, Congressman LaMalfa. And I think that this is a good fit for the section 9003 Program in terms of the large-scale investments that may be necessary, so I will defer to Dr. Neal on that.

Dr. NEAL. Yes, I would appreciate, and we certainly would welcome the opportunity to share more and to research and get back to you about any particular projects that are specific in terms of woody biomass that have been used in section 9003. I don't have that data on me right now.

Mr. LAMALFA. I guess my bottom line when you get back to me is what is actually being built or what is far along in the planning stage that we can count on then coming online? That is what I am looking at. So thank you. I will yield back.

There are two projects pending utilizing Section 9003:

Aemetis Advanced Products Keyes, Inc.

Status: USDA issued a guaranteed loan conditional commitment. The project team is working to complete the final plant engineering, finalize their equity drive and prepare for loan closing.

Description: The project will use renewable biomass (woody biomass) as a feedstock in a pre-gasification stage as a precursor to plasma arc gasification stage where a thermal residence chamber will capture hydrocarbons. The gas stream is then exposed to microbes to produce ethanol. This technology is combined using established entities; InEnTec, who is supplying the gasification and gas clean-up technology and LanzaTech, who is supplying the microbe and gas fermentation process that converts syngas to valuable products.

The integrated technology has a theoretical advantage in that it produces low ash content, however synthetic gasification and biological conversion of gasified biomass into ethanol is still an emerging technology.

Red Rock Biofuels, LLC

Status: Application is pending. Previous application withdrawn—Lakeview project was down-sized to a demonstration scale facility. Lakeview, Oregon plant is under construction. Once constructed, this plant will be used as the Integrated Demonstration Unit for the purpose of building a new plant, or expansion of the Lakeview facility.

Description: The project will produce drop-in renewable fuels from waste woody biomass using gasification and Fischer-Tropsch conversion technology.

SUPPLEMENTARY MATERIAL SUBMITTED BY ANDREW "ANDY" OLSEN, SENIOR POLICY
ADVOCATE, ENVIRONMENTAL LAW & POLICY CENTER

April 6, 2022

Thank you all for the opportunity to testify yesterday. It was a highlight of my career and made for a great adventure. Of course, my mom is also very proud.

A question came up from a couple Reps. regarding the eligibility of non-rural farmers. Apparently their constituents have been told they are ineligible.

This is not true. One can see this in the rule, at 4280.112 where it says "agricultural producers and rural small businesses." It does not say "rural agricultural producers." Also, please find attached a letter to me from Secretary Vilsack, circa 2009, agreeing with that position as well as some of the materials from that effort. (It seems the name "Rural Energy for America" may have contributed to this misunderstanding.)

I hope you can let the Members know and also share this with USDA, as will I. Perhaps this needs to be made explicit in the next farm bill.

Thanks!

ANDY OLSEN

Excerpt from USDA RD Instructions for Part 4280: Loans and Grants, 4280-B Rural Energy for America Program *

[<https://www.rd.usda.gov/files/4280b.pdf>]

Renewable Energy System and Energy Efficiency Improvement Grants

§4280.112 *Applicant eligibility.*

To receive a RES or EEI grant under this subpart, an applicant must meet the requirements specified in paragraphs (a) through (e) of this section.

(a) **Type of applicant.** The applicant must be an agricultural producer or rural small business at the time of application. *For-profit Rural Small Businesses that provide long-term care services that benefit residents, such as nursing homes and assisted living facilities, are eligible. For-profit Rural Small Businesses that provide short-term housing, such as hotels, are also eligible. Newly formed special purpose entities or equivalents that are clearly created solely for the circumvention of REAP regulatory provisions (see examples in (c) below) are not eligible.*

March 23, 2009

Hon. TOM VILSACK,
Secretary,
U.S. Department of Agriculture,
Washington, D.C.

Dear Secretary Vilsack:

We, the undersigned organizations, encourage the USDA to adopt rules for the Rural Energy for America that do not discriminate against agricultural producers based on their location, in time for the 2009 program.

The Food, Conservation, and Energy Act of 2008 (“Farm Bill”) describes eligible recipients as “agricultural producers and rural small businesses.” Currently, the USDA denies eligibility where an agricultural producer’s project is located in a non-rural area. The “rural small businesses” language does signal a clear statutory intent to limit eligibility for small businesses to those located in rural areas.

We offer these other reasons in support of a non-exclusionary implementation of the Rural Energy for America (REAP) program:

- By excluding non-rural agricultural producers, USDA is limiting the potential success of the REAP program. Non-rural producers include greenhouse and nursery operations as well as specialty crop producers. These producers tend to have greater energy needs and niche opportunities for clean energy, which are too often lost opportunities under current rules.
- We understand the mission of the United States Department of Agriculture to be to serve *all* U.S. agricultural producers, not just those located in rural areas.
- The rural/non-rural dividing lines for implementation of this program result in unfair eligibility. For example, in Ohio one grower is excluded only for being on the wrong side of the street. Another grower is ineligible by ½ mile.
- This exclusion serves no useful public purpose that we can determine, or, at least, that the USDA has enunciated. If the USDA continues this restriction we hope you will explain the reasons for it.
- With the increasing interest in “local food” in America, food is increasingly grown near urban (non-rural) areas.
- With the growth of America’s urban areas, many formerly rural agricultural producers are now non-rural under the USDA definition through no fault of their own. Withholding program support intended for agricultural producers can hasten conversion of these lands to urban uses.
- In other programs the USDA has a different set of rules. For example, under the Value-Added Grant Program, projects can be located in non-rural areas. USDA should also explain why two criteria would exist for similar programs.

We believe, given the new statutory provision and USDA definitions of “agricultural producer,” the Department should recognize that any agricultural producers, including greenhouse or nursery operations, are eligible for the REAP program. We

* **Editor’s note:** the instructions, Parts A, B, D, and E are retained in Committee file and are available at <https://www.rd.usda.gov/resources/directives/instructions>.

call on the USDA to recognize this fact and implement the REAP program, starting in 2009, to serve all agricultural producers regardless of location.

ANDY OLSEN,
Senior Policy Advocate,
Environmental Law & Policy Center,
Madison, WI

Dear Mr. Olsen:

Thank you for your letter dated March 23, 2009, to the Department of Agriculture (USDA) detailing your concerns applicable to agricultural producers and the definition of rural areas pertaining to the Food, Conservation, and Energy Act of 2008. We understand your concern that the Rural Energy for America (REAP) program does not support all agricultural producers, specifically, those located in non-rural areas.

Please be advised that USDA plans to implement a regulatory change that will allow agricultural producers located in non-rural areas to apply for assistance under the REAP program. We anticipate implementing this change in Fiscal Year 2010. If you or the representatives of the other organizations that signed your letter have any questions regarding this matter, please contact Bill Smith with the USDA Rural Development Business Program Energy Division at (202) 720-1400.

Thank you for voicing your concerns and bringing this important issue to our attention. Please share this response with the other organizations that also signed the letter.

Sincerely,

THOMAS J. VILSACK,
Secretary.

ATTACHMENT 3

ELPC Farm Energy Backgrounder

*REAP Was Intended To Be Available To **All** Agricultural Producers*

Conceived in 2003, the Section 9006 clean energy program, now the Rural Energy for America Program (REAP), provides agricultural producers and rural small businesses financial assistance to produce clean power and improve their energy efficiency. With annual funding of \$55 million or more, it is a cornerstone of the Farm Bill's Energy Title.

The Problem

Since 2003, USDA has prohibited farmers and other agricultural producers in non-rural areas from applying for REAP funding, even though the statute (as amended in the 2008 Farm Bill) states clearly that all agricultural producers are eligible for the program: “the Secretary shall provide loan guarantees and grants to agricultural producers and rural small businesses.”

Due to USDA’s restriction, many agricultural producers cannot use REAP because they are not in rural areas (in general, areas with less than 50,000 people). This restriction is especially unfair for greenhouse growers, specialty crop producers and others who operate in formerly rural, now-expanding urban/suburban areas. And, with the growing interest in locally grown food, more agricultural producers are farming in areas closer to larger towns and cities.

USDA Should Remove the Rural Restriction for Agricultural Producers

USDA has correctly followed statutory intent on the “rural” issue for other programs, so it can do the same for REAP. For example, the statutory language for the Value-Added Producer Grant program and Agricultural Innovation Center Grant programs do not limit their applicability to rural areas. USDA, in responding to public comments expressing concern that those programs might only apply in rural areas, explained that those sections in the farm bill—unlike another program which explicitly specified only rural areas—contained no such restriction and so the programs applied anywhere:

The legislation authorizing the Rural Cooperative Grant program specifies that the grants are to be used to facilitate the creation of jobs in rural areas. *The Value-Added Producer Grant and Agricultural Innovation Center Grant programs do not have the restriction of facilitating the creation or retention of jobs in rural areas.* Therefore Rural Cooperative Development Grant facilities must be located in rural areas, but Value-Added Producer Grant and Agricultural Innovation Centers do not.

69 *Federal Register* 23421 (2004).

USDA should apply REAP’s rural restriction only to rural small businesses, since that’s what the statute says. REAP contains no similar restriction for agricultural producers, so USDA should make REAP available to all producers, including those in non-rural areas.

SUBMITTED LETTER BY SARAH GALLO, VICE PRESIDENT, AGRICULTURE AND ENVIRONMENT, BIOTECHNOLOGY INNOVATION ORGANIZATION

April 5, 2022

Hon. DAVID SCOTT,
Chairman,
House Committee on Agriculture,
Washington, D.C.;

Hon. GLENN THOMPSON,
Ranking Minority Member,
House Committee on Agriculture,
Washington, D.C.

Dear Chairman Scott, Ranking Member Thompson, and Members of the Committee:

The Biotechnology Innovation Organization (BIO) is pleased to submit a statement for the record to the United States House of Representatives Committee on Agriculture hearing entitled, “A 2022 Review of the Farm Bill: Energy—Renewable Energy Opportunities in Rural America.”

Introduction

BIO¹ represents 1,000 members in a biotech ecosystem with a central mission—to advance public policy that supports a wide range of companies and academic research centers that are working to apply biology and technology in the energy, agriculture, manufacturing, and health sectors to improve the lives of people and the health of the planet. BIO is committed to speaking up for the millions of families around the globe who depend upon our success. We will drive a revolution that aims to cure patients, protect our climate, and nourish humanity.

As Congress begins the process of authorizing the next farm bill, BIO applauds the Committee for examining renewable energy opportunities in rural America and for inviting Pat Gruber from our member company Gevo to serve as a witness.

¹<https://www.bio.org/>.

A farm bill centered on innovation stands to incentivize the adoption of cutting-edge technologies and practices, resulting in benefits to the environment and rural economies. Further, supporting biobased technologies, such as sustainable fuels, renewable chemicals and biobased manufacturing is crucial to agriculture being part of the solution to the climate crisis and fostering energy security.

The Benefits of Innovation

Biotechnology is enabling a dramatic paradigm shift in the production of fuels and chemicals. Modern biorefineries are converting domestic sources of renewable biomass, wastes, and residues into sustainable low carbon fuels, chemicals, and products. In turn, the sector creates high paying jobs, particularly in rural parts of the country where renewable biomass is grown and in manufacturing communities where carbon can be captured and utilized. Developing and employing domestic feedstocks will help reduce the United States' dependence on foreign energy and create an energy sector that reduces greenhouse gas emissions and enhances human health through improved air quality.

Sustainable fuels producers and renewable chemical manufacturers need comprehensive legislation, like the farm bill, to maintain U.S. leadership in the biobased economy. Programs must be supported with robust funding and streamlined and expedited regulatory pathways for breakthrough technology solutions.

At its core, the farm bill promotes durability. The next farm bill offers a timely opportunity to examine innovation's influence on the resiliency of our economy in the face of global challenges. It also provides an unparalleled platform to grow awareness and trust in the innovation ecosystem, so more communities and consumers can embrace deployment of biobased products with confidence and enthusiasm.

To aid the Committee in its work and provide more background on these technologies and the innovative breakthroughs that can reduce greenhouse gas emissions throughout agricultural supply chains, attached is BIO's *Biotech Solutions for Climate Report*,² which examines biotechnology's contributions to addressing the climate crisis and provides case studies on several BIO member companies including Gevo. This report highlights how biotechnology can achieve at least 3 billion tons of CO₂ equivalent mitigation annually by 2030, by delivering vital climate solutions in four key areas:

- Producing sustainable biomass feedstock
- Empowering sustainable production
- Developing lower carbon products
- Enhancing carbon sequestration

Supporting Innovation

Federal programs supporting the biobased economy, like the farm bill energy title, can foster research, development, demonstration-scale activities, and deployment of renewable, low-carbon energy technologies and send positive signals to the investment community. Private sector funding is critical to accelerate innovation, create a more resilient economy, and grow jobs for years to come.

Biobased Markets Program

The Biobased Markets Program, or the BioPreferred® Program, directs Federal agencies to increase their purchase and use of renewable chemicals and other biobased products. This program makes it easier for consumers to identify biobased products with the U.S. Department of Agriculture (USDA) Certified Biobased Product label. According to USDA's *An Economic Impact Analysis of the U.S. Biobased Products Industry*,³ the biobased products industry contributed \$393 billion and 4.2 million jobs to America's economy.

BIO recommends the next farm bill strengthen the BioPreferred® program with significant mandatory funding and enforceable procurement requirements. USDA and the Office of Management and Budget (OMB) should educate procurement officers on the benefits of BioPreferred® to ensure procurement targets are achieved.

Finally, 2018 Farm Bill called for USDA to work with the Department of Commerce to develop North American Industry Classification System (NAICS) codes for renewable chemical manufacturers and producers of biobased products. However, to date, OMB declined to do so. Without dedicated NAICS codes, Federal agencies can-

² https://www.bio.org/sites/default/files/2021-04/Climate%20Report_FINAL.pdf.

³ <https://www.biopreferred.gov/BPRresources/files/BiobasedProductsEconomicAnalysis2018.pdf>.†*

Editor's note: footnotes annotated with † are retained in Committee file.

not accurately classify, collect data, or report on the rapidly growing bioeconomy. BIO urges the Committee to work with USDA and OMB to update NAICS to establish a measurement for biobased products.

Biorefinery Assistance Program

USDA has been a critical partner in promoting and providing financial support for the development of sustainable biofuels and renewable chemicals.

The Biorefinery Assistance Program loan guarantee program provides manufacturers access to capital for large-scale projects in rural communities. Without the loan guarantee program, new innovative companies might never be able to pool sufficient capital to commence development of a project in rural communities with a small population. These biorefineries are proven drivers of job and economic growth for rural communities.

The 2018 Farm Bill expanded access to this program to renewable chemical and biobased product manufacturers. BIO urges the Committee to use its authority to build on report language in the 2018 Farm Bill to ensure that all biobutanol manufacturers can qualify for the biorefinery assistance program as an advanced biofuel, regardless of feedstock. The 2018 Farm Bill also only provided mandatory funding to the program through Fiscal Year 2020. To spur growth of additional biorefineries in rural communities, it will be critical for the next farm bill to provide mandatory funding for the full length of the farm bill.

Improved Modeling

As BIO noted in its statement for the record to the Committee's hearing "A 2022 Review of the Farm Bill: The Role of USDA Programs in Addressing Climate Change,"⁴ just like carbon markets, supporting the development of renewable energy will require infrastructure to measure and verify reductions in emissions and carbon sequestrations at the local farm level. This will ensure both government and industry can invest in and properly award innovative technologies that reduce emissions.

This will also require both modeling and regulatory requirements for greenhouse gas emissions analysis for sustainable fuels and renewable chemicals to reflect the newest science and technology. As BIO recently noted in comments⁵ in response to the U.S. Environmental Protection Agency's (EPA's) workshop on biofuel greenhouse gas modeling, relying on a single, stagnant version of a model jeopardizes the integrity of EPA processes and long-term decision making. Enabling the use of up-to-date modeling tools and data will permit the agency to capture improvements in agricultural efficiency and deployment of innovative technologies.

As such, BIO recommends the Committee and Congress urge EPA to work with U.S. Department of Energy (DOE) to incorporate the DOE's Argonne National Lab Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET) model for measuring lifecycle emissions of transportation fuels. BIO also recommends EPA coordinate with USDA and utilize its practical knowledge and expertise on biofuels and innovative farming techniques.

Conclusion

BIO believes the government can and should play a catalytic role in growing a renewable, biobased economy. This will require Congress to incentivize the adoption of innovative, sustainable technologies and practices. BIO is committed to working with Congress in a forward-looking manner to foster pioneering technology breakthroughs and science. Doing so will bolster our economic and energy independence and set us on a path to better health and prosperity.

Sincerely,

SARAH GALLO,
Vice President, Agriculture and Environment,
Biotechnology Innovation Organization.

Biotech Solutions for Climate Report**Executive Summary**

Examining biotechnology's contributions to addressing the climate crisis

“Climate change is one of the greatest public policy challenges facing this generation.”

New approaches are required at almost every level of the economy. Biotechnology has the potential to be a transformative asset in this struggle, offering vital contributions to near-term greenhouse gas (GHG) reductions and revolutionary tools to avert catastrophic climate change in the longer term. New biotech tools, including gene editing and synthetic biology, can be transformative climate solutions in key emerging industry sectors. Policies supporting the development and deployment of biotech climate solutions should be part of any government effort to address climate change.

Biotechnology can achieve at least 3 billion tons of CO₂ equivalent mitigation annually by 2030, using existing technologies, and emerging biotechnologies could have transformative GHG benefits in a range of industrial sectors. Biotechnology can deliver vital climate solutions in four key areas:

- Producing sustainable biomass feedstock
- Empowering sustainable production
- Developing lower carbon products
- Enhancing carbon sequestration

Producing Sustainable Biomass Feedstock

Substituting sustainably produced biomass feedstocks for fossil feedstocks is a critical component of de-carbonizing the U.S. economy because it leverages the capacity of photosynthesis to remove carbon from the atmosphere. Biomass substitution has provided vital near-term reductions in the carbon intensity of transportation fuels and a rapidly growing array of consumer products. In several key markets, such as aviation fuels, biobased alternatives offer the only viable path to GHG reductions. Biotechnology is being deployed to develop and utilize a range of next-generation sustainable biomass feedstocks to expand the availability and further reduce the carbon intensity of biofuels and biobased products. Future climate gains from biomass will depend critically on the carbon footprint of biomass feedstock production.

Biotech innovations in sustainable biomass production are also transforming the broader agriculture sector. Agriculture accounts for roughly 10% of total U.S. GHG emissions.¹ The vast majority of these emissions are nitrogen emissions from fertilizer and soils and methane emissions from livestock. Biotech is being deployed to tackle both issues.

Key Findings:

- Biofuels from agricultural or municipal waste and dedicated energy crops such as algae, switchgrass, hybrid poplar and *Miscanthus* have achieved GHG reductions of up to 80% *versus* petroleum with current technology.²
- Continued improvements in feedstock production, conversion efficiency, and co-products are expected to yield pathways with negative carbon scores.³
- Biotechnology is being deployed to radically reduce agricultural nitrogen emissions: first, by introducing nitrogen-fixing microorganisms, known as agricultural (ag) biologicals, to the soil; and second, by using plant biotechnology to engineer plants to better utilize soil nitrogen. Biotech solutions could reduce nitrous oxide emissions from agriculture by more than 150 million metric tons of carbon equivalent.
- Ag biologicals and plant biotechnology are being similarly leveraged to enhance soil carbon sequestration through introduction of carbon-fixing soil microbes and larger plant root systems. Ag biologicals and plant biotechnology could enhance

³ Kim S., Zhang X., Reddy A.D., Dale B.E., Thelen K.D., Jones C.D., Izaurre R.C., Runge T., Maravelias C. *Carbon-Negative Biofuel Production*. ENVIRON. SCI. TECHNOL. 2020 Sep. 1; 54(17): 10797–10807. doi: 10.1021/acs.est.0c01097. Epub 2020 Aug. 19. PMID: 32786588. <http://pubmed.ncbi.nlm.nih.gov/32786588/>.

soil carbon sequestration by up to 600 million metric tons per year if widely deployed.

- Biotechnology is reducing methane emissions from livestock through new animal feeds and feed ingredients, more efficient animals, and solutions for processing and reusing animal waste.
- Plant biotechnology will be critical to continued agriculture sustainability gains, including improvements in crop yields, photosynthetic efficiency, and climate resiliency.
- Together, biotech solutions have the potential to reduce agriculture sector GHG emissions by nearly 1 billion metric tons (1 gigaton) annually—or the equivalent of GHG emissions from more than 100 million U.S. homes.

Empowering Sustainable Production

Manufacturing of everyday products, like apparel, plastics, packaging, carpet and cosmetics, is a major greenhouse gas emitter, responsible for 22% of total GHG emissions.⁴ Biotechnology can dramatically reduce these emissions by making their building blocks from renewable feedstocks rather than fossil fuels; in many cases, biology allows drop-in replacements of existing building blocks, enabling faster adoption throughout our economy with homegrown solutions. New biotech tools, including gene editing and synthetic biology, offer the potential for transformative climate solutions in key emerging industry sectors. Biotech offers a sustainable model for manufacturing in the 21st century.

Key Findings:

- Biomufacturing—the use of enzymes and microorganisms in manufacturing—can reduce GHG emissions 80% or more relative to traditional chemical routes for a variety of chemicals and consumer products.⁵
- CRISPR and other gene editing tools have dramatically increased the speed and reduced the cost of genetic engineering and are being deployed to tackle a range of global challenges, including climate change.
- Biology-based parallel computing and DNA data storage have the potential to cut the energy and carbon footprints of computing and data storage—sectors expected to account for 14% or more of global GHG emissions by 2040⁶—by 99% or more *versus* current technology.⁷
- Biological sensors, coatings and ingredients can substantially reduce food and feed waste, which is responsible for roughly seven percent of total global GHG emissions.⁸

Developing Lower-Carbon Products

As awareness of the climate crisis expands, consumers are increasingly demanding lower-carbon options and more sustainable replacements for existing products. This means finding low-emission alternatives that provide the same level of performance, durability and cost-effectiveness as mature fossil-based systems. Biotechnology allows for the production of low-carbon consumer products through the substitution of biomass or other recycled carbon feedstocks and by enabling more efficient, biologically-based production, satisfying an increasingly important market segment while reducing emissions.

Key Findings:

- First-generation biofuels have reduced U.S. transportation sector GHG emissions by 980 million tons over the past thirteen years,⁹ equivalent to taking roughly 16 million vehicles off the road, or 19 coal-fired power plants offline, for that period.¹⁰ Biotech innovations in feedstocks, processing, co-products, and carbon recycling continue to lower their carbon intensity.

¹⁰U.S. Environmental Protection Agency. *Greenhouse Gas Equivalencies Calculator*. <http://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator>. Accessed April 3, 2021.

- With lifecycle GHG reductions of 80% or more *versus* petroleum, next-generation feedstocks will more than double the transportation GHG emissions reductions achieved by first-generation biofuels and are poised to deliver carbon-negative transportation solutions.
- Biobased products produced from biomass or biologically recycled waste gases added \$459 billion to the U.S. economy in 2016¹¹ and are built from carbon that would otherwise reside in the atmosphere, creating a pivotal pathway for atmospheric carbon removal.
- Biobased plastics and polymers, such as PLA, PHA, and BDO have achieved lifecycle GHG reductions of up to 80% *versus* their petroleum-based counterparts.¹² A rapidly growing list of new biobased chemical building blocks is now in development.
- Biotechnology is lowering the carbon footprint of animal products and making possible a growing array of sustainable, low-carbon options for meat and animal products through:
 - Plant-based and cultured meats with up to 89% lower lifecycle GHG emission.¹³
 - Algae and microbial feed ingredients that reduce enteric methane emissions from ruminant animals by 68% or more,^{14–15} avoiding the equivalent of up to 140 million metric tons of carbon annually.
 - Other biotech ingredient options for fish feed that reduce its carbon footprint by up to 30%.¹⁶
 - Anaerobic digestion of animal waste, with the potential to reduce U.S. GHG emissions by 151 MTCO₂ eq. annually by 2050 using current technology.¹⁷

Enhancing Carbon Sequestration

A broad scientific consensus exists that reducing carbon emission alone will be insufficient to avert catastrophic climate change. Almost every model of a successful stabilization of global temperatures includes a substantial component of carbon dioxide removal from the atmosphere as well.¹⁸ Biotechnology has multiple critical roles in achieving the needed carbon removal.

Key Findings:

- Biological carbon capture is the most feasible near-term pathway to meaningful atmospheric carbon removal. Development of thermochemical systems for point-source and direct-air capture remains an important technology pursuit, but photosynthesis and other biological pathways remain the only established mechanisms for carbon capture on a scale sufficient for carbon removal.

¹⁸ http://www.ipcc.ch/site/assets/uploads/sites/2/2019/02/SR15_Chapter2_Low_Res.pdf.

- Bioenergy with Carbon Capture and Sequestration (BECCS) could cost-effectively remove over 700 million metric tons of carbon per year by 2040, or more than half the emissions from all U.S. coal power plants.¹⁹
- Algae and other microbial carbon capture systems applied to biomass energy or other biorefinery systems offer one of the most carbon-negative climate solutions available.
- Suitable land and other infrastructure exists to deploy algae-based carbon capture systems at more than 500 power plants and ethanol facilities in the U.S. These systems would have a potential to capture more than 200 million tons of CO₂ annually.²⁰

Conclusion

Biotechnology is a crucial enabling technology to combat climate change. It offers gigaton solutions from existing technologies and potentially transformative solutions in multiple sectors of the economy. Current and future biotechnology innovations will be needed to achieve a zero-carbon economy and play a key role in carbon capture and sequestration to take us beyond zero. Policies supporting the development and deployment of biotech climate solutions should be part of any government effort to address climate change.

Introduction

“Climate change is one of the greatest public policy challenges facing this generation.”

The rapid accumulation of anthropogenic carbon dioxide in the atmosphere is already altering natural climate¹ and biological systems, resulting in abnormally destructive wildfires, storms, rainfall patterns and the spread of infectious disease. It is increasingly clear that the historical, fossil fuel-based models of carbon, energy and material cycling through the economy are incompatible with maintaining a hospitable environment. Humanity will need to bring every tool it has to bear on this critical challenge. New approaches are required at almost every level of the economy. Biotechnology has the potential to be a transformative asset in this struggle.

Biotechnology is technology based on biology. Biotechnology applications touch most aspects of modern life, from agriculture to manufacturing to medicine. In the context of climate change, biotechnology offers solutions in four key categories:

- Producing sustainable biomass feedstock
- Empowering sustainable production
- Developing lower carbon products
- Enhancing carbon sequestration

Biotechnology offers vital contributions to near-term greenhouse gas (GHG) reductions and revolutionary tools to combat climate change in the longer term. Policies supporting the development and deployment of biotech climate solutions should be part of any government effort to address climate change. This report reviews the current contributions of biotechnology to greenhouse gas (GHG) reductions and identifies the emerging biotech solutions with the greatest potential to avert, and reverse, catastrophic climate change. We focus on four main areas:

Producing Sustainable Biomass Feedstock. For most of human existence, our lives were based on the products of renewable biomass—plants and other living ma-

¹<http://www.ipcc.ch/site/assets/uploads/2018/02/TAR-03.pdf>.

terial. In the past 150 years, much of our economy has come to depend on petroleum and other non-renewable resources. The environmental consequences of this transition from renewable resources to non-renewable resources are well documented.² Biotechnology has developed more sustainable, biobased alternatives for many products, including fuels, polymers, and other chemicals. The U.S. consumed over 7.5 billion barrels of petroleum in 2019,³ some of which was turned into plastic; as much as 35 million tons of plastic ended up in waste streams annually in recent years.³⁻⁴ More sustainable options have been developed over recent decades, but ultimately they still require a material input. Biobased alternatives offer the potential for significantly reduced carbon footprints and environmental benefits compared to the traditional systems they displace, and these alternatives depend on broad availability of sustainable biomass feedstock. At present, there are concerns that not enough biomass will be sustainably available to meet growing demand. Biotechnology is rapidly reducing the carbon footprint of feedstock production by enabling new, sustainable ways to produce usable biomass, improving yields on existing crops, developing scalable, low-input production systems, and finding new ways to utilize biomass that would otherwise be waste.

Empowering Sustainable Production. Manufacturing is a major greenhouse gas emitter, from industrial boilers, chemical production, and the release of high-warming-potential gases like methane or fluorinated hydrocarbons. Biotech empowers a variety of options to reduce emissions from these processes, by reducing the need for energy inputs, facilitating more efficient material processing, or replacing high-warming-potential gases. Biotechnology has also enabled renewable natural gas systems that can displace the fossil-based methane today, simply by switching the source of the gas. The U.S. manufacturing sector is responsible for 22% of total GHG emissions,⁵ and while no single technology or solution can single-handedly solve the problem, biotech enables opportunities for lower-emission production across many sectors.

Developing Lower-Carbon Products. As awareness of the climate crisis expands, consumers are increasingly demanding lower-carbon options and more sustainable replacements for existing products.⁶ This means finding low-emission alternatives that provide the same level of performance, durability and cost-effectiveness as mature fossil-based systems. Biotechnology allows for the production of low-carbon consumer products through the substitution of biomass or other recycled carbon feedstocks and by enabling more efficient, biologically based production, satisfying an increasingly important market segment while reducing emissions at the same time.

Enhancing Carbon Sequestration. While there is a lot of uncertainty about what a sustainable future may look like, several features are common across all likely scenarios. One of these is the deployment of massive amounts of carbon capture and sequestration (CCS), which converts carbon to a form that does not contribute to climate change or stores it underground. CCS cannot be the sole or even the primary solution to climate change, but it will make a critical contribution. Biotechnology has a key role in advancing CCS techniques, making it more scalable, reliable and cost-effective.

2 Technologies

In this section, we review biotechnology applications to climate mitigation in four broad categories: products; agricultural inputs and climate services; new biotech tools and bio-industrial manufacturing; and plant and animal biotechnologies.

2.1 Products

2.1.1 Advanced Biofuels

Liquid biofuels were one of the earliest biotechnology products to be deployed at scale in the U.S. for the purpose of achieving greenhouse gas (GHG) emission reductions. In the early 21st century, production mostly took the form of the first-generation biofuels ethanol and biodiesel, derived from feedstocks such as corn and vegetable oils. Concerns about competition for these feedstocks with the food and animal feed sectors prompted the development of second-generation liquid biofuels that are produced from low-carbon-intensity (CI) feedstocks, such as lignocellulosic biomass.

² <http://www.pnas.org/content/116/15/7192>.

³ <http://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=MTTUPUS1&f=A>.

⁴ <https://www.statista.com/statistics/1097290/us-plastic-waste-generation/>.

⁵ <http://cfpub.epa.gov/ghgdata/inventoryexplorer/>.

⁶ <http://www.carbontrust.com/news-and-events/news/research-reveals-consumer-demand-for-climate-change-labelling>.

Existing first-generation biofuels pathways rely heavily on the fermentation of starch-rich feedstocks to ethanol and, to a lesser but still substantial extent, the transesterification or hydrotreating of vegetable oils to biodiesel or renewable diesel, respectively. Fermentation is one of the oldest examples of biotechnology, having been mastered by humans thousands of years ago for the purpose of producing alcoholic beverages. Glucose is easily fermented by the microorganism *Saccharomyces cerevisiae* to yield a diluted form of ethanol known in the industry as “beer”. Distillation of this intermediate produces a high-proof ethanol that is then blended with gasoline for use in motor vehicles. Most gasoline in the U.S. today contains 10% ethanol, with 15% blends increasingly available.⁷

Advances in biotechnology have enabled U.S. ethanol producers to achieve substantial efficiency improvements in recent decades that have enabled the volume of first-generation ethanol obtained from a bushel of corn to increase by more than 10% between 1982 and 2014.⁸ Milling improvements based on improved knowledge of corn kernel composition increased conversion efficiency, reducing the amount of corn required.⁹ Likewise, a better understanding of yeast biology led to ethanol yield optimization via temperature-controlled fermentation.¹⁰ And advanced fractionation techniques have allowed for greater yield of co-products, such as distillers dry grains (DDGS), a key animal feed ingredient. Together these advances have improved the process economics and sustainability of the pathway by reducing costs and waste. The EPA estimates them to have resulted in reductions to ethanol’s carbon intensity in excess of 10%.¹¹ A shift to more sustainable growing practices, driven by a desire to capture the compliance value of low-carbon programs such as the California Low Carbon Fuel Standard (LCFS), is further reducing the carbon intensity of first-generation fuels. And the prospect of deploying carbon capture technology at ethanol plants, detailed in section 2.2.2, could reduce the carbon footprint of first-generation ethanol by an additional 40%.¹²

Biotechnology has also made a wide range of low-carbon intensity feedstocks available for utilization by biofuel producers. Glucose is a fundamental building block of plants, and plants possess multiple defense mechanisms to protect themselves from yeast and other microorganisms that consume glucose. Plants’ glucose content takes the form of the polysaccharide cellulose that is not digestible by most living things (one notable exception being termites). Other simple sugars such as arabinose and xylose comprise a second type of major polysaccharide that plants contain, hemicellulose. Plants are further protected by a third compound with antimicrobial properties, lignin, that is cross-linked with cellulose and hemicellulose to protect them against attack by microorganisms. These traits allow plants to thrive in the wild but have also posed a major hurdle to their use as a second-generation biofuel feedstock by inhibiting their conversion to ethanol via fermentation.

Recent progress in the development of biocatalysts and engineered microorganisms has made possible the production of ethanol from second-generation feedstocks such as grasses, shrubs, and other dedicated energy crops. The enzymatic hydrolysis pathway employs biocatalysts to break cellulose and hemicellulose down to glucose and other constituent sugars. The glucose is converted to fuel ethanol in the same manner as corn glucose. Microorganisms that are naturally able to ferment glucose have been engineered to make them capable of also fermenting simple sugars derived from hemicellulose to ethanol, improving both yields and efficiencies of lignocellulosic biofuel production.

An early commercial application of this pathway utilizes the lignocellulose that is found in small quantities in corn kernels to produce ethanol. Biotech companies POET, Syngenta, and Enogen, among others, have begun adding corn kernel fiber conversion units to first-generation ethanol plants, potentially increasing ethanol yield per bushel of corn by nearly 10%.¹³

The full potential of cellulosic biofuel to mitigate climate change will depend on broad deployment of cellulosic technology to agricultural residues, municipal solid waste (MSW), and dedicated energy crops. An initial wave of cellulosic ethanol biorefinery construction occurred following the 2009 implementation of the Federal Renewable Fuel Standard (RFS) program. Leading first-generation ethanol producers such as POET, LLC, have partnered with leading biotech innovators to build first-

of-a-kind cellulosic biofuel plants in the U.S., Europe, and South America, but low oil prices, policy obstacles, and technology challenges have limited global production volumes.

Advances in biotechnology have expanded the supply of feedstocks available to biodiesel and renewable diesel, two of the major success stories in sustainable transportation. Biodiesel (BD) is produced via the transesterification process in which lipid feedstocks are reacted with methanol to yield a fatty acid methyl ester (FAME) that can be blended into conventional diesel, without needing any modification to the engine. Renewable diesel (RD) is made by hydrotreating the same kind of lipid feedstocks, in a process very similar to parts of conventional oil refining; it has performance characteristics like those of diesel fuel, passes the same product specifications and can be used in any diesel engine at any concentration. Historically most U.S. BD and RD have been produced from soybean oil.¹⁴ The need for new feedstocks has grown over the last decade, however, as production has expanded and policies such as California's Low Carbon Fuel Standard (LCFS) have incentivized the use of second-generation low-carbon intensity feedstocks. Some of these newer feedstocks are waste products that are not as easily converted to biodiesel as first-generation feedstocks. Biocatalysts have been developed that improve the conversion efficiencies and performance characteristics of biodiesel that is yielded from waste feedstocks,¹⁵ allowing for more of them to be converted to low-carbon transportation fuel.

Biotechnology has also enabled the production of novel low-carbon fuels that complement existing ethanol and biodiesel production. First-generation biofuels have a limited ability to widely displace existing fossil fuels due to infrastructure compatibility hurdles. The U.S. only allows ethanol blends of up to 15% by volume with gasoline in non-flex fuel vehicles¹⁶ and most diesel engine warranties only cover biodiesel blends of up to 20% by volume.¹⁷ Moreover, neither is capable of displacing specialized fossil fuels such as aviation fuel. Technological advances have yielded a new category of "drop-in biofuels"—so named for their ability to utilize the existing refined fuels infrastructure—that have an even greater de-carbonization potential.

Biobutanol (butanol derived from biomass) was one of the first biofuels to gain attention for its drop-in properties, as it chemically behaves more like a hydrocarbon than ethanol does. While actually an intermediate to renewable hydrocarbons (see below), biobutanol's high energy equivalence ratio compared to ethanol and ability to be blended with gasoline at rates of up to 16% by volume allow it to displace correspondingly larger volumes of gasoline.¹⁸ Biobutanol is produced via fermentation from the same simple sugars as in ethanol production. Some biofuel producers have genetically modified ethanol yeast to instead produce isobutanol. There are also pathways that utilize bacteria for the conversion rather than yeast. Biobutanol can also be produced via engineered microorganisms from the carbohydrates in some microalgae strains that remain after lipids have been extracted, allowing for microalgae to serve as a simultaneous feedstock for both biobutanol and biomass-based diesel.¹⁹

More recently, biobutanol has attracted interest as a key step towards production of the renewable hydrocarbon fuels isooctane and sustainable aviation fuel (SAF). Unlike biobutanol, which is an alcohol, biobased isooctane and SAF are hydrocarbons with performance characteristics that are very similar to their fossil counterparts (isooctane is an important blending component in gasoline). They are true drop-in biofuels in that they can be used in the same quantities as the fossil fuels that they displace before encountering infrastructure constraints.

Biotechnology has also enabled the production of SAF directly from biomass via fermentation. Historically the conversion of biomass to hydrocarbons via fermentation has been limited by the presence of oxygen in biomass that has caused microorganisms to favor oxygen-containing products (*e.g.*, ethanol, butanol). Metabolic engineering has been employed to improve the yield of the specific hydrocarbon, ker-

osene, that comprises a common form of aviation fuel by increasing the selectivity of fermenting microorganisms.²⁰ The microorganisms are able to convert sugars derived from a variety of feedstock types to SAF.²¹ Hydrocarbons have hydrophilic properties, allowing those produced in this manner to avoid the need for the energy-intensive distillation step that is required when producing fuel alcohols.

Biofuels currently supply approximately 12% of U.S. on-road transportation fuel.²² Ethanol and biodiesel currently comprise the large majority of U.S. biofuels consumption. Production of second-generation biofuels is expected to increase rapidly during the early 2020s, however, as the new feedstocks and pathways made possible by biotechnology breakthroughs are commercialized (see *Figure 1*).²³ A combination of factors is responsible for this development. First, the COVID-19 pandemic has seriously disrupted demand for fossil fuels in the U.S. transportation sector, in turn limiting demand for biofuels such as ethanol that have restrictive blend limits. Second, policies such as the Federal revised Renewable Fuel Standard (RFS2), the California Low Carbon Fuel Standard (LCFS) and the Oregon Clean Fuels Program incentivize second-generation biofuels, with their lower carbon intensities, over first-generation biofuels (and both over fossil fuels). Third, whereas the last decade's rapid growth in first-generation biofuels production has slowed due to supply constraints, second-generation feedstocks remain underutilized.²⁴

Figure 1: Estimated U.S. biofuel production volumes by type of fuel, 2010–2050.

U.S. Production of Selected Biofuels in AEO2020 Reference Case (2010–2050)

(million barrels per day (MMb/d))

The carbon intensities of biofuels vary widely depending on feedstock(s), conversion processes, and the geographic length of the supply chain. California publishes detailed carbon intensities of the biofuels that participate in its LCFS for both broad biofuel categories as well as individual producers. Ethanol, which has historically been the primary source of biofuels under the LCFS by volume, has achieved average GHG emission reductions compared to gasoline of between 32% and 41% in recent years.²⁶ Ethanol from waste, or dedicated energy crop feedstocks, have achieved GHG reductions of up to 80% with current technology.²⁷ Continued improvements in feedstock production, conversion efficiency, and co-products are expected to yield pathways with negative carbon scores.²⁸

Continued

Similarly, biodiesel has achieved average GHG emission reductions compared to diesel fuel of between 69% and 74% over the same period, although individual reduction values range from as low as 50% to over 90% depending on the feedstock used.²⁹ In both cases, California reports the lowest carbon intensities for those biofuels that are produced from waste feedstocks, illustrating the value that biotechnology has provided by helping to make such feedstocks usable by biofuels producers.

Biobutanol from lignocellulosic biomass has yet to achieve commercial-scale production volumes and does not have published LCFS carbon intensity values as a result. Independent life cycle assessments estimate a GHG emission reduction for the biofuel compared to gasoline of approximately 66%, which is comparable to ethanol from lignocellulosic biomass.³⁰ Likewise, SAF from biobutanol is estimated to achieve GHG emission reductions compared to petroleum aviation fuel of between 60% and 75% depending on the choice of feedstock and conversion inputs.³¹

GHG emissions are not the only form of air pollution that the use of biofuels reduces. Emissions of criteria pollutants such as carbon monoxide, particulate matter, and sulfur dioxide have a direct impact on human health, causing air pollution to be one of the main risk factors causing non-communicable diseases globally.³² The combustion of commonly used biofuels in both blended and unblended forms has been found to reduce many, if not all, of the criteria pollutants that are emitted by the combustion of petroleum fuels.^{33–34}

Gevo is an advanced renewable fuel producer that converts renewable energy to energy-dense liquid hydrocarbons by transforming renewable energy into low-carbon transportation fuels. This next generation of renewable premium gasoline, jet fuel and diesel fuel has the potential to achieve net-zero carbon emissions, addressing the market need of reducing GHG emissions with sustainable alternatives while continuing to utilize current infrastructure and vehicles.

The company originally converted an existing dry-mill corn ethanol facility to a commercial-sized scaled up facility in Luverne, Minnesota. The converted facility utilizes corn starch as feedstock. While corn-based biofuels have not historically been credited with large reductions to carbon intensity relative to gasoline, Gevo employs an integrated approach to carbon intensity reductions that maximizes the environmental and sustainability potentials from agricultural systems, while creating innovative solutions to convert the feedstocks into energy-dense hydrocarbons.

In January 2021, Gevo announced a new project, planned for construction at Lake Preston, South Dakota, to be named “Net-Zero 1.” Gevo expects that Net-Zero 1 would have the capability to produce liquid hydrocarbons that when burned have a net-zero greenhouse gas footprint.³⁵ Net-Zero 1 is expected to have a capacity of 45 million gallons per year of hydrocarbons for gasoline and jet fuel and will produce more than 350 million pounds per year of high-protein feed products for use in the food chain. In addition to feed and fuel, the facility will produce enough renewable natural gas to be self-sufficient for production process needs. The facility will also generate renewable electricity with a combined heat and power system and integrate additional renewable power production utilizing wind energy.

Gevo’s integrated approach utilizes de-carbonization practices across the entire supply chain. It begins by working with the farmers who employ best farming practices that maximize soil carbon sequestration and minimize GHG emissions during the planting, growing, and harvesting stages.³⁶ The partnership with farmers involves the active tracking and monitoring of the feedstock suppliers to ensure that best practices are encouraged and in the future can be incentivized for the purpose of consistently minimizing feedstock carbon intensity.

Gevo also conducts experimental trials to identify additional feedstock de-carbonization routes such as the use of manure in place of nitrogen fertilizer application, enhanced soil carbon sequestration via reduced soil tillage practices, and improved crop yields via microbial soil solutions. The company estimates that its corn feedstock has a carbon intensity that is at least 50% lower than the U.S. average.³⁷

Because of the low-carbon-footprint feedstocks, the sustainable agricultural practices used to produce feedstock, and the use of renewable energy for the production processes—much of which is expected to be generated on site—the hydrocarbon fuel products produced at Net-Zero 1 have the potential to achieve net-zero greenhouse gas emissions, as measured across the whole of the life cycle, based on Argonne National Laboratory’s GREET model. The GREET model takes into account emissions and impacts “cradle to cradle” for renewable resource based fuels, including inputs and generation of raw materials, agriculture practices, chemicals used in production processes of both feedstocks and products, energy sources used in production and transportation, and end fate of products.

Gevo’s Luverne facility also makes extensive use of other sources of renewable energy to reduce the carbon intensity of its production process. The production of biofuels such as isobutanol from corn uses process heat and electricity that have historically been obtained from fossil fuels, such as coal and natural gas. And Gevo has installed wind turbines to generate renewable electricity. Minnesota has abundant access to low-cost wind power and Gevo pays “about the same” price for electricity as it did prior to the installation of the wind capacity.³⁸ In 2019, Gevo announced its intention to utilize renewable natural gas that is produced from dairy manure in place of the fossil natural gas it used to produce process heat in the past.³⁹ In both cases, Gevo has been able to take

advantage of local renewable energy resources that are supplied directly to the Luverne facility via transmission line and natural gas pipeline.

2.1.2 Renewable Chemicals and Biobased Products/Materials

Fossil-derived chemicals and products are a key future driver of petroleum consumption.⁴⁰ The chemicals sector (known as petrochemicals when derived from fossil feedstocks) accounts for a wide variety of common products, including plastics, synthetic rubber, solvents, fertilizers, pharmaceuticals, additives, explosives, and adhesives.⁴¹ They differ from fossil fuels in that their consumption does not normally cause GHG emissions via combustion. They are still produced from fossil fuels, though, especially petroleum and natural gas, and their production incurs both direct and indirect emissions. By one estimate the petrochemicals sector generates 18% of direct industrial GHG emissions, and its production capacity is growing rapidly.⁴² The sector is also, due to its reliance on fossil fuels, an important source of other forms of pollution that have a detrimental impact on human health, especially in disadvantaged communities.⁴³ Moreover, many fossil-derived products such as plastics are resistant to degradation and end their useful lives either in landfills or in natural environments as litter.

Biotechnology's contributions to efforts to mitigate the damage caused by fossil chemicals and products generally fall into one of two broad categories: (1) the replacement of these fossil-derived products by non-fossil products, and (2) the replacement of degradation-resistant materials with biodegradable materials. A substantial amount of overlap exists between the two categories due to the novel production pathways and product types that have been developed by the biotechnology industry. The ability of biomass to replace a wide variety of fossil products has greatly benefited from recent biotechnology advances that have enabled the manufacture of products from both categories.⁴⁴

The petrochemical industry is expected to become a primary driver of demand for fossil fuels by 2030.⁴⁵ Many advances have been made in the production of the same chemicals and products from biomass or recycled feedstocks rather than fossil feedstocks. One early biobased chemical was developed as an extension of biofuels production, allowing it to utilize existing production capacity. Ethanol obtained from corn and sugarcane, but potentially from lignocellulosic biomass in the future, is easily dehydrated to yield a biobased version of the plastics precursor ethylene.⁴⁶ Plastics comprise most of the fossil chemicals market,⁴⁷ giving biobased plastics an important role to play in its de-carbonization.

Biotechnology companies have also developed biobased versions of synthetic fibers that are used by the textile industry. Polyester, which is widely employed in the manufacture of textiles and bottles, is usually produced from natural gas and/or petroleum feedstocks. Its building blocks can instead be obtained either from ethanol, as in the production of biobased plastics, or from hydrocarbons that are directly converted from biomass feedstocks.^{48–49} In both pathways the resulting fibers are the same as those that are currently produced from fossil feedstocks, making them drop-in biobased products.

Growing concerns over the longevity of plastic waste in the environment have also prompted the development of biodegradable plastics that are capable of decomposing

over short timeframes compared to those of traditional plastics. The most common of these are polylactic acid (PLA) and polyhydroxyalkanoates (PHA). PLA is derived from plant sugars that are naturally fermented by bacteria to yield lactic acid. This lactic acid is then chemically converted to PLA for use as a biobased plastic.⁵⁰ PHA is produced via the fermentation of plant sugars (although vegetable oils and even wastewater can also be used) by a different type of bacteria under very specific conditions that promote PHA synthesis.⁵¹ Biobased plastics made from both PLA and PHA are biodegradable under higher-temperature conditions such as those found in industrial composters.

Biotechnology breakthroughs have also been made in the replacement of lesser known but equally important fossil products. Lubricants made from petroleum are in common use throughout the industrial and transportation sectors and, while they represent a small share of a typical refinery's product mix, they are a critical input for many applications (*e.g.*, engine oil). Plant sugars can be fermented by bacteria to yield a chemical that is capable of conversion to biobased versions of the synthetic lubricants that are normally obtained from petroleum.⁵² In a similar application biodiesel, which has a high lubricity, is blended with petroleum-derived ultra-low sulfur diesel fuel to improve the latter's low lubricity.⁵³ Finally, novel medicines and medical treatments are being developed through biotechnology, including those that are personalized to individual patients.⁵⁴

Renewable chemicals and materials provide climate benefits through twin advantages. First, by leveraging biological production platforms, biobased products are frequently less energy-intensive to produce than their petrochemical counterparts. For example, BASF Corporation has developed a biobased home insulation product that results in 66% fewer GHG emissions than its fossil-based alternative.⁵⁵ But, perhaps most significantly, whether produced from biomass or waste gases, biobased products are built from carbon that would otherwise reside in the atmosphere, and thus serve as a vital pathway for atmospheric carbon removal.

The direct recycling of GHG emissions, both biogenic and fossil in origin, to create chemicals and fuels has emerged as a notable pathway over the last decade. Landfills and animal waste lagoons are sources of biogenic emissions of the potent GHG methane. Methane is the primary component of natural gas, however, making biogenic methane when captured a potential biobased chemicals feedstock. Biogas captured from landfills and agricultural anaerobic digesters is also directly utilized as fuel for natural gas-powered vehicles.⁵⁶ The use of biogas in both applications has especially large climate benefits because it eliminates a source of methane emissions while simultaneously displacing demand for a fossil feedstock (biogas combustion converts methane to the comparatively weaker GHG carbon dioxide).

Finally, biotechnology advances have also enabled fossil GHG emissions to be captured and recycled via a pathway known as carbon capture and utilization (CCU), thereby reducing demand for fossil fuels and the resulting emissions without requiring biomass (see Section 2.2.2). One novel process developed by carbon recycling pioneer LanzaTech utilizes engineered microorganisms to ferment emissions captured from industrial facilities such as steel mills to either fuels or chemicals, depending on the choice of microorganism.⁵⁷ While the resulting products are not of biological origin, their climate benefits are substantial and comparable to those of biobased

products in that both partially eliminate the need for fossil fuel extraction and serve as sinks for carbon that would otherwise be emitted to the atmosphere.

Like biofuels, the market for biobased chemicals has been constrained by persistent low natural gas and petroleum prices for much of the last decade. The lack of mandates or other policy mechanisms in the U.S. that internalize biotechnology products' climate benefits have made it still more difficult for biobased pathways to compete with fossil pathways. That said, a growing interest by many manufacturers and their consumers in reducing their climate impacts in service of ESG goals has supported an expansion of the U.S. biobased products industry despite these hurdles. One recent analysis estimated the industry's size to be \$459 billion in terms of value added to the U.S. economy in 2016, up from \$393 billion in 2014 and \$353 billion in 2012.⁵⁸ These bioproducts were estimated to displace 9.4 million barrels of petroleum equivalents in 2016. While still smaller than the fossil products sector—the U.S. chemicals industry alone achieved \$765 billion in sales in 2017⁵⁹—the U.S. biobased products industry is expected to grow rapidly as state governments and corporations increasingly act to minimize plastic waste, methane emissions, and other forms of pollution.⁶⁰

Biodegradable biobased products have the potential to substantially contribute to climate change mitigation efforts due to their ability to achieve net carbon sequestration under certain production conditions. A life cycle analysis of the biodegradable bioplastic PHB calculated negative GHG emissions for the product when produced from either corn or biogas, with the greatest amount of carbon sequestration occurring when the PHB is produced from existing PHB that has degraded to biogas.⁶¹ A separate analysis of PHA production determined that the bioplastic has a carbon intensity that is 80% lower than that of fossil-derived plastics even before taking into account the PHA's ability to be recycled following biodegradation.⁶² Biobased PLA for use in water bottles has likewise been found to have a substantially lower carbon intensity than fossil-derived plastic.⁶³ Finally, a comparison of multiple chemicals and fuels pathways determined that products derived from recycled carbon dioxide achieved carbon intensity reductions compared to conventional fossil products despite ultimately being derived from fossil feedstocks.⁶⁴

Biobased products such as renewable chemicals historically have not received as much attention from policymakers as biofuels, due to the lack of direct emissions resulting from their use. That is changing, however, as policymakers in states such as California and New York have implemented economy-wide restrictions on GHG emissions. In addition to disincentivizing the use of fossil feedstocks in energy-intensive manufacturing processes, such policies also encourage entities such as steel mills and refineries to develop new revenue streams via the implementation of CCU technologies.⁶⁵ Biotechnology provides a wide range of options for reducing the carbon intensities of many of the biobased chemicals and products upon which the U.S. economy relies.

Danimer Scientific Case Study

Biobased PHA is Danimer Scientific's primary bioplastics product. The company manufactures the polyester at a commercial facility in Winchester, Kentucky, by feeding a bacterium with inexpensive vegetable oil feedstock derived from agricultural oilseed crops such as canola, and soy. In addition to directly displacing the fossil fuels used in the manufacture of conventional plastics, Danimer Scientific's production pathway also provides indirect environmental benefits.

Danimer Scientific obtains vegetable oils via the crushing of oilseeds. The crushing process yields protein-rich byproducts that are employed as a natural fertilizer and livestock feed. The vegetable oils are consumed by soil bacteria that biosynthesize the PHA in a bioreactor. The PHA is then separated from the bioreactor medium, purified, and dried in preparation for conversion to various plastic resins, blending with other biopolymers such as PLA, or bonding with materials such as paper.⁶⁶

Danimer Scientific's biobased PHA possesses performance parameters that are comparable to those of many fossil plastics and are capable of use in many of the same applications, including food preservation and storage and conversion to multiple types of finished resins. Unlike fossil plastics, however, PHA utilizes only renewable feedstocks and is biodegradable. This latter characteristic is an important advantage over fossil plastics at a time of growing concern over land-filling and the widespread presence of non-biodegradable plastic waste in many ecosystems.

⁶⁶ <http://danimerscientific.com/pha-beginning-of-life/>.

Genomatica Case Study

Genomatica has commercialized a more sustainable, biobased technology to make a key ingredient used in apparel, spandex, footwear, and plastics used in electronics and automotive parts. Millions of tons per year of this ingredient, 1,4-butanediol (BDO), are currently produced from fossil-derived feedstocks, resulting in many millions of tons per year of greenhouse gas emissions. By contrast, Genomatica's GENO BDO™ process uses renewable feedstocks—the sugars that come from locally-grown crops such as corn and sugarcane—along with engineered microorganisms and fermentation. The products made with Genomatica's ingredient have 56% lower carbon intensity,⁶⁷ and their renewable content is traceable—meaning customers know that the carbon actually came from plants. Genomatica's technology also avoids the use of toxic compounds like formaldehyde, common to fossil processes.

Genomatica's technology has been proven at industrial scale since 2012. Italy-based plastics manufacturer Novamont started production of biobased BDO at a 30,000 ton per year capacity plant in 2016, built with Genomatica's licensed technology. Novamont's BDO has been used in compostable produce bags, mulch film and coffee capsules. BASF has also licensed Genomatica's BDO technology. The Novamont plant is the world's first commercial scale plant to make a widely-used intermediate chemical biologically. Genomatica has received repeated recognition for its innovations, including three EPA Green Chemistry awards, the Kirkpatrick award and ICIS Innovation awards.

2.1.3 Food and Feed Ingredients

According to the 2019 U.N. IPCC *Special Report on Climate Change and Land*, the global food system—including the land and resources to raise animals and grow crops, plus processing, packaging, and transportation—is responsible for up to 19.1 GtCO₂eq annually, or 37% of total net GHG emissions.⁶⁸ The report finds that changes in both production and consumption are needed to meet global emissions reduction objectives. Biotechnology offers the potential for substantial emissions reductions at every stage of the food system, including potentially transformative solutions in food and feed ingredients.

Animal products account for the largest segment of food sector emissions. According to the FAO, livestock production accounts for approximately 7.1 GtCO₂eq annually, or 15% of global GHG emissions, and consumes roughly ¼ of available land worldwide, with meat production expected to increase 19%, and dairy production

⁶⁷ <http://www.brontidebg.com/wp-content/uploads/2020/10/Genomatica-Sustainability-and-Social-Responsibility-2019.pdf>.

⁶⁸ <http://www.ipcc.ch/srccl/chapter/summary-for-policymakers/>.

33%, from 2017 levels by 2030.⁶⁹ Solutions that reduce dependence on animals offer the greatest potential for emissions reductions from the food sector. But, given the growing global demand for meat and other animal products, sustainable near-term solutions are also needed for animal agriculture. Biotechnology is playing a leading role in the development of both new low-carbon product choices and technologies to reduce the carbon footprint of animal agriculture.

Plant-Based Proteins and Food Products

A recent analysis found that if Americans opted for nutritionally equivalent plant-based products for their meat (beef, chicken and pork) consumption choices, U.S. GHG emissions would be reduced by 280 million metric tons annually—roughly equivalent to the total emissions of the state of Ohio.⁷⁰ Consumer concerns with the carbon footprint of animal agriculture—along with health and animal welfare considerations—are driving strong growth in plant-based proteins and food product choices. Many of the leading options leverage biotechnology.

Impossible Foods, the fourth fastest growing brand in the U.S. in 2019,⁷¹ uses engineered yeast to add heme, an iron-containing molecule found in blood, to its plant-based products to produce a meaty flavor. As of September 2020, Impossible Foods burgers were in 11,000 supermarkets and on the menu of a growing list of national and regional restaurant chains.⁷² A 2019 lifecycle analysis of Impossible Foods' burger found a 89% reduction in carbon footprint and 96% reduction in land use versus traditional beef burgers.⁷³

Perfect Day Foods is bringing a similar approach to milk, cheese and ice cream, using genetically engineered microbes to produce animal-free dairy products.⁷⁴ Given the high carbon intensity of dairy products (nearly 12 kilograms of carbon dioxide are produced for every kilogram of butter, for example)⁷⁵ plant-based dairy has the potential to have an outsized impact.

Motif FoodWorks, a spinoff of biotech leader Ginkgo Bioworks, is employing synthetic biology to develop fermentation-based ingredients to enhance the taste and texture of plant-based meat and dairy options. Motif is expected to launch its first commercial product—an ingredient to improve the flavor of beef substitutes—in 2021.⁷⁶

One of the more novel applications of biotechnology is cultured meat products. New Age Meats is one of several companies working to produce cultured meat, an engineered tissue produced in laboratories by microorganisms that induce and feed the growth of animal muscle cells in a bioreactor. Unlike plant-based approaches, cultured meat is a drop-in option for applications in which specific meat attributes are desired. Cultured meat production is an energy-intensive process that requires more energy than poultry production and almost as much energy as pork production (albeit less than sheep or cattle production). But cultured meat's lack of methane production and ability to utilize low-carbon energy sources is projected to reduce GHG emissions up to 96% compared to traditional meat products.⁷⁷ Cultured meat production also utilizes a small fraction of the land required by livestock production, potentially resulting in lower indirect GHG emissions from land-use change. Cultured meat's consumer acceptance is currently limited by its high production costs and novelty, although this is expected to change as the product moves toward commercialization.⁷⁸

Feed and Feed Ingredients

Roughly half of animal agriculture emissions result from land use, production and processing of animal feed.⁷⁹ Biotechnology is being harnessed to address feed-related emissions from multiple angles, from development of new, low-carbon feed options and lower-carbon approaches to feed production to ingredients that reduce feed waste.

In addition to developing biotech options for animal products, biotech innovation is also being deployed to develop new, low-carbon animal feeds. NouriTech, a joint venture between biotech start-up Calysta and Cargill, is among a growing list of companies using microorganisms to convert methane and other heat-trapping waste gases into single-cell proteins or other ingredients for animal feed. In addition to recycling GHGs that would otherwise be emitted directly to the atmosphere, this process, known as gas fermentation, does not require the use of arable land, avoiding the largest source of GHG emissions associated with feed production. A lifecycle analysis of NouriTech's FeedKind fish feed protein found GHG emissions up to 30 percent lower than conventional fish meal, depending on the source of methane used.⁸⁰ Several biotech businesses are also developing feed ingredients using algae. Similar benefits are anticipated.

Reducing Emissions from Animals

Another leading source of GHGs from agriculture are emissions from the animals themselves. Roughly 40% of all animal agriculture emissions is attributable to methane from enteric fermentation in the digestive system of ruminant animals, for example.⁸¹ Biotech solutions are being developed to address emissions from cattle, swine, poultry, and other animals.

Cattle are the leading source of animal emissions, due to the large numbers of cattle grown globally and their high levels of enteric methane production. Microbial feed additives have the potential to dramatically reduce enteric methane emissions from ruminant livestock by disrupting the methane production process. One ester additive suppresses the enzyme that causes methane production in the digestive tracts of cattle, reducing methane emissions by 30% or more.⁸² A study in peer review of microbial feed additives developed by biotech start-up Locus Fermentation Solutions found reduction in methane levels of up to 78%.⁸³ And recent studies have found methane reductions of up to 99% using certain species of algae.^{84–85} Feed additives based on extracts of garlic and citrus have also produced strong results.⁸⁶ All three additives are being developed for the market. Finally, two other feed additives that are already on the market, one a yeast culture⁸⁷ and the other a blend of essential oils,⁸⁸ reduce dairy cow methane emissions indirectly by increasing the efficiency of milk production, thereby reducing the number of methane-emitting dairy cows needed to produce a certain volume of milk.

Biotech enzymes from Novozymes and others have also been introduced into pig and chicken feed to improve nutrient uptake, reduce waste, and substantially reduce carbon footprint.⁸⁹

Emissions of methane and nitrous oxide from manure is another significant source of GHGs, accounting for ten percent of emissions from animal agriculture.⁹⁰ As mentioned previously, biotechnology has a key role in reducing these emissions as well. The use of anaerobic digestion in animal agriculture has the potential to reduce U.S. GHG emissions by 151 MTCO₂eq. annually by 2050 using current tech-

nology.⁹¹ Considerable research and development is also underway to utilize biotechnology to improve the efficiency of anaerobic digestion through optimization of the microbes and microbial communities used.⁹²

Open manure lagoons are capable of both reducing existing methane emissions and displacing fossil fuels when converted to enclosed anaerobic digesters. These systems capture the lagoons' methane emissions in the form of biogas that can be used to displace fossil fuels such as natural gas as a source of heat and/or electricity. The combustion of the biogas converts the methane into the less-potent GHG carbon dioxide. (One ton of methane has 84 times the global warming potential over 20 years of a ton of carbon dioxide.)⁹³ This capability, when combined with fossil fuel displacement, can result in carbon intensity values for biogas that are very negative despite not involving net carbon sequestration. Biogas that is produced from dairy manure and injected into natural gas pipelines for use as transportation fuel in compressed natural gas vehicles under California's LCFS has received certified carbon intensities that are almost four times lower than that of gasoline, for example.⁹⁴ One estimate calculated that up to 3% of total U.S. electricity consumption could be met by biogas produced in manure lagoons and captured for use with microturbines.⁹⁵

Increased demand for animal protein will cause the livestock sector's contribution to global GHG emissions to increase in the years ahead. The use of biotechnology to limit the climate change impacts of livestock production is at a comparatively early stage of development due to a lack of low-carbon incentives, such as those that have existed in the U.S. power and transportation sectors since the turn of the century. Biotechnology has the potential to drive both near-term and long-term GHG emission reductions in the livestock sector, however. Feed additives and the use of enclosed anaerobic digesters can reduce near-term emissions.

Food and Feed Waste

Waste from food and feed production and delivery is also a significant source of GHG emissions. Nearly 1/3 of all food produced is wasted annually. This food waste had a carbon footprint of 3.3 GtCO₂eq in 2007, representing seven percent of total global GHG emissions, according to the FAO.⁹⁶ Biotech solutions are available or under development to reduce food waste at multiple stages of the food and feed system.

The use of enzymes in bread and other baked goods has significantly enhanced product shelf life and reduced waste.⁹⁷ Organic acids and other products of industrial biotechnology have been developed by BASF and others to reduce spoilage of animal feeds.⁹⁸ Other biotech innovators are developing biobased antimicrobial coatings to reduce spoilage and inhibit pathogens in fruits and vegetables.⁹⁹ Others still are focusing on the use of biosensors to optimize produce ripeness to minimize spoilage.^{100–101}

Food Ingredients

Biotechnology is also reducing the carbon footprint of a variety of food ingredients. The plant-based sweetener, stevia, for example has shown an 82% reduction in carbon footprint compared with beet sugar and a 64% reduction compared with cane sugar.¹⁰² But the most desirable compounds of the stevia leaf are present in very low concentrations, limiting its market. Biotech leaders Evolva and DSM have developed pathways to produce those key stevia compounds through fermentation. Both have formed partnerships with Cargill and began production of fermentation-

based stevia at commercial scale in 2019. Cargill's initial lifecycle assessment suggests the fermentation-based stevia has an even lower carbon footprint than the plant-based extract.¹⁰³ Nearly 200 million tons of sugar are produced globally each year.¹⁰⁴ With a carbon footprint of 241 kg CO₂e per ton of sugar,¹⁰⁵ the sugar sector accounts for roughly 48 MTCO₂ annually.

Biotechnology	Applications in Food and Feed Waste
Organic Acids	Reduce Spoilage In Animal Feeds
Biobased Coatings	Reduce Spoilage and Inhibit Pathogens in Fruits and Vegetables
Biosensors	Optimize Ripeness to Minimize Spoilage
Plant Genetic Engineering	Develop Food Varieties With Less Spoilage
Animal Genetic Engineering	Develop Farmed Animals That Require Less Food

As another example, vanillin, one of the most widely used synthetic food ingredients, was traditionally produced through a carbon- and energy-intensive process using coal tar. New biotech routes now allow for purer production without reliance on extraction or processing of fossil fuels.¹⁰⁶

Food Processing

Biotech enzymes are also being used to dramatically lower the carbon footprint of food processing. The most significant example is the use of enzymes in meat processing. By eliminating energy-intensive traditional processing steps, industry-wide integration of enzymatic processes for meat processing would result in over 100 MTCO₂e annually, according to the World Wildlife Fund. Smaller, but significant, reductions would result from adoption of enzymatic processing in fish and dairy processing, and beer and wine production. WWF estimated the total potential reductions from enzyme applications in the food sector at 114 to 166 MTCO₂e annually.¹⁰⁷

Veramaris Case Study

Fish are among the lowest carbon intensity sources of meat.¹⁰⁸ As global demand for animal products continues to grow, and with most of the world's wild

¹⁰⁸ <http://www.nature.com/articles/s41598-020-68231-8>.

fish stocks at, or beyond, sustainable harvest levels,¹⁰⁹ aquaculture—farmed fish and other seafood—will play a key role in mitigating the impact of meat consumption on the climate.

Salmon aquaculture is the fastest-growing food production system in the world.¹¹⁰ Salmon's popularity and relatively low carbon intensity make it an attractive option to displace some of the projected growth in the consumption of beef and other higher carbon intensity meats. The growth of salmon aquaculture is currently limited by the availability of the marine omega-3 oils EPA and DHA, key components of salmon diets. Marine omega-3 oils have, until recently, been derived almost exclusively from wild-caught oily fish, such as anchovy and menhaden, whose wild stocks are limited and increasingly threatened by climate change.¹¹¹

Veramaris, a joint venture between biotech leaders DSM and Evonik Industries, has eliminated this supply chain and sustainability barrier by developing a biotech approach to marine omega-3 oil production. Veramaris identified marine algae that produce EPA and DHA naturally, and recently began commercial production of algae-based omega-3 oils at a \$200 million facility in Blair, Nebraska.¹¹² The facility can produce omega-3 oils equivalent to 1.2 million tons of wild-caught fish, enough to supply 15 percent of salmon farming industry demand,¹¹³ and has brought jobs and economic development to a region hit hard by low commodity prices and recent trade disputes.

By sourcing omega-3 oils from locally grown algae, Veramaris also dramatically shortens the feed supply chain, reducing emissions associated with the harvesting, processing, and transport of fish oil.

2.2 Agriculture Inputs and Climate Services

2.2.1 Agricultural Biological

Modern agriculture is an energy-intensive process. In addition to the need to fuel heavy machinery, many farming practices release carbon dioxide from both biogenic and fossil sources that would otherwise remain stably sequestered. Intensive tilling practices expose soil carbon to the atmosphere, allowing it to react with oxygen to form carbon dioxide. Nitrogen fertilizers increase the sequestration potential and minimize the land footprint of crops, but they are derived from fossil fuels such as natural gas and generate the potent GHG nitrous oxide. Advances in crop science and technology can mitigate some of these unwanted environmental effects. No-till agriculture using herbicide-resistant crops limits soil disruption and reduces the amount of soil carbon that is released to the atmosphere as carbon dioxide. The development of crop varieties with added or improved nitrogen-fixing capabilities allows for more efficient use of nitrogen fertilizer when combined with crop rotation practices.¹¹⁴ And the engineering of commonly used crops to give them resistance to environmental threats such as drought and pests enhances their carbon sequestration potential while minimizing indirect GHG emissions from deforestation.

One of the fastest growing, and most promising, applications of biotechnology is in agricultural biologicals. Soil microorganisms play a key role in plant growth, enabling efficient access to nutrients and protecting against pests and diseases. Ag biologicals leverages biotechnology to improve soil microbes and enhance these natural processes. A major area of focus for ag biologicals companies is increasing plant uptake of nitrogen to allow for more efficient use of synthetic nitrogen fertilizer. Synthetic nitrogen fertilizer is a significant source of climate-warming gases. It is energy intensive to produce, and a substantial fraction of the nitrogen in fertilizer becomes nitrous oxide (N₂O) a greenhouse gas 298 times more potent than carbon dioxide. Joyn Bio, a joint venture between the synthetic biology company, Ginkgo Bioworks, and Bayer, is engineering microbes to enable cereal crops like corn, wheat, and rice to convert nitrogen from the air into a form they can use to grow, allowing for more efficient use of synthetic fertilizers for many of the world's leading crops.

¹¹³ <http://www.veramaris.com/press-releases-detail/veramaris-opens-us200m-facility-for-epa-dha-omega-3-algal-oil-to-support-sustainable-growth-in-aquaculture.html>.

¹¹⁴ <http://news.wisc.edu/corn-that-acquires-its-own-nitrogen-identified-reducing-need-for-fertilizer/>.

Other biotech researchers and businesses are developing nitrogen- and carbon-fixing bacteria or algae to build soil carbon and enhance the absorption of atmospheric nitrogen by soils.^{115–116} And biotech innovators such as Vestaron are developing safer, more sustainable crop protection tools, such as biological peptides, to provide crops with greater resiliency to plant stress induced by climate change.¹¹⁷

Joyn Bio Case Study

Nitrogen is an essential nutrient for plant growth, but the abundant nitrogen in the atmosphere is not in a form that plants can use. Soybeans, peanuts, and other legumes have developed a symbiotic relationship with nitrogen-fixing microorganisms in the soil that convert nitrogen from the air into a form they can absorb through their roots. But cereal crops like corn, wheat, and rice don't have this ability, and require the addition of fertilizers to maximize growth.

Synthetic nitrogen fertilizers have revolutionized farming, but are a potent source of agricultural greenhouse gas emissions. They are energy intensive to produce, and a substantial fraction of the nitrogen in fertilizer becomes nitrous oxide (N₂O) a greenhouse gas up to 298 times more potent than carbon dioxide.¹¹⁸ Joyn Bio, a joint venture between the synthetic biology company, Ginkgo Bioworks, and Bayer, is using biotechnology to reduce agricultural GHG emissions by designing nitrogen-fixing soil microbes that work with corn and other cereal crops, allowing for more efficient use of synthetic fertilizers for many of the world's leading crops.

2.2.2 Biological Carbon Capture, Use and Storage

Biomass is one of America's major, albeit transitory, carbon sinks. All forms of biomass that employ photosynthesis capture atmospheric carbon dioxide and convert it to carbon-based compounds such as sugars, starch, and lignocellulose. The carbon content of this biomass remains sequestered until the biomass is either consumed or decomposes, at which time much of it is oxidized and released back to the atmosphere as carbon dioxide. Some of the carbon content, such as that contained in a plant's roots, is sequestered for much longer time periods in the form of below-ground biomass. It is for this reason that the afforestation/reforestation of marginal land can result in the formation of new carbon sinks and the long-term removal of carbon dioxide from the atmosphere.

¹¹⁵ <http://www.frontiersin.org/articles/10.3389/fmicb.2019.01146/full>.

¹¹⁶ http://usea.org/sites/default/files/event-/USEA%20Tech%20Briefing_Matt%20Carr_Algae%20for%20Carbon%20Capture%20&%20Use_March_2018.pdf.

¹¹⁷ Iriti M., Vitalini S. *Sustainable Crop Protection, Global Climate Change, Food Security and Safety-Plant Immunity at the Crossroads*. VACCINES. 2020; 8(1): 42. <http://doi.org/10.3390/vaccines8010042>. <https://www.mdpi.com/2076-393X/8/1/42>.

¹¹⁸ <http://www.epa.gov/ghgemissions/understanding-global-warming-potentials>.

Carbon that is sequestered as below-ground biomass can remain in that state so long as the surrounding soil is not disrupted. The length of time that biomass's aboveground carbon content remains sequestered depends on how the biomass is utilized. The combustion of biomass, whether in its natural form or following conversion to biofuel, results in the oxidation and release of its carbon content as carbon dioxide. While carbon-neutral in the sense that the released biogenic carbon had been captured from the atmosphere during the growing season, traditional combustion prevents the carbon from being either sequestered or reused prior to the completion of another growing season.

A variety of biotechnologies have been developed that either capture and sequester or recycle atmospheric carbon dioxide. Many of these processes are closely related to the biobased products covered in Section 2.1 because of the ability of biomass to capture atmospheric carbon dioxide before being converted to different fuels and products. The technologies in question impact every stage of the biomass supply chain, from growth/production to conversion and ultimately end-of-life disposal.

Carbon capture and storage (CCS) technologies enable carbon dioxide emissions from fossil power plants or industrial facilities, such as cement or steel, to be captured at the facility and stored underground. A variety of approaches have been developed to absorb carbon dioxide from flue gases, or to remove carbon prior to combustion.¹¹⁹ CCS can also be deployed at facilities utilizing biomass as feedstock. The process is largely the same as that employed at some fossil fuel facilities but, whereas fossil energy carbon capture and sequestration (FECCS) processes reduce the GHG emissions of fossil fuels, biomass energy carbon capture and sequestration (BECCS) processes actually reverse past emissions. The biomass captures atmospheric carbon dioxide during its growth phase and is then combusted, yielding both energy and carbon dioxide. The bioenergy displaces fossil energy and the carbon dioxide is either sequestered in underground caverns as a gas or converted to a degradation-resistant solid such as biochar. BECCS is therefore a carbon-negative process in that it results in more carbon dioxide being sequestered than emitted. Biotechnology advances that increase the growth rate, growth potential, and harvest efficiency of biomass that is used as BECCS feedstock all enhance the process's carbon sequestration capability.

BECCS technology can also be deployed to achieve negative carbon results at any industrial facility using biomass as a feedstock. Perhaps the most intriguing application of BECCS is its potential use at ethanol plants and other biorefineries. One third of the carbon in the biomass feedstock used to produce ethanol is released in the form of carbon dioxide during the fermentation process. Using BECCS to capture this CO₂ reduces the carbon intensity of ethanol by 40%.¹²⁰ Biorefineries represent an extremely attractive option for deploying BECCS because the product of fermentation is a nearly pure (99%) stream of CO₂, requiring little or no separation from other gases. As a result, biorefinery BECCS is among the lowest-cost carbon capture opportunities available, at an estimated cost of under \$30 per ton of CO₂ compared to \$60–\$120 per ton at fossil power plants or traditional industrial facilities.¹²¹ The world's first ethanol BECCS project is now in operation in Decatur, Illinois, capturing and storing 1 MTCO₂eq per year that would otherwise have been emitted to the atmosphere.¹²²

In addition to its role in providing biomass feedstocks for BECCS, biotechnology is increasingly seen as a key enabling technology for carbon capture itself. The U.S. Department of Energy (DOE) has invested over \$150 million since 2015 in the development of algae and other microbial systems for carbon capture as an alternative—or complimentary—approach to chemistry-based approaches to CO₂ extraction from flue gases.¹²³ Microbial systems have several significant advantages over thermochemical approaches to carbon capture. Typical thermochemical CCS systems are highly energy intensive. Roughly 30% of captured carbon is offset by the additional fossil fuel combustion required to separate, compress, and transport the captured carbon.¹²⁴ Microbial systems can dramatically reduce this “parasitic load.” Algae and other microbes extract CO₂ or other target gases biologically, via photosynthesis or other natural energy pathways, eliminating the energy inputs required for separation. Microbial systems can even operate efficiently at the relatively low

CO₂ concentrations found in flue gases from natural gas or coal-fired power plants, and can be deployed economically at relatively small scale to address emissions from smaller power plants and industrial facilities that cannot support traditional CCS systems. Microbial systems also convert the captured carbon into a usable solid or liquid form directly, eliminating the substantial energy inputs required to compress captured CO₂ for transport, or for use in enhanced oil recovery. As such, *microbial carbon capture systems applied to biomass energy or other biorefinery systems offer one of the most carbon-negative climate solutions available.*

DOE in its 2016 Billion Ton Report found that *suitable land and other infrastructure exists to deploy algae-based carbon capture systems at more than 500 power plants and ethanol facilities in the U.S. These systems would have a potential to capture more than 200 MT CO₂ annually.*¹²⁵

Biomass and carbon capture can then be combined with the carbon dioxide recycling technologies discussed in Section 2.1 to produce negative-carbon products from captured biogenic carbon. The biomass energy carbon capture and utilization (BECCU) process displaces both fossil energy consumption and fossil fuel emissions. As with BECCS, BECCU uses biogenic carbon to generate energy via combustion, displacing fossil fuels in the process. The resulting carbon dioxide is captured but, instead of being sequestered, is converted into yet another fuel or product that displaces additional fossil fuels. BECCU can still be carbon-negative, either because it displaces more carbon dioxide emissions from fossil fuels than it emits when the utilization takes the form of conversion to biofuels or biodegradable products, or because the utilization takes the form of conversion to non-biodegradable products.¹²⁶ In the latter case, carbon sequestration still occurs, but in a long-lifetime product, rather than geologic storage.

BECCS and BECCU are not widely employed in the U.S. at present due to a relative lack of economic or policy incentives for the capture of carbon dioxide. Those CCS projects that do exist in North America involve fossil rather than biogenic sources of carbon.¹²⁷ That said, climate scientists increasingly believe that the two technologies will need to be widely utilized if catastrophic climate change is to be avoided. The UN's Intergovernmental Panel on Climate Change (IPCC) has concluded that keeping the atmospheric carbon dioxide level below 450 ppm by 2100, as is necessary if catastrophic climate change is to be avoided, will require the "availability and widespread deployment of BECCS and afforestation."¹²⁸ The primary hurdle facing BECCS/BECCU commercialization is one of economics rather than technology: carbon capture is economically unattractive at a time when the cost of emissions is lower than the cost of capture.¹²⁹ The technical feasibility of capture and sequestration is especially well-established for those technologies that rely upon natural processes such as the building of soil carbon via afforestation/re-forestation or the planting of certain dedicated energy crops. BECCU also offers an advantage over BECCS in the absence of a high emissions cost due to its production of higher-value products such as fuels or chemicals; BECCS, by contrast, produces lower-value products such as heat and electricity.¹³⁰

The ability of BECCS to achieve net-negative carbon emissions and their magnitude depend on several different factors involving the different stages of the supply chain. A comparison of multiple biomass feedstocks combusted in a power plant equipped with CCS technology determined that while growth of the three feedstocks considered (Miscanthus, switchgrass, and willow) all have the potential to achieve net sequestration, the actual amount of sequestration that occurs is determined by biomass transportation distances, carbon capture rates, and especially land-use change (*e.g.*, what type of land that the biomass feedstock is grown on).¹³¹ The analysis calculated that the amount of carbon dioxide ultimately sequestered on average while generating 1 megawatt hour of electricity via BECCS with Miscanthus and switchgrass is equal to the average amount emitted by U.S. power plants to generate an equal amount of electricity.

BECCU has also been found to achieve low-to-negative carbon intensities. A life cycle assessment that compared the carbon intensities of ethanol produced from steel mill waste gases found its carbon footprint to be at least 60% lower than that

of gasoline.¹³² Dedicated energy crops such as Miscanthus and willow grown for the purpose of electricity generation have been found to achieve net-negative emissions of carbon dioxide due to the combined effects of soil carbon sequestration and the displacement of fossil fuels.¹³³ A different analysis found emissions via afforestation/reforestation to also be negative even if the forest is harvested and utilized as wood products such as sawtimber, as these constitute a different form of BECCU.¹³⁴

The carbon dioxide reduction and sequestration potential of BECCS/BECCU technologies is very sensitive to land-use change. For example, the largest amount of sequestration occurs when dedicated energy crop growth or afforestation/reforestation occurs on abandoned or marginal croplands that have previously had their soil carbon depleted. On the other hand, the conversion of grassland to these uses results in a reduced sequestration potential, while the conversion of productive cropland can have the lowest sequestration potential of all if the resulting decrease in the supply of the crop causes the conversion of land such as forest to cropland somewhere else. Biotechnology provides several methods for mitigating these unintended consequences through advances in plant and crop science that are described in more detail in Section 2.4.1.

LanzaTech Case Study

LanzaTech is unique for its ability to make low carbon fuels and chemicals from a variety of waste-based feedstocks, including industrial emissions, unsorted, unrecyclable municipal solid waste, and agricultural or forestry wastes and residues. The company utilizes a naturally occurring bacteria originally isolated from rabbit droppings. As part of its natural biology, the bacteria ferments gases containing carbon dioxide, carbon monoxide, and/or hydrogen into ethanol. This ethanol can be used directly as a fuel to displace gasoline or as a chemical in consumer products.¹³⁵ Additionally, ethanol can be upgraded to make consumer goods from polyethylene¹³⁶ or PET, and to make sustainable aviation fuel (SAF) via the LanzaJet Alcohol-to-Jet pathway,^[1] to displace fossil fuel demand in the aviation sector. The opportunities for LanzaTech's tech-

Editor's note: there appears to be a discrepancy in the numbering of the footnotes. Footnotes 137–139 were used in the *LanzaTech Case Study* and were duplicated in the following section. To avoid confusion the *LanzaTech Case Study* footnotes are renumbered [i]–[iii].

nologies to utilize waste carbon to produce multiple low carbon fuels and chemicals has expanded over the last decade as its technology has been licensed worldwide.

The LanzaTech pathway differs from conventional ethanol production in that it feeds its microorganisms with a gas stream rather than a liquid sugar substrate. While carbon is the most important ingredient in this gas stream, the microorganisms are capable of fermenting gases produced from a variety of industrial processes and feedstocks. The gases are captured and compressed before being delivered to a bioreactor where fermentation to ethanol occurs. The ethanol is then recovered from the bioreactor and stored for future use either in that form or following subsequent upgrading to a hydrocarbon fuel.

The first commercial-scale facility to utilize LanzaTech's pathway is a steel mill located near Beijing, China. Waste gases produced at the mill are captured and fermented to ethanol at a rate of 16 million gallons per year. The company estimates that the recycling of the mill's GHG emissions in this manner is the equivalent of removing 80,000 cars from the road annually.^[ii] The success of the technology at such a large scale has resulted in plans to apply it to other types of industrial facilities, including a petroleum refinery in India that will achieve an annual ethanol yield of 11 million gallons, a steel mill in Belgium that will achieve an annual ethanol yield of 21 million gallons, and a smelter in South Africa that will achieve an annual ethanol yield of 17 million gallons.

Beyond recycled carbon fuels, LanzaTech's platform can make second generation biofuels through gasification of biomass wastes and residues. LanzaTech is developing a project to convert locally available agricultural residues to approximately 5.3 million gallons per year of fuel grade ethanol in India, using commercially proven gasification technology and LanzaTech's commercially proven gas fermentation platform. The integrated technology will have the flexibility to process a wide range of biomass feedstocks enabling rapid replication at other locations.

A byproduct of the project will be a nutrient rich biochar. Biochar can be a useful soil supplement to enrich soil organic carbon and other nutrients. In 2018, LanzaTech launched a new company, LanzaJet to accelerate the commercialization of SAF production. The LanzaJet process can use any source of sustainable ethanol for jet fuel production, including, but not limited to, ethanol made from recycled pollution, the core application of LanzaTech's carbon recycling platform.

Commercialization of this process, called Alcohol-to-Jet (AtJ) has been years in the making, starting with the partnership between LanzaTech and the U.S. Energy Department's Pacific Northwest National Laboratory (PNNL). PNNL developed a unique catalytic process to upgrade ethanol to alcohol-to-jet synthetic paraffinic kerosene (ATJ-SPK) which LanzaTech took from the laboratory to pilot scale. SAF produced via the company's pathway has already been employed in two commercial flights to demonstrate its ability to displace fossil aviation fuel.^[iii] LanzaTech estimates that SAF produced using its technology achieves a 70% reduction to carbon intensity compared to fossil aviation fuel.

2.3 *New Biotech Tools and Bioindustrial Manufacturing*

2.3.1 *New Biotech Tools*

Rapid advances in the fundamental tools of biotechnology increasingly are enabling biotech solutions in manufacturing sectors beyond food, fuels and chemicals. These developments offer the potential for transformative climate solutions in applications beyond manufacturing as well.

Biotech tools for manipulating DNA have been in use for decades. Many of the most important contributions of biotechnology—vaccines and therapies, biotech crops, and modern industrial biotechnology—were made possible by this first generation of genetic engineering tools. But the past decade has seen a wave of new biotech tool innovation with transformative potential. In synthetic biology, scientists insert synthesized pieces of DNA into an organism's genome to alter the characteristics or function of the organism. In genome editing, scientists use tools to make more precise changes to the organism's own DNA to achieve the same outcome.¹³⁷ These and other new biotech tools have dramatically increased the speed and re-

¹³⁷ <http://www.genome.gov/about-genomics/policy-issues/Synthetic-Biology>.

duced the cost of genetic engineering applications and are being deployed to tackle a range of global challenges, including climate change.¹³⁸

2.3.2 Applications of Bio-Manufacturing in Traditional Industries

Some of industrial biotechnology's earliest uses were in the application of enzymes to improve efficiency and reduce energy use in traditional industries. The introduction of enzymes for pulp and paper bleaching, for example, reduced energy consumption 40% *versus* traditional bleaching, and a shift to fermentation-based production of riboflavin (vitamin B₂) in the early 2000's reduced associated CO₂ emissions 80% compared to the traditional chemical manufacturing route.¹³⁹ Applications of enzymes in textile processing, such as pretreatment, bleaching and desizing, save approximately 10 MTCO₂e annually today. Full adoption of these technologies would triple these reductions. The widespread use of enzymes in laundry and dishwasher detergent could save an additional 30 MTCO₂e annually by 2040 by allowing for cold-water washing of laundry and more efficient dishwashing. Full market penetration of biotech applications in these traditional industries is estimated to save 65 MTCO₂e annually by 2030.¹⁴⁰ While these GHG are incremental relative to the global challenge of climate change, they represent near-term opportunities that will be essential to reducing near-term emissions.

GHG reduction potential from applications of biotechnology to traditional industries.

2.3.3 New Markets and Novel Applications

With the emergence of synthetic biology and the ability to tailor microbes to specific industrial tasks, industrial biotechnology solutions are moving into an ever-expanding range of applications. A rapidly growing number of companies, such as Ginkgo Bioworks, Arzeda, and Twist Biosciences, are providing organism design and DNA synthesis services, using synthetic-biology and other modern biotechnology tools to optimize manufacturing pathways. SynBio companies raised over \$1 billion in investment in the second quarter of 2019 alone.¹⁴¹

One intriguing potential application of these new biotech tools is in biological data storage, the storage of data on strands of DNA instead of semiconductors or magnetic devices. DNA is roughly a million times denser than conventional hard-disk storage. Testing is now underway with computers that store data by synthesizing

¹³⁸ <http://www.genome.gov/about-genomics/fact-sheets/Sequencing-Human-Genome-cost>.

¹³⁹ <http://www.bio.org/sites/default/files/legacy/bioorg/docs/files/CleanerExecSumm.pdf>.

¹⁴¹ <http://synbiobeta.com/these-37-synthetic-biology-companies-raised-1-2b-this-quarter/>.

strands of DNA. A shift to biological data storage would eliminate the need for mining and production of silicon or precious metals. More significantly, it could dramatically reduce the need for massive data storage facilities.¹⁴² Energy consumption by data storage facilities already accounts for 2% of global GHG emissions, and is projected to surge to 14% of global emissions by 2040.¹⁴³ DARPA, the Defense Department's Advanced Research Projects Agency, is investing \$15 million in work by Microsoft, Twist Bioscience, and others to develop DNA storage.¹⁴⁴ A collaboration between the University of Washington and Microsoft successfully demonstrated their fully-automated end-to-end DNA storage process in 2019.¹⁴⁵

Biology-based parallel computing—in which biomolecules are used to test a large number of solutions to a problem simultaneously—is also being evaluated as another potential application of biotechnology. A proof of concept experiment at McGill University yielded a solution to a complex mathematical problem with less than 0.1% of the energy required to solve the problem with traditional computing.¹⁴⁶

Synthetic biology is also being deployed to accelerate the development of solutions to the COVID-19 pandemic.

In addition to applications in manufacturing, synthetic biology has the potential to provide transformative solutions for carbon dioxide removal from the atmosphere and oceans.¹⁴⁷

Synthetic biology could be applied to enhance photosynthetic efficiency of trees, or reduce respiration from soil microbes, to shift natural carbon cycles towards carbon removal. Even small improvements in these natural carbon cycles could have profound impacts, given that 120 GTCO₂e is removed from the atmosphere by terrestrial photosynthesis.¹⁴⁸ As discussed in section 2.2.2, deployment of microbial systems for carbon capture has the potential to further draw down atmospheric carbon concentrations.*

Inscripta Case Study

The power of synthetic biology lies in its ability to make possible microbes to perform any task. SynBio innovators are applying the tools of their trade to design microbes to make plastics from plants, optimize fertilizer, capture carbon and even combat COVID-19. But unlocking the full potential of synthetic biology to take on the world's greatest challenges—including climate change—will require synbio tools to be available to every scientist or biotech start-up.

Jennifer Doudna at the University of California, Berkeley, and Emmanuelle Charpentier at the Max Planck Institute in Berlin were awarded the 2020 Nobel Prize in Chemistry for their work in developing the CRISPR gene editing technique, an approach that has revolutionized genetic engineering. But, until recently, CRISPR technology was prohibitively complex and expensive for most researchers.

In 2019, Boulder, Colorado-based Inscripta flipped the script, launching an affordable system that can perform thousands of gene edits at the push of a button.¹⁵⁰ This innovation has attracted hundreds of millions of dollars in venture capital investments and a growing list of global customers, many of whom will surely apply the technology to addressing global climate change.

2.4 Plant and Animal Biotechnology

2.4.1 Plant Biotechnology and Gene Editing
