Biomass has a critical role to play in efforts to mitigate climate change. As described in Sections 2.1 and 2.2, biomass can replace a wide variety of fossil fuels and products, reducing or even sequestering carbon dioxide emissions in the process. At the same time, though, biomass can contribute to climate change if it is used unsustainably, and it will need to adapt to unprecedented growing conditions as the planet continues to warm. Biotechnology is providing important advantages on both counts, enhancing the amount of biomass that can be sustainably harvested while also improving the climate resiliency of many important crops and other plants.

Genetically modified organisms (GMO) have been used since the 1990s to make important crops such as grains and oilseeds resistant to common threats including drought and pests. These past breakthroughs mitigated climate change by reducing the amount of land required by the agriculture sector. Yields of corn per acre in the U.S. increased by approximately 60% between 1991 and 2019¹⁵¹ while those of soybeans increased by almost 50% over the same period.¹⁵² There were fewer acres of

¹⁵⁰ <http://www.inscripta.com/news/press-release-inscripta-launches-the-worlds-first-benchmark-platform-for-digital-genome-engineering>.

¹⁵¹ http://www.nass.usda.gov/Charts_and_Maps/Field_Crops/cornylid.php.

¹⁵² http://www.nass.usda.gov/Charts_and_Maps/Field_Crops/soyylid.php.

cropland in production in the U.S. in 2012 than there were in 1945,¹⁵³ despite the large increases to the U.S. and world populations that occurred over that time, due to this improved productivity.

It is important that these productivity increases continue to be made in the coming decades if agriculture's contributions to climate change are to be limited. The continued growth of the global population will create additional demand for crops at a time when growing seasons and conditions are expected to become more uncertain due to climate change.¹⁵⁴ Future food crop shortages, whether due to increased demand from population growth or crop failures caused by extreme weather, would potentially contribute to climate change by encouraging the conversion of carbon sinks such as grassland and forests to cropland, thereby releasing carbon dioxide sequestered in the biomass and soil to the atmosphere. Likewise, improvements to the resiliency of dedicated energy crops during extreme weather events will improve both climate and energy security by enabling their utilization as low-carbon bioenergy and bioproduct feedstocks to increase.

Biotechnology is also enabling the expansion of existing bioenergy pathways. The U.S. is currently undergoing a rapid increase to its renewable diesel production capacity that will result in additional demand for lipid feedstocks.¹⁵⁵ Work is underway to utilize fast-growing and/or resilient undomesticated biomass such as *Jatropha* and microalgae as biofuels feedstocks. Both forms of biomass can grow on marginal lands while limiting the disturbance of existing carbon sinks. However, their utilization as bioenergy has historically been constrained by poor crop yields outside of the laboratory. Cell engineering has enabled the necessary yields for commercial production to be achieved in microalgae,¹⁵⁶ and research is actively underway to improve *Jatropha* as a feedstock.¹⁵⁷ Biotechnology is also being utilized to expand the supply of lipid feedstocks by enabling the conversion of waste products, as is described in Section 1.1.1.

The development of the CRISPR gene editing technique over the last decade has already led to notable breakthroughs in the effort to mitigate climate change. In addition to microalgae,¹⁵⁸ multiple strains of bacteria, yeast, and filamentous fungi have been modified via the CRISPR technique to increase the yields and types of products produced via fermentation.¹⁵⁹ The CRISPR technique has also been employed with dedicated energy crops such as Miscanthus, poplar, switchgrass, and willow to refine specific traits that improve both resiliency and yields, although the higher complexity of these forms of biomass and regulatory uncertainty about their possible status as genetically modified organisms have slowed progress.¹⁶⁰ Finally, CRISPR gene editing has also been employed to improve the resiliency and carbon efficiency of first-generation bioenergy feedstocks such as corn¹⁶¹ and soybeans under the types of extreme weather conditions that are expected to occur with growing frequency as a result of climate change.¹⁶²

Biotechnology is also being used to develop plant varieties, including apples and potatoes, that extend shelf life and avoid cosmetic issues, such as browning or spotting, that cause consumers to throw away food.¹⁶³

Biotechnology has enabled major improvements to the yields, land-use efficiency, and resiliency of important U.S. bioenergy feedstocks in recent decades. Continued biotechnology advances will need to occur in the near future if these improvements are to be maintained, let alone expanded upon. Climate change is expected to result in extreme weather events that are greater in frequency, magnitude, and duration, and these will threaten production of both the feedstocks that have contributed heavily to U.S. bioenergy and bioproducts to date as well as the plant biomass that slows the rate of atmospheric GHG concentration increase. The development of the CRISPR gene editing technique, along with continued advances in more traditional genetic engineering processes, will do much to enhance the ability of biomass to mitigate fossil fuel consumption and GHG emissions.

2.4.2 Animal Biotechnology

In addition to the on-farm applications addressed in previous sections, biotechnology is also being leveraged to improve the carbon efficiency of animal agriculture through genetic engineering of the animals themselves. The biotech AquaBounty salmon, for example, requires 25% less feed than traditional Atlantic salmon. The combination of lower inputs and a closed-loop, land-based production system that can be deployed much closer to U.S. customers is estimated to result in a carbon footprint that is 96% lower than traditional farmed salmon.¹⁶⁴

Biotech tools are also being used to improve fertility, increase production efficiency, and reduce disease in cattle, swine and other animals, further reducing waste in animal production. Scientists in the U.S. are employing genomic tools to improve the ability of cattle to tolerate higher temperatures while maintaining their growth.¹⁶⁵ Heat stress, which is an increasing problem in the livestock sector due to climate change, limits the production of animal protein, and heat-tolerant cattle will be better able to maintain their production efficiency as temperatures increase. The genetic sequencing of dairy cattle has likewise led to efforts to improve the efficiency of milk production via genetic engineering.¹⁶⁶ Livestock are a major source of the potent greenhouse gas methane, causing improvements to the efficiency of protein and milk production to have an outsized impact on GHG emissions.

3 Climate Impact Analysis

3.1 Issues in LCA for Biotechnology

Successfully mitigating the impacts of climate change will involve simultaneous transformational shifts across technology, policy and business. Effectively planning, managing and evaluating these shifts will require an equally profound shift in how we track and account for carbon. Life Cycle Analysis (LCA) is widely regarded as the most appropriate and effective way of evaluating the carbon impacts of products and processes in the complex, modern economy. LCA is an analytical technique in which all inputs, outputs and impacts of a product or process are tracked and accounted for through its full life cycle. This includes the materials used to make things, the energy and associated emissions from transporting and processing them, and what happens at the end of a product's useful life. LCA is especially important and complex when biological systems are involved, since they introduce a significant degree of uncertainty; external conditions, pathogens, or changes in surrounding ecosystems can all impact the productivity of any organism.

There are three main approaches to LCA: attributional LCA, consequential LCA and economic input-output (EIO) LCA. Attributional LCA focuses on the direct actions taken by a producer in order to make a product; all of the energy or materials consumed during production would be captured by an attributional LCA, for example. Consequential LCA, in contrast, focuses on comparing the world with the product in question to a hypothetical world without it; it not only captures all the materials used in production, but also how the product and its supply chains affect markets or other products. EIO LCA uses the flow of money through systems to estimate environmental impacts. For example, an EIO-LCA may use the average carbon emissions per dollar of revenue in the petrochemical industry to estimate the impacts of petrochemical inputs to other products. The accuracy of EIO LCA suffers because its impact-per-dollar estimates are, by necessity, industry averages or ab-

¹⁶³ <http://www.forbes.com/sites/gmoanswers/2016/11/18/gmos-help-reduce-food-waste/#710a513943bc>.

¹⁶⁴ <http://aquabounty.com/sustainable/>.

¹⁶⁵ <http://www.digitaltrends.com/cool-tech/genetic-engineer-heat-resistant-cows/>.

¹⁶⁶ <http://www.wpr.org/how-we-produce-more-milk-fewer-cows>.

stract estimates. It is best used for high level, market-wide estimates rather than evaluating individual products or services. Attributional LCA is simpler than consequential, especially for most manufacturing processes, but consequential LCA is widely viewed as a more accurate technique because it can account for indirect effects, such as those that occur because of changes in commodity prices or disrupted supply chains. Attributional LCA would overlook the impact of new strains of crop on agricultural markets, for example, whereas consequential approaches may be able to account for these.

The science of LCA has rapidly evolved over recent decades; however, a number of critical challenges remain pertaining to LCA in biotech:

Lack of Data on Critical Inputs or Processes—Like most modeling techniques, the results of an LCA are only as good as the input data. In many cases, critical elements needed to understand the impacts of a product or process are unavailable, due to insufficient fundamental research, protections on proprietary information, or changes in technology. One common example is that many biotechnological manufacturing systems use enzymes or catalysts. Data on the energy or materials used to make these inputs is typically considered proprietary business information, which renders many LCAs on biotech products uncertain, at best. In other instances, the only source of data on an industrial practice is extrapolated from textbooks or older research on the subject, often overlooking recent technological developments in the field.

Inadequate tracking of existing markets or systems—Consequential LCA's value derives largely from its ability to assess indirect effects. A common example of an indirect effect is Indirect Land Use Change (ILUC), which occurs when a system uses an agricultural product as its input, such as a biofuel made from soybean oil. While the biofuel itself may release little carbon during its production or use, the gallons of soybean oil which went into the biofuel would have otherwise been consumed elsewhere, such as in food products, animal feed or cosmetics. Those previous consumers must now find alternative sources of vegetable oil on the open market, driving up prices, which may result in clearing land to grow more oilseed crops. This land clearance is ILUC, the acres being cleared may not be used to produce biofuel, but they are cleared because of biofuel. Consequential LCA often requires tracking markets, land use, or behavior over a long period of time in order to establish "normal" behavior in that system; at present these data are often not collected, or are proprietary.

Multiple LCA Methods—LCA is at its heart a scientific exercise, but parts of it require subjective judgment, like decisions about how to define system boundaries or allocate impacts between multiple products. There may be multiple valid answers to these judgment questions. For example, in the U.S. almost all ethanol production takes in corn and produces ethanol as well as the solids left behind after processing, which are typically sold as a high-protein animal feed known as "distiller's grains". The question for LCA practitioners is how much of the energy used in the process is assigned to the ethanol product *vs.* the distiller's grains. There are several methods for doing this, such as assigning based on the relative mass, energy content or monetary value of each product, but there is no objectively right or wrong answer about which method should be selected; it's a judgment call. When true objectivity may be impossible to attain, consensus can be a reasonable substitute. Government, industry and academic stakeholders can mutually agree on answers to questions like this to ensure that at the very least, LCAs can be made on the basis of similar assumptions, so that they can be effectively compared against each other.

Ultimately, the analytical tools which support LCA will need to evolve in parallel with the biotech industry as it rises to meet the challenge of climate change. Industry groups can help support the continued development of LCA data by supporting basic research, agreeing to make more data on inputs and outputs from manufacturing available to researchers, and continuing to support and publish LCA studies of their products. Luckily, LCA shares a common characteristic of many sciences: as knowledge accumulates, future studies become easier and more powerful. Groups of companies that use similar processes to make a common product can aggregate their data together to publish industry averages for energy or materials use, thereby protecting their proprietary business information while improving analysts' ability to research. LCA data developed for one study is often used in subsequent ones; students who study real-world examples emerge better prepared to contribute in real-world work; and as more studies are published and critiqued, consensus emerges. While successfully mitigating climate change will require significant new investments in cleaner technologies and production systems, complementary investments must occur in evaluation and analysis of these systems to ensure that the LCA tools necessary to inform the next decades' decisions evolve as well.

Keys to Maximizing Biotech's Potential to Reduce GHG Emissions

- GHG accounting needs to be based on life cycle analysis, and include indirect effects such as ILUC. Industry groups can help by making data available to regulators and researchers; IP can be protected by aggregating or anonymizing the data.
- Most biotech solutions will require massive amounts of feedstock, finding ways to produce this more efficiently will always be useful.
- Using waste biomass to produce energy can make a real difference, but keeping organic carbon in solid form as long as possible maximizes GHG benefits.
- Biofuels may not be zero-carbon, but they can be very low carbon and the scale of transportation means making them sustainable and scalable is critically important.
- Carbon capture and sequestration will be necessary for success, but as a complement to reducing emissions, not a replacement.

3.2 GHG Mitigation Potential on National (U.S.) Scale

3.2.1 Producing Sustainable Biomass Feedstock

Biomass is one key to de-carbonizing the U.S. economy because it leverages the capacity of photosynthesis to remove carbon from the atmosphere and convert it to carbohydrates, which can be utilized for their embodied energy, carbon, or both. In theory, biomass can be a carbon-neutral resource, but in practice the situation is much more complex. Growing biomass, especially at commercial scales, typically requires fertilizer and other inputs which have associated emissions. Depending on how the land being used for biomass is treated, there may be additional sources, or sinks, of carbon in the soil. Understanding the emissions impacts of biomass across its full life cycle requires understanding the ecosystems, carbon and nutrient cycles at play where it's grown. Given the potential for biomass production to result in significant and unexpected emissions of carbon, a risk-averse approach is prudent, but the immense potential of biofuels, bioenergy and bioproducts argues in favor of utilizing these resources where available. While there is significant uncertainty around the emissions associated with any source of biomass, there are a few useful rules of thumb:

1. **Biomass can be low-carbon but is almost never zero-carbon.** While the carbon embodied in plant matter was taken from the atmosphere, and therefore has a minimal on climate change, there are numerous sources of climate-forcing emissions from fertilizer, irrigation, transport, processing and changes in the soil.
2. **Biobased products can reduce GHG emissions when substituted for high-carbon ones, especially those relying on fossil fuels.** GHG reductions are realized when low-carbon biobased products displace higher-carbon ones. Without that displacement, there is minimal environmental benefit. Substitution, by itself, is no guarantee of benefit, a few biobased products are more carbon-intensive than their fossil equivalents.
3. **Alternative uses and indirect effects must be considered.** Accurately assessing biomass carbon emissions typically requires considering indirect effects like ILUC, as well as what would have happened in absence of the biomass production. A cultivation system may increase soil carbon, but should only be credited for these increases if this increase is greater than what would have happened otherwise.
4. **The labels “waste” and “residue” can be misleading.** In theory, wastes or residues have no value, and cause emissions from their use. In truth, many of these materials are used in some fashion, sometimes by sustainable bioproduct systems, sometimes more traditionally, as animal bedding or returned to the soil; these uses must be considered.

Climate policy has largely overlooked emissions from agriculture to date, in part because of the complexity of the system and concern about financial impacts on farmers and rural communities. With new focus on sustainable and regenerative agriculture, however, a window of opportunity is opening to achieve a win-win scenario for agricultural producers: utilize the latest science to find opportunities to use agriculture as a tool to reduce emissions, and reward farmers for the carbon benefits they provide.

Agriculture in the U.S. emitted GHGs equivalent to about 658.6 million metric tons of carbon dioxide in 2018, roughly 10% of the U.S. total.¹⁷⁰ About 94% of this

¹⁷⁰ <http://www.epa.gov/sites/production/files/2020-04/documents/us-ghg-inventory-2020-main-text.pdf>.

was emitted from agricultural soils or livestock (direct or “enteric” emissions from animals as well as manure management). Additional emissions come from the production of ammonia, which is a primary input for most fertilizers. With continued population growth as well as the emergence of the bioeconomy, the agricultural sector will be called upon to produce even more food, fodder, fiber and feedstock. Meeting this challenge while reducing emissions will require the rapid deployment of advanced biotechnology in several critical areas including:

Optimizing fertilizer use through new crop strains or increased nitrogen fixation

Nitrogen is often a limiting factor in agricultural yields. The “Green Revolution,” which massively increased agricultural production and allowed rapid population growth during the 20th Century, was largely facilitated by the development of the Haber Process for producing ammonia from natural gas. Ammonia production supports 50–75% of global fertilizer production and is responsible for more than 1% of global GHG emissions.¹⁷¹ Removing biomass from fields, whether it’s crops for consumption or residues for bioenergy, takes some of that nitrogen along with it, which must be replaced. Biotech can improve plants’ efficiency at utilizing nitrogen, or adding genes from nitrogen-fixing organisms to allow them to produce their own. Using modern biotechnological tools to optimize the use of synthetic fertilizers allows growers to consume less of them, which could help U.S. farmers cut back on 15–20 million metric tons of carbon associated with its production, about as much as fueling 3–4 million cars for a year.¹⁷²

Reducing nitrous oxide emissions from soil

Nitrogen fertilizers enhance plant growth, but many soil microbes convert fertilizer nitrogen to nitrous oxide (N₂O), a greenhouse gas up to 298 times more potent than carbon dioxide. In 2017, nitrous oxide emissions from agricultural soil accounted for 266 million metric tons of carbon dioxide equivalent in the U.S. Relatively low-tech interventions, such as using less volatile fertilizers and applying them more efficiently could reduce nitrous oxide emissions by 30–100 million metric tons annually.¹⁷³ Analyses of chemical inhibitors indicate a potential to cut nitrous oxide emissions by over 40%, and there are promising lines of research which would integrate production of these inhibitors into a plant’s root system.¹⁷⁴ By combining all of these approaches, nitrous oxide emissions could be reduced, by well over 150 million metric tons of carbon equivalent, or as much as shutting down 32 U.S. coal power plants for a year.

Enhancing soil carbon retention through expanded root growth

Despite its mundane appearance, soil is a complex and dynamic environment, in which carbon and nutrients enter and leave through multiple avenues and cycle through plants, animals, microbes and fungi. There are several promising approaches by which the soil carbon system could be encouraged to retain more carbon in solid form, rather than being decomposed and released to the atmosphere. Root growth is a major pathway for soil carbon accumulation, as plants take carbon from the atmosphere and convert it to solid plant matter, moving it underground as roots grow. Engineering crops to have larger and deeper root systems expands this pathway and could sequester carbon by 200 to 600 million metric tons per year if widely deployed, though this number is highly uncertain due to the relative immaturity of this technology.¹⁷⁵

Reducing methane emissions from livestock

As population and incomes increase globally, so does the consumption of meat and dairy products. This leads to an increase in livestock numbers and the associated emissions. Livestock, especially cattle, are a major source of methane, from enteric sources (*i.e.*, burps) as well as from decomposing manure. Several novel feed additives have been proposed which may be able to reduce the amount of methane emit-

¹⁷¹ *Green Chem.*, 2020, 22, 5751–5761. <https://doi.org/10.1039/D0GC02301A>. <http://pubs.rsc.org/en/content/articlelanding/2020/gc/d0gc02301a#divAbstract>.

¹⁷² Estimate based on EPA GHG emission inventory. Quantification is imprecise because emissions from energy consumption during ammonia production are aggregated with multiple other uses.

¹⁷³ http://ec.europa.eu/environment/enveco/climate_change/pdf/nitrous_oxide_emissions.pdf.

¹⁷⁵ http://arpa-e.energy.gov/sites/default/files/documents/files/Revised_Final_Report_to_ARPA_Bounding_Analysis.pdf.

ted without negatively affecting animal health or reducing yields. DSM has announced a cattle feed supplement that claims to reduce methane emissions by 30%,¹⁷⁶ while other compounds under investigation—often derived from red seaweed—may be able to provide 80% reductions or greater in methane emissions.^{177–178} While numerous technological and policy hurdles remain, widespread deployment of feed technologies like these could reduce emissions from livestock production by 50–140 million metric tons, or roughly one to three times the annual emissions from the state of Oregon.

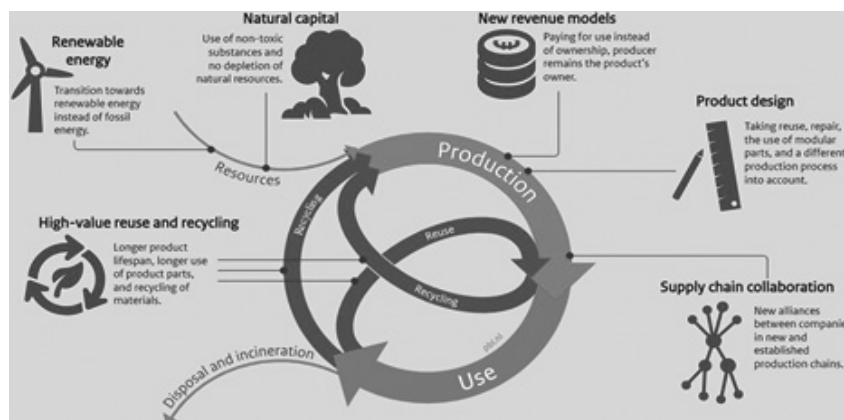

3.2.2 Empowering Sustainable Production

Empowering Sustainable Production

Modern economies produce a staggering amount of things. From millions of printed silicon microcircuits in electronics to billions of tons of concrete and steel, production of physical objects is a hallmark of human society. As we seek to limit the damage caused by climate change, a new focus on sustainability must enter the conversation about how we make things. Luckily, advances in technology have presented a number of opportunities to do just this, by developing more efficient and lower-emission alternatives to traditional industrial techniques. Biotechnology can continue this process by leveraging the affinity biological processes have for working within a circular economy.

Green is the New Black

Elements of a circular economy.

Source: PBL Netherlands.¹⁷⁹

Traditionally, once materials were extracted, their life was a one-way trip that ended in a landfill. As industries become more aware of the need to reduce emissions, it is becoming clear that reuse and recycling of materials and energy is an essential tool for sustainability. Biotechnology is well-positioned to succeed in a sustainable circular economy because it is built on a foundation of biological carbon cycling. Working with natural systems which have evolved to capture and re-use carbon and nutrients, biotechnology firms can expand these processes to commercial scale, replacing energy- and emission-intensive extractive industries with low-impact circular ones.

Turning Carbon into Products

¹⁷⁶ <http://www.dsm.com/corporate/markets/animal-feed/minimizing-methane-from-cattle.html>.

¹⁷⁷ Roque B.M., Venegas M., Kinley R.D., de Nys R., Duarte T.L., Yang X., et al. (2021) Red seaweed (*Asparagopsis taxiformis*) supplementation reduces enteric methane by over 80 percent in beef steers. PLOS ONE 16(3): e0247820. <https://doi.org/10.1371/journal.pone.0247820>. <http://www.biorxiv.org/content/10.1101/2020.07.15.204958v1.abstract>.

¹⁷⁸ Breanna M. Roque, Joan K. Salwen, Rob Kinley, Ermias Kebreab, Inclusion of *Asparagopsis armata* in lactating dairy cows' diet reduces enteric methane emission by over 50 percent, JOURNAL OF CLEANER PRODUCTION, 234, 2019, 132–138, ISSN 0959–6526 <https://doi.org/10.1016/j.jclepro.2019.06.193> <http://www.sciencedirect.com/science/article/abs/pii/S0959652619321559>.

¹⁷⁹ <http://themasites.pbl.nl/o/circular-economy/>.

U.S. industry emits over 800 million metric tons of carbon per year from the combustion of fossil fuels; at present almost all of this goes into the atmosphere, representing over $\frac{1}{8}$ of national emissions. Numerous projects have already sought to demonstrate the feasibility of capturing this carbon and sequestering it underground, or using it for enhanced oil production, but a number of innovative processes are emerging to use the carbon as a raw material for other products, including polymers, carbon fiber, chemicals, nanomaterials or fuels using a variety of methods. Conventional carbon capture systems can typically pull 80–90% of the carbon dioxide out of exhaust from combustion systems,¹⁸⁰ which means that there is a potential resource of hundreds of millions of tons of carbon dioxide which could potentially be used to make new products. The limiting factor will probably be the availability of processes to utilize the carbon and markets for the resulting products.

Bioplastics have been one of the first large-scale applications of biotechnology for the purpose of improving industrial sustainability. Dozens of alternative biobased polymers have entered the market, demonstrating the capacity to replace fossil carbon in a variety of applications and, in many cases, offering more sustainable recycling or reuse options than traditional equivalents. Around 1% of U.S. GHG emissions come from producing plastics. Switching from fossil-based plastics to corn-based biopolymers could reduce emissions by 0.6kg–1.4kg of CO₂ per kilogram of plastic.^{181*} Widely applied, this could reduce emissions from plastic production by about 25%, totaling 16 million metric tons of CO₂ per year. Switching from corn to cellulosic feedstocks, like switchgrass, Miscanthus, or corn stover could double the emission benefits.¹⁸³

Organic Waste Utilization

Researchers and policy makers are becoming increasingly aware of the need to more efficiently use materials in industry. This is particularly true of organic waste, like food scraps, agricultural residue and un-recyclable wood products, because they not only require fertilizer and other inputs to make those materials, but as they decompose, also emit carbon dioxide or, worse, methane. Anaerobic digestion (AD) is a well-understood technology for converting organic waste into energy, while recovering nutrients that can be returned to the soil. When decomposition happens in the absence of oxygen, microbes convert organic waste into biogas—a mixture of methane, carbon dioxide, water vapor and other trace components. This can be cleaned up to yield Renewable Natural Gas (RNG), which is mostly methane and functionally equivalent to fossil natural gas. AD produces not only this valuable product, but also solid digestate, which is very similar to compost and can be used as a beneficial soil amendment. By capturing the methane which would otherwise have been released into the atmosphere, AD further reduces the GHG footprint of organic waste disposal; in some cases the effect of preventing uncontrolled releases of methane can be so great that the resulting RNG is effectively carbon-negative, when evaluated by LCA.¹⁸⁰ Widespread deployment of RNG systems at landfills, wastewater treatment plants, livestock yards and other organic waste hotspots could displace enough fossil natural gas to offset 40–75 million metric tons of carbon dioxide emissions. Using agricultural residue or wood waste could add another 12–40 million metric tons, though these resources may have other competing uses in a low-carbon economy.¹⁸⁴

Cleaner Buildings

There are opportunities to build sustainable, circular material cycles into more than just consumer products. Carbon can be pulled out of the atmosphere and used to make the very buildings, roads, and cities we live in. Wood, long thought of as a traditional building material, is enjoying new attention as a low-carbon solution for future construction. Since wood pulls carbon from the air as it grows, it represents a very stable and durable removal mechanism for atmospheric carbon, which will remain sequestered as long as the wood remains solid. Engineered wood

¹⁸⁰ <http://doi.org/10.1155/2014/828131>. <https://www.hindawi.com/journals/tswj/2014/828131/>.

* **Editor's note:** there is no corresponding footnote reference for footnote 182. The reference as been incorporated herein as follows:

Daniel Posen, *et al.* 2017 *Environ. Res. Lett.* 12 034024. <http://iopscience.iop.org/article/10.1088/1748-9326/aa60a7>. It should be noted that this study found greater GHG benefits from plastic production using renewable energy than feedstock conversion, however these are not mutually exclusive.

¹⁸³ <http://ww2.arb.ca.gov/resources/documents/lcfs-pathway-certified-carbon-intensities>.

¹⁸⁴ <http://gasfoundation.org/2019/12/18/renewable-sources-of-natural-gas/>.

products, including cross-laminated timber, fiber or polymer reinforced products, or wood composites can provide strength and durability previously thought possible only from metal. A recent study of engineered wood products found that they can reduce GHG emissions by 20% when substituted for fabricated metal, 25% for concrete and 50% for iron or steel. Engineered wood has been used to build several multistory demonstration buildings to show that high-rise construction is possible without conventional materials. A five-story wood building stores about 26 lb of carbon per square foot.¹⁸⁵ With over 350 million square feet of multifamily housing constructed in the U.S. in 2019, the potential carbon savings could be substantial.¹⁸⁶

Another opportunity to find uses for carbon dioxide is in cement, which is currently one of the largest sources of greenhouse gas emissions in the world and was responsible for over 40 million tons of emissions in the U.S.¹⁸⁷ Researchers have been investigating alternative formulations of cement, which utilize carbon dioxide during production or absorb it from the air as it cures. By integrating these techniques with renewable energy to power the process, it is possible to end up with carbon-neutral concrete turning some infrastructure projects into net carbon sinks.

3.2.3 Developing Lower-Carbon Products

If humanity is to successfully avoid the worst impacts of climate change, it will have to find lower-carbon substitutes for many of its most important products. No product exemplifies this challenge better than transportation fuel. The ready availability of reliable, high-speed transportation is a foundational element of life in the U.S.; it is the lifeblood of modern supply chains and personal lifestyle. The U.S. is by far the biggest consumer of oil in the world, consuming almost 20 million barrels of crude oil per day, and processing it through more than 130 refineries into a wide range of fuels and petrochemical products, most importantly gasoline and diesel.¹⁸⁸ The emissions from vehicle tailpipes, plus the production and refining of petroleum total over 1,900 million metric tons of carbon dioxide equivalent each year, almost 30% of the U.S. total or about as much as Germany and Japan, combined.¹⁸⁹

Neither the U.S. nor any other nation can halt climate change while depending on petroleum to fuel its transportation system. There is no single solution to this problem, a full portfolio of tools is needed. Light-duty vehicles, like cars, trucks, and SUVs consume the majority of petroleum in the U.S.; there is consensus within the transportation research community that replacing these with battery electric vehicles, charged on a grid dominated by renewables or other carbon-free sources, will be the primary way of reducing these emissions, with mass transit and other measures also playing a role. Many of the medium and heavy duty vehicles, like box trucks, delivery vans and some tractor-trailers will also be powered by electricity from batteries, or possibly hydrogen fuel cells.¹⁹⁰ There are some types of transportation, however, for which energy-dense liquid fuels will be much harder to replace. Aviation is the biggest of these; the U.S. consumed over 18 billion gallons of jet fuel in 2019,¹⁹¹ and while the industry will take some time to recover from the ravages of COVID-19, commercial air travel will continue to factor in global transportation. Some marine applications, long-haul trucking, military operations, backup and emergency power, and specialized vehicles may also need liquid fuels. The U.S. currently consumes around 15 billion gallons of ethanol per year, and around 2.5 billion gallons of biomass-based diesel substitutes including biodiesel and renewable diesel. The vast majority of ethanol is made from corn, while around [] of U.S. biomass-based diesel is made from soybean or canola oil, with the rest coming from waste oil or byproducts.¹⁹²

Most of the biofuels currently used in the U.S. reduce carbon emissions when they displace petroleum fuels. Typical corn ethanol emits about 30% less carbon than gasoline, when the full life cycle of both products are considered, and typical biodiesel or renewable diesel from soybean oil reduces carbon by 40–50% over the full life cycle.¹⁹³ With domestic consumption of these fuels measured in the billions of

¹⁹¹ <http://www.transtats.bts.gov/fuel.asp?pn=1>.

¹⁹² <http://www.eia.gov/biofuels/update/>.

¹⁹³ Based on CARB default values under the LCFS. It should be noted that the GHG reductions from current biofuels are uncertain and the subject of considerable debate, the values pre-

gallons each year, these emission reductions represent millions of tons of avoided carbon. *The use of biofuels is estimated to have reduced U.S. transportation sector GHG emissions by 980 MMT CO₂ from 2009–2020.*¹⁹⁴ *This is equivalent to taking roughly 16 million vehicles off the road, or 19 coal-fired power plants offline, for that 13 year period.*¹⁹⁵

First-generation biofuels alone cannot meet the challenge of near-complete de-carbonization by mid-century, but have achieved critical near-term reductions as other low-carbon transportation solutions are being developed; and they form an important technological foundation for the next generation of low-carbon fuels. The biotech industry can leverage its capacity to innovate to help advance biofuels in two main ways, reducing emissions from current production and developing zero, or near-zero carbon fuels.

Reducing Emissions From Existing Fuels

The U.S. fuel ethanol industry operates around 200 production facilities spread across the U.S., representing tens of billions of dollars in capital investment and thousands of jobs.¹⁹⁶ While corn-based ethanol may struggle to achieve the very low carbon levels needed in the long-term future, it has a critical role to play over the next few decades. As long as there is petroleum-based gasoline being consumed in the world, there will be value in producing a substitute that is 30% less carbon intensive; and the evidence suggests that the industry can reduce emissions even further. Driven in large part by the adoption of carbon intensity standards like California's LCFS, the ethanol industry has improved the efficiency of its facilities and found new ways to recover valuable co-products. Doubling down on these processes can continue to reduce emissions.

Improved efficiency of ethanol production facilities has reduced the energy inputs needed per gallon of output by a few percent per year,¹⁹⁷ and the industry has begun to utilize cellulosic processing technology to convert the previously indigestible corn kernel fiber into ethanol, increasing the yield from each bushel of corn by 3–4%. Improved crop yields and strains optimized for fuel production also help reduce the emissions associated with each unit of fuel. Incremental improvements like these seldom grab headlines, but on the scale of U.S. ethanol production, they add up. Each 1% improvement in average carbon intensity, across the entire U.S. ethanol industry results in around 800,000 metric tons of avoided carbon dioxide emissions each year.¹⁹⁸ Similarly, there are opportunities to improve the efficiency of biodiesel and renewable diesel production, the latter of which anticipates almost a six-fold increase in U.S. production capacity over the next 5 years.¹⁹⁹ More efficient catalysts and purification systems can reduce the need for energy or reagent inputs, driving GHG emissions down even further. If the U.S. renewable diesel industry grows as anticipated, each 1% improvement in efficiency yields around 170,000 metric tons of avoided emissions each year.²⁰⁰

Developing Zero or Near-Zero Carbon Fuels

De-carbonizing transportation will require a new generation of fuels. Cellulosic biofuels, which use inedible plant matter as their feedstock, offer the potential for much deeper reductions in carbon emissions.²⁰¹ Cellulosic biofuels have been on the horizon for many years, but technological and supply chain challenges sank several early projects. A new wave of cellulosic production facilities, promising 60–80% lower emissions than conventional fuels are under development and if early projects are successful, could be the start of a new, multi-billion gallon per year industry. One key difference between the first wave of cellulosic production facilities and this one is that rather than breaking down cellulose into sugars and fermenting them into ethanol like you would with starch, these facilities use heat to convert biomass into a gas, or light oils, then process those into finished fuels. There are numerous opportunities to further refine the process, however, by making more selective and durable catalysts, or providing feedstock which improves yields, is more easily handled or requires less pre-treatment.

Algae or other microbes may offer the greatest potential to deliver fuels that approach or achieve carbon neutrality. Algae can be grown using wastewater or even exhaust gas as their primary source of nutrients and can be tailored to produce highly desirable oils or carbohydrates at extremely high theoretical yields. Attempts to scale these systems up have run into problems with pathogens, competition from wild microbes and finding efficient methods to separate desired products from water and cell mass. If algal fuels, or other advanced synthetic fuels could be commercialized, they offer the potential for billions of gallons of a product that is compatible with existing vehicles and infrastructure. *Figure 2*, shows the potential emissions reductions from 100 million gallons of a hypothetical advanced fuel, at various carbon intensities.²⁰² Depending on what it displaces, *the emissions benefits could be a few hundred thousand to over 1 million metric tons each year*

3.2.4 Enhancing Carbon Sequestration

Enhancing Carbon Sequestration

Drastically reducing carbon emissions is necessary if humanity is to avoid the worst effects of climate change, but more will be needed. Almost every model of a successful stabilization of temperatures includes a large amount of carbon dioxide

²⁰¹ Murphy, Colin W., and Alissa Kendall. "Life Cycle Analysis of Biochemical Cellulosic Ethanol under Multiple Scenarios." *GCB Bioenergy*, vol. 7, no. 5, May 2015, pp. 1019–1033, doi:10.1111/gcbb.12204. <http://onlinelibrary.wiley.com/doi/abs/10.1111/gcbb.12204>.

²⁰² Based on typical carbon intensities of fuels under the LCFS as reported in: http://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/fuel-pathways/current-pathways_all.xlsx.

removal from the atmosphere, through enhanced plant growth and CCS. *Figure 3* shows results from the IPCC 5th assessment report regarding global carbon emissions trajectories that preserve a hospitable climate. Each line represents one simulation of the future in which average temperature increase is kept below 1.5 °C (the graph for a 2 °C outcome looks quite similar). In every case, net emissions must not only be reduced to zero, but the world will need to rapidly remove carbon from the atmosphere over the second half of this century.²⁰³ Biotech can provide crucial tools to help this effort.

It is difficult to estimate how much of an impact carbon capture might have on the climate system of the future; in some ways the sky is really the limit since there is certainly no shortage of carbon dioxide in the atmosphere to remove. Accelerated R&D and rapid deployment of demonstration projects will be necessary to identify and prove the capabilities of the many technological options which could contribute.

Figure 3

Source: IPCC 5th Assessment Report.

Bioenergy with Carbon Capture and Sequestration (BECCS)

Many of the most promising concepts for scalable carbon sequestration rely on photosynthesis to do the actual capturing of carbon dioxide, which can then be used or stored. One of the most promising is BECCS, which uses the biomass from plants to produce fuels or energy, storing carbon along the way. There are many proposed models for BECCS, from burning biomass in conventional power plants and capturing carbon from the exhaust, to gasification systems which leave behind carbon-dense biochar that can be used as a carbon-sequestering soil amendment. The energy or fuels produced by these systems would also help displace fossil fuels, providing a double climate benefit. A recent analysis estimated that, by 2040, BECCS could cost effectively remove over 700 million metric tons of carbon per year,²⁰⁴ or more than half the emissions from all U.S. coal power plants, though doing so would require a massive amount of sustainable biomass feedstock to be produced.

Sequestration in Natural and Working Lands

Natural ecosystems have been sequestering carbon for millennia without human assistance and should not be overlooked as a method of removing carbon from the atmosphere. The main mechanism of sequestration is through the growth of roots

²⁰³ Source: *IPCC Mitigation Pathways Compatible with 1.5°C in the Context of Sustainable Development*, Figure 2.5. http://www.ipcc.ch/site/assets/uploads/sites/2/2019/02/SR15_Chapter2_Low_Res.pdf.

²⁰⁴ <http://www.ornl.gov/news/bioenergy-carbon-capture-combo-could-cost-effectively-mitigate-carbon-dioxide>.

in the soil, accumulation of fallen organic matter, or the accumulation of organic matter at the bottom of oxygen-poor bodies of water. Most biomass decomposes or is consumed by animals but some, especially the hard-to-digest fibrous parts of plants composed of lignin and cellulose, remains in solid form for decades or more and is integrated into soil. Human encroachment on natural lands and climate change are affecting most natural ecosystems, often disrupting this process; but careful intervention, through things like managed replanting, selective breeding for sequestration potential, soil amendments such as compost or biochar, selective harvest and prescribed fire can increase the rate of carbon sequestration and build healthy, resilient ecosystems. The National Academies concluded that enhanced management of forests could sequester anywhere from a few hundred pounds to over a ton of carbon per hectare annually;²⁰⁵ widely deployed this could result in sequestration of *100 million metric tons of carbon per year, with an additional 150 million metric tons possible through expanding forested areas*, this would be like taking 20 to 50 million cars off the road.

Enhanced Weathering

While the majority of carbon removal from the atmosphere is done by plants, it is not the only mechanism. Certain types of mineral like olivine, serpentine and basalt will react with carbon dioxide to form stable carbonate minerals in a process known as “weathering”. This mechanism has been largely responsible for mitigation of high atmospheric CO₂ concentrations in prehistoric times. Unfortunately, it is naturally quite slow, suited for geological rather than human time scales; but there are ways that it might be accelerated and scaled to help address the climate crisis. Olivine and serpentine are often found in discarded mine tailings or asbestos formations; basalt can often be found in geologically active areas, where geothermal power plants may be active. By managing air flow, moisture and pH levels in these sites, the rate of carbon uptake could be substantially increased. Adding catalysts, or microbial agents could increase the potential even further.

Direct Air Capture

Most carbon capture systems rely on natural processes to remove carbon from the atmosphere, but new innovative approaches may offer the opportunity to cut out the intermediate step. Several processes are being tested that use chemical solvents, such as amine or carbonate solutions, to absorb CO₂ from the atmosphere, and release it into a containment system, resulting in pure CO₂ that can then be sequestered underground or used to make products. Since CO₂ is only a few hundred parts per million in the atmosphere, this process requires a lot of surface area and usually uses heat to regenerate the solvent solution. This can make these systems bulky and energy-intensive. By developing more effective and durable solvents, or lower-energy regeneration processes, these systems could be made cheaper and more scalable. The upper limit of potential for these systems depends on how optimistic one is about the rate at which they will improve their energy and cost efficiency. Studies have projected the impact of direct air capture at anywhere from a few hundred million tons to more than half of today’s global CO₂ emissions.²⁰⁶

4 Barriers to Adoption and Policy Proposals

4.1 Financing Barriers

Biofuels and bioproducts have historically faced a major commercialization hurdle in the form of access to financing. Biotechnology products that are intended to reduce GHG emissions must necessarily compete with fossil fuels that supply a well-established refining and petrochemicals production infrastructure. Whereas this fossil infrastructure is often decades old and has often been fully paid off by its owners, biotechnology products require investment in either new infrastructure or large-scale retrofits of existing infrastructure. These investments can be very expensive, with one review of announced commercial-scale cellulosic biofuel projects finding capital costs to be approximately \$11/gallon of installed production capacity.²⁰⁷ With the exception of large, established companies, few new producers have ready access

²⁰⁵ <http://www.nap.edu/catalog/25259/negative-emissions-technologies-and-reliable-sequestration-a-research-agenda>.

²⁰⁷ Brown, T.R. and Brown, R.C. (2013), *A review of cellulosic biofuel commercial-scale projects in the United States*. BIOFUELS, BIOPROD. BIO-ref., 7: 235–245. <http://doi.org/10.1002/bbb.1387>. <https://onlinelibrary.wiley.com/doi/full/10.1002/bbb.1387>.

to this amount of capital, necessitating that they access the capital markets through lenders and/or investors.

Private sources of capital generally require a demonstration that a biotechnology project can achieve certain levels of profitability in the form of a “hurdle rate” before providing access to financing. Biobased fuels and products compete with fossil fuels and products for market share, and the market value of the former operates as a function of the latter as a result. On occasion this has been advantageous for biotechnology products, such as when fossil fuel prices rose sharply in 2007–08. The steady decline of fossil fuel prices that has occurred over the last decade in response to increased unconventional production of natural gas and petroleum in the U.S. has made it more difficult for biotechnology products to obtain the necessary hurdle rates for financing, however, even as climate change has become an important concern for American consumers.²⁰⁸ Likewise, the immediate financial incentive to make investments in energy efficiency and other marginal reductions to GHG emissions is limited when energy costs are low.

A challenge faced by biofuels and bioproducts is that many of the advantages that they offer over fossil fuels are not reflected in their market value. For example, in addition to the GHG emissions reductions discussed above, many biotechnology products achieve low levels of other types of pollution such as particulate matter emissions, sulfur emissions, water contamination, and toxic waste production compared to fossil fuels. These reduced impacts on human health and the environment have a clear monetary benefit in the form of reduced spending on medical services, environmental remediation, recovery from extreme weather events, *etc.*²⁰⁹ Moreover, biotechnology provides the ability to reduce GHG emissions and other forms of pollution across a variety of economic sectors, including agriculture, manufacturing, and transportation. Such benefits are not reflected in the market value of the biotechnology products, however, placing them at a competitive price disadvantage to fossil fuels.

Governments have sometimes enacted policies that cause the benefits of biofuels and bioproducts to be reflected on the marketplace, either by subsidizing those biotechnology products that have reduced impacts on human health and the environment or by increasing the cost of fossil fuels (see Section 4.3). Some, such as California’s LCFS, have prompted rapid growth in the use of biofuels by subsidizing biofuels, especially those from second-generation feedstocks, based on the degree to which they reduce transportation GHG emissions.²¹⁰ The LCFS recently expanded to provide support for CCS; when combined with Federal 45Q tax credits, this can offer over \$150/tonne of total incentive for project developers.^{211–212} Government incentives in the U.S. have not always been sufficient to make biotechnology products competitive with inexpensive fossil fuels, though: one recent analysis calculated that new cellulosic biorefineries would struggle to be financially viable despite the presence of supporting Federal policies because of the low fossil fuel prices that have prevailed since 2014.²¹³ Producers of biotechnology non-fuel products, for which government support mechanisms are fewer, have also faced high hurdles to private financing.

Some producers of U.S. biofuels and bioproducts have been able to obtain public financing in the form of loans, loan guarantees, and grants from the Federal and state governments. The U.S. Department of Agriculture offers loan guarantees of up to \$250 million for the building of capacity for the production of specific biotechnology products including advanced biofuels and biobased chemicals.²¹⁴ The loan guarantee program was started in 2008 to enable financing of advanced biofuels and was expanded in 2014 to cover other bioproducts as well. The loan guarantee reduces the barriers to obtaining private financing by having the U.S. Government backstop qualifying loans to producers. While this backstop does not guarantee private financing for the facility, it substantially reduces the producer’s

²¹⁴ <https://www.rd.usda.gov/programs-services/biorefinery-renewable-chemical-and-biobased-product-manufacturing-assistance>.

financing hurdle rate by reducing the risk of default on any loan covered by the guarantee. Several states operate their own direct loan and loan guarantee programs for biorefineries, albeit on a smaller scale.²¹⁵

Grants are another public finance mechanism that has supported the commercialization of biotechnology. Unlike direct loans and loan guarantees, grants are one-time awards of financing that are not repaid. The awards generally involve smaller amounts of financing than are provided via direct loans and loan guarantees, and they have often been used to support R&D or make improvements to existing facilities rather than to build a new commercial-scale facility. One example is the Value-Added Producer Grants program administered by the U.S. Department of Agriculture, which “helps agricultural producers enter into value-added activities related to the processing and marketing of new products.”²¹⁶ Other grants indirectly support the establishment and commercialization of biofuels by being directed toward the upgrading of infrastructure that is downstream of production facilities and improving consumer access.

The private and public capital that has been invested into biobased fuels and products has spurred the commercialization of low-carbon technologies since the turn of the century. Investments have fallen far short of what is necessary to avert catastrophic climate change, however, reflecting the major hurdles to financing that still exist within the biotechnology industry. The IPCC estimates that \$2.4 trillion in annual investment is needed globally in the energy sector alone until 2035 to limit temperatures to no more than 1.5 °C above pre-industrial levels.²¹⁷ This number is larger still if the de-carbonization of non-energy sectors such as agriculture and materials are accounted for. Actual global low-carbon energy investment in 2019 was only \$0.6 trillion, or 25% of what is needed.²¹⁸ Additional policy mechanisms will be required to rapidly reduce existing hurdles to the financing of biobased projects. Governments will also need to reduce the regulatory barriers that these projects face, as unfavorable regulatory environments increase the financial risks that they bear and their hurdles to financing.

4.2 Regulatory Barriers

The biotechnology industry plays an important role in developing and commercializing novel products that are not always directly compatible with the existing infrastructure in the sectors into which they are introduced. Moreover, many of these products are manufactured using technologies such as gene editing that are closely regulated by national governments. These factors have resulted in the formation of multiple regulatory barriers that hinder the adoption of low-carbon biofuels and bioproducts and constrain the biotechnology industry’s ability to reduce emissions of GHGs and other pollutants.

Biotechnology Regulation

GMOs have had a long and contentious regulatory history in the U.S. Since 1986, biotech products in the U.S. have been regulated under the *Coordinated Framework for the Regulation of Biotechnology (Coordinated Framework)*.²¹⁹ The framework has been updated several times since its introduction, including a comprehensive revision in May 2020, known as the Sustainable, Ecological, Consistent, Uniform, Responsible, Efficient (SECURE) rule, or Part 340 rule, which significantly streamlined and modernized the regulatory framework.²²⁰ While U.S. regulators and consumers are relatively accepting of GMO products, societal opposition to the use of GMOs in the agriculture sector in particular has, on occasion, prompted a cautious response to new GMO products by regulators that has slowed the introduction of biotech products to the market.

Regulations in other regions, such as Europe, are more hostile,²²¹ hampering the ability of the U.S. biotechnology market’s products to make an outsized contribution to global GHG emission reductions. For example, as discussed in Section 1.4, GMO food crops have enhanced resiliency under the types of extreme weather conditions that are becoming more common as the climate changes, thereby reducing the

amount of land required by agriculture and reducing the incentive to increase GHG emissions via land-use change.

Studies have found that Americans, including those residing in states with large agricultural sectors, have concerns about the production of bioenergy from GMO feedstocks as well.²²² Some second-generation bioenergy feedstocks have attracted opposition due to their use of fast-growing and potentially invasive forms of biomass. These feedstocks, especially those that have been genetically engineered to expand rapidly, have prompted concerns that they could expand into and damage the surrounding ecosystem.²²³ Notably, though, biotechnology has also provided a means of potentially overcoming this barrier. In one recent research breakthrough, microalgae grown as a biofuels feedstock has been genetically engineered to be unable to survive outside of the production facility, thereby preventing its uncontrolled growth.²²⁴

Genetically engineering microorganisms used in the production of fuels, chemicals and other products are also subject to Federal regulation, but their place in the Coordinated Framework has long been unclear, and GE microbes were not clearly addressed in the SECURE rule. This regulatory uncertainty is likely to present a significant barrier to the development and commercialization of biotech climate innovation.

Regulation of Fuels and Products

A second major regulatory barrier is posed by conflicting state policies on certain biotechnology products. While the U.S. has a comparatively more integrated common market than the European Union, individual state governments sometimes have policies in place that discourage the introduction of biotechnology products into entire regions, let alone individual markets. This situation can prevent the adoption of products that have interstate supply chains. One example that is already occurring involves the transport of renewable diesel through existing refined fuels pipelines. Renewable diesel is a drop-in biofuel that can utilize cost-effective distribution infrastructure such as the refined fuels pipelines that connect refineries to multiple states' markets (e.g., the Colonial Pipeline in the Southeastern U.S.). Many states require that the biofuels content of fuels retailed within their borders be stated on a fuel pump label, but this is not easily known if the renewable diesel is being pipelined in a blended form with diesel fuel. The result is that having even a single state on an interstate pipeline with strict pump labeling requirements can discourage the movement of a drop-in biofuel such as renewable diesel through it. The biofuel must instead be transported by rail, ship, or truck, all of which are more expensive and polluting options than pipeline.²²⁵

Biotechnology products that are not compatible with unmodified existing infrastructure often face a heightened regulatory barrier. U.S. ethanol consumption has historically been constrained by the so-called "ethanol blend wall", which refers to the maximum blend that can be used in existing infrastructure. Ethanol is a hydrophilic fuel that is miscible with water, and this trait prevents its movement through pipelines at any blend rate and use in unmodified engines above specific blend rates due to the potential for water contamination. Ethanol blends for use in unmodified engines were limited to 10% by volume (E10) until 2011, when the U.S. Government began to allow blends of up to 15% by volume (E15) during certain seasons of the year.²²⁶ The unrestricted sale of E15 was not permitted until 2019.²²⁷ The blend limits apply to ethanol whether produced from corn or lignocellulosic biomass, and the blend wall sharply constrained fuel ethanol demand from all feedstocks beginning in 2013 as a result.²²⁸

The U.S. Government has also used regulatory changes to restrain demand for all biofuels since 2017. National biofuels demand over the last decade has been driven by the revised Renewable Fuel Standard (RFS2), which mandates the annual consumption of specific volumes of different types of biofuels. Petroleum refiners are

²²⁸ http://www.usda.gov/sites/default/files/documents/MARKET_EFFECTS_AND_WELFARE_IMPACTS_OF_THE_RENEWABLE_FUEL_STANDARD.pdf.

tasked with ensuring that sufficient quantities of biofuels are blended with refined fuels to comply with the mandate, and a refiner's individual blending quota is determined by its market share. Between 2017 and 2019 the Federal Government greatly increased the number of hardship waivers that it awarded to refiners, reducing their blending quotas and overall demand for biofuels under the mandate.²²⁹ One analysis calculates that the increased number of hardship waivers awarded caused demand for advanced biofuels under the mandate to be up to 1 billion gallons lower per year, and that the amount of the annual reduction has equaled as much as 50% of U.S. production.²³⁰

Regulatory barriers can be particularly high for truly novel biotechnology products due to a lack of suitable regulatory frameworks. Cultured meat, for example, has been identified as one product for which existing U.S. regulations are inadequate due to the existence of myriad production techniques and the potential for genetic modification as part of the production process.²³¹ Regulatory uncertainty is as much of a barrier as adverse regulation is, inasmuch as both discourage financiers from providing the capital necessary for commercialization. The lack of an adequate regulatory framework also raises the possibility that adverse regulation could result from a regulatory rulemaking process.

The future growth of the U.S. biotechnology industry will be heavily affected by existing and potential regulatory barriers. One recent analysis estimated that 50% of the total economic impact of biotechnology over the next decade "could hinge on consumer, societal, and regulatory acceptance" of the industry's products.²³² The analysis further calculated that this amount increases to 70% over the next 2 decades. This has important implications for the ability of biotechnology to provide climate solutions given that early emissions reductions are more valuable than later reductions. The continued presence of regulatory hurdles is an especially pressing issue given the major shortfall of de-carbonization investments (see Section 4.1).

4.3 Policy Proposals

The growing recognition by many U.S. policymakers that existing efforts to de-carbonize the country's economy are falling short of its commitments under the 2015 Paris Climate Agreement has led to the unveiling of a variety of climate policy proposals at the Federal, state, and local levels of government. These proposals fall into two broad categories: the first category focuses on the de-carbonization of individual sectors while the second category instead takes an economy-wide approach. The sector-based proposals are similar to policies already in place in states such as California, whereas the economy-wide proposals are more novel and less well established. An aggressive combination of sector-based and economy-wide policies is needed to rapidly realize the full potential of biotechnology to combat climate change.

4.3.1 De-carbonizing Transportation

The first 2 decades of the 21st century saw the introduction of several policies to reduce the carbon intensity and GHG emissions of the transportation sector. Some, such as Federal RFS2 and California LCFS, were successfully implemented and have resulted in the partial de-carbonization of the on-road transportation sectors in their respective jurisdictions through the increased use of biofuels. But regulatory implementation of these policies has, particularly in the case of RFS2, limited their impact. *Barriers to the full implementation of existing Federal renewable fuels policies should be removed and aggressive follow-on transportation sector climate policies adopted to achieve the maximum near-term and longer-term GHG reductions.*

Renewable Fuel Standard

The continued presence of the RFS2 as the centerpiece of U.S. transportation sector de-carbonization efforts has had an important impact on the development of intermediate-term GHG emission reduction strategies, with cumulative reductions of

²³² <http://www.mckinsey.com/industries/pharmaceuticals-and-medical-products/our-insights/the-bio-revolution-innovations-transforming-economies-societies-and-our-lives#>.

980 MMT CO₂ since RFS2 was enacted.²³³ But a series of EPA regulatory actions has substantially limited the program's climate gains. The agency has repeatedly reduced RFS volume obligations and has issued a growing number of small refinery waivers, further reducing the market for biofuels in the U.S.²³⁴

EPA has taken some steps to expand U.S. biofuels markets. The ongoing effort to expand the volume of ethanol permitted by the ethanol blend wall is one example of this trend (see Section 3.2). Following on earlier efforts to ease restrictions on E15 consumption, in 2020 the Trump Administration announced that the Federal Government would not block the use of E15 in fuel pumps that were compatible with E10 (although state governments are still able to do so).²³⁵ The complete replacement of E10 consumption by E15 would increase the amount of fuel ethanol consumed in the U.S. by 50%. While the magnitude of the associated transportation sector emissions reduction would depend on the feedstocks being used, any increase to E15 consumption would contribute to the sector's de-carbonization. *Additional actions to expand U.S. biofuel markets and establish greater RFS program certainty are needed to maximize near-term climate gains.*

Low Carbon Fuel Standard

The success of California's LCFS and a lack of Federal action on climate policy after 2016 has prompted similar policies to be proposed in other states. Oregon adopted a LCFS under its Oregon Clean Fuels Program that mandates a 10% reduction to the carbon intensity of its transportation sector from 2015 levels by 2025.²³⁶ Efforts to implement a statewide LCFS in neighboring Washington are ongoing despite the failure of an earlier attempt.²³⁷ Similar regional initiatives have been proposed in the Midwest²³⁸ and East Coast,²³⁹ although legislative action on these proposals has yet to occur.

Efforts to implement a national LCFS date to 2007, when then-U.S. senator Barack Obama introduced a bill to require future reductions to the carbon intensity of the U.S. transportation sector.²⁴⁰ While that proposal was ultimately discarded in favor of legislation that created the RFS2, the U.S. House Select Committee on the Climate Crisis recently recommended that the RFS2 be transformed into a national LCFS.²⁴¹ That recommendation also included a provision to expand the remit of the RFS2 to include shipping and aviation fuels, in addition to on-road transportation fuels, as part of the transformation. The success of California's LCFS and steps by other states to adopt similar programs suggests *the time has come for a Federal low-carbon fuel standard.*

Other Fuel Policies

In addition to market-driving programs such as the RFS and LCFS, ongoing Federal and state investments in the improvement of existing biofuels and the development of next-generation biofuels are recommended to achieve the greatest near-term climate benefit. *Robust Federal investment in biofuel research and development at the U.S. Department of Energy and USDA and long-term tax credits or other incentives for private-sector biofuel research and development and facility construction are recommended to help drive additional private-sector investment in low-carbon fuels.*

The development of a long-term sustainable aviation fuel specific blender's tax credit will attract significant investment to the sector, address existing structural and policy disincentives, and ramp up domestic SAF production to meaningful levels.. Further continuation of the Second Generation Biofuel Producer Tax Credit is incredibly important to companies that are making significant investments to create new agricultural supply chains, build infrastructure for liquid biofuels, and develop innovative new technologies.

²⁴¹ <http://climatecrisis.house.gov/sites/climatecrisis.house.gov/files/Climate%20Crisis%20Action%20Plan.pdf>.

4.3.2 De-carbonizing Industry

Policy has historically favored the production of biofuels over other forms of biobased products. Renewable chemicals and other non-fuel biobased products that achieve GHG emission reductions, such as those described in Section 2, will need to be supported if sectors outside of transportation are also to be successfully Dearborn. Several potential mechanisms exist for achieving this result, some of which build upon existing policy frameworks and others that employ more novel approaches.

Renewable Chemical and Biobased Product Programs

The U.S. Government operates two important farm bill energy title programs, the BioPreferred Program and the Biorefinery, Renewable Chemical, and Biobased Product Manufacturing Assistance Program, that support the commercial development of renewable chemical and biobased product manufacturers. These producers continue to face substantial hurdles to commercialization due to the lack of an even playing field with producers of competing products from fossil fuels.

The BioPreferred Program, originally authorized under the 2002 Farm Bill and reauthorized and expanded under the 2018 Farm Bill, includes a Federal biobased product procurement preference program and a voluntary USDA labeling program for biobased products.²⁴² These programs have significantly increased both consumer awareness and market demand for biobased products. The 2018 Farm Bill provided increased funding for BioPreferred and, among other provisions, directed USDA and the Department of Commerce to develop North American Industry Classification System (NAICS) codes for renewable chemicals and biobased products.²⁴³ The 2020 National Academies of Science report on “Safeguarding the Bioeconomy” cites the lack of an industry classification system for biotech products as a significant roadblock to investment and broader adoption, and recommends a series of actions to fill this gap.²⁴⁴

The Biorefinery, Renewable Chemical, and Biobased Product Manufacturing Assistance Program (BAP) provides loan guarantees for the development, construction, and retrofitting of commercial-scale biorefineries.²⁴⁵ The 2018 farm significantly expanded and streamlined the BAP loan program.

The Commerce Department and USDA should move swiftly to implement biobased product classification systems, and Congress should fully fund BioPreferred and the BAP loan program.

Tax Policy

Tax policy has been a vital early driver of biofuel and other renewable energy development. Several recent policy proposals seek to provide a similar push to non-fuel biobased products. A proposed change to Federal tax law would enable producers of biobased products to utilize the Master Limited Partnership pass-through tax structure that is widely employed by fossil fuel producers to improve access to capital and reduce tax burdens.²⁴⁶ Such an expansion has been employed in the past in the U.S. to support the development of renewable electricity and biofuels logistics infrastructure, making its absence in the biobased products sector particularly notable. Federal legislation to expand existing business-related and investment tax credits to include renewable chemicals production has also attracted bipartisan support in Congress,²⁴⁷ although it has yet to become law.

U.S. tax policy should be updated to extend renewable energy tax incentives to renewable chemicals and biobased products.

4.3.3 De-carbonizing Agriculture

One of the most important mechanisms available to leverage biotechnology for climate mitigation is agriculture policy. As discussed in section 2, the carbon intensity of industrial products is highly dependent on the carbon intensity of feedstocks. Substitution of biobased feedstocks for fossil feedstocks is an essential step, but the greatest gains are achieved when climate objectives are integrated into the production of the feedstocks themselves, internalizing the environmental benefits that are provided by producers of biobased products, especially those that operate within the agricultural sector.

²⁴² <http://www.biopreferred.gov/BioPreferred/faces/pages/AboutBio-Preferred.xhtml>.

²⁴³ <http://www.soybiobased.org/update-of-usda-biopreferred-program/>.

²⁴⁴ <http://www.nap.edu/resource/25525/interactive/>.

²⁴⁵ http://www.rd.usda.gov/sites/default/files/fact-sheet/508_RD_FS_RBS_Biorefinery.pdf.

²⁴⁶ <http://www.bio.org/sites/default/files/2020-01/Final-BIO%20Comments-House%20Committee%20on%20Climate%20Crisis%20RFI-12-20-19.pdf>.

²⁴⁷ <http://pascrell.house.gov/news/documentsingle.aspx?DocumentID=4548>.

One such proposal would expand farm bill programs such as the Conservation Stewardship Program, which encourages producers to undertake conservation activities on working lands,²⁴⁸ to include practices that decrease the carbon intensity of agricultural production while increasing crop yields. Likewise, the existing section 45Q tax credit for certain CC&S technologies could be expanded to encompass the building of soil carbon in the U.S. agriculture sector.

The agriculture sector faces high barriers of entry to voluntary carbon credit programs that prevent their full carbon sequestration potential from being recognized. Federal legislation such as the Growing Climate Solutions Act of 2021 has been introduced as a means of enabling the private-sector to overcome these hurdles,²⁴⁹ but Federal agencies could also provide additional support by expanding existing agricultural conservation programs and creating agricultural sequestration certification programs.

Congress and the White House should move swiftly to implement programs to reward farmers for reducing the carbon footprint of feedstock production and for capturing and sequestering carbon.

4.3.4 Negative-Carbon Technologies

To achieve agreed upon climate mitigation objectives, a major focus of climate policy must be investment in negative-carbon technologies. This will require policies that drive carbon capture, use and storage throughout the economy, including in agriculture and manufacturing. This should include sector-specific programs in each of these areas. *Climate policy should drive investment in agricultural biologicals, plant biotechnology and other biotechnologies to increase soil carbon sequestration and should reward microbial carbon capture and other biotechnologies for carbon removal and recycling.* Provisions for biological carbon capture and use in the section 45Q tax credit provide a template for inclusion of these technologies in future climate policy.

4.3.5 Economy-Wide Climate Programs

The U.S. transportation and power sectors have been the primary focus of policymakers due to their large share of total U.S. GHG emissions (28% and 27%, respectively, in 2018).²⁵⁰ Several states have adopted more ambitious long-term policies that require the full de-carbonization of their economies by 2050, however, and the remaining sectors (industry, commercial/residential, and agriculture) will need to achieve future carbon intensity reductions greater than those that have been achieved by the power and transportation sectors to date if these policies are to be successful.

The first such state policy to be implemented was California's Global Warming Solutions Act of 2006, which mandated an economy-wide emission reduction of 80% by 2050.²⁵¹ In 2018 California's governor issued an Executive Order that changed this target to 100% on a net basis by 2045.²⁵² Equally ambitious is the New York Climate Leadership and Community Protection Act (CLCPA). Passed in 2019, the CLCPA requires that the state's economy-wide emissions be reduced by 100% by 2050,²⁵³ although up to 15% of the reduction can take the form of offsets such as those described in Section 2.2. Colorado, Connecticut, Maine, Massachusetts, Minnesota, Nevada, Rhode Island, and Washington also all have statutory targets requiring statewide GHG emission reductions of at least 80% by 2050.²⁵⁴

A notable aspect of the deep economy-wide de-carbonization targets is that they will likely require the widespread deployment of carbon-negative technologies and non-fuel bioproducts in order to be successful. Policy language referring to "net-zero" emissions targets or, in the case of New York, explicit carbon offset thresholds reflects the recognition of this probable outcome by policymakers. Existing state de-carbonization requirements also identify varying degrees of de-carbonization difficulty for different economic sectors. New York's statutory target, for example, imposes an absolute zero-emission target on its power sector by 2040 through language that explicitly excludes the use of carbon offsets by that sector. The reason for this distinction is the expectation that zero-emission technologies such as solar PV and wind will enable an absolute zero requirement to be achieved. Those sectors such

²⁴⁸ <http://www.federalregister.gov/documents/2019/11/12/2019-24367/conservation-stewardship-program-csp-interim-rule>.

²⁴⁹ <https://www.congress.gov/bills/117/congress/117th-congress/senate-bill/1251>.

²⁵⁰ <http://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions>.

²⁵¹ <http://ww2.arb.ca.gov/resources/fact-sheets/ab-32-global-warming-solutions-act-2006>.

²⁵² <http://www.ca.gov/archive/gov39/wp-content/uploads/2018/09/9.10.18-Executive-Order.pdf>.

²⁵³ <http://climate.ny.gov/-/media/CLCPA/Files/CLCPA-Fact-Sheet.pdf>.

²⁵⁴ <http://www.c2es.org/document/greenhouse-gas-emissions-targets/>.

as transportation and manufacturing that utilize more energy-intensive systems, by contrast, will need to rely upon biomass and biotechnology to achieve net-zero emissions, sometimes via carbon-negative technologies, while supplying close substitutes for the fossil fuels and products that modern economies rely upon.

Existing government efforts in the U.S. to incentivize de-carbonization have largely been limited to the transportation sector, whereas the implementation of performance-based de-carbonization standards in manufacturing would enable the broad scope of biotechnology's benefits to be recognized by the market. Such standards include, but are not limited to, financing R&D, promoting alternatives to non-fuel fossil products, supporting and expanding sustainable procurement policies, and incentivizing the development of green manufacturing and sustainable agriculture practices.

Recent years have seen only limited action at the Federal level to encourage the utilization of biotechnology's de-carbonization potential. Several states have adopted more ambitious long-term economy-wide de-carbonization targets, however. While the policy mechanisms to achieve these targets have yet to be established, their success will likely depend on the extent to which the policies properly value the de-carbonization, including net carbon sequestration, abilities of both fuel*

Summary and Conclusion

"Climate change will affect every person, nation, industry, and culture on Earth."

Avoiding its worst effects will require an equally universal response. The biotechnology industry is uniquely positioned to play a leading role in the effort to reduce emissions, adapt to new climate conditions, and address the needs of the 21st century and beyond. In this report, three key themes have emerged. These themes should guide policymakers—and the biotech industry itself—if we are to achieve the full potential of biotechnology to address climate change.

Biotechnology is an essential climate mitigation tool. Biotech has already delivered vital climate solutions and holds the potential to provide transformative climate technologies across a broad spectrum of industrial sectors.

Biotech can achieve at least 3 billion tons of CO₂ equivalent mitigation annually by 2030 using existing technologies. The biotechnologies with the greatest potential impact include:

- Biotech solutions have the potential to reduce agriculture sector GHG emissions by nearly 1 billion metric tons (1 gigaton) annually—or the equivalent of GHG emissions from more than 100 million U.S. homes. This includes reducing nitrous oxide emissions from agriculture by over 150 million metric tons of carbon equivalent and enhancing soil carbon sequestration by up to 600 million metric tons per year through a combination of agriculture biotechnology and agricultural biologicals.
- The transition to next-generation biofuels enabled by biotechnology will double the per-gallon emissions reductions of biofuels *versus* petroleum. Doubling biofuel use through broad adoption of next-generation biofuels in aviation and other transportation sectors would increase the contribution of biofuels to U.S. transportation sector GHG emissions reductions from 980 million tons over the past thirteen years to over 1.8 billion tons for the decade 2020–2030, a reduction equivalent to taking more than 45 coal-fired power plants offline.
- Broad adoption of algal and microbial feed ingredients that reduce enteric methane emissions from ruminant animals can avoid the equivalent of up to 140 million metric tons of carbon annually.
- Broad adoption of anaerobic digestion for animal waste would reduce U.S. GHG emissions by over 150 million metric tons annually using current technology.
- Bioenergy with Carbon Capture and Sequestration (BECCS) could cost-effectively remove over 700 million metric tons of carbon per year, or more than half the emissions from all U.S. coal power plants.
- Suitable land and other infrastructure exists to deploy algae-based carbon capture systems at more than 500 power plants and ethanol facilities in the U.S. These systems would have a potential to capture more than 200 million tons of CO₂ annually.

Emerging biotechnologies could have transformative GHG benefits in a range of industrial sectors. Among the most promising applications are:

* **Editor's note:** the paragraph is not completed in the submitted report. It has been reproduced herein as submitted.

- Biobased plastics and polymers, such as PLA, PHA, and BDO have achieved lifecycle GHG reductions of up to 80% *versus* their petroleum-based counterparts. A rapidly growing list of new biobased chemical building blocks is now in development.
- Plant-based and cultured meats are providing new consumer choices and up to 89% lower lifecycle emissions for a global food sector responsible for more than 1/3 of total GHG emissions.
- Biology-based parallel computing and DNA data storage have the potential to cut the energy and carbon footprints of computing and data storage—sectors expected to account for 14% or more of global GHG emissions by 2040—by 99% or more *versus* current technology.

Biotechnology offers vital contributions to near-term GHG reductions and revolutionary tools to combat climate change in the longer term. To successfully address the challenge of climate change, humanity will need to predominantly de-carbonize the global economy by mid-century and begin significantly drawing down concentrations of atmospheric carbon shortly thereafter. The struggle against climate change must be viewed as a multi-decade process, which needs to begin immediately. A ton of carbon emissions avoided now matters more than a ton avoided next year, but every step needs to be evaluated from the perspective of maintaining a trajectory towards success.

An aggressive combination of sector-based and economy-wide policies is needed to rapidly realize the full potential of biotechnology to combat climate change. The future growth of the U.S. biotechnology industry will be heavily affected by both existing and potential regulatory barriers, and by the degree to which governments invest in the development and deployment of biotech solutions. Biotechnology is a vital component of the national and global infrastructure needed to combat catastrophic climate change. The economy-wide scope of this challenge will require the adoption of policies that reflect the ability of biotechnology products to achieve de-carbonization across all major sectors of the U.S. economy. Biotechnology companies will need to speak up not only to ensure that new policy provides opportunities for success, but to make it clear that prosperity is not threatened by sustainability. There is ample evidence that reducing emissions is, in fact, essential in supporting a thriving economy.

The biotechnology industry has a tremendous opportunity to build upon decades of success, and provide critical tools and expertise for the decades to come. Like every other industry, change will be profound and lasting, but if any industry can demonstrate that change can be an opportunity for growth, it is this one.

SUBMITTED LETTER BY RINA SINGH, PH.D., EXECUTIVE VICE PRESIDENT, POLICY,
ALTERNATIVE FUELS & CHEMICALS COALITION

April 15, 2022

Hon. DAVID SCOTT,
Chairman,
House Committee on Agriculture,
Washington, D.C.;

Hon. GLENN THOMPSON,
Ranking Minority Member,
House Committee on Agriculture,
Washington, D.C.

Dear Chairman Scott, Ranking Member Thompson, and Members of the Committee:

Alternative Fuels and Chemicals Coalition (AFCC) appreciates the opportunity to submit a statement for the record to the United States House of Representatives Committee on Agriculture hearing, “A 2022 Review of the Farm Bill: Energy—Renewable Energy Opportunities in Rural America.”

AFCC and its member companies applaud the House Committee for closely looking at the renewable energy opportunities in rural America and for having two of AFCC’s member companies, Dr. Pat Gruber, CEO, Gevo, and Mr. Jay McKenna, CEO, Nacero, participate in the second panel of the hearing as witnesses.

Introduction

AFCC is a collaborative government affairs effort organized by the Kilpatrick Townsend & Stockton law firm and American Diversified Energy. AFCC was created to address policy and advocacy gaps at the Federal and state levels in renewable chemicals, bioplastics/biomaterials, cell-cultured food ingredients, single cell protein for food and feed, enzymes, alternative fuels, biobased products and sustainable aviation fuels (SAF) sectors. AFCC member companies work on feedstocks, re-

newable chemicals, food, feed, fiber, bioplastics and biomaterials, and biofuels impacting the biobased economy.

The farm bill focusing on innovation aimed at boosting renewable energy in rural areas, including incentives for manure digesters for renewable natural gas producers, renewable fuels for ground transportation and sustainable aviation fuels, and renewable chemicals and biobased products. Making these programs cost effective for farmers who are responsible for generating the raw materials is key to all of our downstream successes in industrial biotechnology. Especially now, with high oil prices that suddenly make alternative energy sources more attractive and critical, and renewable energy production is also a driver of economic equality for farmers of racial backgrounds, as well as a cost-saver and a tool to mitigate climate change.

Importance of the Farm Bill Programs in Energy Title IX

Energy Title IX programs has been integral for fostering innovation and facilitation research and development of agricultural and forestry feedstocks for biofuels, renewable chemicals, and biobased products. The establishment of one new program in the 2018 Farm Bill—Carbon Utilization and Biogas Education Program brought the importance of climate change and a closer look at sources of feedstocks deployed for bioenergy and renewable chemicals and biobased products. Federal programs supporting the biobased economy provides de-carbonization and new sustainable products produced at scale in fewer steps than conventional fossil fuel processes, lowers greenhouse gasses, increases jobs, and provides a stable economy.

With the current national economy in a heightened state of uncertainty, the next farm bill and Energy Title IX programs become even more important to fuel the nation with a stable biobased economy. Companies look to deploy capital in the aftermath of COVID-19 and during increased supply chain project costs resulting from spiraling inflation and the Russia-Ukraine war, economic and regulatory certainty will be provided from the programs in the Energy Title IX programs in the re-authorization of the fifth farm bill. The programs are paramount, with investors stressing the importance of disciplined allocation. The Federal programs will take a positive step in providing the certainty, as government support is pivotal for renewable projects and the deployment of capital for lower carbon technologies for biofuels, renewable chemicals and biobased products. In turn, the nation will have sustainable biobased products.

The Fifth Farm Bill—Energy Title IX Programs Promoting Innovation

Section 9002 Biobased Markets Program

The 2018 Farm Bill directs the Secretary of Agriculture and the Secretary of Commerce to jointly develop NAICS codes for renewable chemicals and biobased products manufacturers. The next farm bill needs to have the NAICS codes directive with a timeline for its implementation by OMB.

NAICS codes would greatly enhance the ability to track and report on the renewable chemicals and biobased products industry, determine the funding requirements from Federal and state governments, track innovative activities in the sector, mitigate climate change, and capture the jobs created. Currently, production of renewable chemicals and biobased products have no tracking system and the industrial biotechnology sector has no knowledge of its growth potential.

There are changes requested in the implementation of the BioPreferred® Program, while encouraging the purchasing program of sustainable products, it is not operating the way Congress intended. Without sound sales numbers and procurement officers identified for the program the supply chain for renewable chemicals and biobased products will continue to be broken. If the program were operating properly, it would be very successful. AFCC requests quarterly updates from USDA to Congress for the procurement of renewable chemicals and biobased products in the fifth farm bill.

The BioPreferred® Program needs the label or certification to be modernized, showing that the renewable chemicals and biobased products are indeed sustainably sourced. Currently, the label shows a carbon content which is based on beginning of life, there is no end of life—the sustainability piece is missing on the label. Therefore, at a time of increased pressures on retailers, brands and manufacturers to reduce the carbon footprint of their consumer products, the label needs to show a carbon intensity (CI) score which will be determined by an international American Standard Test Method (ASTM). Today, the biobased products are being denied shelf space in large retailers shelves, because the products are not considered sustainable. AFCC is working with ASTM on developing the CI score for biobased consumer products based on sound science and regenerative agriculture practices.

AFCC is requesting increased funding for the BioPreferred® Program to support procurement officers and the development of modernizing the label which will give consumers confidence the products are sustainably sourced.

Section 9003 Biorefinery Assistance Program for Renewable Chemicals and Biofuels

AFCC is requesting a grants program be created for the Biorefinery Assistance Program which will encourage innovation and generate jobs.

AFCC in its Agriculture FY 2023 Appropriations request, which is attached, requests Congress expand its authority to 5 years funding for the biorefinery program instead of only 2 years as is in the 2018 Farm Bill. The 2018 Farm Bill expanded access to stand alone renewable chemicals manufacturing facilities, but without a full 5 years of funding the program, new innovative technologies and companies are prevented in capital in rural areas, which prevent job growth and economic growth in rural America.

Soil Carbon and Regenerative Agriculture Practices

Creating an ASTM standard based on good science practices that utilizes baseline soil carbon storage will give farmers and growers Section 45Q tax incentive for carbon capture in soil. AFCC supports the *Growing Climate Solutions Act*, since it would create a voluntary, producer-led carbon sequestration certification program at the Department of Agriculture (USDA) and provide farmers with technical resources to participate in voluntary carbon markets. AFCC is requesting an interagency be created to work with the Department of Treasury in the development of a tax incentive for farmers in Section 45Q of the Tax Code.

New Grant Program: The Bioeconomy Development Opportunity (BDO) Zone Program

BDO Zone Supports Energy Infrastructure in Rural & Distressed Communities

The Bioeconomy Development Opportunity Zone Program is a certification and regional designation grant program that enables economic development agencies and communities to more effectively and credibly disclose feedstock-related risks and promote biobased development opportunities to developers and investors around the world. The program would support development of manufacturing sites and jobs in underserved communities. A marker bill is attached which AFCC is promoting for the next farm bill.

Compostable Bioplastics

Under the carbon capture utilization education program. AFCC is requesting that bioplastics and biobased packaging will provide key opportunities to fight against climate change. The next farm bill, Energy Title IX should have research programs showing that compostable bioplastics and packaging can be tested and have proven to safely break down without any harm to the environment and can dramatically reduce the amount of food waste going into landfills. Composting that food waste instead of landfilling it is one the best strategies for addressing climate crisis. Sending food waste to landfills generates methane, which is 20 times worse than carbon dioxide as greenhouse gas emission. We urge USDA and DOE to create programs funding composting of bioplastics and food waste. Finished compost is critical for improving soil health, which is also an emerging solution to protect the climate and restoring the Earth's topsoil for better draw down of carbon dioxide in soil, thereby reducing emission in the atmosphere, and the soil is the carbon sink for smart climate practices for U.S. farmers.

Improving Modeling Technologies in Assessing Life Cycle Analysis

AFCC is requesting USDA, DOE, and EPA consider using greenhouse gas assessment of renewable fuel and renewable chemical pathways and using modernized methods such as the Argonne GREET model. A thoughtful, scientific, and holistic approach to establishing low-carbon or clean fuel standards and related policies that will reflect all relevant aspects of feedstock processing and recognize its value for renewable chemicals, biofuels, and biobased products to accelerate the growth of value-added agriculture and the de-carbonization of the U.S. biobased economy.

Conclusion

Thank you for the opportunity to provide statement for the record. AFCC recommends Congress should promote innovative technologies, which are sustainable, safe for the environment, and encourage greater investments in lowering the carbon

footprint which would protect the national security interests. This would build the biobased economy, build the rural and underserved areas, and create more jobs.

Sincerely,

RINA SINGH, Ph.D.,
Executive Vice President, Policy,
Alternative Fuels & Chemicals Coalition.

[Endnotes]

Please note:
 (U) *This program has neither met its potential nor its promise.* USDA is the Federal agency where the BioPreferred® Program sits. Yet USDA has yet to make a significant effort to purchase bio-based products and encourage other agencies to do so.

- **The USDA BioPreferred® Program enacted in the 2002 Farm Bill (Section 9002, Biomarkets Program, Energy Title IX)**, has been reauthorized every 5 years in each subsequent farm bill. It began in 2002 with a mandated appropriation of \$1 million which, with advocacy, has been increased to \$5 million annually. AFCC's request to increase the funding level to \$5 million annually would solve the implementation for the program.
 - **The program has two parts:**
 - **Certification** (a USDA label on product packaging shows how much carbon came from crops or is new carbon), and
 - **Procurement**: a biobased product is available as an alternative to a fossil-based product, by law, USDA and all Federal agencies and their contractors must buy the biobased product in lieu of fossil-based products.
 - *Certification is working; Procurement has not worked for just about any producer.*
 - Therefore, in the 2018 Farm Bill, AFCC's Executive Vice President advocated to move the program to a new home in USDA.
 - However, after 2 years, no changes have occurred on the procurement side with the new management; the law still is not being carried out, implementation of the program is still not occurring, there is no accountability, and the program is not functioning as Congress intended.
 - **If USDA is not purchasing biobased products, which is the Federal agency where the program sits, why would the other Federal agencies consider buying it?**
 - **Biobased product companies would like to expand their business in sustainability and a climate-smart platform**, but if they can't get the current biobased products sold, it is very difficult for them to justify to their board of directors to expand or even be in this space. We need a solution to this issue.
 - **USDA currently is purchasing petroleum-based office supplies** from distributors such as Office Max, Amazon, others, biobased products are not being purchased. Office supplies are everyday products which USDA and other Federal agencies should be purchasing routinely from their distributors.
 - **The BioPreferred Program has not been operating as Congress intended**, and now that Secretary Vilsack has been confirmed and we know that he has been supportive of the program, we would like Congress to add statutory language in the appropriations bill, the following information:
 - ✓ Quarterly, provide Congress a report, the procurement of biobased products from the catalogue on their website, *BioPreferred* (<https://www.biopreferred.gov/BioPreferred/faces/catalog/Catalog.xhtml>) which has all of the biobased products listed. What are the sales number and the actual biobased products sold? There is no transparency.
 - ✓ Provide purchases of low-hanging fruits, such as USDA certified office supplies (bioplastic binders, notepads, paper) and biobased cleaning products which USDA currently is purchasing from distributors like Office Max, Amazon, which are not biobased—this needs to occur within 90 days of receiving the letter from Congress. USDA will provide proof of purchase to Congress for these biobased products (how many and at what price) every quarter. The quarterly report should include all procurement of biobased products.
 - ✓ Modernizing the BioPreferred label with sustainability parameters such as carbon intensity score. The label has a beginning of life parameter on its label which is not based on sustainability.
 - **Biobased product companies would like to expand their business in sustainability and a climate-smart platform**, but if they can't get the current biobased products sold, it is very difficult for them to justify to their board of directors to expand or even be in this space. Some companies have been waiting almost 10 years. We need a solution to this issue.
 - ② Unlike previous farm bills, which provided mandated funding for the Section 9003 loan guarantee program for each year of the 5 year term of the farm bill, the 2018 Farm Bill provided only 2 years of mandated funding with discretionary funding of up to \$50 million per year authorized for each of the remaining years covered by the 2018 Farm Bill. **AFCC strongly recommends that the Section 9003 Loan Guarantee Program receive its full discretionary authorization of \$25 million for FY 2023.**
- This is a critical program: It is one of only two Federal loan guarantee programs that are available to bridge the "valley of death" between the final validation and demonstrated workability of a promising new concept, technology, or product and the ability to bring it to commercial realization.*
- Every project brought to fruition through this program creates jobs and economic development for its first commercial facility, as well as many additional jobs and economic development for local communities throughout the U.S.**, as the success of the first commercial facility leads to private-sector financing at multiple follow-on projects.
- Only after the concept, technology, or product has been proven at commercial scale, will private-sector investors and lenders find the project risks acceptable to further replicate and deploy the concept, technology, or product.*
- ③ **The appropriation of \$20 million under the Forest Service's National Forest System, State and Private Forestry account, to create incentives for increased use of biomass from National Forest Lands has far reaching significance:**
- First**, because it will remove dead and diseased wood and slash piles from logging operations from the National Forests which exacerbate and can lead to extreme fire hazards,
- Second**, because it begins to carry out, for the first time, the mandate in the "Policies Relating to Biomass Energy" (page 371 of H.R. 2471), which has been incorporated into every Consolidated Appropriations Act since FY 2018,
- Third**, because it helps facilitate responsible forest management, and
- Fourth**, because it recognizes biomass as a renewable energy source which:
- Using a liability that contributes to forest fires, increased carbon emissions that contribute to climate change, loss of wildlife habitats, loss of property, and ballooning firefighting budgets, As an asset to produce value-added products which can:*
- create jobs,
 - generate revenues and improve the economies of rural communities,
 - replace fossil-based products, and

AFCC's 2023 Appropriations Requests
Key Program Summaries: Agriculture & Rural Development
AFCC's Priorities Are [Highlighted]
 Subcommittee: Agriculture & Rural Development
 Agency: U.S. Department of Agriculture (USDA)

Account/Program:	FY 2019 Appropriation	FY 2020 Appropriation	FY 2021 Appropriation	FY 2022 Appropriation	President's FY 2023 Budget	AFCC's FY 2023 Request	Notes
------------------	--------------------------	--------------------------	--------------------------	--------------------------	-------------------------------	---------------------------	-------

- mitigate the impacts of climate change.
- Fifth**, because the USDA Forest Service has launched a robust, 10 year strategy to squarely address this wildfire crisis in the places where it poses the most immediate threats to communities, which was announced on January 18, 2022 by Agriculture Secretary Vilsack and Forest Service Chief Randy Moore.

See: <https://www.fs.usda.gov/news/releases/secretary-vilsack-announces-new-10-year-strategy-against-wildfire-crisis>

The strategy:

- Estimates that funding to remove hazardous fuels will range from \$1,000 to \$2,500 per acre
- the strategy calls for the Forest Service to treat up to an additional 20 million acres on national forests and grasslands and support treatment of up to an additional 30 million acres of other Federal, state, Tribal, private, and family lands
- The President's FY 2023 budget (see page 27) requests \$3.9 billion for Forest Service Wildland Fire Management, as well as an additional \$2.6 billion authorized by the suppression cap adjustment to carry out this initiative.

AFCC requests that the President's request of \$3.9 billion be appropriated along with an authorization of an additional \$2.6 billion.

117TH CONGRESS
1ST SESSION

H. R. _____ / **S.** _____

To provide grants for eligible entities to create Bioeconomy Development Opportunity Zone designations that enable local communities to utilize biomass for biofuel and energy development.

IN THE HOUSE OF REPRESENTATIVES or
IN THE SENATE OF THE UNITED STATES
_____, 2021

Mr./Ms. [SPONSOR (for him/herself, and [LIST OF INITIAL COSPONSORS])] introduced the following bill; which was referred to the Committee on _____

A BILL

To provide grants for eligible entities to create Bioeconomy Development Opportunity Zones to utilize local biomass resources and create jobs by de-risking investment and accelerating development of new renewable energy production facilities in distressed communities.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the “BDO Zone Grant Program Act of 2021”

SECTION 2. BIOECONOMY DEVELOPMENT OPPORTUNITY ZONE GRANTS

(a) FINDINGS.—Congress finds the following:

- (1) Fifty-two million Americans live in economically distressed communities.
- (2) Many of these communities have substantial biomass assets—agricultural residues, wood fiber, food and farm waste that can be used to produce ground and aviation biofuel, renewable chemicals, biomass to power, biogas, biochar and other biobased products.
- (3) Ground and aviation biofuel is an immediately available path toward decarbonizing the transportation sector while driving rural economic development and growth, stabilizing feedstock prices, and providing additional markets for agricultural products.
- (4) United States farmers and forests are producing record amounts of feedstock for renewable fuels, but market disruptions and fluctuations due to the COVID–19 pandemic have created uncertainty and reduced markets for United States feedstock producers.
- (5) Biofuels, renewable chemicals, biomass to power, biogas, biochar and other biobased products which contribute to energy security, reduce air pollution, and support rural economic development, are an important market for United States feedstock producers.

(b) ESTABLISHMENT.—

- (1) [IN] GENERAL.—Not more than 180 days after enactment, the Secretary of Agriculture, working through the Administrator for Rural Business—Cooperative Service, shall, subject to appropriations, establish the “BDO Zone Grant Program.”

(c) **ELIGIBLE APPLICANTS.**—The Secretary may make a grant under this subsection to a partnership that—

(1) is composed of;

(A) entities representing a region composed of 1 or more rural areas, including—

(aa) except as provided in subparagraph (B), 1 or more of—

(i) a unit of local government;

(ii) a Tribal government; or

(iii) an authority, agency, or instrumentality of an entity described in item (i) or (ii); and

(B) a nonprofit or for-profit organization, including a public benefit corporation, an economic development organization, a community or labor organization, an institution of higher education, a community development financial institution, a philanthropic organization, an instrumentality of a state agency relevant to community and rural development, a cooperative extension, an institution in the Farm Credit System, and a local food policy council; and

(C) such other entities as the Secretary or the partnership may determine to be appropriate;

(2) does not include a member described in subparagraph (1)(A)(aa) but demonstrates significant community support sufficient to support a likelihood of success on the proposed projects, as determined by the Secretary; and

(3) demonstrates, as determined by the Secretary, cooperation among the members of the partnership necessary to complete comprehensive, asset-based rural development to align Federal, state, regional, and Tribal investment, while leveraging nongovernmental resources, to build economic resilience and aid economic recovery, including in communities impacted by economic transitions and climate change.

(d) **USE OF GRANT FUNDS.**—The use of grant funds provided under this section may be used for the following purposes;

(1) The creation of Bioeconomy Development Opportunity (BDO) Zone designations to support the development of new markets that will stimulate local and regional biobased economic development. This includes quantifying, scoring and issuance of ratings that reflect regional feedstock and infrastructure risk for use by bio-project development companies and capital markets.

(2) Supporting organizational operating expenses and planned BDO Zone economic development related to BDO Zone designation activities for which the grant was provided.

(e) **AMOUNT OF GRANTS.**—The Secretary will make grant awards to eligible entities, as described in subsection (d), of not more than \$200,000 per eligible applicant.

(f) **MATCHING REQUIREMENT.**—

(1) **IN GENERAL.**—Subject to paragraph (2), the recipient of a grant under this section shall contribute a non-Federal match of 25 percent of the amount of the grant, which may be satisfied through an in-kind contribution.

(2) **WAIVER.**—The Secretary may waive any portion of the matching requirement described in paragraph (1) on a finding that the recipient of the applicable grant is economically distressed.

(g) **AUTHORIZATION OF APPROPRIATIONS.**—There is authorized to be appropriated to the Secretary \$20,000,000 for each of fiscal years 2023 through 2030 to carry out this section.

SUBMITTED QUESTIONS

Response from Hon. Xochitl Torres Small, Under Secretary for Rural Development, U.S. Department of Agriculture

Question Submitted by Hon. Gregorio Kilili Camacho Sablan, a Delegate in Congress from Northern Mariana Islands

Question. Secretary Torres Small, you mention in your testimony that USDA Rural Development is looking for creative ways to provide capital and technical assistance to communities that historically have not had resources like the Rural En-

ergy Savings Program. I respectfully request you consider the Northern Mariana Islands and other U.S. Territories, which all could benefit from additional support from Rural Development to promote clean energy, tackle the climate crisis, and cut costs for families and businesses.

Answer. The agency would welcome an opportunity to work with you, along with our colleagues in the CNMI and other Pacific communities to finance energy efficiency and renewable energy projects. RUS programs are fully open to Compact of Free Association States and the Commonwealth of Northern Mariana Islands (CNMI), Puerto Rico, Virgin Islands and American Samoa. The Rural Energy Savings Program (RESP) will lend funds to a utility at zero percent interest rates and the utility will then re-lend those funds to rate payers for energy efficiency measures with the utility paying RUS back over 20 years and consumers paying back the utility via an on-bill financing mechanism over 10 years at interest rates no higher than 5%. In addition to RESP, communities in the Pacific have also successfully applied for grant funding for renewable and other energy projects under the High Energy Cost Grant (HECG) program which statutorily targets communities with energy costs 275% above the national average. The challenge when it comes to serving some Pacific communities in need is that even at zero percent interest, utilities may not have sufficient resources to repay those loans. The HECG program can help but is typically funded at a modest level which in recent years has been at or near \$10 million.

USDA's Rural Development State office in Hawaii oversees many of our programs with Compact States and the CNMI and we are united in the field and at headquarters in our desire to support people in CNMI and throughout Pacific communities.

Response from John J. "Jay" McKenna III, Chief Executive Officer, Nacero, Inc.

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. Mr. McKenna, you mentioned that the Russian invasion of Ukraine accelerates the need for the United States to reduce our reliance on foreign oil. How would making gasoline from natural gas and renewable natural gas/biomethane help achieve this objective, especially when you stated that construction of each Nacero facility can take 4 years?

Answer. It takes two barrels of crude oil, $\frac{1}{3}$ of which is imported, to make one barrel of gasoline. The natural gas and renewable natural gas used to make Nacero gasoline is one hundred percent domestic. Nacero's Penwell plant will reduce demand for foreign crude oil by 208,000 per day, the same amount we were importing from Russia before the embargo. Facilities of this scale can't be built overnight but given the size of the reduction in foreign dependence, 4 years is a remarkably short time.

Question 2. Mr. McKenna, you stated that making gasoline from natural gas and renewable natural gas would result in lower greenhouse gas emissions. Can you please detail the sources of these savings and indicate how the substitution of fuel made in this manner could impact the U.S. and global greenhouse gas emissions?

Answer. Making gasoline from natural gas instead of crude oil cuts the lifecycle carbon footprint of the gasoline manufacturing process in half by avoiding the production of crude oil refinery byproducts, many of which are not needed in this country. Using renewable natural gas ("RNG") from farms, feedlots and landfills to make Renewable Gasoline prevents the raw release into the atmosphere of biomethane, which is 80 times more harmful over 20 years than carbon dioxide. A Nacero plant the size of Penwell that uses a feedstock mix of 75% conventional natural gas and 25% RNG could offset fifty million ton per year of carbon emissions. Four Nacero plants of this size with this feedstock mixture would offset the carbon emissions of Los Angeles.^{1*}

Question 3. Mr. McKenna, in your testimony, you wrote that the technology you intend to use has been proven. Can you please tell us where and when this technology has been used?

Answer. Nacero has exclusive rights in the lower 48 states to the Topsoe TIGAS™ natural gas to gasoline technology. A TIGAS™ system of identical size to the one Nacero is using has been in successful operation in Turkmenistan since 2019. The

¹ <https://www.wired.com/story/la-emissions-block-by-block/>, † CARB shows statewide emissions dropping about 1% per year (<https://ww2.arb.ca.gov/ghg-inventory-data>), † which would put the LA total at about 167M tons (down from 176M tons in the 2017 study).

* **Editor's note:** items annotated with † are retained in Committee file.

Turkmenistan Government, which owns the plant, is planning to add additional units.

Question 4. Mr. McKenna, you made some bold predictions about the economic impact of a Nacero plant on a local and regional economy. Can you please break down how the construction of a projects like the ones planned for west Texas and north-east Pennsylvania will generate a \$25 billion impact?

Answer. See the Bureau of Business Research, IC2 Institute, The University of Texas at Austin, “Economic Assessment of Nacero’s Planned Investment: State of Texas, Permian Basin, and Ector County Impacts, 2022–2077,” (2021), which estimates \$27.8Bn GDP impact to the regional economy through construction and operation. Similar results are expected elsewhere.

Question 5. Mr. McKenna, you stated that Nacero facilities will create enough renewable natural gas demand for up to 75–100 additional digesters. What is the environmental benefit from using renewable natural gas? What is the cost to develop this additional renewable natural gas capacity and how much income might the farmers receive from selling their biomethane?

Answer. The capture and use of biomethane prevents its raw release into the atmosphere, where, as indicated above, it is 80 times more harmful over 20 years than CO₂. A single Nacero facility that consumes 250,000 MMBtu/d per day of RNG would double the current 250,000 MMBtu/d U.S. demand for RNG and in turn create demand for 75 to 100 new digesters. Each digester costs \$35–\$50 million and generates about \$1.1 million of additional annual farm income.

Question 6. Mr. McKenna, you stated that construction of a Nacero plant would require thousands of jobs during the construction phase and hundreds of permanent jobs thereafter. What would you expect these jobs to look like and how would you support the development of these potential employees?

Answer. It will take an estimated 3,500 construction workers 4+ years to build a Nacero facility the size of Penwell and 450 operators to run it thereafter. This does not count the workers needed to capture and convert biomethane into renewable natural gas, or the workers needed for annual maintenance. Construction and operation will be accompanied by broad based training programs.

Question 7. Mr. McKenna, you talked about the importance of engaging the “everyday driver” in battling greenhouse gas emissions and said that you expect that Nacero gasoline with half the lifecycle carbon footprint will be sold at a competitive price. Can you please explain the importance of this strategy and how Nacero is able to help everyday drivers reduce global greenhouse gas emissions?

Answer. Global warming is a problem for everyone. The transportation sector is the largest contributor of greenhouse gas emissions in the United States and gasoline is the majority contributor to transportation sector emissions.² Nacero’s affordable, environmentally superior gasoline will be useable in today’s cars and trucks without modification and will make it possible for everyone, regardless of income, to fight climate change without having to buy a new car or pay more at the pump.

**A 2022 REVIEW OF THE FARM BILL
(INTERNATIONAL TRADE AND FOOD ASSISTANCE
PROGRAMS)**

WEDNESDAY, APRIL 6, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON LIVESTOCK AND FOREIGN AGRICULTURE,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:03 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Jim Costa [Chairman of the Subcommittee] presiding.

Members present: Representatives Costa, Spanberger, Hayes, Axne, Craig, Bishop, Johnson, DesJarlais, Rouzer, Kelly, Baird, Mann, Feenstra, Moore, and Thompson (*ex officio*).

Staff present: Lyron Blum-Evitts, Daniel Feingold, Josh Lobert, Lesly Weber McNitt, Ashley Smith, Caleb Crosswhite, Jennifer Tiller, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. JIM COSTA, A
REPRESENTATIVE IN CONGRESS FROM CALIFORNIA**

The CHAIRMAN. Good morning, everyone. I say good morning. The Subcommittee on Livestock and Foreign Agriculture will now come to order, and we are doing a hybrid Subcommittee hearing this morning, which is not unusual these days. We are, unfortunately, still not out of the woods of this horrific COVID pandemic that has impacted every fabric and region of American lives, over 900,000 lost around the world. So, we hope that we are going to pass some additional funding to protect American people, but that is not the subject of this morning's hearing.

The subject of this morning's hearing is a review of the farm bill as we set the table for next year's reauthorization, focusing today on international trade and food assistance programs. And it could not be more timely for a number of reasons, but the fact is the efforts to ensure that American agriculture, which it has traditionally done, provides a sort of support, not only to feed all of our people, but to also help in places of the world where there is hunger and food insecurity has been a tradition of previous farm bills. So, we are going to look at that.

The Subcommittee will receive testimony from the witnesses today. We have two panels of very good witnesses, and with consultation of the Ranking Member, pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members

of the full Committee may join us today. They are always welcome, and we appreciate their participation.

With that said, I will begin with my opening statement, and I want to thank Ranking Member Johnson and Members of the Subcommittee, and those that are participating on Zoom for your focus on international food assistance and trade programs within the farm bill. These programs are important for multiple reasons. They open and grow new markets for high-quality American food and agriculture; they save lives; they build local agriculture and food systems in developing economies; and they strengthen our foreign relations to advance shared values. As the oldest democracy in the world and still a beacon of light, these shared values that we have that begin with human rights, and the democratic institution that protects those human rights, our freedoms that we hold most dearly.

So, I think all of you know, I like to say as a third-generation farmer, still my primary source of income, that food, the food that we grow in America, is a national security issue. May not always look at it that way, but I think maybe at the beginning of the pandemic with the closure of restaurants and schools, people began to realize in seeing some scarcities on grocery shelves that, in fact, we can't take it for granted that the hardworking American farmers, ranchers, dairymen and -women, the farmworkers, every day do so much with less than four percent of the nation's population to put that food on America's dinner table every night. Let us never, ever take it for granted. And not only can we feed America with the highest quality of products, the most nutritious products, and every day we work hard to make it better at the most cost-effective level, although we know this inflationary spiral we are in right now is impacting the cost of those groceries. The fact is nobody, nobody, as that song goes, does it better than the American farmer, and stewards of our environment as well.

Obviously, I am very passionate about that from my own experience, but the fact is that we have problems. I wanted to send a copy of a story that I thought was very good. I bring it to your attention, and I would urge you to look at it. The title this morning is, *Russia's War on Ukraine: We See the Storm Coming: U.S. Struggles to Contain a Deepening Global Food Crisis*. And that is, in part, why we want to have this Subcommittee hearing here this morning. Putin's war on the Ukraine has been horrific, and I think we all have our very personal feelings about what we have seen and the courageous Ukrainian people fighting for their independence and their sovereignty. And he is a pariah, and I think he is a war criminal. But the fact is that the devastation that he has placed upon the people of Ukraine is a wake-up call for all of us, and I think he has, in a strange sort of way, brought us together. We needed to be together before this, but I think we will see continuing things from the testimony of our witnesses and the questions we ask about what this means. We have already seen the disruption of global grain and fertilizer markets. We have seen a significant downstream effect on countries reliant on Black Sea trade, and for this reason, I have signed on to a letter with many of my agricultural colleagues requesting that the USDA and the USAID use resources available in Bill Emerson's Humanitarian Trust to

help address food insecurity. The Trust is one of many vital farm programs that we look forward to hearing about today from our witnesses, but I believe that—and I have had conversations and I suspect many of my colleagues have with the Secretary of Agriculture and folks in the USDA that we are going to have to look at other resources with the Commodity Credit Corporation and others to provide funding to optimize American farmers and ranchers to use their land and resources that allows for surplus production in various commodities, especially in our grain and wheat areas that many countries don't have.

Though the international food assistance programs only make up a fraction, a fraction of one percent of our Federal budget, Americans still lead global donations and share a bounty through the farm bill programs, like Food for Peace, the McGovern-Dole, and Food for Progress. And so, I think a concomitant view, I believe, that we share is a moral obligation to provide in leading nations, to provide assistance to countries in need, and there are certainly many people who need our help.

According to the USDA's *International Food Security Assessment* from last summer, before the invasion of Ukraine, the number of food-insecure people in 2021 was estimated to be at 1.2 billion people: 1.2 billion people. There are seven billion people plus on the planet, so think about that. That is almost 20 percent, and that increase was due to a lot of factors, including COVID-19 and climate-related disasters, and conflict. And the conflict, of course, is bearing on us now.

The past 2 years have made it clear that our global integrated food system has some cracks, and I want to hear ideas from our two panels and from Members of the Committee on how we can deal with some of those cracks. The vulnerabilities as climate change continues to impact our production systems, exchanging technical knowledge with partnering countries, such as the Farmer-to-Farmer Program, Cochran fellowships can be helpful in food-insecure nations, make them more food efficient.

But food is just one assistance that agriculture connects us globally, and I think the farm bill trade promotion programs are something else that we need to think about in terms of next year's farm bill reauthorization. Market Access Program has had a tremendous benefit in every region of the country. I know it has in California. We are very strong advocates for the Market Access Program. Foreign Market Development Program, FMD, is also helpful for U.S. producers to develop commercial relationships and facilitate agricultural trade.

In addition, we are going to have to deal with the supply chain issue. I mean, it is still a problem and these empty containers are not good. We have two bipartisan pieces of legislation that many of us are supporting. Congressman Garamendi has that piece of legislation that we hope to get it worked out here that will deal with the demurrage issue and the delay issues on the empty containers, and I have legislation on anti-trust provisions.

So, it is kind of an all of the above approach. These programs when they work and to the degree we make them work more efficiently, they contribute to local growth and to agricultural support. Maintaining and deepening relationships is a vital part of engen-

dering economic development and shared values, and building future markets for American agriculture.

So, the two objectives that are advanced by the farm bill's Title III programs are not mutually exclusive in my mind. I think they are complementary, and I would like to hear our witnesses give their thoughts on that. So, we look forward to hearing from them on the full spectrum of Title III programs and delivering on their mission.

The witnesses on our two panels have an impressive amount of knowledge on how Title III farm bill programs impact their efforts in the world. I am excited to hear from them, and I know we will have a productive discussion about what is working and what is not working so well, and how we can improve it.

[The prepared statement of Mr. Costa follows:]

PREPARED STATEMENT OF HON. JIM COSTA, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

Good morning. Thank you to our witnesses, Ranking Member Johnson, and the Members of the Subcommittee for convening today to discuss the international food assistance and trade programs within the farm bill. These programs are important for multiple reasons: they open and grow new markets for high quality, American food and agriculture products, they save lives, they build local agriculture and food systems in developing economies, and they strengthen foreign relations to advance shared values and security. I've been known to say that food security is national security and that linkage has never seemed stronger than it is today.

Unfortunately, we may be called on to do even more in the coming months as we grapple with the fallout from Putin's war in Ukraine. We have already seen disruption of global grain and fertilizer markets, which will have significant downstream effects on countries that are reliant upon Black Sea trade. For this reason, I signed onto a letter with many of my Agriculture Committee colleagues requesting that USDA and USAID use the resources available in the Bill Emerson Humanitarian Trust to help address food insecurity. The Trust is one of many vital farm bill programs that I look forward to hearing about and discussing today.

American farmers and ranchers are experts at optimizing their use of land and resources. Their efficiency allows for surplus production of commodities—a benefit that many countries do not have. Though international food assistance programs only make up a fraction of one percent of our Federal budget, Americans still lead global donations, sharing our bounty through farm bill programs like Food for Peace, McGovern-Dole, and Food for Progress.

I believe it is a moral obligation of leading nations to provide assistance to countries in need, and there are certainly many people who need help. According to USDA's *International Food Security Assessment* from last summer, the number of food-insecure people in 2021 was estimated at 1.2 billion, an increase of almost 32% (291 million people) from the 2020 estimate. They estimated that much of this increase was due to persistent effects of COVID-19, along with climate-related disasters, and conflict.

The past 2 years have made clear that our globally integrated food system has some cracks. And many of these vulnerabilities may worsen as climate change continues to wreak havoc on our agricultural production systems. Exchanging technical knowledge with partner countries, through initiatives such as the Farmer-to-Farmer program and the Borlaug and Cochran Fellowships, will be critical in helping food-insecure nations become more efficient.

Food assistance is just one way that agriculture connects us globally. Farm bill trade promotion programs such as the Market Access Program (MAP) and the Foreign Market Development Program (FMD) help U.S. producers establish commercial relationships and facilitate agricultural trade. These programs and the work they support are vital to opening new markets, but they also contribute to local growth of food and agriculture supply chains. Maintaining and deepening good relationships is a vital part of engendering economic development and shared values and building future export markets for American agriculture. These two objectives, which are advanced by the farm bill's Title III programs, are not mutually exclusive—they are complementary. I look forward to hearing from our witnesses about how the full spectrum of Title III programs are delivering on their mission.

The witnesses on our two panels today have an impressive amount of knowledge on how Title III farm bill programs impact the world. I am excited to hear from them and have a productive discussion about what is working and how we can improve these programs.

Before the introduction of our witnesses, I'd like to recognize the Ranking Member, Mr. Johnson of South Dakota, for any remarks he'd like to make.

The CHAIRMAN. So, before the introduction of the witnesses, I would like to introduce my friend and the Ranking Member of the Subcommittee, the gentleman from South Dakota, Mr. Johnson, for any remarks he would like to make.

**OPENING STATEMENT OF HON. DUSTY JOHNSON, A
REPRESENTATIVE IN CONGRESS FROM SOUTH DAKOTA**

Mr. JOHNSON. Well, thank you, Mr. Chairman, and I start by associating myself with so much of what you said, sir. I think as I watched the development of the 2018 Farm Bill from afar, it was clear to me how focused people on both sides of the aisle were on putting together the right Title III approach. And I think we all understand the value proposition, right? Clearly, it is needed for communities in need. Clearly, it can be helpful to producers, providing them an avenue for their hard-earned yields. But also, sir, you are right when you talk about shared values. Clearly, these Title III programs can help to advance shared values.

And Title III is not perfect, and I think as we understand amid pandemic, ongoing conflict, and weather-related disasters, it is good for us to have hearings like this so that we can look forward to what does Title III need to look like, not just today, but in the next farm bill as well.

As we talked, sir, before the hearing, you had noted that *POLITICO* article, and I, too, thought it was prescient. I thought it was on target for today. We see the storm coming. We see the storm coming, and we know that the war on Ukraine is adding shocks to an already fragile supply chain, and is exacerbating inflationary pressure.

I think we do see a storm coming. I think we see a global food crisis that could be every bit as dangerous as those we saw in 2007 and 2008, and I think we are looking forward to hearing from our witnesses about are there things that we can do to be more resilient, to be more prepared to try to shave off the most jagged edges of that storm that we see coming.

And of course, I am pleased to hear USAID will trigger the Bill Emerson Humanitarian Trust, and I do have concerns, and I know a number of my colleagues do, about how long it takes those commodities to enter the pipeline. And so, can the communities in crisis, can they wait until the fall, and hopefully, Ms. Charles can educate us more on what that pipeline will look like, and when that relief can actually be delivered.

And before I close, I just wouldn't feel right if I don't mention, again, how important it is for this Administration to prioritize trade: our trading programs, trading relationships, and as the Chairman mentioned, trade promotion programs. And one thing we need to do, our country, is make sure we get swift nominations of a Chief Ag Negotiator, and of course, also a USDA Under Secretary for Trade and Foreign Agriculture. Both of those positions are needed. They are uniquely positioned to be able to help in this

whole suite of conversations we are going to be having today. And frankly, it is hard to imagine a healthy American agricultural sector without new markets, expanded markets, stable markets, and those positions will help with that.

So, with that, I welcome our witnesses. I am excited about it, too, and Mr. Chairman, I yield back.

The CHAIRMAN. Well, I thank the gentleman from South Dakota for his statement and good words. I concur.

Chairman Scott wanted to be here, but is not able to, and I appreciate all the good work that he does in providing leadership for our Committee, and as common courtesy, we want to provide the Ranking Member an opportunity to weigh in as well for any opening statement he might like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Sure. Chairman Costa, Ranking Member Johnson, thank you so much for this Subcommittee hearing, and for your leadership. It is much appreciated. Thank you to our witnesses here. I had a chance to talk with each of you briefly here that are testifying on the first panel. Thank you for your leadership. The times that we are in are difficult times, and I think only going to get worse here, unfortunately, as we reach into the fall.

But good morning, everybody. My thanks to our witnesses for spending time with us this morning. This is a timely conversation. I look forward to learning from you and thinking more comprehensively about how we can best move forward.

We are at a crossroads. The geopolitical strife, weather-related disasters, pandemic-related impacts, and supply chain and inflationary crisis are wreaking havoc on the world, and especially affecting those in vulnerable countries and communities. And there are so many simultaneous emergencies at the moment, so I do want to take this opportunity to extend my appreciation to USDA and USAID, and all their partners for their tireless work to feed our world's hungry. You are truly doing God's work, and we thank you for that. And please pass that thanks along to your colleagues that work with you.

However, there is much more to do, and that is why this hearing is so important. The review of Title III will allow us to learn what is working, what isn't, and to provide direction as we head into deliberation of the 2023 Farm Bill. And this conversation will also be informed by the crisis in Ukraine. As almost everybody knows, Ukraine is a large producer of grain, and together, Russia and Ukraine supply 26 percent of global wheat exports, and Ukraine supplies 13 percent of the world's corn. Ukraine is also the largest global supplier of sunflower oil. Russia is a major global supplier of fertilizer ingredients, and oil and gas products. I think we have been meeting with some of the best thought leaders, trying to really map what we will see occur here into the fall. I am looking forward to hearing your analyses and assessments of this. But everything we have heard and really leads to a pretty grim conclusion that by this fall, we are going to see significant increase in hunger, starvation, and death by famine. And with that, a destabilization

that is going to result in violence and probably an increase in terrorism.

When you think about the Middle East, it gets almost $\frac{1}{2}$ of its food from the Ukraine and these farmers are now on the frontlines defending their nation, and the lack of supply of diesel fuel, we don't know when that winter wheat is going to get harvested, and we certainly don't anticipate where if this continues, where the spring planting will occur.

So, as a result of the disruption to exports, global commodity markets have spiked and will continue to experience volatility, and this volatility leads to higher commodity prices, but there remain very real concerns over fertilizer and pesticide availability, and their skyrocketing costs.

So, I echo my colleagues in hoping this hearing reveals more immediate solutions to these problems. Anything, obviously, I believe that we can do to provide tools to American farmers that they can increase their production at this point in time, which is challenging with inflation costs and availability of fertilizer and those things, but anything that we can do and that the President can do—and I think there are some things that he can do immediately—to help increase that production by American farmers of just additional bushels. Because I believe with every additional bushel above and beyond what we normally would produce is lives saved somewhere around the world at this point in time.

I also hope USDA and USAID can shed some light on any near-term executive actions this Administration is aiming to take, including the drawdown of the Bill Emerson Humanitarian Trust.

With that, Mr. Chairman, Mr. Ranking Member, thank you so much. I yield back.

The CHAIRMAN. All right. I thank the gentleman from Pennsylvania, and let me just underline a number of comments you made. I really believe that we are, as you noted, in a seminal moment in world history. You can look back at the 20th century and you can look at World War I and the Spanish Flu, you can look at the Depression and World War II, Vietnam War, and civil rights movement, but clearly, this time period that we are living in today, the last 4 and the next 4 years, historians will look back 25 years from now and they will make determinations. Did we make more good decisions than poor decisions? We are going to make both. Hopefully we will make more good decisions, and therein lies our challenge.

So, the chair would request that other Members who wish to submit their opening statements for the record will do so and will be accepted, and let us begin with our witnesses and their testimony to ensure that we have ample time for questions.

I am pleased to welcome two distinguished panels of our witnesses for our hearing today. Our witnesses bring a wide range of experience and expertise, and we want to thank you for joining us.

Our first witness on our first panel today is Mr. Daniel Whitley who serves as the Administrator of Foreign Agricultural Service at the United States Department of Agriculture, and we thank you for taking the time this morning. I think you understand, as all the witnesses do here, the regular order. We have 5 minutes, although your testimony I think, is much more detailed and we appreciate

that. You got the green light, then you got the yellow light, and then the red light. Nothing bad will happen, but we would like you to conclude.

So, Mr. Whitley, thank you. Please begin your testimony.

**STATEMENT OF DANIEL B. WHITLEY, ADMINISTRATOR,
FOREIGN AGRICULTURAL SERVICE, U.S. DEPARTMENT OF
AGRICULTURE, WASHINGTON, D.C.**

Mr. WHITLEY. Thank you, Mr. Chairman, Ranking Member Johnson, and Members of the Committee. I am pleased to appear before you today with my colleague from the U.S. Agency for International Development, Sarah Charles. I appreciate the opportunity to discuss the trade, market development, international food assistance, and capacity building programs and activities administered by USDA as authorized by the farm bill.

As Administrator of the Foreign Agricultural Service, I want to thank the Subcommittee for your continued support for the work of the agency and the Department. As the farm bill process moves ahead, I look forward to working with you and offer the assistance of our staff and to help and support your efforts.

Our prayers are with Ukrainian people as they deal with this unprovoked and unjustified attack, and we stand with the people of Ukraine during this tragic moment. Recently, Secretary Vilsack implored farmers to never take freedom for granted and highlighted the key role of farmers and ranchers in helping America prosper. Never have those words rung more true than today.

FAS is USDA's lead international agency linking U.S. agriculture to the world to enhance export opportunities and global food security. FAS supports producers with a network of agricultural economists, marketing experts, negotiators, and trade specialists in Washington, D.C. and nearly 100 international offices covering 180 countries. We are proud that our role in opening and maintaining markets has resulted in billions of dollars of additional U.S. agricultural exports for the benefit of American producers, and that the international food assistance programs and capacity-building activities administered by the FAS provide assistance that has helped millions of people worldwide.

In addition to our farm bill authorized programs, FAS also expands and maintains access to foreign markets for U.S. agriculture products by removing trade barriers, helping to enforce U.S. rights under existing trade agreements, and negotiating new agreements that benefit agriculture.

FAS works with foreign governments, international organizations, and the Office of the U.S. Trade Representative to establish international standards and rules to improve accountability and predictability for agricultural trade. We will continue to focus on maintaining and expanding access for U.S. agriculture exports through rebuilding trust with our partners and holding them accountable.

Exports of U.S. farm and food products to the world totaled \$177 billion in 2021, topping the 2020 total by 18 percent, and shattering the record set in 2014 of 14½ percent. For many agricultural products, foreign markets now represent more than ½ of total sales. U.S. ag exports support more than one million jobs here at

home, and contribute more than \$154 billion in additional economic activity.

To continue these impressive gains, we cannot rest. We must not rest. We must continue to refine and improve our longstanding farm bill authorized programs to ensure that they operate efficiently, effectively, equitably, and sustainably. Over numerous farm bills Congress authorized and refined an effective combination of ag market development and export credit guarantee programs. These programs are designed to develop markets, facilitate financing of overseas sales, and resolve market access barriers, all of which are goals central to the FAS mission.

The FAS partners with more than 70 cooperative groups representing a cross section of the U.S. food and agriculture industry, and manages a toolkit of farm bill authorized trade promotion programs to help U.S. exporters develop and maintain markets for all of our products.

Included under the umbrella of the farm bill programs are the MAP Program, the TASC Program, the EMP Program, along with several others. A newly independent study prepared by some of our independent research organizations concluded the effectiveness and the benefits of these programs. The largest market development program operated by FAS is the Market Access Program. Through MAP, FAS partners with nonprofit U.S. agriculture trade organizations, U.S. agricultural cooperatives, nonprofit state and regional trade groups, and state agencies to share the cost of overseas marketing activities, such as consumer promotion, market research, and trade show participation.

The 2018 Farm Bill makes available \$200 million of CCC funds annually for MAP. Funding levels for MAP have showed the impressive gains that can be made for U.S. agriculture by using these programs.

As I conclude, as Administrator of USDA's Foreign Agricultural Service, I am proud of our efforts to improve foreign market access to U.S. products, build new markets, improve the competitive position of U.S. ag in the global marketplace, and provide food aid and technical assistance to foreign countries. We have the opportunity to refine our programs when reauthorizing the farm bill Trade Title so that they make U.S. farm policy more efficient, equitable, and sustainable, while providing greater export opportunities to a vast range of markets for the benefit of U.S. farmers, ranchers, and other stakeholders.

This concludes my statement. I look forward to answering any questions you may have, and working with you to reauthorize farm bill programs that will facilitate U.S. agriculture exports and maintain our commitment to providing technical and food assistance to those around the world in need.

Thank you very much.

[The prepared statement of Mr. Whitley follows:]

PREPARED STATEMENT OF DANIEL B. WHITLEY, ADMINISTRATOR, FOREIGN AGRICULTURAL SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chairman Costa, Ranking Member Johnson, Members of the Subcommittee, I am pleased to appear before you with my colleague, Sarah Charles, Assistant to the Administrator, USAID Bureau of Humanitarian Assistance, U.S. Agency for International Development (USAID). I appreciate the opportunity to discuss the trade,

market development, international food assistance, and capacity building programs and activities administered by the United States Department of Agriculture (USDA) as authorized by the Agriculture Improvement Act of 2018 (2018 Farm Bill), the Food for Peace Act, the Agricultural Trade Act of 1978, and a host of other agricultural trade laws. As Administrator of the Foreign Agricultural Service (FAS), I want to thank the Subcommittee for your continued support for the work of the Agency and the Department. As the farm bill process moves ahead, I look forward to working with you and offer the assistance of our staff to help support your efforts.

As Secretary Vilsack noted before this Committee in January, the COVID-19 pandemic has been incredibly difficult on Americans in urban, rural, suburban, and tribal communities. Despite this unprecedented adversity, the Biden-Harris Administration is working to better position our agriculture and rural communities to compete in the global economy. For our part, we are working every day to meet this challenge by creating more and better export market opportunities for our farmers, ranchers, and producers.

Before I discuss our work to support trade and international food aid, I would like to start by sharing that our prayers are with the Ukrainian people as they deal with this latest unprovoked and unjustified attack by Russia. We stand with the people of Ukraine during this tragic moment for the world. For our part, USDA stands ready to step up. The Secretary is fully engaged on this issue alongside his G7 agriculture minister counterparts. He has empowered all of USDA to review the tools at our disposal to assist Ukraine. At the recent Commodity Classic, the Secretary implored farmers to never take freedom for granted and highlighted the fact that it is farmers and ranchers that helped America prosper. Never have those words rung true more than today.

Introduction

The Foreign Agricultural Service (FAS) is USDA's lead international agency, linking U.S. agriculture to the world to enhance export opportunities and global food security. FAS supports producers through a network of agricultural economists, marketing experts, negotiators, and trade specialists in Washington, D.C. and nearly 100 international offices covering 180 countries. We are proud that our role in opening and maintaining markets has resulted in billions of dollars of additional U.S. agricultural exports for the benefit of American producers and that the international food assistance programs and capacity building activities administered by FAS provide assistance that has helped millions of people worldwide.

The efforts of FAS employees, both in Washington and around the globe, combined with 2018 Farm Bill authorized market promotion programs, and in collaboration with the U.S. agricultural community, have contributed to some of the strongest agricultural export numbers on record. Exports of U.S. farm and food products to the world totaled \$177 billion in 2021, topping the 2020 total by 18 percent and eclipsing the previous record, set in 2014, by 14.6 percent. For many American agricultural products, foreign markets now represent more than half of total sales. U.S. agricultural exports support more than one million jobs here at home and contribute more than \$154 billion in additional economic activity. Nonetheless, in order to continue these impressive gains, we cannot rest. We must continue to refine and improve our longstanding farm bill authorized programs to ensure that they operate efficiently, effectively, equitably, and sustainably.

Trade Policy¹

FAS expands and maintains access to foreign markets for U.S. agricultural products by removing trade barriers and enforcing U.S. rights under existing trade agreements. FAS works with foreign governments, international organizations, and the Office of the U.S. Trade Representative (USTR) to improve accountability and predictability for agricultural trade. We will continue to focus on maintaining and expanding access to export markets for American producers through rebuilding trust with our partners and also holding them accountable.

The People's Republic of China (PRC), Mexico, and Canada continue leading as the top importers of U.S. agricultural products with record high values at \$33 billion, \$25.5 billion, and \$25.0 billion in calendar year 2021 respectively (up 25 percent, 39 percent, and 12 percent from 2020).

With a population of 1.4 billion and a middle class the size of the entire United States, the PRC is the largest market for U.S. agricultural exports. Following the 2018-2019 trade war with China, the Phase One Agreement provided some relief, allowing American agriculture to prove once again how effectively it could compete with a more level playing field. As a result of the Agreement and growing import

¹<https://www.fas.usda.gov/topics/trade-policy>.

demand, the United States continues to have strong, record high exports to the PRC of corn, wheat, beef, and poultry. The Phase One Agreement addressed a number of non-tariff measures affecting U.S. agricultural exports. However, we still face a number of barriers in that market, and the U.S. Government is engaging the PRC on next steps. While it is incredibly difficult to manage all the complexities of our relationship with the PRC, we recognize the importance of this market and will continue to represent and advocate for U.S. agriculture. At the same time, we are aggressively diversifying our global portfolio of export markets for U.S. agricultural products to other promising markets.

Canada and Mexico are two of the top three largest export markets for U.S. agricultural exports, accounting for a combined \$51 billion in 2021, up \$10 billion from 2020. While our closest neighbors are among our largest trading partners and benefit nearly every segment of American agriculture, these relationships are not without challenges. USDA is working diligently with our Mexican counterparts to ensure expanded market access for U.S. fresh potatoes. USDA, in close coordination with USTR and industry, is pressing Mexico at every level to ensure they live up to commitments made by their regulator to USDA and this longstanding issue is soon resolved. We are also monitoring Mexico's treatment of biotechnology products very closely and pressing Mexico to maintain a transparent, science- and risk-based regulatory approval process. With respect to our northern neighbor, the recent decision by the USMCA dispute settlement panel on Canada's allocation of dairy tariff rate quotas is an important step for the U.S. dairy sector to realize the full benefits of the USMCA. We will continue to press for the full, fair, and timely access for U.S. dairy exports to Canada that the United States secured in the USMCA negotiations and hold Canada accountable to the commitments made in the USMCA.

In addition to mature and traditional markets, USDA is also paying attention to opportunities in the Indo-Pacific region. President Biden announced in October 2021 that the U.S. is developing an Indo-Pacific Economic Framework with regional allies to deepen economic relationships in the region and coordinate approaches on addressing global economic challenges such as ensuring fair and resilient trade, insufficient or deteriorating infrastructure, and supporting clean energy. Although it's not a traditional trade agreement, the Framework is the beginning of a process that could bring increased opportunities for U.S. agriculture. We have been interested in this region for some time so we welcome the opportunities an enhanced focus on this region could bring for U.S. agriculture and market diversification efforts. In 2021, 16 of the 25 largest U.S. agricultural export markets were in the Asia-Pacific region, including fast growing markets in Southeast Asia. USDA is turning senior level attention to this region and will continue to consult with USTR on what agricultural trade barriers, other than tariffs, we could seek to address in the Framework and how we can advance U.S. exports to this important region.

Africa remains a continent of untapped potential for U.S. agricultural exports. In 2021, only one African country (Egypt) was in the United States' top 25 agricultural export markets, and only two additional countries (Nigeria and Morocco) were in the United States' top 50 agricultural export markets—but we expect this to change significantly in the future. U.S. agricultural exports to Africa totaled close to \$5.6 billion in 2021, with soybeans, wheat, and poultry meat and products as the top three products. A key development for trade across Africa is the 2019 ratification of the African Continental Free Trade Area (AfCFTA) that aims to create a continental market for goods and services with a harmonized trade facilitation regime. AfCFTA will be one of the largest trading blocs in the world once trade negotiations conclude over the next couple of years and the AfCFTA is fully implemented. USDA shares many of AfCFTA's objectives, including lowering barriers and diversifying trade. In these ways, the AfCFTA presents a long-term positive opportunity for U.S. exporters seeking to gain market access in Africa.

Market Development and Export Assistance

Over numerous farm bills, Congress authorized and refined an effective combination of agricultural market development and export credit guarantee programs. These programs are designed to develop markets, facilitate financing of overseas sales, and resolve market access barriers—all of which are goals central to the FAS mission. We must open, expand, and maintain access to foreign markets, given 95 percent of the world's consumers live outside the United States. FAS partners with more than 70 cooperator groups representing a cross-section of the U.S. food and agricultural industry and manages a toolkit of farm bill-authorized trade promotion programs to help U.S. exporters develop and maintain markets for hundreds of agricultural products. FAS also supports U.S. agricultural exporters through export credit guarantee programs and other types of assistance. Included under the umbrella of the Agricultural Trade Promotion and Facilitation Program as provided in

the 2018 Farm Bill are the Market Access Program (MAP), Foreign Market Development Cooperator Program (FMD), Technical Assistance for Specialty Crops (TASC), and the Emerging Markets Program (EMP). These programs, in conjunction with participation at USDA-sponsored international trade shows and Agribusiness Trade Missions, not only assist U.S. agricultural producers market commodities overseas, but bolster their overseas in-country presence, helping make sales and build demand for U.S. products. Applicants to the FAS market development programs submit their applications through the Unified Export Strategy database system (UES). The UES allows applicants to submit and manage holistic marketing plans that outline their proposed foreign market development strategies and request funding under each of the FAS market development programs, facilitating input of strategic and tactical planning and financial information into a single, coordinated system.

Market Access Program (MAP)

The largest market development program operated by FAS is the Market Access Program (MAP). Through MAP, FAS partners with nonprofit U.S. agricultural trade organizations, U.S. agricultural cooperatives, nonprofit State Regional Trade Groups, and state agencies to share the costs of overseas marketing activities, such as consumer promotion, market research, and trade show participation. The 2018 Farm Bill maintained the available \$200 million of Commodity Credit Corporation (CCC) funds annually for MAP. Funding levels for MAP have not increased in over a decade. That amount is more than matched with industry contributions to aid in the creation, expansion, and maintenance of foreign markets for hundreds of U.S. agricultural products. A range of U.S. commodities, from California prunes and almonds to South Dakota beef and soybeans, to Georgia poultry and cotton, dairy and timber from the Northeast, and apples and pears from the Pacific Northwest, all benefit from MAP. In FY 2022 MAP provided funding to 73 U.S. agricultural trade associations, State Regional Trade Groups, state agencies, and agricultural cooperatives. For perspective, the EU Central Fund, Common Market Organization investment, and individual investments of the Governments of Italy, France, Germany, and Spain, combined are estimated to be more than double the combined funding of MAP and FMD. A 2017 competitor study, led by the Wine Institute and MAP funding, determined the EU increased its investment in agricultural export promotion to \$443 million and forecasted its investment would increase to \$555 million in 2019. This study is currently being updated by the USA Poultry and Egg Export Council using MAP funds and is expected to be completed later in 2022.

A few MAP examples I would like to highlight for you today include the California Table Grape Commission, which has used MAP to support in-store sampling, point-of-purchase materials, themed promotions, mascots, and retail promotional displays in Mexico that drew in customers and helped California table grape exports reach a record \$116.5 million in Mexico in 2020. In addition, the California Walnut Commission used MAP funds to support an online consumer campaign in Germany demonstrating how walnuts are the ideal ingredient in home bread-making, and we saw a nearly 70,000 MT of exports to Germany (valued at nearly \$224 million) in September 2019 through August 2020, up 46 percent from the previous year.

Foreign Market Development Cooperator Program (FMD)

The Foreign Market Development Cooperator Program (FMD) is another FAS-administered market development program reauthorized by Congress in the 2018 Farm Bill. FMD is a cost-share program that aids in the creation, expansion, and maintenance of long-term export markets for U.S. agricultural products. The 2018 Farm Bill maintained the annual funding level for FMD at \$34.5 million in CCC funds. The program fosters a market development partnership between FAS and U.S. agricultural producers and processors who are represented by nonprofit commodity or trade associations known as cooperators. Under this partnership, FAS and each cooperator pool their technical and financial resources to conduct overseas market development activities. FMD-funded projects generally address long-term opportunities to reduce foreign import barriers or expand export growth opportunities. For example, FMD supported projects might include efforts to reduce infrastructure or historical market impediments, improve processing capabilities, modify codes and standards, or identify new markets or new uses for the agricultural commodity or product. In FY 2022 FMD provided funding to 25 U.S. agricultural trade associations.

As a particular example, thanks to FMD funding, U.S. Wheat Associates can maintain experienced technical staff to serve customers in Indonesia and around the world. Technical assistance and trade servicing are critical to U.S. Wheat's marketing strategy, demonstrating how customers can meet their product needs economically by blending various U.S. wheat varieties. This technical support also

helps to resolve potential market disruptions like mitigating a potential trade disruption in Indonesia due to fungal spores. Technical support provided the mill with confidence to manage the situation and prevented disruption in U.S. wheat exports that reach over 1 MMT annually.

Technical Assistance for Specialty Crops (TASC) Program

U.S. exports of specialty crops reached \$22.5 billion in fiscal year (FY) 2020, accounting for 15 percent of total U.S. agricultural exports. Tree nuts represented more than 1/3 of FY 2020 specialty crop exports. Other specialty crops like fruits, vegetables, dried fruits, horticultural crops, wine, and nursery crops are increasing in export value. Despite these increases, trade barriers such as burdensome requirements related to pre-export plant health inspections, low or missing pesticide maximum residue levels, labeling, or quality certification may discourage some U.S. specialty crop producers from shipping products overseas.

Utilizing the Technical Assistance for Specialty Crops (TASC) program, USDA is committed to assisting U.S. agricultural stakeholders to overcome trade barriers that deter U.S. specialty crop exporters and help them compete in the global marketplace. First authorized in the 2002 Farm Bill, FAS administers the current TASC program to fund projects that address existing and potential SPS and technical barriers to trade that may affect U.S. specialty crop exports. TASC activities must benefit the industry at large rather than a specific company, and applicants must provide a clear strategy for overcoming trade barriers and market access issues. In line with the changes to the program made in the 2018 Farm Bill, TASC awards are generally granted for a project period not exceeding 5 years, with the opportunity for an extension based on a determination of the effectiveness of continued funding.

For example, a TASC grant for the Almond Alliance of California (AAC) is helping establish new export markets for whole almond hulls in Asia, including China and Korea. Almond hulls are a commercially established feed ingredient in California, with growing supply and hold potential for feed use in Asia's dairy sector, increasing feedstuff options and reducing feeding costs. In another project, TASC funding helped the California Table Grape Commission monitor and report on non-precleared product shipments to Australia. Without this funding, California table grape shippers would have had to gather information on an individual basis which would have been difficult for small- to mid-size shippers. This reporting, funded by TASC, helped improve the on-arrival process, minimize problems during the shipping season, and allowed for broad distribution of actionable information to California table grape shippers exporting to the Australian market.

Emerging Markets Program (EMP)

EMP provides grants to eligible U.S. private or government entities to conduct assessments of the food and rural business system needs of emerging markets, make recommendations on how to enhance the effectiveness of such systems, including potential reductions in trade barriers, and conduct technical assistance to enhance the effectiveness of such systems. For this program, emerging markets are defined as any country, foreign territory, customs union or other economic market that "is taking steps toward a market-oriented economy through the food, agriculture, or rural business sectors of its economy," and "has the potential to provide a viable and significant market for United States agricultural commodities." Private, Federal, and state organizations are eligible to participate in EMP. For Fiscal Year 2021, the EMP program supported 26 agricultural export promotion projects with funding totaling \$3.74 million.

A great example of EMP work is a 2021 Cranberry Marketing Committee project that implemented a multifaceted culinary training program for more than 900 students across India to familiarize these young culinary professionals with U.S. cranberries. The training sessions concluded with a competition in which the students were asked to prepare their own unique dish using U.S. cranberries, and the dishes were judged by an expert panel of chefs. In a post-training survey, 97 percent of the participating students indicated that the training heightened their awareness of U.S. cranberries, with nearly 88 percent stating that they would use U.S. cranberries in future recipes. Moreover, three of the five participating institutes plan to continue U.S. cranberry education in the years to come, helping to establish U.S. cranberries' presence within India's expansive and growing foodservice sector and leading to increased export opportunities for the entire U.S. cranberry industry.

Export Credit Guarantee Program (GSM-102)

The GSM-102 program increases sales of U.S. agricultural commodities to international markets by facilitating the extension of needed trade financing. Over 130 countries—mainly developing countries and emerging markets in Latin America, Asia, and Africa and the Middle East—are targeted destinations under the program.

In 2021, the GSM-102 program supported \$2.1 billion in U.S. agricultural commodity exports, including exports of corn, soybeans, soybean meal, wheat, rice, cotton, and other commodities. Significant export markets included Mexico, Colombia, Honduras, Guatemala, South Korea, and Egypt.

Accomplishments for 2021 include bringing Bangladesh in as a new entrant to the program, which resulted in the export of more than \$6 million in sales of U.S. cotton and \$22 million in sales of U.S. soybeans to that market. USDA now has five Bangladeshi banks participating in the GSM-102 program.

Data and Analysis²

FAS's network of global contacts and long-standing relationships with international groups contribute to the Agency's unique market intelligence capacity. FAS analysts provide objective intelligence on foreign market conditions, prepare production forecasts, assess export opportunities, and track changes in policies affecting U.S. agricultural exports and imports and support U.S. foreign policy around the globe. The Agency is trusted by U.S. decision-makers and entities worldwide to provide relevant, sound, and reliable information related to foreign agricultural markets, international trade barriers, crop conditions, and related policy developments. Through market analysis in Washington and reporting from FAS overseas offices on foreign production and demand, FAS contributes to the USDA economic information system establishing official estimates of world agricultural supply and demand that drives trading on commodity markets worldwide. FAS maintains key public-facing databases to provide convenient access and up-to-date international market information to inform strategy and business decisions. Collecting and communicating market information is invaluable for U.S. exporters, as it provides a level playing field for U.S. organizations working abroad and supports these organizations in identifying new market opportunities. Through our Global Ag Information Network (GAIN) this type of information is gathered and reported by our 70 posts overseas and published on the FAS website. In 2021, we published over 3,000 reports that were viewed 2.6 million times.

FAS information helps producers and others make informed decisions during fluid and challenging situations by providing data and analysis to make sense of complex global commodity fluctuations, such as those we are currently seeing in the wake of the Russian invasion of Ukraine.

Food Security and Capacity Building³

In addition to the important work FAS does to promote U.S. exports and build trade capacity for American agriculture, FAS also leads USDA's efforts to help developing countries improve their agricultural systems and build their trade capacity to receive our exports or send us products the U.S. needs to meet consumer demand. From selecting countries and priorities to reviewing proposals, monitoring agreements, evaluating project performance, and reporting progress, USDA's food assistance staff coordinate with colleagues across the Department and the U.S. Government, particularly USAID, as well as with donors, stakeholders, and recipients to enhance global food security. Collaboration with our interagency partners does not occur just in Washington—our programs benefit from collaborating with FAS Attachés in our embassies around the world and with foreign officials and stakeholders.

USDA administers three international food assistance programs authorized by the farm bill. These include the McGovern-Dole International Food for Education and Child Nutrition Program (McGovern-Dole); the Food for Progress Program (FFPr); and the USDA Local and Regional Food Aid Procurement Program (USDA LRP). USDA also manages the Bill Emerson Humanitarian Trust (BEHT), which serves as a backstop reserve of funds for the USAID-administered Food for Peace Title II program if the USAID Administrator determines that funds available for emergency needs under Title II for a fiscal year are insufficient to meet emergency needs during the fiscal year. These programs support international assistance and development activities that alleviate hunger and improve nutrition, education, and agriculture in some of the world's poorest countries. FAS's non-emergency food assistance programs help meet recipients' nutritional needs and support agricultural development and education.

McGovern-Dole

This year the McGovern-Dole Program will celebrate its 20th anniversary, which is a significant achievement and a testament to the value of the program. USDA

² <https://www.fas.usda.gov/data>.

³ <https://www.fas.usda.gov/topics/food-security>.

is proud to administer the McGovern-Dole Program and continue the legacy of its two great champions of U.S. agriculture and international food assistance—the late George McGovern and Robert Dole. Since its inception in the 2002 Farm Bill, the McGovern-Dole Program has helped feed and educate more than 31.1 million children in more than 48 countries. Over the past 20 years, the McGovern-Dole Program has grown in size and scope to support quality school meals around the world. Through the McGovern-Dole Program, USDA has worked to build the capacity of host governments and communities to transition McGovern-Dole supported schools to their national school meals programs. For example, USDA had been supporting school feeding in Kenya through McGovern-Dole since 2004, and, in June 2018, the remaining balance of McGovern-Dole commodities was completely handed over to the Government of Kenya’s National School Meals Program, thus formalizing the graduation of school feeding activities entirely to the Government of Kenya. In November 2021, despite the challenges of the COVID-19 pandemic, USDA celebrated the handover of school feeding activities in 915 primary schools in Laos that had been supported by McGovern-Dole since 2008 to the Government of Laos’ National School Meals Program.

McGovern-Dole uses commodities grown by American farmers to enhance food security; improve literacy (especially for girls); and strengthen the nutrition, health, and dietary practices of school-aged children, mothers, and families. McGovern-Dole awards to fund projects are made annually to implementing partners—private voluntary organizations (PVOs) and international organizations like the World Food Programme. Following an objective proposal review process, USDA selects and funds the strongest proposals based on rigorous criteria, including demonstrated experience, ambitious goals and outcomes, established capacity to coordinate with U.S. Government agencies and local governments, detailed commodity distribution plans, and thorough graduation and sustainability plans. School meals are made possible through a combination of U.S. donated food commodities, some food commodities procured locally or regionally, and technical assistance provided by qualified entities to help each project achieve success. In countries where McGovern-Dole projects are implemented, USDA works to assure that host country governments contribute to school feeding in many ways and from a variety of levels, from local to national. Frequent contributions include internal transportation of commodities, provision of land for project infrastructure, construction materials, in-kind labor, food accompaniments, and more.

In FY 2021, USDA funded ten McGovern-Dole proposals for new projects valued at \$248 million in Benin, Burkina Faso, Guatemala, Kyrgyzstan, Laos, Liberia, Madagascar, Republic of Congo, Senegal, and Sierra Leone. A total of 46,770 metric tons (MT) of donated U.S. commodities will be provided over the term of these 4 to 5 year projects. In addition, USDA awarded \$20 million in prior year McGovern-Dole funding to strengthen and expand three active agreements in Guatemala and Honduras in alignment with Administration priorities on addressing the root causes of out-migration in Central America. Including the ten new projects funded in FY 2021, McGovern-Dole now has a total of 55 active projects in 31 countries valued at close to \$1 billion across the life of the projects.

In FY 2021 alone, McGovern-Dole projects:

- directly benefited more than 4.5 million children and community members;
- fed nutritious school meals to over 2.1 million food-insecure children;
- distributed take home rations to over 2.1 million children and community members during the global COVID-19 pandemic;
- trained over 11,200 Parent Teacher Associations in how to champion education in their communities;
- educated over 10,800 teachers, helping them to work to improve instruction and literacy;
- rehabilitated or constructed more than 5,100 facilities, including latrines, kitchens, handwashing stations, storerooms, and classrooms; and
- worked in over 14,400 schools to enhance the quality of education that children receive.

The 2018 Farm Bill provided that USDA shall use not more than ten percent of the funds made available for McGovern-Dole for the procurement of local and regional agricultural commodities. The FY 2021 agricultural appropriations act provided that not less than \$23,000,000 will remain available until expended for the local and regional procurement of agricultural commodities under McGovern-Dole. For FY 2021, each of the ten awards includes a local and regional commodity procurement component. The integration of the local and regional procurement compo-

ment into McGovern-Dole is a welcome addition that allows project implementers to improve the dietary diversity of school-age children through including more fresh fruits, vegetables and animal protein into the daily school meal, and strengthens the capacity of local and regional farmers, cooperatives, processors, and agribusinesses to provide high-quality commodities in support of sustainable school meal programs.

Food for Progress

The Food for Progress Program (FFPr) was authorized by the U.S. Congress in the Food Security Act of 1985. FFPr has two principal objectives: to improve agricultural productivity in developing countries and emerging democracies and to expand trade in agricultural products. It may receive funding through either Food for Peace Title I appropriations or CCC financing. The FFPr statute provides that no more than \$40 million of CCC funds may be used annually for non-commodity costs such as freight costs, which limits the amount of shipped commodities, particularly in years with high shipping costs. Donated U.S. agricultural commodities are shipped to recipient countries and sold on the local market in a process referred to as monetization. USDA enters into cooperative agreements with eligible organizations to use the proceeds to implement field-based projects generally to support agricultural, economic, or infrastructure development projects and programs can also be targeted at hunger and malnutrition. FFPr projects have trained farmers in animal and plant health, improved farming methods, developed road and utility systems, established producer cooperatives, provided microcredit, and developed agricultural value chains. FFPr project implementers have included PVOs, foreign governments, universities, and intergovernmental organizations.

In FY 2021, a total of 22 sales of donated U.S. commodities, organized into 19 shipments, were made by project implementers to buyers in 18 countries. The commodities included crude degummed soybean oil, milled rice, soybean meal, yellow soybeans, hard red winter wheat, and dark northern spring wheat. A total of 440,890 MT of U.S. commodities with a commercial value of nearly \$210.52 million was donated in FY 2021, representing the highest totals for tonnage and value in more than a decade. During FY 2021, activities conducted by active projects reached more than 370,000 direct participants. As a result of FFPr project activities, more than 199,000 individuals applied improved agricultural management practices or technologies to over 569,000 hectares of land. Access to working capital and credit are other significant components in expanding participation in agricultural sectors in emerging markets, and last year FFPr project activities resulted in access to more than \$84 million of financing for farmers and cooperatives.

For example, the Food for Progress Malawi project completed in 2021, implemented by Land O'Lakes Venture³⁷ and valued at \$15 million, assisted over 39,000 farmers. Under this project, small-holder producers received assistance in organizing cooperative farmer-based organizations to assist them in selling their produce. The project's interventions have helped horticultural producers and processors be more competitive in both local and regional markets, leading to over \$18.4 million in sales and trade of over 63,000 metric tons of horticultural produce. Additionally, during the life of the project, 10,377 loans valued at \$699,879 were disbursed.

Local and Regional Food Aid Procurement Program (USDA LRP)

First authorized as a permanent program in the 2014 Farm Bill, USDA LRP was designed to provide a complementary mechanism for delivering international food assistance. In accordance with Congressional intent, preference for funding under USDA LRP has been given to entities implementing active projects under McGovern-Dole. As part of the 2018 Farm Bill, Congress authorized a new local and regional procurement component within McGovern-Dole. Thus, USDA LRP has not received appropriated funds since FY19 and local and regional procurement is now conducted directly through McGovern-Dole authority. The objectives of local and regional procurement include strengthening the ability of local and regional farmers, community farmer groups, farmer cooperatives and associations, processors, and agribusinesses to provide high-quality commodities. Local and regional procurement can enhance organizations' abilities to procure such commodities in support of school feeding programs, provide technical and management expertise, and, in coordination with USAID, help expedite provision of safe and quality foods to populations affected by food crises and disasters. Last funded in FY 2019 before the local and regional procurement component was folded into McGovern-Dole, the USDA LRP Program funded three projects to support McGovern-Dole activities in Burkina-Faso, Cambodia, and Nicaragua. USDA LRP was used to purchase local commodities such as fruits and vegetables, increase the acceptability and palatability of nutritious meals, strengthen supply chains, and boost local support for sustainability, as well

as strengthen the ability of local host governments to take ownership of McGovern-Dole projects. During FY 2021, USDA had seven continuing USDA LRP agreements with project implementers in seven countries, including two agreements in which all project activities were concluded. The total number of beneficiaries reached by all seven active USDA LRP projects in FY 2021 was 139,431.

Fellowship Programs and Capacity Building

USDA invests in the future of developing countries by helping them strengthen their agricultural institutions and regulatory systems, encouraging compliance with international norms and fostering an environment conducive to agricultural growth. Before developing countries can become customers for U.S. agricultural products, they must first become politically, economically, and socially stable. The lack of economic development, particularly in fragile and strategic countries and regions, results in economic and political instability which can pose a national security threat to the United States. FAS-sponsored fellowship programs and exchanges enable international researchers, policymakers, and agricultural specialists to work alongside their U.S. counterparts, acquiring knowledge and skills to help build their countries' agricultural sectors. FAS administers three Congressionally authorized fellowship programs: the Borlaug International Agricultural Science and Technology Fellowship Program (Borlaug); the Cochran Fellowship Program (Cochran); and the International Agricultural Education Fellowship Program (IAEFP).

The namesake of Nobel Laureate Dr. Norman E. Borlaug, the Borlaug program promotes agricultural productivity, food security, trade, and economic growth by providing training and collaborative research opportunities to early and mid-career scientists, researchers, or policymakers from developing and middle-income countries. Since the program's inception in the 2008 Farm Bill, USDA has supported more than 920 Borlaug Fellows from 69 countries. Cochran operates in middle-income and emerging market countries, providing training opportunities in the U.S. for senior and mid-level specialists and administrators working in agricultural trade and policy; agribusiness development; management; animal, plant, and food sciences; extension services; agricultural marketing; and many other areas representing the public- and private-sectors of interest to agriculture. Since 1984, Cochran has provided training for over 19,000 international Fellows from 127 countries worldwide. Opportunities to host Cochran Fellows are circulated through the U.S. Land-Grant University System, USDA, other Federal Government agencies, the U.S. Agricultural Export Development Council, U.S. private agribusinesses, and agricultural consultants. The IAEFP was authorized under the 2018 Farm Bill to provide fellowships to eligible U.S. citizens to assist developing countries in establishing school-based agricultural education and youth extension programs. The program was created to (1) develop globally minded United States agriculturists with experience living abroad; (2) help meet the food and fiber needs of the domestic population of eligible countries; and (3) strengthen and enhance trade linkages between eligible countries and the United States agricultural industry. Congress appropriated \$1 million in FY20 for the inaugural IAEFP program and an additional \$1 million in FY21 and FY22. FAS awarded FY20 funds to Texas A&M University and Catholic Relief Services for programming in Ghana and Uganda, respectively. Due to the ongoing global pandemic, selected fellows were restricted from traveling, thus their fellowships were delayed. However, in early fall 2021, nine fellows arrived in Ghana and have been busy in their host communities providing technical advice on improving agricultural production, increasing knowledge of the importance of robust agricultural extension programs, and sharing their experiences with youth-based agricultural organizations, such as 4-H. Later this spring, an additional nine fellows are expected to arrive in Uganda to begin their fellowships.

Conclusion

As Administrator of USDA's Foreign Agricultural Service, I am proud of our efforts to improve foreign market access for U.S. products, build new markets, improve the competitive position of U.S. agriculture in the global marketplace, and provide food aid and technical assistance to foreign countries. I believe Congress has an important opportunity to refine these trade programs when reauthorizing the next farm bill so that they make U.S. farm policy more efficient, effective, equitable, and sustainable while providing greater export opportunities to a vaster range of markets for the benefit of U.S. farmers, ranchers, and other stakeholders.

As the situation continues to unfold in Eastern Europe, it is clear that maintaining trading relationships globally will help benefit all nations at a time that food security is in question for many. Trading means sharing. And sharing will help all countries and all regions of the globe get through these difficult times successfully. We stand with the people of Ukraine during this tragic moment for the world. For

our part, USDA stands ready to step up and assist and to help facilitate the global relationships and the partnerships that will be absolutely vital going forward.

This concludes my statement. I look forward to answering any questions you may have and working with you to reauthorize farm bill programs that will facilitate U.S. agricultural exports and maintain our commitment to providing technical and food assistance to those around the world in need. Thank you.

The CHAIRMAN. Thank you, Administrator Whitley, for those good words and your testimony. I will make sure to put in some good points to the Secretary on your behalf. Thank you.

Our next witness on the panel is Sarah Charles. Sarah Charles serves as the Assistant to the Administrator at the Bureau of Humanitarian Assistance at the United States Agency of International Development, and it directly relates to the comments that we have already heard this morning by a number of us as to the potential challenges that we are facing this year, and I believe into next year, as it relates to the potential humanitarian crisis for food that many of us fear is going to only heighten as a result of the factors that we are dealing with.

So, Ms. Charles, please begin your testimony.

STATEMENT OF SARAH CHARLES, ASSISTANT TO THE ADMINISTRATOR, BUREAU FOR HUMANITARIAN ASSISTANCE, U.S. AGENCY FOR INTERNATIONAL DEVELOPMENT, WASHINGTON, D.C.

Ms. CHARLES. Thank you. Chairman Costa, Ranking Member Johnson, distinguished Members of the Subcommittee, thank you for the opportunity to discuss the U.S. Agency for International Development's food assistance programs, and thank you to Administrator Whitley for being with me here today.

Most importantly, thank you for your collective commitment to help alleviate hunger and improve food security throughout the world. Your support has helped us reach the most vulnerable in times of need, and helped communities around the world build resilience in the face of multiple shocks. And as you both alluded to, it is also a strong demonstration of U.S. leadership and shared values throughout the world.

USAID's food assistance programs are more important than ever. Global food insecurity levels continue to break records due to the confluence of conflict, climate impacts, and the economic impacts of the ongoing COVID-19 pandemic. At the beginning of 2022, the United Nations estimated there were 274 million people in need of assistance, a 60 percent increase over 2020, and this was before Russia's unprovoked invasion of Ukraine.

Russia's invasion has caused intense suffering and displacement in Ukraine and in the region, and it is already impacting food security around the world. As a result of the war, we could face another 10 to 20 percent rise in commodity prices due to supply chain disruptions and export restrictions.

In the Yemeni city of Aden, the price of a piece of bread increased by 62 percent in less than 1 week after the start of the war. In Lebanon, domestic food price inflation has now climbed to a record 483 percent. We are extremely grateful to Congress for the generous funding provided to USAID through the omnibus, including the supplemental funding to address rising needs caused by

Russia's war. We are already using those funds to provide relief to those both inside and outside of Ukraine impacted by the war.

And in response to the rising global food insecurity, exacerbated by the war on Ukraine, and its impact on global food supplies, USAID and USDA are in very active dialogue to determine the specifics that would go into drawing down funding from the Bill Emerson Humanitarian Trust. We are considering all factors, including commodities and countries that could benefit from these U.S. food commodities, with the intent to bolster existing emergency food operations in countries acutely impacted by this crisis.

I am also pleased to announce today that USAID is providing an additional \$114 million to the people of Ethiopia, Kenya, and Somalia, who are grappling with the worst drought the region has seen in 4 decades. The funding will be used to provide food and specialized nutrition assistance for malnourished children and mothers, medical supplies, and clean water to those in need.

Unfortunately, the reality is that while the number of people in need is growing, the number of people we can reach with the same amount of funding is decreasing. Rising transportation and food prices have cut USAID's purchasing power. Even prior to Russia's war on Ukraine, our purchasing power for food commodities had already dropped 11.4 percent in just 1 year. This equates to feeding ten million fewer people in the coming year with the same amount of funding. We must look for efficiencies to help save as many lives as possible.

Given the scale of global food insecurity and the dynamic nature of its causes, it is imperative that we are able to fully optimize our programs to be able to employ best approaches for each context in the future. The reauthorization of the farm bill at this time of global crisis provides a critical opportunity for Congress to ensure that the U.S. Government has the most effective tools at its disposal to meet the humanitarian challenges of the day. Technical fixes in the 2018 Farm Bill, like the elimination of monetization requirements, allowing community development funds to count towards the \$365 million annual non-emergency floor, and adjusting cost categories to provide more flexibility have had a positive impact on USAID's food assistance programs over the last 4 years. But more could be done to ensure that Title II assistance remains fit for purpose in the face of global food insecurity and increased costs.

To help keep this program viable in the years ahead, there are three technical fixes that could be pursued as part of the 2023 Farm Bill. First would be increasing the cap on section 202(e) resources to provide USAID with the flexibility to support both increasingly expensive emergency logistics, and quality non-emergency program design at the same time. Second, we could expand the Food for Peace Act to allow IDA in Title II funding and the same award to cut down on paperwork and improve efficiency of taxpayer dollars. And third, we could establish a single associated cost category to eliminate some of the barriers to entry for new small or local organizations.

U.S. leadership has never been more critical in the face of staggering levels of food insecurity. Optimizing our food assistance programs saves lives. We look forward to working with the Committee ahead of the upcoming farm bill reauthorization to assure we can

effectively respond to crises, built resilience among communities, and ensure that taxpayer dollars alleviate hunger and improve food security around the world.

I look forward to your questions.

[The prepared statement of Ms. Charles follows:]

PREPARED STATEMENT OF SARAH CHARLES, ASSISTANT TO THE ADMINISTRATOR,
BUREAU FOR HUMANITARIAN ASSISTANCE, U.S. AGENCY FOR INTERNATIONAL
DEVELOPMENT, WASHINGTON, D.C.

Introduction

Chairman Costa, Ranking Member Johnson, distinguished Members of the Subcommittee, thank you for the opportunity to discuss the U.S. Agency for International Development's (USAID) food assistance programming with you today. I also want to thank the Committee for its commitment to maintaining U.S. global leadership in international food assistance. Your support for establishing more flexibility within international food assistance programs has helped USAID to reach the most vulnerable in times of need and build resilience in communities around the world.

USAID's food assistance programs are more important now than ever, as global food insecurity continues to break record after record due to a confluence of conflict, climate change, the second order economic impacts of the ongoing COVID-19 pandemic, and now the war in Ukraine. Russia's invasion of Ukraine has not only elevated humanitarian needs and displacement in the region, but threatens to further jeopardize food security around the world due to its impact on global food supply chains. According to the International Monetary Fund, Ukraine and Russia account for nearly 30 percent of wheat exports and 18 percent of corn exports in the world, most of which are shipped through Black Sea ports that are now closed. USAID is particularly concerned about the impact on geographic areas characterized by already high levels of acute food insecurity, significant vulnerability to price increases, and/or reliance on food imports from Russia or Ukraine—and Afghanistan, the Horn of Africa, Lebanon, the Sahel, the Maghreb, South Sudan, Sudan, Syria, and Yemen are at the top of the list. The impacts of the current crisis on poverty, hunger, and malnutrition could be even more significant than those seen in the global food price crisis of 2007–2008 and the subsequent civil unrest, as the last crisis followed a period of strong global economic growth, whereas the years since the onset of the COVID-19 pandemic have been characterized by an increasingly worse global economic downturn. For example, in the Yemeni city of Aden, the price of a piece of bread increased by 62 percent between February 25 and March 3. In Lebanon, domestic food price inflation has reached 483 percent. In West Africa, wheat prices increased by 58 percent per ton in just 5 days.

As you know, USAID uses resources authorized under Title II of the Food for Peace Act and appropriated under the annual Agriculture appropriations for both emergency and non-emergency food assistance programs. In Fiscal Year 2021, USAID provided nearly \$2.3 billion in Title II Food for Peace Act assistance, funding the procurement of nearly 1.7 million metric tons of food from the United States to serve a total of almost 28 million beneficiaries in 35 countries. Nearly 86 percent of Title II assistance was for emergency responses and approximately 14 percent was for non-emergency programming.

USAID provides emergency food assistance to vulnerable populations affected by natural disasters, such as droughts and floods, and complex emergencies, such as conflict. U.S. in-kind food assistance is often used to respond to an emergency where local markets are not functioning; there is not enough food in local markets to meet needs; or beneficiaries do not have physical access to markets. The food baskets provided at food distributions can vary based on dietary preferences and nutritional needs of beneficiary populations. Because U.S. in-kind food assistance takes an average of 4 to 6 months to reach beneficiaries, USAID prepositions commodities in warehouses that are strategically located across the globe to reduce delivery times.

In addition to emergency programs, USAID works beyond the immediate response phase to improve and sustain the food and nutrition security of vulnerable populations through non-emergency assistance authorized in Section 202(b), what USAID now refers to as Resilience Food Security Activities (RFSAs). These unique programs build on USAID's humanitarian interventions to strengthen the ability of people, communities, countries, and systems to adapt to and recover from shocks and stresses, in a way that reduces chronic vulnerability and facilitates inclusive growth.

USAID merged the Office of Food for Peace (FFP) and the Office of U.S. Foreign Disaster Assistance (OFDA) to form the Bureau for Humanitarian Assistance (BHA) in 2020 to streamline the Agency's humanitarian programming and optimize the use of U.S. taxpayer resources. However, the efficiency envisioned by the creation of BHA could be further enhanced by legislative adjustments to truly maximize the impact of humanitarian programs. USAID welcomes the Committee's regard for this topic and interest in strengthening USAID's ability to more effectively respond to crises, build resilience within communities, and improve stewardship of taxpayer dollars.

Positive Impact of 2018 Farm Bill Reforms

Incremental technical fixes to authorizing language in the Agriculture Improvement Act of 2018 (the 2018 Farm Bill) have positively impacted USAID's food assistance programs over the past 4 years. For example, the 2018 Farm Bill eliminated the monetization requirement for food assistance, which has both ensured that taxpayer dollars do not go to waste and improved the impact of USAID programs by allowing increased investment in the resilience of vulnerable communities. Previously, USAID was required to monetize 15 percent of all U.S. in-kind commodities shipped overseas under RFSAs (based on tonnage) which, according to a Government Accountability Office report, resulted in a financial loss of approximately 24¢ on the dollar.¹

The 2018 Farm Bill also allowed Community Development Funds (CDF) from the Development Assistance account in the State, Foreign Operations, and Other Programs appropriation to count towards the \$365 million Title II floor for non-emergency programs included in the Food for Peace Act. This change allows USAID to increase its commitment to building resilience, provides additional flexibility in non-emergency programming, and frees up \$80 million in Title II funding each year for use in humanitarian emergencies. USAID's non-emergency food assistance programming under Title II primarily consists of RFSAs, which have proven instrumental to furthering the Agency's broader efforts to decrease global chronic food insecurity and contributed significantly to results under the Feed the Future initiative. RFSAs are intended to reduce humanitarian caseloads by strengthening resilience in populations that are vulnerable to acute or chronic hunger and recurrent shocks and stresses through multi-year, multi-sectoral interventions. The current RFSA portfolio includes programming in Bangladesh, Burkina Faso, Democratic Republic of the Congo, Ethiopia, Haiti, Kenya, Madagascar, Malawi, Mali, Niger, Uganda, and Zimbabwe.

The RFSA program in Kenya, for example, is a partnership with the local government and focuses on four counties in the Arid and Semi-Arid Lands that are impacted by recurrent drought cycles and persistent acute malnutrition at or above emergency levels. The program's goal is to break this cycle of acute malnutrition through localized interventions that are sustainable so that communities and county administrations can successfully implement them on their own. The program focuses on building resilience so that the impacts of the drought cycles are lessened through activities like teaching families how to identify malnutrition and prevent or treat it at home, and long-term asset creation such as water pans, shallow wells, and irrigation for people and their livestock. The RFSA program is also able to pivot to respond to shocks like the current drought, deploying rapid response activities already built into the program which help protect the families' and communities' assets during shocks.

The 2018 Farm Bill also clarified the use of associated cost categories, resulting in significant cost savings for Title II programs. USAID has four associated cost categories that support the transportation, programming, implementation, and distribution of Title II food assistance under the Food for Peace Act: Section 202(e), Internal Transportation Storage and Handling (ITSH), ocean freight, and inland freight. Section 202(e) funds support the administrative costs of programming U.S. food assistance and are limited to 20 percent of Title II funding. ITSH funding supports in-country costs directly associated with the movement, storage, distribution and implementation of U.S. food assistance. Ocean freight supports the cost of shipping the commodities on U.S.- or foreign-flag ships. Inland freight supports the cost of moving commodities from a port to land-locked countries. By adding "implementation costs" (such as milling) to the ITSH definition, the 2018 Farm Bill allowed USAID to more effectively use its limited 202(e) funding. For example, flour is a staple in Yemen, but shipping U.S. flour to Yemen is not appropriate due to its limited

¹*International Food Assistance: Funding Development Projects through the Purchase, Shipment, and Sale of U.S. Commodities Is Inefficient and Can Cause Adverse Market Impacts*; <https://www.gao.gov/assets/gao-11-636.pdf>.

shelf life. The ability to use the ITSH cost category for milling costs allows USAID to provide bulk wheat, sourced in the United States, for milling in Yemen. This change saves USAID approximately \$40–\$80 million in 202(e) costs each year that can be used to support and enhance other programs.

As humanitarian needs continue to outpace available resources, BHA's programming must be routinely evaluated so that programs can be adapted to changing contexts and successes can be replicated. Changes in the 2018 Farm Bill allowed USAID to expand its program design, learning, adaptive management, and evaluation activities by adjusting funding under Section 207(f) to be a percentage of annual appropriations, rather than a static dollar amount. These funds support critical oversight, monitoring and evaluation activities including the Famine Early Warning Systems Network (FEWS NET), the Food Aid Quality Review (FAQR), program impact evaluations, third party monitoring, and the maintenance of BHA's information technology systems. The expansion of these activities has been critical over the past 5 years to ensure the quality and effectiveness of Title II programs.

Again, USAID thanks the Committee for its support in addressing the challenges that the Agency faced ahead of the 2018 Farm Bill. Our collaboration on the technical fixes outlined above have led to more effective and efficient food assistance programs and improved use of taxpayer dollars.

Opportunities Presented by the Reauthorization of the Farm Bill

Given the scale of global food insecurity and the dynamic nature of its causes, it is imperative that BHA fully optimize its programs and be able to employ the best food assistance modalities for each context in the future. The reauthorization of the farm bill, at this time of global crisis, provides an unparalleled opportunity for Congress and USAID to work together to ensure the U.S. Government has the best tools at its disposal to meet the humanitarian challenges of the day, while upholding U.S. international commitments.

USAID's goal has always been to optimize humanitarian assistance programming and maximize taxpayer dollars within the confines of authorizing legislation in innovative ways. For example, in our non-emergency RFSAs programming, USAID piloted the "Refine and Implement" approach to co-creation which is based on adaptive management principles. The method allows partners to work closely with USAID and target communities to refine activity design in a way that is considerate of local context and community priorities while addressing the underlying causes of food insecurity. Our partners use evidence and pilot studies gathered during the first year of the award to refine the design of the program. Partners continue to review the assumptions and monitoring data annually to adjust the program as needed. Using this co-creation approach ensures that RFSAs are effective, efficient, and responsive to the needs of beneficiary communities over time. RFSAs are strategically designed to improve the sustainability of outcomes beyond the life of the programs. These programs also build the capacity of local actors to own the delivery of necessary inputs and services using a market-based approach, which is in line with USAID's localization agenda.

In fact, even more optimization and efficiencies could be gained by adjusting some of the approaches to implementing Title II resources. For example, USAID most commonly utilizes Title II and International Disaster Assistance (IDA) resources to fund humanitarian assistance programs. The number of countries where sustained, large volumes of U.S. in-kind food assistance are the most effective modality is limited, and it can be difficult to redirect commodities if the needs or the context change. Increasing flexibility between Title II and IDA accounts to allow USAID to quickly pivot programming in response to changing contexts would help ensure that the Agency utilizes the most appropriate funding tool in each response. Additionally, expanding the Food for Peace Act to allow IDA and Title II funding in the same award, would obviate the need for multiple awards to a single partner implementing both IDA and Title II resources in the same response. Humanitarian crises are rarely limited to one sector-robust wrap-around services (including health, nutrition, and water, sanitation, and hygiene) are often needed to support vulnerable people receiving food assistance. Expanding USAID's ability to co-program accounts would increase USAID's flexibility to respond to complex emergencies and its ability to implement multi-sectoral programs efficiently. Amending the Food for Peace Act to allow the co-programming of accounts could help BHA implement robust, multi-sectoral programs, as it was designed to do through the Bureau's creation.

USAID is also committed to improving localization in humanitarian responses. On November 4, 2021, USAID Administrator Samantha Power laid out her vision for the future of USAID in a speech at Georgetown University, which included an increased focus on localization, as local actors are best positioned to drive their country's development. Administrator Power set two ambitious goals for localization dur-

ing this speech: 25 percent of USAID assistance must go to local partners within the course of the next 4 years, and 50 percent of USAID programming must place local communities in the lead to either co-design a project, set priorities, drive implementation, or evaluate the impact of our programs by the end of the decade. USAID's localization agenda has strong bipartisan support; it was also a priority under former USAID Administrator Mark Green's New Partnerships Initiative and procurement reform efforts. In an effort to attract new, small, or local organizations to apply for these resources, establishing a single associated cost category would help streamline budgets and lessen the administrative burden of implementing Title II programs. This change would result in the elimination of barriers to entry for smaller organizations while retaining the necessary financial oversight to ensure compliance with the strict authorized uses of cost categories, such as Section 202(e) and ITSH.

The combination of CDF authorizations in the 2018 Farm Bill and the increased 20 percent 202(e) cap from the 2014 Farm Bill allowed USAID to eliminate the monetization requirement. Further increasing the cap on 202(e) resources would give BHA the flexibility to support emergency programming while also using the most appropriate modality for each non-emergency program based on local context and beneficiary needs. The 20 percent cap on 202(e) limits our ability to support both quality non-emergency program design and increasingly expensive emergency logistics needs at the same time. Because of this, USAID must still program commodities in RFSAs, where market-based modalities can be better suited to building long-term resilience. For example, the 2021 Haiti RFSA solicitation required a minimum of 50 percent of each annual budget be used to program U.S. in-kind commodities. During the question and answer period, many partners, including local Haitian non-governmental organizations, expressed logistical concerns about the need to program commodities due to inadequate warehouse and storage facilities, supply chain challenges, and security concerns. Some partners also did not believe that RFSAs with a commodity requirement could be sustainable after the end of the award or make lasting improvements to the resilience of vulnerable populations. As such, increasing the cap on 202(e) resources would give our partners increased flexibility to program RFSAs effectively.

Conclusion

Addressing the staggering level of food insecurity around the world will be one of the greatest challenges of our time. Optimizing USAID's food assistance programs will be critical to saving the most lives when confronted with growing humanitarian needs and limited resources. As demonstrated by 2018 Farm Bill changes I outlined above, incremental technical fixes to authorizing language in the farm bill have had significant positive impacts on USAID's food assistance programs over the past 4 years. Similar solutions exist for each of the current challenges USAID is experiencing as well. We look forward to working with the Committee ahead of the upcoming farm bill reauthorization to maximize the ability of the legislation to support USAID to more effectively respond to crises, build resilience among communities, and improve stewardship of taxpayer dollars. Thank you again for the opportunity to testify today; I look forward to your questions.

The CHAIRMAN. Thank you very much for your testimony, and I want to thank both witnesses this morning. We will now recognize Members of the Committee—excuse me—for 5 minutes each, alternating between the Majority and Minority Members of the Committee, and I shall begin by recognizing myself for 5 minutes.

Ms. Charles, in your testimony you noted that, as we all stated, Ukraine and Russia account for nearly 30 percent of wheat exports and 18 percent of corn exports in the world. Obviously, that is a staggering number. As I spoke with Secretary Vilsack last week, we don't know how much seed is going to get in the ground as a result of this war.

Have you begun to do an analysis on how we will work together in terms of the non-emergency food aid programs to build more resilience, but also the emergency aid food programs? I think we have to deal with both.

Ms. CHARLES. Maybe I can start specifically by talking about efforts inside of Ukraine to ensure that even under these incredibly

difficult conditions, they are able to export as much as possible. So, our development programming in Ukraine is working very closely with Ukrainian [Ministry of Agrarian Policy and Food]. Their estimates right now are that Ukraine may be able to plant for the spring season and yield something in the range of 50 percent of what a normal harvest might be from that spring crop. The challenge, of course, remains critical inputs to that, including diesel, as I think it was alluded to before. The Government of Poland has actually made the decision to draw down on their strategic reserve in order to supply the Ukrainians with diesel from Poland, and then the Ukrainians are working with Exxon-Mobile to backfill.

But like you said, this has ongoing impacts around the world, so we are working through the Feed the Future Program to look at ways to expand our efforts to increase yields worldwide, but also to look for greater efficiency in our emergency programs as well.

The CHAIRMAN. I had a meeting earlier this week with the French ambassador, and he indicates that his country, with his President and others, are leading a European effort to deal with this issue of hunger and humanitarian assistance. Are we working together with our friends with the European Union? Because it seems to me we are working together on a whole host of efforts as it relates to this crisis, and this seems to be one of those that I think we really need to be coordinating hand in glove.

Ms. CHARLES. We absolutely are. I actually just came back from Europe about 10 days ago where I was meeting with our European counterparts, both on the response in Ukraine, but more critically or as critically, the global response to the food security crisis. Administrator Powers actually chairs a weekly meeting with our European Union counterparts on the crisis in Ukraine, but the focus of these discussions in the last couple of weeks have been as much about response to the global impact of Ukraine's war on global food security as well. So, the French, the European Union, the Germans, the United Kingdom, these are critical partners in our response.

The CHAIRMAN. Well, they have to be, and obviously, working together we can consolidate resources and do a better job in addressing it and avoid duplication and be more cost effective. We might want to suggest Administrator Powers come here to brief us on this.

Mr. Whitley, I am very concerned about how climate change is impacting global food systems, and what role the farm bill programs have in improving uptake in sustainable practices with our partner countries. Would you care to comment?

Mr. WHITLEY. Yes, sir. Thank you, Mr. Chairman.

I think that one of our programs we can certainly prioritize and target countries that are interested and have shown a willingness to embrace climate-smart agriculture in the manner in which American agriculture views sustainability. Food for Progress is a program where we can highlight and emphasize and share our technology, our expertise, our innovation on global ag production in a sustainable manner. And this year's priority country lists three countries that we think we can partner with and educate them on, and they can be partners in the international conversation on what does—

The CHAIRMAN. Well, I think we would like to have more detail on that. I think many of us are watching what Europeans are doing with this Farm to Fork policy and wondering ultimately how that is going to work. But, there is more to be learned about that.

Let me close before my time runs out. I mentioned earlier in my statement about the supply chain issues, and I know the Europeans are having similar supply chain issues. What emergency procedures or efforts is the Administration contemplating? I mean, if we are having empty containers going back on the West Coast up to 80 percent, that is a problem and we are in a crisis, and even if we can consolidate our commodities that we can use to ship for support, if we don't have the capacity to move those products, then this is different than some of the other support we are providing into Poland or Romania. When we are talking about food grains and other such, you need ships.

Mr. WHITLEY. Absolutely, and the Administration does have a Supply Chain Task Force. Secretary Vilsack is a member of that task force, and—

The CHAIRMAN. With Porcari?

Mr. WHITLEY. Yes.

The CHAIRMAN. Yes, we have had conversations, but have you looked at how this pertains to this effort with this potential humanitarian food crisis?

Mr. WHITLEY. Yes, absolutely. It certainly is a problem in terms of trying to get product around the world, but we are providing assistance and information. We are hearing from our stakeholders every day about the challenges they face with getting products to market, and the two pop-up ports we announced in Seattle and Oakland hopefully will relieve some of the bottlenecks at the ports so we can get those cars loaded.

The CHAIRMAN. Well, let the Secretary know—my time has run out, but we are going to want more information on this container issue, because not only is it depressing current markets of American exports, California exports 44 percent of its agriculture.

Mr. WHITLEY. Correct.

The CHAIRMAN. It is a real challenge. But now you add to this crisis. We need to look at what emergency procedures could be implemented.

My time has really expired, and I will defer to my colleague and good friend, the gentleman from South Dakota, Mr. Johnson.

Mr. JOHNSON. It is good to be the king, right? You get that extra minute when you need it. It is great.

Administrator Whitley, I will start with you. Recently, in fact, yesterday, my colleagues and I sent a letter to Secretary Vilsack and Ambassador Tai about Canada's proposal for their tariff rate quotas on dairy products, and I will just be very up front. I thought Canada's proposal fell woefully short, and I wanted to give you an opportunity to share any of your thoughts on both their proposal and where do we go from here?

Mr. WHITLEY. Yes, sir, and I think USDA agrees that Canada's proposal has fallen woefully short. I think the ruling by the dispute settlement panel under the USMCA was clear that more needs to be done, and Canada has not met what we think the ruling has indicated. We are in talks and conversations with USTR on a regular

basis. This is a top priority for the Secretary and USDA, and we are working on both what we can do to continue our conversation with our Canadian counterparts, but also, what are the tools at our disposal, given the USMCA agreement.

Mr. JOHNSON. Well, thank you for that, and I want to reiterate both to the Administration and probably more importantly, to Canada, that I think a vast swath of bipartisan Members here in the United States House believe that Canada is not living up to its commitments under USMCA, as you alluded to, sir, and we certainly want to support bold efforts on behalf of the Administration to close that gap, because I do think American dairy producers deserve fair opportunity for market access. So, thank you very much for that.

Ms. Charles, you in your testimony noted the purchasing power of your budget has gone down. I think you said 11.4 percent, which is obviously substantial. The Chairman had noted that John Garamendi and I have a bill, the Ocean Shipping Reform Act (H.R. 4996), that would address some of the supply chain crunches. He noted that he and I have a bill that would address the anti-trust exemptions that the foreign-flag ocean carriers have. That would help a little bit.

But give us some sense to what extent have food aid recipients been impacted by the supply chain crunch, by shipping delays generally?

Ms. CHARLES. So, thank you for highlighting that. We certainly feel the impact of supply chain disruptions. That 11.4 percent was even before the war in Ukraine, so I think we can anticipate that our purchasing power unfortunately will go even lower. Just to give you some flavor, it now costs something in the range of \$164 per metric ton to ship food overseas, so where we are really feeling this is in the cost, the cost to move food around the world. And we already see ration cuts in places like Yemen. I think David Beasley was up on the Hill, the leader of the World Food Programme, sharing some of this a couple of weeks ago where we have seen a country where 13 million people are dependent on food aid, 50 percent ration cuts, again, even before the impact of those—

Mr. JOHNSON. So, Ms. Charles, I mean, clearly it is a budgetary problem. I mean, also is it a logistical problem? I mean, even if you have the budget, are you able to get the food where it needs to go when it needs to get there?

Ms. CHARLES. So, we have supply chain experts who work very hard with our partners to ensure that we can plan as far in advance as possible, but that planning does take 3, 6 months in advance to get food where it needs to go in the face of these kinds of supply chain disruptions. It makes it particularly difficult to use U.S.-sourced commodities for something like a sudden onset crisis. I mean, this really is most appropriate in context where we are facing more chronic hunger in part because of that lag time.

Mr. JOHNSON. And what about our international partners, other developed countries that have a tradition—I mean, almost nobody has a tradition like we do of international food aid, but is their ability to respond to these pop-up crises also reduced, I would think?

Ms. CHARLES. So, most of our peer donors provide cash as opposed to in-kind assistance, so our assistance really does complement those efforts in places where we have acute food insecurity and local markets can't support local procurements. That is one of the kind of niche roles that our assistance provides. But we certainly are seeing these supply chain disruptions everywhere that we work.

Mr. JOHNSON. Yes, and I would just close by putting an even finer point on what you note, and that is that the United States plays an almost unique role in international food security. While others are able to provide cash, and that is clearly needed and helpful, we are the bread basket of the world. We are growing and raising the kind of food and protein that people need during times of duress, and I just want to thank you for your efforts.

With that, Mr. Chairman, I yield back.

The CHAIRMAN. I thank the gentleman for his focus and his questions.

The chair will now recognize the gentleman from Georgia, our good friend Representative Sanford Bishop, who we are very fortunate not only does a terrific job on the policy committee, but also does a good job for us on Appropriations, representing the jurisdiction on the appropriate funding measures that will have to do a lot of what we are trying to do here, as we implement Title III and other related programs.

The gentleman from Georgia, Sanford Bishop.

Mr. BISHOP. Thank you, Mr. Chairman, and let me thank our witnesses, Administrator Whitley and Ms. Charles, for appearing this morning.

Let me ask you a couple of questions. The first has to do with the current situation in Ukraine. It has only compounded the global food crisis by intensifying the need for humanitarian assistance, and by reducing global supplies of wheat, cooking oil, and fertilizer. To bolster the American response to these crises, 36 bipartisan Members of the House Agriculture Committee, myself included, recently sent Administrator Power and Secretary Vilsack a letter encouraging them to tap the Bill Emerson Humanitarian Trust to make additional commodity donations available. Is this something that your agency is considering? If so, can you share your current plans to obligate available Food for Peace funds, and what steps need to be taken to access the trust?

Second, how are the Bill Emerson Humanitarian Trust funds replenished once they have gone down, and how long would it take to replenish those funds?

Ms. CHARLES. Thank you for that question, Congressman.

I can assure you that we are in very active conversations with the U.S. Department of Agriculture about determining the specifics about drawing down that Bill Emerson Humanitarian Trust, and we are in the process right now of looking at commodities in countries that could benefit from U.S.-sourced food commodities. And again, in terms of replenishment, I do think the statute has a specific cap on how much is replenished each year. I believe it is \$20 million each year, and we will be very eager to share with the Committee as soon as those specifics have been decided between

USDA and USAID about specific plans, including what that would mean in terms of replenishment.

Mr. BISHOP. Thank you.

Next question. In past farm bill debates, there have been efforts to reform the Food for Peace to shift more resources away from commodity food aid to cash assistance. What do you believe is the appropriate balance of commodities and cash assistance in Food for Peace, and what are the tradeoffs of proposals to shift more resources into cash or vouchers? And are there other ways that we should consider adding flexibility into the program implementation?

Ms. CHARLES. Thank you again for that question.

As I think Ranking Member Johnson mentioned, we do see a critical role for U.S.-sourced food commodities with our humanitarian assistance and our resilience-focused programs, particularly where local markets can't support the acute food needs of those that are most in need of assistance. We are seeking, in part because of what we talked about in terms of the reduced purchasing power of our Title II resources, greater flexibility in the 2023 Farm Bill, including, for example, when we look at some of our resilience programs, we may, in the first, second, third year of a program focused on increasing the resilience of local communities, want a bigger basket of U.S.-sourced food commodities, but over time as we invest in agricultural inputs, small-hold farmer yields, want to transition to more cash and voucher assistance to support local markets and hopefully markets that will become import markets as well for U.S. farmers.

Mr. BISHOP. Thank you very much. I will yield back the balance of my time. I thank you very much.

The CHAIRMAN. Will the gentleman yield?

Mr. BISHOP. Yes, I will.

The CHAIRMAN. Since you have a little more time.

It dawned on me as the gentleman from Georgia was asking you, it just seems to me that we have some commodities in this country in which we have surpluses, and some of those surpluses are, in part, caused by the supply chain issue with regards to empty containers. Have you looked at whether or not there is—as that is a source of protein that can be used in terms of your program, focusing on possibly purchasing some of those commodities in which there are surpluses and product just sitting, if not at ports, sitting in warehouses that could be shipped?

Ms. CHARLES. So, we start from the place of looking in the areas where we are seeing acute food insecurity, looking at the specific needs of those communities, what is appropriate for their local diet, what is familiar to those communities, and then we work very closely with colleagues at USDA to source the appropriate commodities in response to that. And often, that does include certain protein sources.

The CHAIRMAN. Well, let me give you an example and then get back to us on this. But wheat shortages, as we noted with Ukraine produces the flour to produce a lot of the bread products that certain diets in certain parts of the world—almonds, as you make almond flour, and that works as a good substitute, and—in terms of

a protein substitute. So, those are the kinds of things I think we need to be looking at in terms of thinking out of the box.

Our next Member is the Ranking Member, the gentleman from Pennsylvania, Congressman GT Thompson from the 15th Congressional District of Pennsylvania.

Mr. THOMPSON. Well, Mr. Chairman, thank you. Once again, thank you to the witnesses and your written testimony has been very helpful.

I wanted to follow up on some things. Ms. Charles, your testimony mentions the benefits of the flexibilities provided in the 2018 Farm Bill, and thank you for those kind comments, remarks. Yet, it seems USAID has continued to push to make Food for Peace Program a really important program, a cash giveaway program with virtually no requirements for the use of U.S.-grown food. Do you worry that a continued push in that direction will erode domestic support for this longstanding program, and quite frankly, I worry about the effectiveness of this pivot when the fact is, it is really about having enough food commodities with what we are experiencing—what we are seeing over the horizon come this fall. I don't—it seems to be the better push would be to, obviously, to help our farmers increase yield and production so that we actually have food. I am not sure where that money is going to be used to purchase commodities, given what is happening in Europe right now and will spread into the Middle East.

Ms. CHARLES. Thank you, Congressman Thompson.

I can assure you that the Food for Peace Program, both as authorized and as implemented, at its core is using U.S.-sourced food commodities. We do, at times, depending on the market conditions, the particular needs and environment, have wraparounds in terms of cash and voucher assistance. So, for example, in a place like Somalia or like Yemen, we may be pairing U.S.-sourced wheat, lentils, soy, or vegetable oil with that cash and vouchers that allow people to purchase things like vegetables to supplement those U.S.-sourced commodities or iodized salt, which is more appropriate to purchase on the local market.

Mr. THOMPSON. Okay, thank you.

Administrator Whitley, with the agriculture trade promotion programs winding down over the next year and a half, how do you foresee promotion of American agricultural products abroad being impacted?

Mr. WHITLEY. Thank you, Congressman, and we do have the MAP Program, which is the farm bill authorized program to promote U.S. agricultural products, and we have seen tremendous success. Obviously, we set a record amount of exports in 2021 at \$177½ billion, and many of our cooperators and companies tout the fact that they have been able to use MAP and FMD and some of these other programs to reach those successes.

So, as Congress authorizes these programs, we are certainly capable of implementing them and benefitting American agriculture to achieve exports, and as we get these authorizations and the requests from the farm bill, we will implement them to the best of our abilities.

Mr. THOMPSON. And thank you for that. Obviously, I am a big fan of both agencies, and the MAP Program and FMD, those two

tools that we provide through the farm bill are extremely important for our farmers, right, and our ranchers to be able to kind of navigate what can be pretty confusing and challenging in terms of trade. And so, I look forward to working with you to make sure that all the tools are there as we prepare for the next farm bill to continue to be effective.

One of the many lessons of this terrible genocide in the Ukraine is looking at how vulnerable food security can be, and so this is a win-win, because economically, this is a great market for our farmers and ranchers. I know the Great Recession of 2009 when many industries were just struggling desperately, agriculture actually held its own and we were resilient, but that was because of our trade that we have. So, we can never forget that it is important to serve the needs of people around the globe, but quite frankly, economically it helps those hardworking folks that work so hard every day.

And my time has just about expired, so I will yield back.

The CHAIRMAN. Well, we thank the gentleman from Pennsylvania always for your contributions, and we will continue to work together on all of the above.

Our next Member who is on queue is Representative Scott DesJarlais from the wonderful State of Tennessee, the 4th Congressional District. Mr. DesJarlais?

Mr. DESJARLAIS. Thank you, Chairman Costa, and thanks to our panelists today for being here.

Ms. Charles, I will start with you. USAID has historically pushed Members of this Committee to advocate for more flexibility to use cash to procure foreign commodities over in-kind donations of U.S. commodities. For example, instead of buying U.S. rice or U.S. wheat, USAID and its implementing partners could theoretically use U.S. taxpayer dollars to buy Russian wheat or Vietnamese rice to support feeding and development projects. Do you know, does USAID have controls in place to prevent U.S. dollars from supporting Russian businesses or others that directly compete with U.S. farmers?

Ms. CHARLES. So, all of our U.S. foreign assistance programs certainly have controls in place to make sure that our assistance is used consistent with the law and consistent with, certainly right now our partners are looking very closely at new sanctions that have been imposed. We do not restrict our partners, though, from procuring with our International Disaster Assistance, our IDA funding, from procuring what is on the local market.

Mr. DESJARLAIS. Okay. Administrator Whitley, Ranking Member Thompson touched a little bit on this, but when you talk about the MAP or FMD funds, how are they awarded to cooperator groups. Is there a formula, and is it based on the domestic production value of the commodity?

Mr. WHITLEY. No, the funds for MAP and FMD are awarded based off of export strategies called the Unified Export Strategy that they submit annually, and we have experts that assess these strategies for their capabilities to increase trade and increase exports. So, we work with the cooperators in the companies who submit these strategies. We add a little of our own analysis to those strategies and have a conversation with the companies, and deter-

mine the appropriate awards that we think those activities will lead to exports.

Mr. DESJARLAIS. Okay, and do you have concerns with how current transportation costs may limit the reach of the Food for Progress Program, and if so, has FAS been looking at creative ways to be more flexible with the \$40 million transportation cap?

Mr. WHITLEY. Yes, sir. We are limited by the cap, so we can only ship the amount of commodities that \$40 million will support in terms of transportation. So, we look forward to working with Congress and this Committee as we think about the next farm bill and what are some of the options and some ways that it can possibly be adjusted or more flexibility can be given so we can ship more commodities.

The CHAIRMAN. Would the gentleman yield?

Mr. DESJARLAIS. Yes, sir.

The CHAIRMAN. I am wondering either what could be done under emergency authority to lift the cap, and what we could do to help if this is anticipation of this year?

Mr. WHITLEY. We would welcome that conversation with Congress, Mr. Chairman, and certainly, this is a limitation of the program, the \$40 million cap.

The CHAIRMAN. We ought to look at that.

I defer back to my colleague, and I will give you the balance of the time that I used of yours.

Mr. DESJARLAIS. Okay. I guess we have time for one more question.

Administrator Whitley, Food for Progress is an excellent long-term industrial development market development program administered by USDA; however, I am hearing concerns with the narrow scope of Food for Progress's most recent key priority areas, and how they may preclude work on other worthwhile projects. Can you speak to how Food for Progress develops its priorities, and how these priorities can be expanded and improved upon in advance of the Fiscal Year 2024 funding opportunity to allow more U.S. co-operators to participate?

Mr. WHITLEY. Yes, sir. We work closely with USAID and other partners in carrying out a scoping mission on which countries and which parts of the world the program can be most effective. We evaluate those countries, those regions, those markets. We go through a process internally at USDA to determine where we think it is appropriate to go ahead and announce its priority countries, and once those countries are announced, we have a conversation with our implementing partners and we ask them to submit proposals and think about those options. And those proposals come in and again, we formulate an expert committee to evaluate those proposals and make those awards.

Mr. DESJARLAIS. Okay. That about uses all my time. Thanks again to both of you for appearing today, and Chairman Costa, I yield back.

The CHAIRMAN. Well, I want to thank the gentleman, and the chair was more than willing to provide additional time for allowing me to—your willingness to yield, because I think this cap issue may be something we are going to have to look at. Thank you for your good questions and your comments.

The next Member that I think is in queue at this point in time is Representative Jim Baird from the 4th District in Indiana. Mr. Baird, I believe you are on Zoom.

Mr. BAIRD. Thank you, Mr. Chairman, and I really appreciate this opportunity to discuss international trade and food assistance, and I really appreciate the witnesses being here.

My question goes to Administrator Whitley, and in your testimony, you stated that the Biden-Harris Administration is working to better position our agricultural and rural communities to compete in the global economy. Your testimony goes on to say USDA is working every day to meet this challenge by creating more and better export market opportunities for farmers, ranchers, and producers.

Some of my colleagues and I are concerned about the commitment this Administration is making to prioritize trade, to craft an ambitious agenda, as well as swiftly nominating individuals to fill the position of Chief Agriculture Negotiator and the Under Secretary for Trade and Foreign Agricultural Affairs. So, I really appreciate all the work that you do and the work that USDA FAS is doing, but I want to know what you are doing in this area of trying to fill these positions and enhance foreign trade?

Mr. WHITLEY. Thank you, Congressman Baird. I know the Administration is eager to complete the process to fill all of these positions that you mentioned. I will also add that we recently had our first in-person trade mission in the 2 years since the pandemic began. We took over 40 companies to Dubai on a trade mission and trade shows, and we received a very enthusiastic welcome from all of our trading partners and importers and distributors that we met in Dubai. Many of our companies walked away with enormous success moving forward. We had our first projections from that trade mission come out last year, and many of the companies in total reported that first year sales will exceed \$200 million. So, we are excited to take along American agribusinesses to new companies and new markets, introduce them to importers and buyers, and continue the process of creating these market access opportunities. We have four more trade missions on tap later this year, and we are looking forward to additional successes.

Mr. BAIRD. In that vein, the commodities that we are able to produce and incorporate into our trading programs, what are the comments for some of those on these trade missions, the recipients of our products, in your opinion?

Mr. WHITLEY. Well, the biggest comments I think we heard in Dubai is that American agriculture is the most reliable in the world. We received a lot of feedback that many countries and many buyers want to strengthen their ties with American agriculture because of our ability to provide safe, nutritious, timely commodities and be reliable year in and year out.

It is no accident that American agriculture set record exports in 2021 despite the supply chain logistics, despite the COVID pandemic. It is because of the resilience of American agriculture to perform in all times, and I think that is being shown, given the situations around the world, that we are a reliable supplier and many of our trading partners are looking forward to strengthening their relationship with us.

Mr. BAIRD. In that same vein, I am going to switch a little bit. Do you have concerns about our current transportation costs and how that may limit the reach of our Food for Progress Program? And if so, has FAS been looking to create ways to be more flexible with the \$40 million transportation cap?

Mr. WHITLEY. Yes, sir, we do have concerns about the \$40 million cap and we are certainly open to a conversation with Congress and the appropriate committees as they formulate the next farm bill to discuss what could be done or how it could be more helpful to have any flexibility with that cap to ship more products.

Mr. BAIRD. Thank you very much. I appreciate those remarks, and I yield back, Mr. Chairman.

Mr. WHITLEY. Thank you, sir.

The CHAIRMAN. Thank you. I thank the gentleman for his questions and his focus.

I now believe that Representative Hayes wishes to be recognized. I believe Mrs. Hayes is on Zoom. I don't see you.

Mrs. HAYES. I am here.

The CHAIRMAN. Oh, terrific.

Mrs. HAYES. Thank you, Mr. Chairman.

The CHAIRMAN. You are welcome. Glad to have you, and you are recognized for 5 minutes.

Mrs. HAYES. Thank you. Thank you, Mr. Chairman, and thank you for hosting this very important hearing.

During my time as the National Teacher of the Year, I traveled the world as an ambassador for education, and while I was abroad, I learned the degree to which many communities look to Americans to lead the way on food security. When I would visit towns, many students assumed I was there to bring food, as other Americans had done before me. Our international food programs are not just an exercise of goodwill; they are absolutely critical to communities that are impacted by the devastation of food insecurity.

I am thinking about now the crisis in Ukraine and what is happening as the world is watching many pregnant and nursing women flee their country, and I am particularly concerned about the health and well-being of these women.

Ms. Charles, how is USAID addressing the nutritional needs of pregnant and nursing mothers in Ukraine and their newborn babies?

Ms. CHARLES. Thank you. It is such a good question. This obviously has been a crisis that has even more so than normal disproportionately impacted women and children. We see this all over the world when war strikes. Women and children are most vulnerable, but we are seeing it in full force in Ukraine. I actually think it is a good example to come back to Mr. Thompson's question about how are U.S.-sourced commodities combined with greater flexibility around cash can be helpful in addressing the acute needs of lactating women and children. The flexibility we are pursuing in terms of wraparound services for the U.S. commodities allows, for example, for us to use U.S.-sourced specialized products to treat malnutrition, both in young children, but also pregnant and lactating women, but also have the cash to provide the kind of wraparound nutrition services, the training of community health workers, the assessment of nutrition, the follow up services that are pro-

vided to ensure that those programs can be most effective and use our U.S.-sourced food commodities most effectively.

Mrs. HAYES. Thank you. I appreciate that.

Additionally, the McGovern-Dole International Food for Education and Child Nutrition Program is a critical international program which is aimed to provide at least one nutritious meal per day to vulnerable children in schools across the world.

Mr. Whitley, how has the McGovern-Dole program been adapted to the COVID-19 pandemic, and do you have any recommendations for Congress to ensure the program can adequately respond to crises of this magnitude in the future?

I can't hear in the room. I am sorry.

The CHAIRMAN. You need to activate your microphone there.

Mr. WHITLEY. Okay, thank you. Thank you, Congresswoman.

Yes, the McGovern-Dole program has continued to operate during the COVID pandemic, and we have seen enormous success. Coincidentally, this is the 20 year anniversary of the program, and since the program's inception, we have fed over 31 million children around the world in 48 different countries, purchasing more than 1.3 million tons of American food. So, it has been a huge success, the overall program. So, every year we look forward to carrying out and implementing this program, identifying the places around the world where it can be most useful, and of course, as the farm bill authorizes this program, we are excited about the opportunities to continue.

Mrs. HAYES. Thank you. I appreciate your commitment to this work, and just the appreciation that we have to prioritize making sure that we get healthy meals to children, not just in our country, but all over the world.

Mr. Chairman, that is all I have. I yield back. Thank you.

The CHAIRMAN. We thank the gentlelady for her questioning, and the chair will now recognize the next Member of the Subcommittee, Representative Tracey Mann from Kansas's 1st District.

Mr. MANN. Thank you, Chairman Costa and Ranking Member Johnson.

The CHAIRMAN. You are welcome.

Mr. MANN. I appreciate it.

Today's hearing represents much of Kansas's legacy. I get to represent the big 1st District of Kansas, and former Senator Bob Dole used to be in this seat, and he paved the way, of course, for the McGovern-Dole International Food for Education and Child Nutrition Program, which as you all know, helps fight hunger by providing nutritious meals to children in schools and developing countries. The origins of Food for Peace Program actually came out of the district as well at a county farm bureau meeting in southwest Kansas years ago, and so, the list of reasons why international trade and food assistance programs like these are important to my district and important to Kansas, and that list goes on and on.

Ms. Charles, first off a question for you. Kansas is the Wheat State. Wheat is the number one commodity used in U.S. donations. If you add up all of the aid destinations, they would represent a top ten market for U.S. wheat. In that same vein, the last two farm bills have granted USAID flexibility in implementing aid programs; however, more than 1/2 of that funding is for market-based assist-

ance, meaning non-U.S. food. How can USAID prioritize in-kind donations of U.S. commodities like wheat?

Ms. CHARLES. Kansas certainly has a very proud legacy when it comes to food assistance overseas.

I will say, as you noted, wheat is the biggest commodity that we source here in the United States. When we look at assistance, we really are looking at how to deliver the most effective assistance, including how to make sure that that wheat is accompanied by the kind of wraparound services to ensure that it is actually addressing the most critical food security needs, that it is targeted at the most vulnerable, and that they are provided the kind of wraparound nutrition and health services that ensure that that can be effective.

Mr. MANN. Great, thank you.

My next question is for you, Administrator Whitley.

As you mentioned, the 2018 Farm Bill created International Agriculture Education Fellowship Program, or IAEFP. I applaud USDA's successful of IAEFP in Africa, but I am concerned with USDA's recent decision to relocate IAEFP after only 1 year in a country. While I recognize the need for this type of program in many geographic regions, such a move in the program's second year would undermine or could undermine the intent, sustainability, and overall success of the entire program.

What do you need from Congress to ensure multi-year sustainability in a particular country so that we don't risk exiting a country prematurely before progress is made and accounted for?

Mr. WHITLEY. Thank you, Congressman Mann.

The recent decision to offer ag program and under IAEFP to another country we do think is within the legislative authority of how the program was written. The funding is available on an annual basis, and we award on an annual basis; however, the programs do have a 3 year component to it. So, we will monitor and assess the program over a 3 year period for its overall effectiveness. But we can only allocate the money on that annual basis.

Mr. MANN. Great, thank you.

I believe that for IAEFP to be successful, the Department must find ways to extend its presence in awarded countries or regions. We can't expect to monitor any program with only a years' worth of results. I just think, once these programs are stood up, we have to do it for a few years to really know if we are having results, and there has to be a sense of longevity and sustainability to see effectiveness and really effective use of tax dollars.

So, thank you both for being here and what you do, and with that, I yield back.

The CHAIRMAN. The gentleman yields back and we thank him for his questions and comments.

The chair will now recognize the representative from Virginia's 7th District, my friend, the very able Representative Abigail Davis Spanberger.

Ms. SPANBERGER. Thank you so much, Mr. Chairman and Ranking Member Johnson, thank you for organizing this hearing, and thank you to the witnesses for being here today.

I also serve on the House Foreign Affairs Committee, so I am very excited to have the opportunity to discuss the role of American agriculture abroad in the ways that we can both support our farm-

ers and producers here domestically, and also affirm our global leadership in assisting in humanitarian crises and economic development priorities across the world.

So, Administrator Whitley and Ms. Charles, thank you for being here today and more importantly, thank you for the work that you do at USDA and USAID respectively. As my colleagues have mentioned, certainly there is significant concern about what the Russian invasion will have in terms of impact on the global food supply, the potential for an increase in food insecurity in lower- to middle-income countries, in particular, not to mention cost of food prices associated with rising costs of fertilizer, some of the secondary and significant impacts of this invasion.

We saw that just this week the reporting is that farmers in Ukraine are expected to plant 8.6 million fewer acres compared to 2021, and in addition to challenges with planting, of course, we see the Russian invasion destroying agricultural equipment and other essential elements of production, harvest, and ultimately storage.

So, looking into the future, I am curious kind of in a broader scale if you could speak to some of the role of USDA or USAID in helping Ukraine rebuild its agricultural capacity, and related to that, as we are looking at the 2023 Farm Bill, are there any additional flexibilities that we should be considering in this frame of how we assist countries that might need to not only feed their hungry citizens, but also rebuilt their agricultural capacity? And I will open that up to both of you.

Ms. CHARLES. Maybe I can take that question about Ukraine and their recovery.

I would just say we are not waiting for the end of the war to work with the Government of Ukraine on resilience in their agriculture industry. Already, there is very close collaboration between existing USAID agricultural programs to help farmers with access to credit to purchase seeds, fertilizer, and other core inputs. We really are working very closely with the [Ministry of Agrarian Policy and Food] in Ukraine to ensure that they are able to, even in the midst of the war, plant and hopefully export as much as possible, as well as supporting small-hold farmers on local production for the local market.

I would also say we do think there are a couple of flexibilities that could be pursued as part of the farm bill to give us greater flexibility to respond to what we know is going to be acute food insecurity throughout the world as a result of this crisis really for the next several years, we anticipate, including flexibility on the 202(e) cap to allow us to use a greater percentage of Title II funds to help build capacity of local partners and provide wraparound services to—along with U.S.-sourced commodities, as well as, again, greater flexibility to co-program IDA funds and Title II funds for similar types of reasons.

Ms. SPANBERGER. One really quick follow-up question. Are you also engaging directly with our European Union partners as well?

Ms. CHARLES. Yes. I am on the phone almost daily with my European Union partners. We are working very closely with them in the region. As well, Administrator Power does a weekly sync with our European partners, including on the responses out of Ukraine, but also how to support Ukraine in exporting as much as possible,

even under the circumstances, to address that global food security crisis, and coordinating on humanitarian efforts overseas. We are pressing on our European partners to not divert humanitarian resources from other parts of the world to Ukraine, but to seek new resources for that humanitarian response in Ukraine, and I think that will be critically important next year in particular as we see the impacts of this food price spike.

Ms. SPANBERGER. I know we are low on time. Hopefully the Chairman will be a little more generous.

Mr. WHITLEY. Thank you, Congresswoman.

Yes, so I think one of the things that USDA has provided early on to the crisis is an overall economic assessment and analysis of the situation. We have an economic reporting mandate from Congress and we report out monthly through our *World Agricultural Supply and Demand Estimates* the overall S&D situation, production/consumption, imports/exports, as well as stocks around the world. The next report comes out on April 8, so we have a lot more information in this month's report than we had in the previous month's report, and we work with our Office of the Chief Economist. The Chief Economist, Seth Meyer, briefed several of your staff a couple of weeks ago on this situation. So, that is the official USDA estimates and projections of the overall global supply and demand situation. So, we look forward to sharing that information publicly and with the world, because it certainly advises and gives insight as to how we see the overall situation and outlook of global commodities.

Ms. SPANBERGER. Fantastic. To both of our witnesses, thank you so much, and I really appreciate your time.

The CHAIRMAN. And we thank the gentlewoman from Virginia.

The chair will now recognize Representative Barry Moore from the wonderful State of Alabama, the 2nd Congressional District.

Mr. MOORE. Thank you, Chairman Costa, and I want to thank all the witnesses for being in attendance today.

Ms. CHARLES, this is a question I have. Can you explain why the International Disaster Assistance account which is being used for support does impact Ukraine, which we have been talking a good deal about today, but it generally precludes the use of U.S.-grown food. I am just curious what your thoughts are on that, and why?

I can't hear her.

Ms. CHARLES. Sorry. Our International Disaster Assistance account has maximum flexibility, including the ability to source food in-kind from the United States, if that is the most appropriate modality to respond in the context in which we are responding.

Mr. MOORE. Okay, and so, does that make sense to you? I know in situations where we try to support American agriculture, is it just a logistics issue most of the time with shipping costs, or could you maybe go in specifics on why you see that as—we don't use the U.S. food as often as we should maybe?

Ms. CHARLES. We tend to—we start from a place of analyzing both the local needs and the local markets, and from that, determine the most appropriate modality, which at times is U.S.-sourced in-kind commodities. Often, that comes from the Title II account that we are discussing here today, but that could come from IDA-based assistance as well.

Mr. MOORE. Okay. Well, thank you, and thank you for your time. With that, Mr. Chairman, I yield back.

The CHAIRMAN. All right, the gentleman yields back, and we thank him for his participation.

The chair will now recognize Representative Randy Feenstra from the good State of Iowa, the 4th Congressional District.

Mr. FEENSTRA. Thank you, Chairman Costa, and thank you, Ranking Member Johnson.

Administrator Whitley, in your testimony you speak of how the Biden-Harris Administration is working to position our agriculture and rural communities to compete in the global economy. This morning, I was with our pork producers. I have also been talking with our soybean association and corn growers, and there is this passion, probably their number one issue, is trade, and especially advancing trade in the Pacific Rim, the second phase of the Chinese trade deal, and then USMCA issues with the GMO corn in Mexico.

And I know you have talked about this already. I was listening earlier on, and you noted that the Administration has yet to fill the Under Secretary of Trade and Foreign Agriculture Affairs position, and the Chief Agriculture Negotiator has not been filled. I am really concerned about this. I want you to elaborate why. Why are we a year and 3 months down the path and these are critical, critical to our agriculture community, and yet, these things haven't been filled? I just see a tremendous void here.

Mr. WHITLEY. Thank you, Congressman Feenstra, for your question. So, at USDA, we do have a White House liaison office who manages the political appointments for the Department, so I would have to have the staff there get back to your staff on the particulars as to why the positions haven't been filled. But we do have an office that manages that.

Now, I know there is—they are working very hard in trying to get those positions filled, but that is outside the normal responsibilities of FAS.

Mr. FEENSTRA. Thank you, Administrator. Can you just bring back my comments to them, because these big organizations—I mean, for me, I am number one in hog production in the country in my district, and also close to the top in cattle, corn, soybeans, eggs, and they all need export markets. And so, this is so critical.

Another question. As you mentioned in your testimony, U.S. farmers export billions of dollars of corn products to Mexico each year. Unfortunately, Mexico is taking a non-science-based regulatory approach to agricultural products, including a December 2020 Presidential decree promising to phase out all genetically modified corn imports by 2024. Already, we have seen the Mexican Government take steps to begin enforcing this decree. What steps is USDA currently taking to ensure that Mexico upholds these commitments that they made under the USMCA, and ensure that U.S. farmers have access to the latest agricultural technology based on sound science?

I saw yesterday the USDA's press release that noted the Secretary's visit to Mexico, but unfortunately, did not mention at all any progress on the corn biotech approvals. Can you broach that subject at all, or tell us where we are at?

Mr. WHITLEY. Yes. I can assure you that the Secretary's visit to Mexico, which was yesterday, that he met with the [Secretariat of Agriculture and Rural Development], Mr. Villalobos, as well as the President of Mexico to make the case on the importance of following sound science and international standards for many of these inputs and products that we cultivate here in the United States of America. That is a high priority for Secretary Vilsack as well as the Department, and we have made the case at all levels with Mexico that the direction they are headed is quite troublesome. We have heard from many industries here at home and they, too, are extremely troubled by this, and this will continue to be a major focus and prioritization at USDA.

Mr. FEENSTRA. I am glad to hear that. I mean, it is so important that we keep Mexico as a trading partner. And frankly, I look at it and say the USMCA hasn't been agreed to, and there are parameters in there on how we move forward with this. So, that is great to hear.

One more thing, and I know you have talked about this again already; but, we have a lot of vulnerabilities in our country when it comes to drought, when it comes to flooding, obviously with the war going on now we have these issues with fertilizer and drought-resistant seeds. So, I am just wondering, is there anything that you can add to our farmers? I mean, we are ready to plant. My family, in-laws, are ready to plant. Is there anything that we can do in this upcoming season yet that is right around the corner to help out our farmers to get the seeds or to get fertilizer to where it needs to be and we can get it taken care of?

Mr. WHITLEY. Yes, Congressman. Recently USDA announced support for American farmers and offered up a program to encourage innovation, independent assessments, and to be resilient in terms of what we can do to produce fertilizer here at home. So, hopefully that program spurs and generates some creative thought on behalf of American agriculture, and we can bring down those costs with resources right here at home.

Mr. FEENSTRA. Thank you, and just one little note on that. Hog producers use natural fertilizer, so that is a way to do it.

I yield back. Thank you.

The CHAIRMAN. Well, the gentleman yields his time, although it has expired. But there is all sorts of good fertilizer out there that we can use.

I want to thank our two witnesses for your testimony here this morning. I think it really gave us an opportunity to focus on the challenges we are facing today, and as we all noted, the current crisis that we are dealing with, and really get in front of it. And so, we are going to continue to work with both of you and the Department of Agriculture and the Secretary, because it is so important for all the reasons we are aware of.

We are going to recess briefly for 5 minutes so that we can allow these two panel members to get back and do other important things, and we will have our second panel start shortly thereafter. So, we have a little break here that we are going to recess for, and then we will begin with our second panel just in a few minutes, okay?

So, if you want to take a little break, and the chair will recall the Committee shortly.

[Recess.]

The CHAIRMAN. All right. The Committee will now come back to order, and I want to recognize our second panel. We had a good first part of our hearing, and we want to thank our two witnesses for joining us. Our first witness is Ms. Krysta Harden, who is the President and Chief Executive Officer of the U.S. Dairy Export Council, and our next witness is Mr. Bill O'Keefe, and we are appreciative of his participation as well. I think both of you are old hands here, appearing before Congress, and you understand that you have 5 minutes appropriately, and we appreciate very much your being here.

As I said on the outset this morning, we have a crisis that we are dealing with as a result of world events, and the situation in Ukraine, the horrific invasion of Ukraine by Russia is having a ripple effect across the world. And the markets that are being impacted in terms of food availability is something that this Subcommittee is very concerned on, and we are very interested in how we anticipate this storm that is coming, and address it in every best way that we possibly can.

So, Mr. O'Keefe, your previous background is with mobilization of Catholic Relief Services and in your current role as Executive Vice President, we are looking forward to hearing your testimony as well. So, I want to thank you folks for both being here, and let us begin with Mr. O'Keefe, and we will go from there. Thank you very much. Please proceed.

**STATEMENT OF BILL O'KEEFE, EXECUTIVE VICE PRESIDENT
FOR MISSION AND MOBILIZATION, CATHOLIC RELIEF
SERVICES, BALTIMORE, MD**

Mr. O'KEEFE. Thank you so much, Chairman Costa, Ranking Member Johnson, and Members of the Subcommittee for the opportunity to testify today on the implementation of international food assistance programs authorized under Title III of the farm bill.

CRS was founded in 1943 due to an outpouring of concern from Catholics across the United States to help refugees from World War II. I have served CRS, starting in Africa, for over 40 percent of that time, implementing, supervising, visiting, and supporting USDA and USAID food assistance programs.

The arc of how Congress, USAID, and USDA have gradually shaped these programs bends towards sustainability, resilience, and flexibility. Marginal change, though, will no longer meet the challenges we as a country and the poor of the world face.

After decades of progress, global hunger has steadily risen for 7 consecutive years. The three C's, conflict, climate change, and COVID-19, are exacerbating chronic and severe food insecurity for people living in highly vulnerable and fragile contexts. This hearing has already brought out how Putin's war in Ukraine further threatens catastrophic global food insecurity. CRS Madagascar has already reported a 200 to 300 percent price hike in staple crops like wheat and vegetable oil, which dramatically cuts the number of vulnerable people our Title III supported program can reach.

As others have already mentioned, we are going to need significant supplemental food assistance and other international disaster assistance to prevent famine, death, and suffering in innumerable places. We at CRS are not the hyperbolic types, but we are extremely concerned.

This farm bill, though, provides an opportunity to get in front of the storm that is coming. The non-emergency international food assistance programs are critical mechanisms for helping communities prepare for, adapt to, and even thrive in the world of the three C's. We need to scale and maximize investments in multi-year development efforts aimed at sustainably reducing poverty and putting marginalized communities on a path towards resilience.

People are multi-sectoral beings, and their families and communities have varied and complex multi-sectoral needs. Food for Peace Title II programs uniquely respond to those needs according to local contexts. In Haiti, Ethiopia, Kenya, Madagascar, Uganda, the DRC, and Niger are Title III supported resilience food security activities, support families to recover from crises and transition from subsistence farming into greater market engagement. These critical activities depend on a locally determined and flexible mix of cash and in-kind agricultural commodities, and the ability to design programs based on present on the ground needs.

That is why CRS recommends that the next farm bill authorize full flexibility of funding for Title II non-emergency resources, and the removal of the cap in 202(e) funding that Assistant to the Administrator Charles mentioned earlier. Implementing partners must be able to mix cash and commodities and multi-sector activities in direct response to local context, experience of local partners, and changing realities on the ground. In-kind commodities are critical in food deficit context, such as Madagascar and Ethiopia right now. Market-based analyses frequently point, though, to a balance of food sourced from the United States, food sourced locally, mobile money, vouchers, cash, alongside a mix of supporting activities. Furthermore, COVID-19 disruptions in adaptations along with global food supply shortages and price inflation exacerbated again by the war on Ukraine are limiting the impact and sustainability of programs, given the inflexibility of current Title II resources. Without a legislative fix that makes the non-emergency resources fully flexible, program design may undermine some of the best practices to fight hunger.

Recently in designing RFSA in Haiti, these restrictions required too much commodity in the final year or 2 of the award, which limited our ability to transition to full self-reliance of the communities that we are serving.

I urge Congress to consider building this greater flexibility for non-emergency programs in the upcoming farm bill, and to adopt the other recommendations my written statement elucidates, including improving the Bill Emerson Humanitarian Trust and school feeding through the McGovern-Dole Food for Education Program, and reauthorizing the other notable trade title programs such as agricultural value chain support provided through Food for Progress. Emergency and long-term assistance, and eventually Feed the Future play dynamic roles as layered and sequenced re-

sponses that are a lifeline for hungry people, and build the foundation for more resilient and prosperous communities.

We look forward to continuing our partnership with Congress, this Committee, this Subcommittee, USDA, and USAID to strengthen farm bill Title III international food assistance, and we thank you for the opportunity to share our work, and I welcome any questions that you might have.

Thank you.

[The prepared statement of Mr. O’Keefe follows:]

PREPARED STATEMENT OF BILL O’KEEFE, EXECUTIVE VICE PRESIDENT FOR MISSION AND MOBILIZATION, CATHOLIC RELIEF SERVICES, BALTIMORE, MD

Thank you, Chairman Costa, Ranking Member Johnson, and Members of the Subcommittee, for the opportunity to provide testimony today on the implementation of international food aid programs authorized under Title III of the farm bill. My name is Bill O’Keefe, and I am the Executive Vice President of Mission and Mobilization for Catholic Relief Services (CRS), the humanitarian relief and development agency of the Catholic community and Church in the United States.

CRS was founded in 1943 due to an outpouring of concern from Catholics across the United States to help thousands of survivors and refugees of World War II with emergency food, water, and shelter assistance. It was from this initial response that CRS realized the overwhelming needs that existed not only in mid-war Europe, but across the globe for people impacted by poverty and facing crises, leading CRS to establish its mission of serving the world’s most vulnerable. Today, we partner with over 2,000 local, national, and international Catholic institutions and structures, faith-based and secular organizations, and the U.S. Government to assist people on the basis of need, not creed, race, or nationality. Motivated by the desire to preserve and uphold the sacredness and dignity of all human life, CRS serves more than 150 million people in over 100 countries globally. Through life-saving assistance for those impacted by unanticipated socioeconomic, political, and climate-related shocks and long-term, holistic development projects, CRS is working to sustainably reduce poverty, build resilience, and promote peace and prosperity for all God’s children.

After 2½ decades of historic and landmark progress that reduced the number of hungry and malnourished people in the world by half, global hunger is steadily on the rise for the seventh year in a row. The interconnected and compounding drivers of hunger that are a consequence of what we refer to as the “three Cs”—climate change, conflict, and now COVID–19—are exacerbating chronic and severe food insecurity for people living in highly vulnerable and fragile contexts. This has contributed to a significant backslide in once-achieved, record-breaking progress, pushing our world entirely off-track to achieving zero hunger and malnutrition by 2030.

As a leading U.S. Government implementing partner responding to emergencies around the globe, it is abundantly clear that U.S. international food aid programs have and continue to fulfill a dynamic role as mainstays of the American international response to the global hunger crisis and reflect the generosity of the American people. Through the combined work of farm bill-authorized international food aid programs like Title II Food for Peace, McGovern-Dole Food for Education, Food for Progress, the Farmer-to-Farmer program, the Bill Emerson Humanitarian Trust, and the International Agricultural Education Fellowship that effectively deliver a hand-up to people in need, the U.S. Government in partnership with organizations like CRS continue to inspire hope for those who are often left-behind.

As work begins to reauthorize the 2023 Farm Bill, CRS requests the following reforms to enhance international food aid programs:

- We request full flexibility for non-emergency Title II Food for Peace development programming, eliminating constraints around associated costs, such as 202(e) and the commodity requirement.
- We request that the Community Development Fund is reauthorized at an appropriated funding level to ensure continued and long-term flexible funding to support activities that holistically address hunger needs and build resilience.
- We request additional funding, at the discretion of the U.S. Department of Agriculture, for expanded local and regional procurement activities in the McGovern-Dole Food for Education program to enhance sustainability.
- We request that funding for commodities provided in the Bill Emerson Humanitarian Trust be made accessible to respond to unanticipated food crises; author-

ize a replenishment mechanism to respond to recurrent food security needs arising globally; allow for the prepositioning of emergency food aid so that food can arrive as quickly as possible in the face of an emergency; and permit the trust to cover associated costs, like ocean freight and warehousing, when Commodity Credit Corporation funding is not available.

The Food for Peace Program

For more than 65 years, the Food for Peace program has provided food assistance to over four billion people in need around the world. Today, the program provides funding for both emergency and development food security responses. In an emergency, Food for Peace delivers U.S.-sourced agricultural commodities to people facing crises. This emergency aid allows people to receive enough food to survive and prevents them from either having to migrate in search of better opportunities or sell off critical assets like seeds or livestock.

Food for Peace also authorizes a minimum of \$365 million a year—of which \$15 million supports the Farmer-to-Farmer program—for non-emergency, development programming that works with the most vulnerable communities in the late-recovery stage to build back better and create a pathway towards resiliency so that communities can once again provide for themselves and thrive. These multi-sectoral, multi-year programs address a number of sectors simultaneously—agriculture, nutrition, land regeneration, water management, infrastructure improvements, and market engagement—in order to holistically meet the needs of communities. The root causes of hunger, malnutrition and poverty are many and often interrelated; therefore, multi-sectoral programming effectively breaks down those silos that occur too often in foreign assistance, allowing implementers to tackle challenges from a systems-based approach.

CRS is currently utilizing Food for Peace Title II funding to respond to emergencies in Ethiopia, Sudan, South Sudan, and Madagascar, in addition to non-emergency funding for multi-year Resilience Food Security Activities (RFSA) in Kenya, Uganda, Ethiopia, the Democratic Republic of Congo, Haiti, Niger, and Madagascar.

Food for Peace in Southern Madagascar

The effects of an increasing global temperature, resulting in more frequent and extreme climate-related disasters, environmental degradation, increased resistance of agricultural pests and diseases, and decreased nutritional quality of staple crops, is posing a severe threat to the global food and agriculture system. Unfortunately, those who have contributed the least to the climate crisis will suffer the greatest consequences due to the impact on their livelihoods from lessening crop yields at best, or total crop failure at the very worst. CRS is already witnessing the devastating impacts of climate change on the lives of the communities we serve.

In Southern Madagascar, Catholic Relief Services, using emergency Title II Food for Peace resources, is responding to one of the worst multi-year droughts in the country's history. Poor rainfall, in addition to the economic impacts of the COVID-19 pandemic, sandstorms, and pest infestations, have driven nearly two million people into crisis-level hunger, with approximately 30,000 experiencing famine-like conditions. Through funding provided by the U.S. Agency for International Development (USAID) that totals \$40 million over 2 years, CRS is distributing emergency food aid to over 220,000 people and providing nutrition counseling and monitoring to over 25,000 children who are vulnerable to wasting, the most acute form of malnutrition. Additionally, CRS is repairing water points to provide much-needed water in this extremely arid environment, while simultaneously training program participants on how to maintain and manage their water supply. As a part of this emergency response, CRS is also building the foundation for resilience by integrating long-term solutions to drought and poverty. We are working with communities to strengthen local governance structures and are encouraging climate-smart agricultural practices. Additionally, the program supports youth and gender-sensitive approaches to agricultural development and community decision-making, while fostering financial literacy to help participants learn how to save and manage their money. For Madagascar's poorest people, Food for Peace is a lifeline that is staving off hunger and alleviating human suffering.

Nearby to this response, CRS is implementing a 5 year Resilience Food Security and Nutrition Program that works with the most vulnerable people, households, and communities to prevent and reduce acute food insecurity in Madagascar's Deep South. The project pursues a multi-sectoral approach to support families by improving their health; livelihoods through agriculture, fisheries, and livestock; and social services and safety nets. Through this response, CRS—with the support of the U.S. Government—is addressing the root causes of hunger and poverty by building the

foundations for sustainable agriculture-led growth that will prevent previously vulnerable populations from falling back into poverty.

Title II Food for Peace Recommendations

We thank Congress for continuing to support the Food for Peace Title II program and honor the good work it does in places like Madagascar. Additionally, CRS supports the reauthorization of Title II Food for Peace in the 2023 Farm Bill, acknowledging its role in providing both emergency food assistance and implementing risk-reducing and resilience-building activities that reduce poverty among the most vulnerable, thereby decreasing the need for future humanitarian assistance. However, as unprecedented crises continue to arise globally, and with funding and resources failing to keep up with the pace of the global need, we recommend improvements to the program to ensure that CRS and other implementers are utilizing the best and most appropriate tools in our toolbox, reaching as many families in need as possible.

A core focus of CRS' implementation of Food for Peace development programs is on improving the livelihoods of small-holder farm families as a means to achieving food security and optimal nutrition. This requires transitioning families from subsistence farming into greater engagement with markets with the goal of sustainability. We do this by: (1) building sustainable sources of income through savings groups, diversified livelihoods, new small-scale business opportunities, and links to sources of loans and other financial instruments; (2) improving capacity within local governments and civil society actors to carry forward new skills and practices introduced in programs, but also to continually learn and adapt practices to new challenges long after a program ends; and (3) by building lasting linkages between beneficiaries, service providers, and other market actors so that once the program is over, the network remains in place.

These activities require the use of cash-based resources, rather than in-kind commodities, and the ability to design programs based on present, on-the-ground needs, as opposed to legislative policy directives.

That is why CRS is requesting full flexibility of funding for Title II non-emergency resources, so that implementing partners have the agency to utilize the best and most appropriate modality choice to make responses and interventions context-specific and poverty-reducing. The statutory 20% cap on 202(e) funding, which provides fully flexible cash to support multi-sectoral development interventions (like the above) that are essential to graduating communities out of poverty, is not sufficient to meet the needs and objectives of Title II development programming. This is even more true today, as programming costs are increasing due to COVID-19 and global food supply shortages and price inflation as a result of the war in Ukraine. While we recognize the need for some in-kind aid in contexts like Madagascar or Ethiopia, we need the flexibility to pursue context-specific approaches using market-based analyses that address the needs of the people we are serving on the ground, which requires a more proportionate balance of food and cash.

CRS also supports the reauthorization of the Community Development Fund (CDF), Development Assistance funding provided through State, Foreign Operations appropriations, that is transferred to the Bureau for Humanitarian Assistance to directly fund or supplement Food for Peace development programming. The funding provided in CDF allows for fully flexible direct assistance, much like 202(e), to support sustainability activities that improve livelihoods, the nutritional status of communities, and enhance long-term economic productivity. **We request that Congress maintain the mechanism for CDF in the next farm bill, reauthorizing it at an appropriated funding level to ensure continued and long-term flexible funding to support activities that holistically address hunger needs and build resilience.**

Last, we emphasize the need for continued integration of climate adaptation interventions into Title II non-emergency, development responses to ensure that communities hardest hit by the impacts of a changing climate are not further pushed into poverty and food insecurity. Universally mainstreaming climate-smart and agroecological approaches into long-term food security activities enables rural farmers to strengthen their climate resilience, sustainably improve their incomes and livelihoods, incorporate locally led approaches for community capacity building, and strengthen the global food system. These activities include restoring degraded landscapes, developing better water management systems, planting drought-resistant crops, repairing soil health, and preserving biodiversity.

COVID-19's Impacts on Food Security

In the early days of the COVID-19 pandemic, when widespread movement restrictions were in place and schools across the world were closed, children who participate in the McGovern-Dole Food for Education program were impacted by unanticipated disruptions to their daily meals and education. For many of the children, who overwhelmingly come from chronically food-insecure households, a school meal is the only reliable source of food they are guaranteed to receive on a daily basis. Furthermore, the pandemic's stress on the global food and agriculture system resulted in inflated prices and widespread food shortages, making nutritious food less affordable and accessible to marginalized households and communities.

Thanks to the flexibility of USDA to help the McGovern-Dole program quickly pivot projects across the world—such as CRS's Learning for Life project in Guatemala—were able to adapt and pivot to the challenges posed by the pandemic by administering take-home rations at socially distanced food aid distribution sites. This allowed caregivers to collect food to feed themselves and their children, in addition to receiving learning materials so young children can continue their education at home.

McGovern-Dole Food for Education Recommendations

CRS recognizes the tremendous work of the McGovern-Dole program in serving millions of primary school children, infants, and new mothers across 40 countries in the 2 decades since its inception in 2002. Additionally, we express our utmost gratitude to Congress for continuing to fund and support the program's existence. Currently, CRS leads implementation in nine McGovern-Dole funded projects in: Guatemala, Honduras, Burkina Faso, Sierra Leone, Mali, Guinea-Bissau, Benin, Togo, and Laos. Each of these programs focus on improving childhood nutrition, promoting literacy, and supporting optimal maternal health outcomes for pregnant and lactating women. CRS also believes that continued support and robust investments in the McGovern-Dole Food for Education program aligns well with the U.S. Government's commitment to improving the nutrition, health, and education of vulnerable children worldwide as a member of Global School Meals Coalition. The coalition aims to make nutritious meals available for all children around the world by 2030. We stand with USDA in their commitment to graduation and a transition to public ownership, supporting efforts to build the capacity of host country governments to sustainably maintain their own independent school meal programs.

In the 2018 Farm Bill, a change to the McGovern-Dole program was incorporated that required USDA to allocate 10% of total McGovern-Dole funding to support local and regional procurement (LRP) activities. Previously, the agency had the discretion to choose which McGovern-Dole projects would receive funding for LRP. The United States Department of Agriculture (USDA) interpreted this change by universally applying LRP to all McGovern-Dole programs across the board. CRS welcomes the universal application of LRP activities into all active McGovern-Dole programs, enabling McGovern-Dole implementers the ability to supplement U.S. in-kind aid with culturally appropriate and locally sourced commodities, with the additional benefit of stimulating the local market by supporting livelihoods within the community.

In the upcoming farm bill, CRS requests that Congress allow for increased LRP activities to be determined on a yearly basis at the discretion of USDA, within a Congressionally directed authorizing window, to promote long-term sustainability and transition schools to a self-sustaining home-grown school feeding system. Furthermore, we request that the current *status quo* of 10% serves as a floor for McGovern-Dole LRP funding going forward, and that increases to LRP do not come at the expense of McGovern-Dole programs that improve food security; reduce the incidence of hunger; improve literacy and primary education—particularly with respect to girls; and maternal, infant, and child nutrition programs for pregnant women, nursing mothers, infants, and children who are 5 years of age and younger.

In places like Sierra Leone, where CRS is implementing McGovern-Dole projects in two districts, the host government has shown increasing interest in a home-grown school feeding model for schools across the country, acknowledging its role in serving as a vital safety net system for hungry children who rely on daily school meals. An increase in LRP commodities will allow McGovern-Dole programs the opportunity to work with local farmers to become a reliable market for schools in the community. Purchasing staple foods locally helps create a bridge that supports rural economies and livelihoods, diversifies school meals with locally appropriate foods to increase nutritional outcomes in young children, and strengthens local infrastructure and capacity.

Additionally, investments in LRP support USAID's Locally Led Development Initiative by engaging local actors in a holistic and meaningful way as co-equal partners working to strengthen local capacity, enable local actors to facilitate decision-making and develop their own solutions, and mobilize local resources to catalyze sustainable and transformative development outcomes.

CRS in South Sudan

Conflict is the primary driver of hunger globally with more than half of the world's hungry people living in areas of extreme violent conflict. Protracted crises, like conflict, combined with poor governance and corruption pose the most significant and grave threat to global food security, beyond—though exacerbated—by other drivers like climate change and COVID-19. South Sudan provides one of the clearest examples of the inexplicable linkage between hunger and conflict and the vicious cycle it creates. Since South Sudan's founding in 2011, the nation has been mired by extreme violent conflict, resulting in high levels of displacement, both internally and externally. Furthermore, the ongoing conflict has severely impacted food production in the country, with a record 5.8 million people currently facing a severe hunger crisis. Some areas are dealing with fighting. Others struggle with the influx of 1.6 million displaced people. This is in addition to a persistent El Niño-driven climate pattern which has caused the most severe drought in decades, with nearly half of the country's population unsure of where their next meal will come from.

Since January 2015, CRS continues to implement emergency relief and long-term development programs within South Sudan to provide agriculture, nutrition, and water and sanitation assistance, as well as promote peace-building and social cohesion to thousands of program participants. In 7 years, CRS has distributed food and nutritional supplements to over ½ million people; provided bags of grain and training on post-harvest storage to roughly 4,000 farmers; repaired 80 water sources; and trained communities on how to keep their water supply safe and flowing. We do this work in partnership with USAID through two programs: The Livelihoods Recovery and Resilience Program and the Resilience Food Security Program both funded by the USAID's Bureau for Humanitarian Assistance. Together, CRS is having an impact in over 1.3 million lives through integrated and multi-sectoral programming. A major component of the Livelihoods Recovery and Resilience Program is distributing in-kind food aid from the U.S. to families in need in exchange for work on community projects that rebuild roads and irrigation systems.

The Bill Emerson Humanitarian Trust

While Title II Food for Peace provides significant emergency resources to many countries around the world, hunger needs have ballooned significantly in recent years. The Bill Emerson Humanitarian Trust (BEHT) was created with the intent that U.S. Government emergency resources could be scarce in any given year, therefore resources provided in the trust can supplement emergency food needs when Food for Peace resources have been fully utilized.

The trust was originally established in 1980 to hold up to 4 million metric tons of wheat. It was later expanded to include a number of other commodities and was renamed the Bill Emerson Humanitarian Trust in 1988. Today, the BEHT has morphed into an all-cash reserve for the purchase of U.S. commodities for when unforeseen food needs arise. USDA and USAID jointly administer the BEHT, and the Commodity Credit Corporation (CCC) holds all BEHT funds. Equivalent to a rainy-day fund, the BEHT allows USDA and USAID the option to provide additional food assistance quickly, without having to rely on supplemental appropriations from Congress.

Unfortunately, despite increasing hunger needs and funding shortfalls, the resources in the trust have been mostly untapped, even though there is significant mobilization capacity and thousands, if not millions, of additional people who could benefit from this lifesaving assistance. Most recently, the trust was last accessed in 2014 to supplement a Food for Peace emergency response in South Sudan. The response required a \$50 million drawdown from the trust and \$130 million in associated costs from the CCC. At the time, very remote regions of South Sudan, where millions of people were on the brink of starvation, were impossible to reach by land and required more costly airdrops of food to urgently arrive to these areas. The funding in the BEHT made this effort possible; otherwise, hundreds of thousands of South Sudanese would have potentially faced death due to catastrophic levels of hunger as a result of ongoing war.

The Bill Emerson Humanitarian Trust Recommendations

Due to persistent global food insecurity, and looming famines around the world, **CRS requests that Congress make reforms to the BEHT that: (1) eliminate the barriers for accessing funding, (2) provide a replenishment mechanism**

to ensure long-term use of the trust in the face of growing global food insecurity, (3) allow for prepositioning of food in advance of anticipated crises, and (4) cover all associated costs, such as ocean freight and warehousing, when CCC funding is no longer available. According to the President’s Fiscal Year 2023 budget request, the trust currently holds approximately \$282 million in funding.

Additional Farm Bill Recommendations

CRS thanks Congress for continuing to support Farmer-to-Farmer (F2F), Food for Progress (FFPr), and the International Agricultural Education Fellowship. Each of these programs, in combination with Title II Food for Peace, McGovern-Dole Food for Education, and the Bill Emerson Humanitarian Trust, provide a holistic package of interventions that are layered and sequenced as communities transition from crises and recovery to long-term development interventions that connect small-holder farmers to markets, build connections with private-sector enterprises, and foster a legacy of food security in communities that were once dependent on U.S. Government assistance. In the upcoming farm bill, CRS supports:

- The reauthorization of the FFPr program, acknowledging its achievements in places like Uganda, where CRS has helped local vanilla farmers improve their livelihoods. Additionally, we support the reauthorization of pilot programs funded by FFPr for direct technical assistance of \$10 million annually to support agriculture extension projects, rather than through monetization, as authorized in the 2018 Farm Bill for Fiscal Years 2019–2023.
- The reauthorization of the International Agricultural Education Fellowship, established in the 2018 Farm Bill, to allow U.S. citizens—in partnership with implementing organizations like CRS—the opportunity to establish school-based agricultural education and youth extension programs in communities ripe for capacity building and scaling.
- The reauthorization of the F2F program, which partners American farmer volunteers with local small-holder farmers, producer groups, and rural businesses to develop their local capacity with the goal of increasing food production and rural incomes, expanding economic growth, and addressing environmental and natural resource management challenges. We hope F2F’s reauthorization will build off lessons learned from COVID–19 by continuing to pair U.S. volunteers with local experts to encourage sustainable knowledge and skills transfer.

The War in Ukraine’s Impacts on Food Security

The ongoing conflict in Ukraine is having an undeniable impact on the state of global food security within Ukraine and around the world. As a top exporter of wheat and sunflower oil, accounting for 40% and 60% of the global supply, respectively—many countries throughout North and East Africa and the Middle East are already feeling the effects of food price spikes and global supply shortages. Furthermore, agricultural inputs like fertilizer—which are vital for strong crop yields—have also taken a massive hit to its global supply due to sanctions imposed on Russia, who is the lead global supplier of potash, ammonia, and other soil nutrients. Countries on the brink of famine, like South Sudan, Yemen and in the Horn of Africa, are particularly vulnerable to the worsening impacts of the ongoing war in Ukraine, with an unfortunate likelihood of new hotspots arising in places like Lebanon, Egypt, and Jordan. In fact, global projections predict a food price crisis worse than 2008 and 2009, when widespread food scarcity led to civil unrest throughout the Middle East.

While there is great uncertainty as to how significantly food prices and availability will be impacted over the next 4 to 6 months, it is clear that the worst is yet to come. Staple crops like wheat, maize (predominantly for livestock), and sunflower oil, in addition to fertilizers and crude oil—a necessary input for food use, production, and distribution—have already seen price increases as high as 200–300% from pre-conflict levels. In anticipation of what is yet to come, the U.S., in partnership with implementing organizations like CRS, need to be prepared to mobilize rapidly in advance of a potentially deteriorating global food security situation. **As with any evolving humanitarian crisis, funding needs to be applied in a flexible and adaptive manner to avoid programming delays and ensure that the most appropriate modality is utilized to efficiently meet the needs of impacted populations and local market conditions. Additionally, interventions—even in a response setting—need to prioritize long-term resilience building, disaster preparedness, and strengthening of local structures to have the greatest possible impact.**

Conclusion

As Pope Francis urgently reminds us, “There needs to be a constant acknowledgement that the right of every person to be free of poverty and hunger depends on the duty of the entire human family to provide practical assistance to those in need.” This is why CRS thanks Congress for continuing its moral leadership in support of international food assistance programs like Food for Peace, McGovern-Dole Food for Education, Farmer-to-Farmer, the Bill Emerson Humanitarian Trust, the International Agriculture Education Fellowship, and Food for Progress.

In light of climate change, conflict, and COVID-19 aggravating severe hunger needs globally—and most recently, the conflict in Ukraine causing extreme price volatility and food supply shortages—we urge Congress to implement vital reforms to improve international food aid programs, such as:

- Allowing for full flexibility in non-emergency Title II Food for Peace development programming, eliminating constraints around associated costs, such as 202(e) and the commodity requirement.
- Authorizing the Community Development Fund at an appropriated funding level to ensure continued and long-term flexible funding to support activities that holistically address hunger needs and build resilience.
- Expanding local and regional procurement activities in the McGovern-Dole Food for Education program to enhance sustainability.
- Allowing resources in the Bill Emerson Humanitarian Trust to be made more accessible to respond to unanticipated food crises; authorizing a replenishment mechanism to respond to recurrent food security needs arising globally; allowing for the repositioning of emergency resources so that food can arrive as quickly as possible in the face of an emergency; and permitting the trust to cover associated costs, like ocean freight and warehousing, when Commodity Credit Corporation funding is not available.

These changes will allow us to nuance our responses to the numerous emergencies around the world, thus enhancing program impact and ensuring that CRS and our partners are reaching those in need with the most appropriate and context-specific responses to reduce vulnerability and address the root causes of hunger and malnutrition. Furthermore, CRS will supplement our farm bill outreach and requests by working with appropriators on the Agriculture Appropriations Subcommittee to increase U.S. investments to key accounts in the upcoming fiscal year and beyond. While policy-related improvements to Title III food aid programs through the farm bill reauthorization process are critical for catalytic community-level change, commensurate increases to baseline funding through Congressional appropriations is equally crucial for programs to keep up with rapidly increasing global needs.

As a leading implementer of U.S. international food aid programs, we can attest to the very real and lifesaving impact that these programs are having on countless lives around the world. Our proposed reforms reflect our experiences working with marginalized communities on the ground and a sincere understanding of how to make these great programs even better. We are grateful for your consideration of our recommendations and look forward to continuing our partnership with Congress, especially with Members of this Subcommittee, and the Administration to strengthen farm bill Title III international food aid programs, protecting their core focus of alleviating hunger and human suffering to save lives.

Thank you for this opportunity.

The CHAIRMAN. Well, thank you, Mr. O’Keefe, and your testimony is timely. Your suggestions on modifications with regards to Title III and implementation of various programs, given the current circumstances and the crisis that we are in, I fear only to grow worse, are very important and I am sure other Members will revisit this in the time of questioning.

In this time of—and you noted this pandemic, we have tried to learn to continue to work as efficiently as we can through Zoom and hybrid hearings, but we don’t always get it right. I certainly don’t always get it right, and I was focused on those that were physically here on the panel, but we have two other members that are on the panel that I failed to properly introduce, and I want to do that now.

Our next witness on this second panel today is Ms. Krysta Harden, who is the President and Chief Executive Officer of the U.S. Dairy Export Council, and then, of course, I noted earlier that we have Ms. Nicole Berg who will be testifying on behalf of the National Association of Wheat Growers, and then our fourth witness of this panel, Dr. Arif Husain, who is the Chief Economist of the World Food Programme. Dr. Husain is also joining us today from a long ways away. He is at the Democratic Republic of Congo, and we thank him for making the extraordinary effort to be testifying today before the second panel.

So, let us begin with Ms. Krysta Harden, who is the President and Chief Executive Officer of the U.S. Dairy Export Panel—Council, excuse me. Ms. Krysta Harden.

STATEMENT OF KRISTA HARDEN, PRESIDENT AND CHIEF EXECUTIVE OFFICER, U.S. DAIRY EXPORT COUNCIL, ARLINGTON, VA

Ms. HARDEN. Thank you, Mr. Chairman, Ranking Member Johnson, and other Members of the Committee for inviting me today.

I am not in the Congo, but I have to tell you on my family farm in southwest Georgia, Congressman Bishop's district, there are a lot of people in the world I would disappoint and leave early and come to be in person in this hearing, but my parents are just not one of them. So, I had to be with them this week and I really regret not being with all of you in person.

The CHAIRMAN. We will give you a raincheck.

Ms. HARDEN. My name is Krysta Harden. I am testifying on behalf of the U.S. Dairy Export Council. I serve as President and CEO.

USDEC represents the global trade interest of U.S. dairy farmers, processors, cooperatives, dairy ingredient suppliers, and export trading companies, and USDEC works closely with our partner, the National Milk Producers Federation, on trade-related issues.

Since USDEC was founded 27 years ago, dairy exports have grown ten-fold, reaching a record \$7.75 billion last year. All told, dairy exports accounted for about 17 percent of milk production. Our impressive export results, made possible in part by U.S. programs and policies that support exports, many overseen by this Committee. Today, I will discuss how existing farm bill programs, potential new farm bill provisions, and other trade policies can help drive the global demand and growth our dairy farmers and manufacturers need in order to create jobs in both rural and urban America.

The farm bill promotes American produced products through the Market Access Program and the Foreign Market Development Program, both of them instrumental to USDEC's efforts to support dairy exporters and build a market share against entrenched competitors. My written testimony includes a few specific examples and the many ways in which USDEC has used these programs in markets around the world.

An important part of MAP is its cross sector global-based initiative program—now, that is a mouthful, including one that USDEC leads that is noted to preserving export access for U.S. foods and beverages using common names. This GBI has been extremely im-

portant to American agriculture's work to combat EU's abuse of geographic indicators by imposing new trade barriers in various international markets. MAP and FMD offer excellent returns. For every dollar invested in the export market development programs, over \$20 is returned in export revenue. Yet, while our exports have expanded in whole, MAP and FMD resources have remained stagnant over the years. Given their critical missions and their impressive results, USDEC urges Congress to double MAP and FMD funding in the next farm bill.

Another major component of the farm bill are U.S. food aid programs—we have talked a lot about those today—which play an important role in helping support the world's nutrition needs. However, U.S. dairy products are not typically a sizable piece of our food aid purchasing. This is despite of the robust scientific evidence on dairy's unique nutritional benefits.

To make better use of these programs, Congress should seek opportunities in the farm bill to increase the use of U.S. dairy ingredients in food aid, including by scaling up purchases of ready-to-use therapeutic foods.

We also ask this Committee to consider a new provision. First, we recommend language to combat the EU's abuse of geographic indications. Legislation that can ensure USTR and USDA more proactively can defend common use names using a variety of tools. We also recommend establishing specific timeframes for the Administration to put forward critical nominees, specifically the USTR Agricultural Ambassador, and the USDA Under Secretary for Trade and Foreign Ag Affairs.

While the farm bill's related provisions are vital to American exports, Congress should also consider and work to promote additional policies that are key in advancing market access for farmers and food manufacturers. I just speak on two. I know I am running out of time, but our largest competitors have been exceptionally active in free trade agreements. The U.S. needs to get back in the game as well and craft an approach to pursuing comprehensive trade agreements that allow this country to advance its values and priorities on global trade. In the meantime, we need to fulfill the use of available tools, like the Indo-Pacific Economic Framework and the Trade Investment Framework Agreements. We also need to ensure our trading partners faithfully uphold current trade deals, and we talked about that today. We greatly appreciate the Administration securing a successful verdict in the USMCA's first ever dispute panel, yet more work remains and we discussed that today. We just need robust enforcement in this and in other markets, such as Mexico, as it has to be a key part of ensuring our exporters can meet the full rewards of U.S. trade agreements.

In closing, I would like to emphasize again how important Title III of the farm bill is to the American dairy industry and its workers. USDEC looks forward to working with our industry colleagues to provide further input on these programs, as work on the next farm bill advances.

Thank you for this opportunity. I look forward to questions.
[The prepared statement of Ms. Harden follows:]

PREPARED STATEMENT OF KRISTA HARDEN, PRESIDENT AND CHIEF EXECUTIVE OFFICER, U.S. DAIRY EXPORT COUNCIL, ARLINGTON, VA

Good morning, Chairman Costa, Ranking Member Johnson, and distinguished Members of the Subcommittee. Thank you for inviting me to testify as part of your 2022 Review of the Farm Bill's International Trade and Food Assistance Programs.

My name is Krysta Harden. I am testifying today on behalf of the U.S. Dairy Export Council (USDEC) where I serve as the President and Chief Executive Officer.

USDEC is a nonprofit, independent membership organization representing the global trade interests of U.S. dairy farmers, dairy processors and cooperatives, dairy ingredient suppliers and export trading companies. Our mission is to enhance U.S. global competitiveness and assist the U.S. industry to increase its global dairy ingredient sales and exports of U.S. dairy products. USDEC and its 100+ member companies are supported by staff in the United States and overseas in Mexico, South America, Asia, the Middle East and Europe. Dairy Management Inc. founded USDEC in 1995 and, through the dairy check-off program, is the organization's largest funder, however none of those funds are utilized in advocacy efforts. USDEC works with the National Milk Producers Federation to promote and advance the trade interests of the dairy community. USDEC's advocacy with Congress and the Administration related to trade policy issues is solely funded by membership dues.

USDEC is the dairy industry's cooperator, executing programs to increase U.S. dairy exports with the support of the MAP and FMD programs since its founding 27 years ago. As part of that work, USDEC has also been an active participant in multiple Global Based Initiatives. Over that time period, dairy exports have grown from \$764 million in 1995 to a record \$7.75 billion last year. Farm bill Title III programs' support has been instrumental to that growth and will continue to be critical in sustaining and growing U.S. dairy exports in the years to come.

The robust environmental stewardship of U.S. dairy farmers bolsters our capacity to meet global demand and provides an additional opportunity to be competitive. No other country is as greenhouse gas efficient in milk production as the United States, where producers reduced the greenhouse gas emissions of producing a gallon of milk by almost 20 percent from 2007 to 2017. We make highly sustainable products and continue to improve on that through our 2050 goals to become greenhouse gas-neutral or better, improve water quality, and optimize water usage.

Our history of stewardship and strong commitment to building upon our progress further in the coming years makes the U.S. dairy industry extremely well poised to responsibly meet the growing global demand for sustainably produced, high-quality dairy nutrition. We're eager to rise to that challenge and appreciate this opportunity to outline how Congress and the U.S. Government can best support dairy farmers and manufacturers in this critical endeavor.

Strong Title III funding of export promotion programs in the farm bill lays the bedrock necessary for our success; coupling that with additional trade policy measures enabling the U.S. to better compete against the world's largest global suppliers of dairy will help our dairy farmers and manufacturers thrive and support the millions of American jobs that are reliant on a healthy U.S. dairy industry.

Economics of Dairy Sector and Trade

U.S. dairy is an essential component of American communities across the country, employing more than one million workers and adding \$750 billion to the U.S. economy.¹ For the U.S. dairy industry to be successful and continue to support farmers, workers, and consumers, international trade and exports are of utmost importance. Exports underpin U.S. dairy's success in the present and will support the industry's growth in the future.

To best understand the impact of exports, it's important to understand how milk is produced and priced. Milk contains three essential components: milkfat, protein and lactose. The domestic *versus* international uses of these different components vary. In essence, U.S. cows naturally produce more of these essential dairy components than the United States consumes, making export markets critical to fully and efficiently using all the valuable components in the milk produced by dairy farmers.²

Over the past 20 years, satisfying international consumers' growing demand for dairy, particularly dairy protein, has allowed the industry to grow. Today, exports account for 17% of U.S. milk production. That figure is expected to continue to climb in the years ahead as global dairy demand continues to grow.

¹ <https://www.idfa.org/dairydelivers>.

² According to USDA, on average, out every 100 pounds of milk, 4 pounds were milkfat and 9 pounds were protein, lactose and other skim solids. The rest is water.

Percent of U.S. Milk Production Exported

(Rolling 12 Months)

Since 2001 U.S. milk production has increased by 37% while exports have more than quintupled. Impressive as that export growth has been, the *value* of exports has increased even faster than the *volume* of exports over that time, jumping by 537%. This highlights the fact that international markets can be a high value proposition for U.S. dairy. And those sales are critical to our customers abroad as well—the U.S. is the third largest exporter in the world. The well-being of the U.S. dairy industry is inextricably tied to international trade and the global dairy demand is strongly reliant on the U.S. remaining a consistent and reliable supplier.

Total Exports to World

(Rolling 12 Months, Value)

Million USD

As important as exports are today to America's dairy industry, they're essential to our future. International dairy trade is growing faster than the U.S. domestic market. As shown in the chart below, since 2010, the amount of dairy traded internationally has grown by more than twice the rate (+4% per year on average) of U.S. domestic dairy consumption (+1.5%).

Incremental Growth of Global Dairy Trade & Domestic Consumption since 2010

(Rolling 12 Months, Milk Solids Equivalent)

'000 MT MSE

The U.S. dairy industry's strongest future growth opportunities will come from international trade with 96% of the world's population living outside of the United States and rising populations and incomes in dairy importing markets. In some ways that future is already here. Perhaps the most telling statistic of all is that **U.S. dairy exports have grown by more than domestic sales in 4 out of the past 5 years**, including 2021, which set records for volume, value and percent of production exported. And this is despite what U.S. exporters face in key markets with recent export supply chain headwinds and competition disadvantages.

Ultimately, if the United States wants to continue to help fulfill the growing demand for high-quality nutrition around the world—and reap the benefits that those sales create for U.S. dairy farmers and workers through the production of Made-in-America products, we will need to continue to expand export sales. That takes broad-based support—including from the farm bill as well as the complementary matching funds the U.S. dairy industry provides—and additional policy tools to set our farmers and dairy manufacturers up for continued global success.

The growing global market is a highly competitive environment with experienced competitors entrenched in key markets. The European Union and New Zealand, the world's two largest dairy exporters, have been active in international markets far longer than the U.S., which has provided them with powerful historical advantages. They've built upon those advantages through a much more robust trade policy strategy—between the EU and New Zealand, one or both have free trade agreements (FTA) in 15 out of the 17 largest dairy markets by value.³ The U.S., by contrast, only has FTAs with five.⁴

With the combined investment of U.S. dairy farmers, processors, policymakers and associations, the U.S. is asserting itself as the primary dairy supplier to the growing global market. In 2021, the United States grew dairy exports by more than any other country in the world. However, sustaining that success is not guaranteed.

Maintaining trade relationships is vital to the strength of the domestic dairy industry and the economic health of rural America. Congress and the U.S. Government must work together to preserve equitable trade relationships with key dairy trading partners and prioritize creating greater market access for the high quality, sustainably produced milk and dairy ingredients manufactured by the U.S. dairy industry.

Expanding trade opportunities for dairy and reducing tariffs and non-tariff barriers to trade is crucial. The case for free trade agreements is more important than ever. With the international market growing at a faster rate than the domestic market, well negotiated FTAs support jobs in the United States. Over the past 10 years, global dairy trade grew on average by 3.8% per year on a milk solids equivalent basis. Customers around the world continue to demand more high-quality, nutri-

³ Excluding the U.S. and European Union, the seventeen largest dairy import markets by value are China, United Kingdom, Russia, Saudi Arabia, Mexico, Japan, Indonesia, South Korea, Malaysia, Philippines, Australia, Singapore, Canada, Thailand, Taiwan, Switzerland, and Egypt. Only Russia and Saudi Arabia don't have FTAs with either the EU or New Zealand.

⁴ The U.S. has FTAs with Australia, Canada, Mexico, Singapore, and South Korea. Although the U.S.-Japan Phase One Agreement expanded U.S. access to that market, work to complete it and create a permanent, comprehensive FTA has not been concluded.

tious, and sustainable dairy products every year, a need that U.S. dairy farmers and their cooperatives are well positioned to meet. Greater access to key dairy markets where the U.S. exports currently face competitive disadvantages will mean continued opportunity and growth for U.S. dairy farmers.

Title III and U.S. Dairy

MAP & FMD Funding

The Market Access Program (MAP) and the Foreign Market Development (FMD) program promote American-grown and produced food and ag products that are in competition with heavily subsidized foreign products. According to preliminary data from a forthcoming econometric study, the benefit-cost ratio of these programs is exceptional. For every \$1 invested in export market development programs, well over \$20 is returned in export revenue. Additionally, these programs increased net farm cash income by an average of nearly \$3 billion per year over the last 2 decades. These programs have significant direct impacts for farmers and ranchers, while also generating indirect effects in jobs and wages created at the state and local level.

Over the past 5 years, USDEC has received an average of \$5.3 million annually in MAP funding⁵ and an average of \$697,000 annually in FMD funding.⁶

- USDEC MAP funds are largely used for investments in our international office network of “boots on the ground” in key markets around the world; global cheese communication and education work conducted through USDEC’s USA Cheese Guild; retail cheese promotions; strategic market research, participation in the Middle East’s flagship trade show, Gulfood; and market servicing work on one of our largest export destinations: Southeast Asia.
- USDEC FMD funds are largely used for investments in strategic research; communications, seminars, shows and workshops focused on driving international use of U.S. dairy ingredients.

The following are just a few examples of the ways in which USDEC has used these programs:

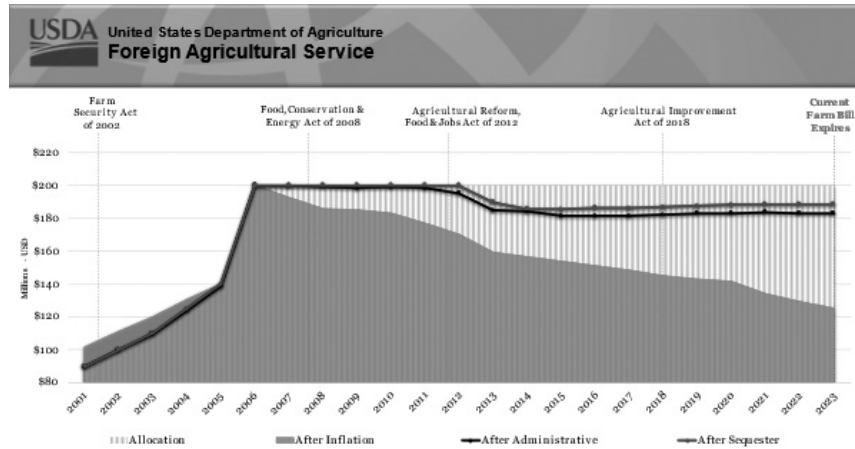

- USDEC trade servicing and promotions have effectively introduced new cheese varieties and supported new menu items containing U.S. cheese in Japan. As a result, Japan has been a consistently growing market for U.S. cheese, with U.S. exports more than doubling in the past 10 years, reaching nearly \$163,000,000 in value in CY 2020, compared to \$73,000,000 in CY 2010; Jan.–Jun. 2021 exports are at about \$97,000,000, 11 percent ahead of last year.
- Southeast Asia has become one of the most significant regions for U.S. milk powder exports as well as other dairy ingredients. A key impetus for our milk powder export gains was the USDA MAP-funded Milk Powder Summit held by USDEC in Singapore a few years ago. In addition, in 2021, USDEC launched the virtual Dairy Protein Snack Studio to give Southeast Asian food manufacturers ideas for incorporating U.S. dairy protein into new snack products targeted to regional tastes. This MAP-funded online tool has an interactive interface to spark R&D imaginations, with the ability to experiment virtually with different product shapes, U.S. dairy protein type, flavor, complimentary ingredients and coatings.

MAP is currently funded at \$200,000,000 annually, while FMD is at \$34,500,000. Based on various factors, including inflation, sequestration, and administrative expenses taken out of the program, the value of the MAP program has been reduced to approximately \$129,000,000 as illustrated in the chart below, decreasing the program by \$70,000,000. This trend will continue to decrease the program’s value every year. Similarly, over \$3,000,000 is stripped from FMD.

⁵ 2022—\$5.790M; 2021—\$5.318M; 2020—\$5.221M; 2019—\$5.292M; 2018—\$4.998M.

⁶ 2022—\$694K; 2021—\$789K; 2020—\$632K; 2019—\$712K; 2018—\$657K.

Impacts on MAP Funding 2001–2023

Recent reports from the U.S. Grains Council and the U.S. Agriculture Export Development Council show that doubling MAP and FMD would add \$44,100,000,000, or 3.6 percent, to agricultural export revenues. These programs undeniably add tremendous value to not only U.S. dairy exports, but the ability of all U.S. producers to market their goods internationally.

As Congress looks toward the next farm bill, USDEC urges doubling funding for MAP and FMD to better promote America's food and ag products across the globe. Based on our experience with the Agricultural Trade Promotion (ATP) Program, short term funding imposes significant constraints on the effectiveness of U.S. co-operators' ability to build sustainable market development activities. USDEC was awarded approximately \$7,800,000 in ATP funds in 2019—funds which must be spent by the end of 2023.⁷ The ATP program has been helpful, and we value these additional resources, yet their time-limited nature greatly limits our ability to develop the type of programs we would see as most effective long-term.

Common Food Names and the Farm Bill

In addition to our traditional promotion and research-oriented activities under the MAP program, USDEC has also been an active participant in various Global Based Initiatives (GBI), cross sector projects that benefit from a small portion of the total MAP funding. We are particularly active through the Consortium for Common Food Names in leading the charge to defend the use of common food and beverage names against aggressive global efforts by the EU to impose geographical indications (GIs) trade barriers in markets around the world. In principle, GI protections are used to describe specialized products made in a specific region of a country to protect the unique nature of that product. However, the EU has used GIs to restrict the use of generic terms by which millions of consumers recognize some of their favorite foods and beverages. The use of GIs to restrict consumer access to generic named foods must be firmly rejected as the protectionist and anti-trade policy that it is.

To complement the industry-led activities executed through the GBI program, we have urged the U.S. Government to secure firm and explicit trade commitments assuring the future use of specific generic food and beverage names targeted by EU monopolization efforts and rejecting the use of GIs as barriers to trade in products relying on common names. USMCA's common food name side letter provisions established a new precedent affirming market access rights for a non-exhaustive list of commonly used product terms. However, to effectively combat the EU's trade-distorting and WTO-illegal actions, the U.S. Government must proactively and consistently expand beyond this precedent to rectify these trade barriers with other trading partners. Accomplishing this will ensure that market access protections for American-made common food name products are strengthened and these cloaked barriers to trade are rejected.

⁷In 2021 ATP funds were primarily used for the following: market and consumer research; retail cheese promotions in Mexico and South America; dairy ingredient activities in Mexico; dairy ingredient promotions and communications in SE Asia; trademark registrations for USDEC promotion efforts.

This Committee also holds a responsibility to address non-tariff barriers like GIs. Language in the 2023 Farm Bill would help combat the challenge of GIs restricting trade of U.S. exports of common food names products. This would ensure that USTR and USDA negotiate proactively to defend the ability to use common names through bilateral agreements, MOUs and exchanges of letters. We look forward to working with our dairy industry partners to further elaborate on potential recommendations for this Committee as the writing of the next farm bill progresses.

Food Aid

Dairy provides high quality nutrition, which is particularly important for food-insecure populations.⁸ Milk and dairy products are nutrient-dense foods, supplying energy and high-quality protein with a range of essential micronutrients (especially calcium, magnesium, potassium, zinc, and phosphorus) in an easily absorbed form. Milk minerals are crucial for human health and development as well as in dairy processes as cheese-making and for all traits involving salt-protein interactions. Dairy products are rich in nutrients that are essential for good bone health, including calcium, protein, vitamin D, potassium, and phosphorus. Adequate calcium intake influences skeletal calcium retention during growth and thus affects peak bone mass achieved in early adulthood. The high levels of calcium play an important role in the development, strength, and density of bones for children and in the prevention of bone loss and osteoporotic fractures in elderly people.

With respect to protein quality, dairy outperforms alternatives and has important advantages for consumers over other (typically lower priced) protein sources. Despite the robust scientific evidence that demonstrates the nutritional benefits provided by dairy, dairy products are not widely used in U.S. food aid programs. *USDEC encourages Congress to examine opportunities to increase the use of U.S. dairy ingredients in a targeted manner in U.S. food programs in order to draw more heavily on the high-quality nutrition that dairy can offer, particularly for vulnerable groups such as children who are experiencing the devastating consequences of malnutrition.*

One area that is particularly ripe for greater near-term focus worldwide is the use of dairy ingredients in the treatment of malnutrition and wasting. For example, powdered milk is one of the primary ingredients used in ready-to-use therapeutic food (RUTF), an energy-dense, fortified medical food paste used to treat severe acute malnutrition the deadliest form of malnutrition, known as wasting. Just three RUTF packets every day can bring a child back from the brink of death in a matter of weeks. Despite being ranked as one of the most effective child survival interventions, RUTF is vastly under-funded. Less than one in four children suffering from wasting have access to this life-saving treatment.

American dairy farmers have the capacity to meet more of this emergency global need, but current investment in RUTF production is not enough. *USDEC encourages Congress to examine opportunities in the upcoming farm bill to scale up purchases of U.S. RUTF products that are compliant with World Health Organization (WHO) guidelines.*

Additional Trade Priorities

As vital as the farm bill's Trade Title is to supporting U.S. dairy exports, to maximize success America's dairy farmers and manufacturers need to see additional policy steps taken to advance U.S. agricultural export opportunities. A few top priority policies are outlined below:

Swift Appointment and Approval of Key U.S. Agricultural Export Nominees

To achieve full implementation of our existing trade agreements, and to broker new trade deals, it is imperative that we have the correct people at the helm of these negotiations. We are extremely worried that over a year into this Administration, we still do not have a confirmed USTR Agricultural Ambassador or a USDA Under Secretary for Trade and Foreign Agricultural Affairs. We believe the next farm bill trade title should provide specific timeframes for the Administration to put forward nominees for these two positions for Congress to consider. In the meantime, we urge Congress to push the Administration to fill these positions swiftly given how critical they are to defending the interests of U.S. farmers and food manufacturers working hard to sell their American-made products around the world.

Strong Support for Comprehensive Trade Agreements

As noted earlier, U.S. dairy exporters operate in a highly competitive global marketplace where our largest competitors—the EU and New Zealand—have been much

⁸Dairy facts in this paragraph sourced from: <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6723869/>.

more active than the U.S. over the past decade in negotiating and implementing trade agreements. This is already putting U.S. dairy exporters at a disadvantage in certain markets and the gaps will continue to grow the longer the U.S. delays reengaging in the global trade policy sphere in earnest. For this reason, USDEC strongly urges a resumption of the pursuit of comprehensive trade agreements with key dairy importing markets.

For example, we should restart U.S.-United Kingdom (UK) FTA negotiations. In 2021, the U.S. exported only \$30,000,000 in dairy products to the UK despite the fact that the UK is a major dairy importer. Our exports were significantly constrained due to existing tariff and non-tariff barriers. A resumption of FTA negotiations, and an eventual agreement, would substantially increase trading opportunities for this region.

Moreover, we urge the pursuit of comprehensive trade negotiations with key Asian markets such as Japan, Vietnam, Malaysia, Thailand, Indonesia and the Philippines. This is particularly important given that our major dairy competitors in many of these markets already have FTAs in place, putting U.S. dairy producers at a competitive disadvantage. USDEC does not consider FTAs to be an outdated 20th century tool; rather, FTAs remain the primary tool by which the U.S. can level the playing field for the sale of American-made goods around the world. The contents of FTAs can and should evolve over time to best advance U.S. priorities; yet abandoning this tool entirely due to concerns about some of our FTAs' past provisions risks losing market share to our competitors.

As FTAs are unfortunately not advancing, it's key that we maximize use of the tools USTR has announced to date. The Indo-Pacific Economic Framework provides an opportunity to address tariff and non-tariff trade barriers to U.S. dairy exports throughout the region. It is imperative that agriculture is a core component of these conversations given our industry's position as a reliable net-exporting producer of products supporting U.S. workers. The U.S. should maximize use of the Indo-Pacific Economic Framework to benefit U.S. agricultural exporters while continuing to work toward resumption of comprehensive trade agreement negotiations.

At the same time, USTR has also touted the value of Trade and Investment Framework Agreements (TIFAs) to advance U.S. export interests. We are hopeful that TIFAs can indeed be leveraged to make a degree of progress on expanding markets; doing so will require a greater prioritization of U.S. agricultural export interests than has traditionally been the case in TIFA discussions, however.

Implementation and Enforcement of Existing Trade Agreements

As important as it is to forge new agreements to continue to reduce barriers to U.S. dairy exports, it is critical that the U.S. ensure that our trading partners are held accountable of the provisions in our current deals.

In this respect, USDEC emphasizes the importance of fulsome implementation and robust enforcement of the U.S.-Mexico-Canada Agreement (USMCA) in order to preserve and fully deliver on the market access opportunities the U.S. procured for U.S. dairy exports.

We greatly appreciate the work of the Administration to initiate and secure a successful verdict in the first dispute settlement panel proceeding ever brought under USMCA, focusing on Canada's breach of its USMCA dairy tariff-rate quota (TRQ) commitments.

I would like to thank the numerous Members of this Subcommittee for their strong support on this issue.

Unfortunately, Canada's proposal to alter its USMCA dairy TRQ system falls far short of the genuine reforms needed to comply with all of its USMCA commitments. The U.S. must insist that Canada's proposal is unacceptable and that full compliance with the agreement is the only acceptable outcome in this case. The future of U.S. dairy exports to Canada depends on this, as does the outlook for the ability of USMCA's dispute settlement case to deliver real change when our trading partners shirk their obligations.

Other issues must be monitored and focused on by the Administration to ensure USMCA works for the dairy industry:

- Canadian exports of milk protein isolates (MPI) and certain skim milk blends manufactured under the new Class IVa have been increasing in a manner that appears designed to intentionally circumvent USMCA's dairy protein export disciplines. Curbing Canada's use of global markets to dispose of the excess dairy protein generated by its government-controlled supply management system was a core USMCA objective and must remain a focus area of the Administration.
- Vigilant monitoring and aggressive enforcement will also be necessary with our other USMCA partner, Mexico. Mexico is the largest export market for U.S.

dairy products, and the U.S. trade relationship with Mexico is of the utmost importance. Unfortunately, Mexico has seen a proliferation of poorly designed regulations that threaten to disrupt trade and erode the U.S. role as a reliable supplier. These overly burdensome regulatory proposals pose a particular threat to U.S. milk powder and cheese exports to Mexico. Close attention must also be paid to Mexico's implementation of USMCA side letter provisions on geographical indications (GIs) and common food names.

The U.S. should ensure discussions with Mexico treat its surge in regulatory and customs enforcement issues as a collective concern, and not simply as one-off issues. We need to restore smooth and predictable trading conditions with Mexico to ensure that the U.S. and Mexico remain an integrated market fulfilling the promise of USMCA.

Another area where implementation and enforcement are crucial is the China Phase One agreement. The Phase One trade agreement with China achieved important progress on several non-tariff-barrier (NTB) issues such as dairy facility registrations and access for high-value products such as extended shelf-life milk. However, retaliatory tariffs continue to impose a significant burden on U.S. dairy exports. The U.S. should secure long-term relief from these tariffs and work to ultimately achieve removal of them so that the U.S. dairy industry can reap the full benefit of the Phase One agreement and grow its market share and export volumes.

Over the past decade, China has become a critically important market for U.S. dairy exports. Sales last year alone totaled over \$700,000,000, ranking China the third largest export market for U.S. dairy products, despite the harmful impact of China's retaliatory tariffs in response to USTR Section 301 duties. While this progress is appreciated, it should also be noted that the Chinese have fallen short of their Phase One commitments to the tune of over \$17,000,000. The impact of this shortcoming did not escape the dairy industry—China continues to primarily source key dairy commodities such as milk powder and cheese from non-U.S. sources.

While there remains tremendous potential in this market as demand for dairy products continues to expand, China has not prioritized purchasing significantly larger shares of its dairy needs from the U.S. to date, despite its Phase One agricultural purchase commitments. We urge this Committee, and all of Congress, to work with the Administration to hold China accountable for their purchase commitments, press for removal of all retaliatory tariffs on dairy, and in the interim secure year-long retaliatory tariff exemptions for dairy products.

U.S. Leadership on Global Sustainability Efforts

We believe that the U.S. is uniquely positioned to promote sustainability on the global stage by leading a science-based, productivity-oriented approach that will be critical to supporting global competitiveness of U.S. agriculture exports, particularly dairy. We expect to see increasing pressure from our export competitors focused on advancing their agriculture, sustainability and trade objectives through ongoing work in the United Nations and international standard setting bodies. To balance the discussion and ensure global recommendations and standards are science-based, facilitate trade, and deliver more sustainable food systems, it is essential that the U.S. Government take a leadership role and work with like-minded countries around the world to deliver priority outcomes.

The U.S. dairy industry demonstrated that it is a strong partner in this charge at this past year's United Nations Food System Summit. As a proud member of the Coalition of Action for Sustainable Productivity Growth for Food Security and Resource Conservation, we stand ready to do the work needed to advance the pragmatic, forward looking approach that the U.S. Government has identified in their fight against climate change. This wide-ranging effort includes encouraging other countries and sectors to embrace the benefits of a sustainable productivity model and support innovation through initiatives such as our Net-Zero Initiative, which is a voluntary on-farm effort to advance our 2050 goals of achieving GHG neutrality and improving water and land use.

As dialogue around the world and within the UN itself often focuses on an anti-trade, anti-dairy, and anti-agriculture narrative, the U.S. dairy industry looks to U.S. leadership to inform the debate about the benefits of innovation and technology while advocating an approach that respects the legitimate role of all agricultural sectors in the future of the global food system. Given current and anticipated challenges combined with the solutions U.S. agriculture has to offer, the United States must remain uniquely focused on charting a more workable, trade-friendly and science driven pathway forward on sustainability and climate issues. Agricultural producers across the board are stewards of the land, and the U.S. dairy industry provides a prime example of that.

Closing

In closing, I would like to reiterate how important Title III of the farm bill is—the trade title supports U.S. dairy producers and processors in accessing profitable and successful global trading routes, while maintaining capacity at home. This importance cannot be understated, yet it is critical that we see more policies and actions by Congress and the Administration to best support American-made ag exports.

Again, Chairman Costa and Ranking Member Johnson, I truly appreciate the opportunity to testify before this Committee and serve as a voice for the U.S. dairy industry to highlight the importance of global trade to American dairy farmers across the nation.

The CHAIRMAN. Thank you very much, Ms. Harden, and with your previous experience both working with USDA in other past years. We look forward to your thoughts in terms of the question period.

Our next witness on today's panel is Ms. Nicole Berg, who is the President of the National Association of Wheat Growers, and in a conversation I had with her earlier, she has some familiarity with her family in the San Joaquin Valley where I grew up and was raised, and have the honor to represent. And we welcome you here, and your thoughts as it relates to the challenges we are facing, not only in Title III, but as we set the table for next year's farm bill reauthorization and the challenges we face, and what insight you might be able to provide us.

Ms. Berg?

**STATEMENT OF NICOLE BERG, PRESIDENT, NATIONAL
ASSOCIATION OF WHEAT GROWERS, PATTERSON, WA**

Ms. BERG. Chairman Costa, Ranking Member Johnson, and Members of Congress, thank you for the opportunity to testify before the Subcommittee on Livestock and Foreign Agriculture. My name is Nicole Berg. I am a fourth-generation farmer where I work alongside my dad and two brothers on our family farm in Patterson, Washington. We grow dryland and irrigated wheat on a diversified farm. Currently, I serve as President of the National Association of Wheat Growers.

NAWG is a federation of 20 state organizations and industry partners. We believe the farm bill Title III programs and how our Federal partners administer them can be improved going into the next farm bill. NAWG intends to outline our priorities in the coming months as Congress begins debating reauthorization.

Title III consists of two major elements that play a critical role in agricultural trade: international food aid and agricultural trade promotion. The international food aid programs have been successful in stabilizing economies and populations impacted by climate change, famine, and war. Trade promotion programs have helped U.S. agricultural products remain competitive on world markets and open access to new markets, which has boosted the agricultural economy and kept farmers in business.

Nationwide, there are six different classes of wheat grown in different climates for different uses. In my home State of Washington, there are roughly 2,500 wheat farmers, and eastern part of the state is known as the home of the soft white wheat. This variety is grown primarily for their use for cookies, crackers, cakes, as well as flatbreads. Washington farmers also raise superb hard red winter and spring wheats for bread. So far, marketing this year soft

wheat makes up 34 percent of the food aid donations and has several success stories resulting in the Title III trade promotion programs.

The programs in Title III play a significant role in the agricultural community. According to a study on MAP and FMD, these programs contribute an average of \$8.2 billion more in ag export revenue per year. However, MAP and FMD funding levels have remained stagnant for 15 years. During that time, cooperators like U.S. Wheat have reduced staff and offices while they work to prioritize and maintain programming. NAWG has historically sought to preserve and enhance funding levels for export promotion programs, given their significant return on investment and support for American agriculture and rural communities. The study also concluded that by doubling annual MAP and FMD funding, cooperators would increase their investment by 50 percent, creating yearly increases in agricultural exports by \$4.5 billion.

As an example, this return on investment can be seen in the Philippines where using Title III funds has increased our market share over 97 percent for U.S. wheat over the last 60 years. The Title III programs are essential to build trust with buyers and end-users who also look to U.S. Wheat for advice.

While there is still uncertainty about how Russia's invasion of Ukraine will impact world markets, we know that the invasion will exacerbate global food insecurity. Title III food aid programs are the best suited for the U.S. wheat to help support the humanitarian needs of those involved. Markets that typically purchase wheat from Russia and Ukraine, including bread heavy diets in the Middle East and Africa historically cannot afford high quality, high premium U.S. wheat. Using these programs will be the best way for the United States to help fill the unmet needs of a potential food crisis.

I was fortunate enough to witness the effects of these life-changing programs firsthand when I joined members of U.S. Wheat Associates and other ag groups on a 2 week journey to Kenya and Tanzania in 2019. The trip was funded by export market development programs, toured the Kakuma refugee camp in Kenya, where the World Food Programme is feeding more than 200,000 residents from nine countries, with over ½ of their food supply coming from the United States. A man I met there named Nelson expressed they are always happy to see the high quality of U.S. food they received. We also visited the World Food Programme's office in Mombasa, Kenya, where one of the largest ports in Africa is located. Through this port, the World Food Programme supports feeding programs in multiple African countries, all of which receive regular U.S. food shipments. This is just one example of life-changing impact these programs have made, and certainly changed my life.

As the Committee continues to have these hearings and reflects on programs authorized under the 2018 Farm Bill, I look forward to working with Members of the Committee, their staff, and other witnesses here today to help craft a farm bill that enhances trade and helps deliver American commodities to populations in need.

Thank you again for the opportunity to testify before the Committee today.

[The prepared statement of Ms. Berg follows:]

PREPARED STATEMENT OF NICOLE BERG, PRESIDENT, NATIONAL ASSOCIATION OF
WHEAT GROWERS, PATTERSON, WA

Chairman Costa, Ranking Member Johnson, and Members of the Subcommittee thank you for the opportunity to testify before the House Agriculture Subcommittee on Livestock and Foreign Agriculture (LFA). My name is Nicole Berg, and I am a fourth-generation farmer where I work alongside my dad and two brothers on our family farm in Paterson, Washington. We grow dryland and irrigated wheat on a diversified farm. I currently serve as the President of the National Association of Wheat Growers (NAWG). Thank you for holding this hearing today to discuss Title III—the trade title—of the 2018 Farm Bill. The Title III programs, originating in the farm programs following World War II, are vital programs that work to open new markets for agricultural production and help stabilize food-insecure countries and regions to preserve peace.

NAWG is a federation of 20 state wheat grower associations and other industry partners. We work collaboratively to represent the needs and interests of wheat producers before Congress and Federal agencies. Based in Washington, D.C., NAWG is grower-governed and works in areas as diverse as Federal farm policy, trade policy, environmental regulation, the future commercialization of emerging technologies in wheat, and uniting the wheat industry around common goals. Our members feel it is important to provide testimony before the LFA Subcommittee today as we reflect on the programs authorized under Title III of the farm bill. Today's hearing is particularly timely as NAWG is also evaluating the effectiveness of the farm safety net programs, how those programs can be improved going into the next farm bill, and how the U.S. Department of Agriculture (USDA) administers these programs. NAWG intends to outline our specific farm bill priorities for lawmakers in the coming months as Congress begins debating farm bill reauthorization. However, we are prepared to speak to how the programs have been functioning from the wheat perspective since enactment of the 2018 Farm Bill.

Title III of the farm bill consists of two major elements that play a crucial role in agricultural trade: international food aid and agricultural trade promotion. The international food aid programs have been successful in stabilizing economies and populations hurt by climate change, famine, and war and have helped promote peace by reducing terrorism and food emigration. Trade promotion programs have helped U.S. agricultural products remain competitive on world markets and opened access to new markets, which has boosted the agriculture economy and kept farmers in business. While making up less than one percent of total farm bill funding, Title III plays a crucial role in the farm safety net.

According to the United States Department of Agriculture's (USDA) World Agriculture Supply and Demand Estimates from March 9, the United States (U.S.) exported over an estimated 26 million metric tons (MMT) (990 million bushels) of wheat in 2020/21 and projects the U.S. to export 21.77 MMT (800 million bushels) in 2021/22, representing 54 percent and 49 percent of total U.S. wheat production respectively, with such a large percentage of our production exported, U.S. wheat growers' profitability is intricately connected to our export markets. The U.S. is the largest donor of food assistance worldwide, with over 1 MMT in food aid tenders in marketing year 2021/22 so far, making up around five percent of commercial sales, plus substantial additional cash and non-U.S. purchased food. Wheat is one of the principal food grains produced in the United States and consumed around the world, constituting roughly one in five calories consumed worldwide. Food aid donations have made significant impacts in markets like Ethiopia and Yemen that are facing food shortages.

Nationwide, there are six different classes of wheat grown in different climates and for different uses. In my home State of Washington, there are roughly 2,500 wheat farmers. The eastern part of the state is known as the home of soft white wheat. These varieties are grown primarily for their use in cookies, crackers, and cakes as well as flat breads. Washington farmers also raise superb hard red winter and spring wheats for bread. So far, this marketing year soft wheat (SW) has made up 34 percent of food aid donations and has seen several success stories resulting from Title III's trade promotion programs.

World Wheat Markets

With over 50 percent of U.S. wheat heading to overseas markets, trade is a major priority for wheat farmers. The United States is the world's fourth largest exporter of wheat, behind Russia, while being the largest contributor to food aid, providing around half of the world's food aid. On average, Mexico, the Philippines, Japan,

South Korea, and Nigeria make up the top five destinations for U.S. wheat. Following the United States's success at the World Trade Organization (WTO) and through efforts to negotiate the China Phase 1 deal, China went from being the world's 16th largest importer to the 4th largest in a single year. In addition, top recipients of food aid most recently include Yemen, Ethiopia, and Sudan.

The world wheat market is an ever-changing one that provides unique opportunities for U.S. wheat farmers. But wheat is also the world's most widely planted and traded commodity. That means global competition among exporters is fierce. It highlights the continuous need for new market access to keep U.S. growers on a level playing field with other countries—especially as our primary competitors in quality wheat markets—Canada and Australia continue to sign and pursue new free trade agreements around the world. Two free trade agreements that are currently being evaluated by the administrations are with the United Kingdom and Kenya. Both would be prime examples where U.S. wheat faces tariff and non-tariff barriers that we would hope to resolve through trade negotiations. In addition, the Asia Pacific is a region ripe for U.S. attention on trade, given several competitor agreements in place and the continuing growth in their wheat consumption. Whatever form those future discussions take, agricultural market access must be a priority.

Recently, the global wheat market has drawn a great deal of attention with Russia's invasion of Ukraine and the subsequent impacts on wheat trade and markets. Together the two countries represent around 30 percent of global wheat exports, and 14 percent of global wheat production. In the aftermath of the invasion wheat markets skyrocketed, and farmers witnessed unprecedented market volatility. Market prices have decreased since then but remain elevated and the volatility continues in the market.

While there is a great deal of unknown how the international sanctions will impact Russian exports of food grains and how the conflict will impact Ukrainian exports, we know that these increased prices are exacerbating global food insecurity. Russia and Ukraine are large wheat exporters, but even more so to some of the world's most price-sensitive markets. The White House has put together a conference on hunger and has stressed the dangers of world food shortages. Markets historically served by Black Sea wheat are scrambling to figure out how they are going to fill their demand and feed their people. As these events unfold, Title III will become more critical. The U.S. food aid programs will be needed to curb the effects of hunger in a humanitarian crisis that is unprecedented in recent history. The trade promotion programs will be vital diplomatic tools to build relationships with countries that have historically sourced wheat from Russia. Congress needs to take the opportunity to strengthen these programs in the new world.

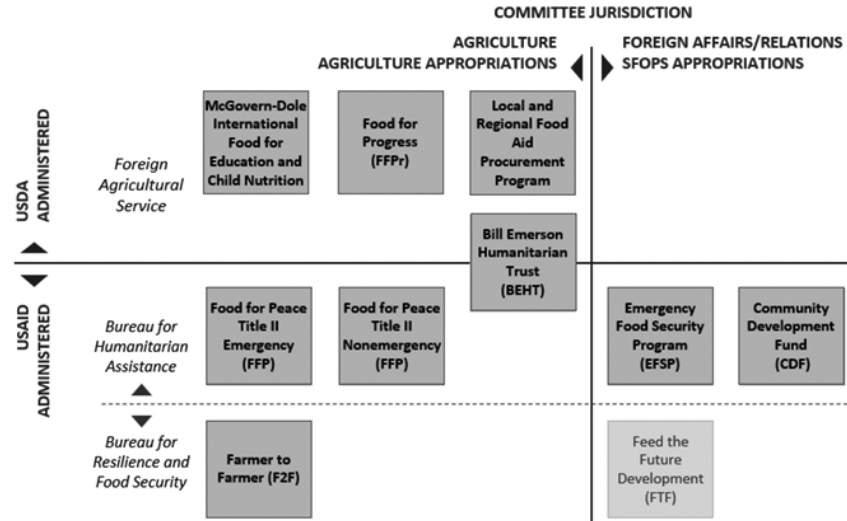

Food Aid Background and the 2018 Farm Bill

Title III international food aid and trade promotion programs have their roots in post-World War II European reconstruction efforts. President Dwight Eisenhower signed the Agricultural Trade Development and Assistance Act of 1954, Public Law 480, creating the program now known as Food for Peace which is Subtitle A of Title III of the farm bill. Food for Peace worked to decrease the surplus of domestic agricultural commodities, improve domestic markets, and stimulate new international markets. The 1985 Farm Bill saw the marriage of international food aid programs to the farm bill by authorizing the donation of USDA commodities by the Secretary of Agriculture to provide food aid to countries in need. Since 1985, farm bills have sought to allow the agencies that implement these programs, the United States Agency for International Development (USAID) and USDA's Foreign Agriculture Service (FAS), the flexibility to address humanitarian and food security crises adequately and efficiently.

Today, USDA and USAID partner with organizations to implement the food aid programs. Each program serves a separate purpose and provides assistance through either in-kind assistance or market-based assistance. In-kind assistance includes commodities produced in the U.S. and shipped to a target region and includes monetization where a partner organization sells commodities on local markets in developing countries and uses the proceeds to fund development projects. Market-based assistance provides direct cash transfers, food vouchers, or locally and regionally procured food to populations in need.

Jurisdiction of international food assistance programs, not all of which are in the farm bill, is demonstrated in the chart below from the Congressional Research Service.

Figure 1. U.S. International Food Assistance Jurisdiction

Source: CRS.

Notes: Feed the Future Development refers to agricultural development assistance provided under the Feed the Future initiative. The Feed the Future initiative is a government-wide initiative that includes all programs in this matrix, as well as other assistance provided outside USDA and USAID. Thus, this matrix does not include all programs that comprise the Feed the Future initiative. The programs highlighted in this graphic are the programs discussed in this report. SFOPS = Department of State, Foreign Operations, and Related Programs; USDA = U.S. Department of Agriculture; USAID = U.S. Agency for International Development.

International food aid programs are subject to annual appropriations and are included with funding originating outside of the farm bill. Food for Peace Title II programs are authorized at \$2.5 billion. The chart below shows total U.S. food assistance outlays for all food aid programs, not just ones inside the farm bill.

Figure 2. U.S. International Food Assistance Outlays, FY 2010–FY 2020

\$ in billions (current year)

Source: figure created by CRS using data from USAID, *U.S. International Food Assistance Report*, various years.

Notes: FFP = Food for Peace; EFSP = Emergency Food Security Program; The “Other” category includes the Farmer-to-Farmer Program Local and Regional Food Aid Procurement Program, Bill Emerson Humanitarian Trust, and Community Development Fund.

The 2018 Farm Bill continued prioritizing Title III and its role in international food aid while making key changes to provide maximum flexibility in how agencies and NGO’s implement these important programs. The new farm bill eliminated the 15 percent monetization requirement in Food for Peace, which allowed additional flexibility in program implementation. It also permitted ten percent of McGovern-Dole program funds to be used for local and regional procurement, established a pilot agreement allowing supplemental appropriated Food for Progress funds to be used for direct development activities, and made technical changes to several fellowship programs.

International Food Aid Programs

This section provides a brief overview of each of the international food aid programs.

- The *Food for Peace (FFP) Title II* is aid provided by the U.S. to recipients in foreign countries. All FFP assistance is required to be labeled as from the American people. Assistance must not interfere with the local agricultural economy, whether assistance be commodity, locally procured food, vouchers, or cash.
- The *Farmer-to-Farmer Program (FFP Title V)* coordinates short-term placements for U.S. volunteers to services to provide technical assistance to farmers in developing countries.
- The *McGovern-Dole International Food for Education and Child Nutrition Program* provides U.S. commodities to developing countries for school feeding programs and for pregnant and nursing mothers.
- The *Food for Progress Program (FPPr)* monetizes U.S. commodities in recipient countries to fund humanitarian or development projects.
- The *Bill Emerson Humanitarian Trust (BEHT)* is a mandatory reserve of funds held by the USDA that can supplement FFP assistance when FFP alone cannot meet emergency food needs. There have recently been a number of calls to release BEHT funds, which we fully support and believe is necessary.
- The *Local and Regional Food Aid Procurement Program (LRP)* finances the provision of local and regionally procured foods in non-emergency situations.

Agricultural Promotion Background and the 2018 Farm Bill

The agricultural promotion programs in the farm bill date back to 1978, when Congress passed the Agricultural Trade Act to increase the profitability of farming by increasing opportunities for U.S. commodities by expanding markets and improving their competitiveness in world markets. The 1981 Farm Bill was the first to include a trade promotion title.

Today, USDA FAS works with cooperator organizations to create, expand, and maintain foreign agricultural markets using the Market Access Program (MAP) and the Foreign Market Development (FMD) program. Title III also provides essential financing to encourage exports through the Export Credit Guarantee Program (GSM–102).

The 2018 Farm Bill continued promoting trade by consolidating several programs into the Agricultural Trade Promotion and Facilitation section, which maintains the unique functions of each program while establishing permanent, mandatory funding for export promotion activities. It also created a Priority Trade Fund that allows the Secretary of Agriculture to allocate additional funds to any export promotion program. MAP and FMD funding was also made available for activities in Cuba.

Agricultural Promotion Programs

The 2018 Farm Bill provides \$255 million in annual mandatory funding for export programs from the Commodity Credit Corporation, while GSM–102 was given over \$3.5 billion for allocation in the Fiscal Year 2022.

- The *Export Credit Guarantee Programs* provide credit guarantees to encourage the financing of commercial exports. This program helps lenders balance financial risk, especially in developing countries.
- The *Market Access Program* partners FAS with U.S. agricultural trade association and other groups to share the costs of overseas marketing and promotional

activities in order to build export markets for agricultural products. The farm bill provides \$200 million for MAP.

- The *Foreign Market Development Program* partners FAS with nonprofit agricultural trade associations to address long-term opportunities to reduce foreign import constraints or expand export growth opportunities. The farm bill provides \$34.5 million for FMD.
- The *Emerging Markets Program (EMP)* provides cost-share funding for technical assistance activities that support exports of U.S. commodities. The farm bill provides \$8 million for EMP.
- The *Technical Assistance for Specialty Crops (TASC)* program provides funding organizations to address non-tariff barriers of U.S. specialty crops. The farm bill provides \$9 million for TASC.

In the wheat industry, U.S. Wheat Associates is the USDA cooperator organization. They participate in MAP, FMD, and occasionally EMP in their efforts to expand markets for U.S. wheat producers. Those USDA grants are required to be matched, in the case of wheat, though farmer dollars are collected by individual state check-offs. Combined, those monies support a global network of 13 overseas offices and around 75 technical, marketing, and support staff, all working on behalf of U.S. wheat farmers.

Implementation of 2018 Programs

The programs in Title III play a significant role in the agricultural economy. According to an econometric study of MAP and FMD, conducted by Informa Economics IEG (now IHS Markit), these programs contributed an average of \$8.2 billion more farm export revenue per year between 1977 and 2014. These programs also boost export volume, and farm cash income. The study also concluded that doubling annual MAP and FMD funding would encourage cooperators to increase their investments by 50 percent, and the total investment would create yearly increases in agricultural exports by \$4.5 billion, increase the farm economy through cash receipts and income and farm assets by \$4.0 billion, increase domestic GDP by \$6.0 billion, while creating 84,600 new full and part time jobs. The graph below from USDA's Economic Research Service shows just how big an impact these programs have had over the past 3 decades.

Figure 2
Increases in U.S. agricultural export value by region, 1995 to 2017
 Value (\$ billion)

Source: USDA, Economic Research Service, U.S. Agricultural Trade topic page.

It can be an uphill battle to convince milling wheat buyers to opt for premium-priced, but better performing, U.S. wheat. However, there are many examples of

how MAP and FMD funding have had an impact. Within the class of wheat that I produce, soft white, The Philippines contains many such success stories, where through a combination of marketing and technical assistance over the last 60 years, the U.S. has built better than a 90 percent milling wheat market share and helped increase Filipino wheat consumption. U.S. wheat enjoys this level of market dominance because the program investments have helped U.S. Wheat Associates (USW), a MAP and FMD cooperator organization, stay “on the ground” in the Philippines and other Asian markets for decades, making trade and technical service calls and conducting wheat food production training. The Title III programs are essential to building trust with buyers and end-users who also look to USW for advice.

To increase wheat foods consumption in the Philippines, USW has helped flour millers, and commercial food companies build and maintain a multi-year campaign. As a result, over the past 5 years, the annual per capita consumption of wheat in the island nation has increased from 23 to 29 kilograms. That is an annual demand increase of 600,000 metric tons of wheat, with an estimated 97 percent of that wheat coming from the United States.

The funds also allow U.S. cooperators to work directly with companies to highlight the advantages of using U.S. commodities. Flour milling courses at international facilities highlighting the superior end-use attributes of U.S. grown wheat have led to Filipino millers adopting “Guaranteed 100% U.S. Wheat” labels on flour bags. This effectively locked mills into annual wheat purchases from U.S. origin supplies.

Providing technical services for emerging technologies is another area that can lead to increased loyalty to U.S. commodities. Through USW education and technical services, more than half of the Philippines’ mills have installed Solvent Retention Capacity (SRC) testing—a method for measuring protein functionality that most accurately conveys the end-use product attributes for soft white wheat. USW technical milling specialists have pioneered the use and adoption of the technology. As a result of these SRC-related efforts, millers and their customers can use objective, repeatable statistical data to communicate quality information while providing a clear advantage for U.S. wheat classes to the industry. That technology is especially critical for SW producers as each year’s crop’s functional attributes depend not only on genetics or management but also on the weather—which is clearly outside of our control. SRC has helped ensure millers and bakers receive the functional quality wheat they need regardless of what mother nature throws at us as farmers.

In another example of how cooperators use MAP programs to support customers’ purchase of U.S. grown wheat, USW has provided multiple layers of trade and technical support to a specific Philippine milling company, including custom training at the Wheat Marketing Center in Portland, Oregon, in 2020 to analyze the optimal blend of U.S. western white (WW) wheat flour in Philippine sponge and chiffon cakes as well as on layer cakes and Japanese sponge cakes. As a result, after follow-up technical servicing with USW technicians in 2021, the company launched their new unchlorinated cake flour utilizing 48,486 MT of WW valued at \$14 million, which was the first WW commercial shipment to the Philippines since MY2012/13.

The impacts of international food aid on the lives of millions of people are indescribable. I was fortunate enough to witness the effects of these life-changing programs firsthand when I joined members of U.S. Wheat Associates, U.S. Grains Council, and USA Rice for a 14 day journey to Kenya and Tanzania in 2019. The trip, funded by USDA FAS using export market development program funds, toured the Kakuma Refugee Camp in Kenya, where the World Food Programme (WFP) is feeding 98 percent of the more than 200,000 residents from nine countries, with over ½ of their food supplies coming from the United States. A man that I met there named Nelson emphasized that they were always so happy with the high quality of the U.S. food they received, especially because of the quality of wheat flour. We also visited the WFP office in Mombasa, Kenya, where one of the largest ports in Africa is located. Through this port, WFP supports feeding programs in Sudan, South Sudan, Mozambique, Rwanda, and Uganda, all of which receive regular U.S. food shipments. This is just one example of the life-changing impact that these programs have. It certainly changed my life, and this is just one example of the many stories that can be told that have originated out of Title III programs.

Critiques of Title III

Food aid and trade promotion programs remain a critical part of the overall export economy of U.S. wheat. The 2018 Farm Bill provided mandatory funding of \$255 million annually for trade promotion activities. Unfortunately, these funding levels become less effective as costs and the numbers of grant applicants increase, as indicated in the graph from USDA below. It has been more than 15 years since Congress increased funding for MAP and 20 years for FMD. During that time, cooperators like U.S. Wheat Associates have reduced staff and offices while they work

to prioritize and maintain programming. The non-farm bill authorized Agricultural Trade Promotion Program (ATP) has temporarily staved off further reductions and allowed a much-needed increase in programming, but those funds run out in 2024. Significant increases to the MAP and FMD baseline funding levels will be critical as ATP funding is exhausted. Throughout the appropriations process and in past farm bill reauthorizations, NAWG has sought to preserve and enhance funding levels for export promotion programs given their significant return on investment and support for American agriculture and rural communities. Currently, NAWG is formalizing our farm bill priorities, however, important groundwork has been laid through the MAP/FMD Coalition seeking to double the funding level for these critical programs, given the decade and a half of level funding. It is important the Subcommittee consider these requests going into the 2023 Farm Bill debate.

Available MAP Funding

2001-2023

Similarly, as the price of shipping and fuel increases, the amount of commodities donated through food aid, given the authorized funding levels, continually decreases. Therefore, it is important that this Subcommittee give serious consideration to addressing the increased costs of providing food aid and expanding markets while looking at the funding levels of each of the programs contained in Title III. One such area the Subcommittee should examine is the cost it takes to ship commodities. According to a Congressional Research Service Report, procurement of commodities for in-kind food aid made up approximately 40 percent of funding in FY 2020. These commodities are subject to U.S.-flag shipping requirements in the Cargo Preference Act of 1954, which requires at least 50 percent of the gross tonnage of U.S. Government-financed cargoes must ship on U.S.-flag vessels. Shipping on U.S.-flag vessels typically costs more than foreign-flag vessels, which raises the cost of providing in-kind food aid. This reduces the volume of food aid that can be provided. Congress should evaluate the required threshold for food aid programs, consider an increase to the Food for Progress Transportation Cap, and work with the maritime industry to find a creative solution that maximizes food aid while keeping the maritime industry strong.

The last two farm bills have granted USAID flexibility in implementing programs. Unfortunately, this flexibility has gone almost solely toward cash donations or vouchers. As seen in the graph below, market-based assistance makes up close to 60 percent of food aid funding. While NAWG supports flexibility in food aid assistance, including monetization when absolutely necessary, the Subcommittee should consider prioritizing in-kind donations of U.S. commodities.

FY 2020 Funding by Modality*

* All data included in this presentation is preliminary and will be shared, when final, in the *FY 2020 International Food Assistance Report*.

Another area of concern is the FAS staffing levels in overseas offices. FAS staff play a key role and work in nearly 100 offices across approximately 180 countries. These staffers play a crucial role in increasing trade opportunities across these countries, which helps support and create jobs here at home. Additionally, financial support is needed to support administrative costs at FAS, which would allow full MAP and FMD funding to be used for export promotion and market development. Without long-term sustained investments and support for FAS staffing in overseas offices, our trade missions will be at a competitive disadvantage compared to our main competitors in finding new opportunities and executing the great work they already carry out.

It is important that USAID and USDA continue to work together on all U.S. foreign aid programs, and NAWG encourages greater cooperation moving forward. Each agency brings unique skillsets to the operation and provides value in different ways. NAWG believes that implementation and funding of LRP should go through USAID, while the USDA should retain administration of Food for Progress programs.

Conclusion

NAWG's policy committees and board of directors are evaluating these programs' effectiveness. We are working to finalize our policy priorities over the coming weeks. These farm bill priorities will be shared with you and your staff upon being finalized. As the House Agriculture Committee and the various subcommittees continue to have these hearings and reflects on programs authorized under the 2018 Farm Bill, I look forward to working with the Members of the committee and their staff to help craft the next farm bill that works for wheat growers and all American agriculture. Farmers play a key role in helping sustain our rural communities and feeding the world. As the farm bill process continues, I would urge judicious and expeditious review of authorized programs and work to ensure a full reauthorization of farm bill programs prior to the expiration of the current farm bill on September 30, 2023.

We look forward to continuing to work with you to ensure a strong U.S. farm economy. Thank you again for this opportunity.

Sincerely,

NICOLE BERG,
President,
NAWG.

The CHAIRMAN. Well, we thank you, Ms. Berg, for your testimony and your background and experience. That is eastern Washington State that you farm in?

Ms. BERG. It is.

The CHAIRMAN. Terrific.

Our last witness on this panel wins whatever prize we can award this individual for testifying from the longest distance. Dr. Arif Husain is the Chief Economist of the World Food Programme, and he is joining us today from the Democratic Republic of Congo. So, Dr. Husain, I don't know what time of the day or night it is there, but we really very much appreciate your taking this opportunity to inform us on the challenges that we are facing with world hunger in the areas that we are very familiar with, and the new crisis that we have spoken about this morning with regards to Russia's invasion of Ukraine and the additional impact it is having on food supplies.

So, your thoughts and comments will be very much appreciated this morning. What time is it there, Dr. Husain?

Dr. HUSAIN. Sir—good afternoon, sir. I am just on my way. I was so concerned about the connection that I postponed my leaving until tonight. So, I am in still in Rome.

The CHAIRMAN. Oh, Rome? That is still the longest distance for today's witnesses in terms of testifying, but what time is it in Rome?

Dr. HUSAIN. Sir, it is just after 6:00 p.m.

The CHAIRMAN. Well, we thank you. Please begin your testimony. It is 5 minutes, so I think you are familiar with this process and we look forward to hearing from you.

**STATEMENT OF ARIF HUSAIN, PH.D., CHIEF ECONOMIST,
UNITED NATIONS WORLD FOOD PROGRAMME, ROME, IT**

Dr. HUSAIN. Thank you, sir. Chairman Costa, Ranking Member Johnson, and distinguished Members of the House Agriculture Subcommittee, thank you. I greatly appreciate the opportunity to brief this Subcommittee on the United Nations World Food Programme's efforts to assist ever-increasing numbers of people with food assistance.

Today, our world is not moving towards, but away from zero hunger, and the costs of humanitarian response is soaring while resources are more constrained.

But first, I want to thank Members of Congress from both sides of the aisle and both chambers for their continued support of the World Food Programme. The United States is our largest partner, and we share an important history that dates back to the organization's very founding in 1961. The United States is our largest donor, and we deeply appreciate our partnership with the American farmers and agribusinesses.

The quantity and quality of U.S. commodities is invaluable to our operations, and it is critical to our efforts to save lives, but also change lives around the world. Last year, the United States provided a record \$3.86 billion to our World Food Programme, and a significant portion came through programs under the jurisdiction of this Committee. As a share of value United States in-kind donations constituted 17 percent of WFP's total food procurement in

2021. We are very grateful for the commodity support we receive through Title II emergency programs and the McGovern-Dole school feeding program.

While WFP has increased its cash-based assistance portfolio in recent years, that does not mean that food transfers have become any less important. In fact, WFP benefits from having a balanced toolbox of food assistance modalities. We offer cash-based assistance where supplies are ample, markets are functioning, and inflation is under check, and we provide in-kind food assistance where markets are disrupted, food availability is limited, and inflation is a concern.

The war in Ukraine has underlined the importance of in-kind assistance as well, which has a critical role in responding to domestic supply shortages which may soon be triggered in countries reliant on grain imports from the Black Sea region. Indeed, we cannot adequately speak to the current global hunger crisis and the importance of American food aid programs without addressing the conflict in Ukraine, which has global repercussions for food insecurity. It has caused deep upheaval in global food and energy markets, steep rises in international prices for basic staples, fertilizers, and energy, equal to those last seen in the high food and fuel crisis of 2008 or 2011. But today's price hikes are perhaps even worse, because previously, we did not also have to deal with COVID-19 or wars in Ethiopia, Yemen, Syria, and northeast Nigeria.

Sir, in 81 countries where WFP operates, up to 276 million people were already facing severe hunger crises or worse conditions. Now, the Ukraine war would easily push another 47 million people worldwide into acute hunger. This means that up to 323 million people would become acutely food-insecure just this year. They will need urgent food, nutrition, and livelihood assistance. Refugees, returnees, asylum seekers, and internally displaced persons are particularly vulnerable.

WFP therefore plans to assist about 145 million people in 2022. This is an even higher number than in the past 2 years when WFP assisted a record-breaking 115 million beneficiaries in 2020, and a record 128 million beneficiaries in 2021. This year, WFP's assistance will cost approximately \$20 billion. Unfortunately, however, our funding requirements are growing much faster than our contributions, and today, we face a funding gap of about 50 percent.

While WFP has always faced funding gaps, they have previously not been this wide or in such a difficult environment, as other UN agencies are being forced to cut out assistance at the same time. This makes cuts to WFP assistance, which offers a lifeline to millions of people, much more painful than they would have been in the previous years. The Ukraine crisis only adds to the funding gap by increasing commodity and transportation costs. Buying from further afield implies higher transport costs and delivery times. This means that WFP's monthly costs are expected to be \$71 million above their 2019 average. This is a 44 percent increase and enough to cover one lifesaving daily meal for 3.8 million people for a month. WFP is increasingly confronted with decisions of who to support and among those in need, and who not to support. Which child lives, which child dies? The costs of humanitarian inaction are tremendous, especially for people on the edge of starvation who,

in worst cases, will pay with their lives. Failing to mobilize sufficient and timely funds for humanitarian assistance also means that donors bear the cost of inaction.

As soon as refugees arrive at donor countries doors, the new host governments start literally paying the price for not acting earlier. For every U.S. dollar spent on forcibly displaced persons in the developing world, \$70 U.S. dollars goes to an asylum seeker in a donor country. WFP is extremely grateful for the sustained commitment of the American people to addressing global hunger and responding to urgent humanitarian crises around the world. We thank you for your continued support, partnership, and collaboration.

Thank you, Mr. Chairman, and I am ready for any questions. Thank you very much.

[The prepared statement of Dr. Husain follows:]

PREPARED STATEMENT OF ARIF HUSAIN, PH.D., CHIEF ECONOMIST, UNITED NATIONS WORLD FOOD PROGRAMME, ROME, IT

This brief is being provided on a voluntary basis and should not be understood to be a waiver, express or implied, of the privileges and immunities of the United Nations and its officials under the 1946 Convention on the Privileges and Immunities of the United Nations.

Introduction

Chairman Costa, Ranking Member Johnson, Members of the House Agriculture Subcommittee on Livestock and Foreign Agriculture, thank you for convening this hearing on “International Trade and Food Assistance Programs” as they relate to the farm bill.

Today, I will provide a briefing on the United Nations World Food Programme’s efforts to assist increasing numbers of people in a world that is not moving towards, but away from zero hunger, and where the humanitarian response is becoming more expensive with constrained resources.

Before I do that, I want to thank Members of Congress—from both sides of the aisle and both chambers—for your continued support of the United Nations World Food Programme. The United States is WFP’s largest partner, and we share an important history that dates back to the organization’s very founding. Last year, the United States provided \$3.86 billion in support to WFP, and a considerable amount was provided through programs under this Committee’s jurisdiction.

We also deeply appreciate the partnership we have with the American farmer. The United States is the largest contributor of commodities to international food aid programs and is critical to our efforts to alleviate hunger around the world. The quantity and quality of U.S. commodities is invaluable to our operations, and we could not do the work we do without the support and engagement of American farmers and agribusinesses.

U.S. Food Aid Programs

The United Nations World Food Programme has been a U.S. partner for the P.L. 83–480 (Title II) and McGovern-Dole International Food for Education and Child Nutrition programs since their inception and remains today the largest recipient of American-grown commodities provided through those programs. As a share of value, United States in-kind donations constituted 17 percent of WFP’s food procurement in 2021. WFP is encouraged by the proposed increase of ten percent in Title II funding for FY 2023, as reflected in the White House FY 2023 Presidential Budget Request released last week.

While WFP has increased the amount of assistance it provides through cash-based assistance in recent years—from US\$210 million in 2011 to US\$2.3 billion in 2021—that does not imply that food transfers have become any less important. WFP values a balanced “toolbox” of food assistance modalities. The use of commodities in WFP programming has remained relatively constant over the last decade, increasing slightly from 3.6 million metric tons (mt) in 2011 to 4.4 million mt in 2021.

Cash-based assistance needs functioning markets. If markets are not working properly and responding to an increase in demand with rising supply, cash-based transfers can fuel inflation. Moreover, the current high food inflation rates in many

poor economies pose a challenge for cash-based assistance. When money rapidly loses value, a set transfer value won't go as far anymore as it used to, making it difficult to ensure that beneficiaries are able to cover their food and other essential needs.

In-kind food assistance, on the contrary, can put downward pressure on food prices. What is more, especially, in the scenario of a prolonged war in Ukraine, in-kind assistance can help respond to local supply chain breaks that the conflict could trigger in countries dependent on Black Sea grain imports.

In short, the United Nations World Food Programme is grateful for the commodity support provided through the Title II emergency program and the McGovern-Dole School Feeding program. These resources are especially important today given volatile market and currency conditions faced in many countries and prolonged humanitarian emergencies driven by conflict that destroy markets and reduce domestic production of food.

State of Global Hunger

The world is not on track in its efforts to achieve Zero Hunger. Progress on SDG2 was waning even before the COVID-19 pandemic began causing economic turmoil and eroding food security. In 81 countries where WFP operates, up to 276 million people are acutely food-insecure in 2022 and in need of urgent food, nutrition, and livelihoods assistance. This is a record high, and an increase of 126 million people compared to before the pandemic. Refugees, returnees, asylum-seekers, and internally displaced persons are particularly vulnerable.

There are more than ½ million people (670,000 people) facing famine-like conditions (IPC/CH Phase 5, Catastrophe/Famine). Some 400,000 of these people are in parts of Ethiopia affected by the Tigray crisis—the highest number recorded since the 2011 famine in Somalia—while the remaining people are in South Sudan and Yemen. 44 million people living across 38 countries currently face severe hunger emergencies (IPC/CH Phase 4) and are one step from falling into famine. This number has risen from 27 million in 2019.

Ukraine Crisis

We cannot adequately speak to the current global hunger crisis and the importance of American food aid programs authorized through the farm bill without addressing the conflict in Ukraine and the ripple effects it has produced. The conflict happens at a time when global hunger is already at record levels. This is a conflict that has global repercussions. I commend the bipartisan efforts already taken by the U.S. Congress to address the way the war is impacting global food and fuel prices, putting millions of people at risk of food insecurity in 2022 and beyond.

In recent years Ukraine and Russia have become “major engines” for feeding the world. With these countries critical suppliers to global markets for wheat, maize, and other food commodities as well as energy and fertilizer, the Ukraine conflict has caused an upheaval in global food and energy markets. Steep rises in international prices for basic staples—notably wheat and maize—in recent weeks reflect this, resulting in a food price environment that resembles the 2008 or 2011 crises. Given heavy reliance on world commodity markets by numerous countries, prices are rising even in places that do not source their wheat, maize, or other commodities directly from Ukraine or Russia.

This is especially important for countries that rely on global trade for their food supplies. The war in Ukraine does not immediately mean that there will a shortage of wheat production in the world. Much of the world's wheat is still consumed where it is grown; exports represent only a fraction of the global wheat supply (of the total global wheat production of 775 million tonnes in 2021–22, only 194 million tonnes are traded internationally).

Still, Ukraine and Russia account for a large portion of the world's wheat exports and countries that rely heavily on grain imports from the Black Sea like Lebanon, Yemen or Egypt will be greatly affected. Medium- and long-term global food security implications of the Ukraine crisis will depend on the duration of the conflict. If the conflict is resolved on the ground within the next 5 to 6 weeks, there could be a quick return to pre-conflict realities. However, if the conflict continues beyond 2 months, we face a completely different situation.

In the case of a prolonged conflict, the absence of farmers or fuel shortages during critical periods for tending new crops could imply massive cuts to Ukraine's upcoming grain harvests. This includes planting for corn, barley, and sunflower seeds, which should begin this month, and the next major wheat harvest, which should take place this summer. Meanwhile, a lack of fertilizer supplies from Russia and continuously high energy costs could constrain yields in many countries around the

world. Some 25 countries depend on Russia for 30 percent or more of their fertilizers.

In this worst-case scenario, across the 81 countries with WFP operations, we estimate that acute hunger could rise by 47 million people (sub-Saharan Africa is most affected) from a pre-war baseline of 276 million people who were already in the grip of acute hunger. This means that up to 323 million people could become acutely food-insecure in 2022.

COVID-19

The current price hikes unfold in a much more difficult global context than previous price crises. There are two reasons for this: First, the world was more stable in 2008 than it is today. Several major conflicts have erupted since. The civil war in Ethiopia began in 2020, the Yemeni civil war in 2014, the Syrian civil war in 2011 and the conflict in Northeast Nigeria in 2009. Second, the world has still not fully recovered from the fallout of the COVID-19 pandemic, leaving it in a difficult place to cope with yet another crisis.

Global food prices have been on the rise since mid-2020. The Food and Agriculture Organization of the United Nations Food Price Index, a measure of the monthly change in international prices of a basket of food commodities, reached a new all-time high in February 2022. Similarly, crude oil prices, which have an enormous impact on food prices, have steadily increased since the spring of 2020, recovering from a pandemic-driven plunge and then surpassing their levels of previous years. When the price of gas goes up, everything else follows.

Domestically, food prices have risen by at least 15 percent in 31 countries over the past year, rendering essential purchases unaffordable for many. Three countries—Lebanon, Venezuela and Sudan—have been drastically affected, with triple-digit food inflation rates. An additional 29 countries have experienced food price rises between 10 and 15 percent over the past year and 55 countries between five and ten percent.

Skyrocketing inflation is often associated with depreciating currencies. The currencies of these three countries—Lebanon, Venezuela, and Sudan—are highest in terms of year-on-year food inflation, and each lost more than 50 percent of their value over the past year. WFP currently flags 22 currencies as hotspots or in alert status, indicating annual value losses that are unusually high, rapidly accelerating or both.

At the same time, incomes are still depressed from COVID-19. Labour markets are struggling to recover and, after staggering losses in working hours in 2020 and 2021 (equivalent to 258 million and 125 million full-time jobs), the International Labour Organization projects a working hour deficit equivalent to 52 million full-time jobs for 2022. This implies sustained losses in income and purchasing power, on top of inflation.

The world has taken extraordinary measures to safeguard lives and livelihoods during the COVID-19 crisis—at an unprecedented cost. Fiscal support and monetary measures that governments put in place during the first 18 months of the pandemic to stave off economic collapse amount to US\$26 trillion, nearly 30 percent of global gross domestic product. Debt is at record levels. About 60 percent of low-income countries are at high risk or already in debt distress, compared with 30 percent in 2015. Governments are less economically resilient after 2 years of dipping into their coffers to soften COVID's economic blow on their citizens. This means that governments are tapped out too.

Funding Shortfalls

WFP aims to assist increasing numbers of people, however, faces a significant funding gap. The Ukraine crisis not only unfolds in the aftermath of COVID-19 but with other drivers of hunger like conflict and climate change unabating, other crises—such as climate-related crises in Eastern and Southern Africa—are still there.

WFP, therefore, plans to step up and assist increasing numbers of people: 145 million beneficiaries in 2022. This is an even higher number than in the past 2 years, when WFP assisted a record-breaking 115.5 million beneficiaries in 2020 and a record 128 million in 2021. This year WFP's assistance will cost approximately US\$20 billion.

Funding requirements have unfortunately increased faster than contributions and today WFP faces a funding gap of 50 percent. While WFP has always faced funding gaps, they have previously not been to this extent or in this environment. As other UN agency and government budgets are similarly under strain, everyone is forced to cut assistance at the same time. This makes cuts in the lifeline of WFP assistance much more painful for people than they would have been in previous years.

The Ukraine conflict only adds to the funding gap, by increasing WFP's operational costs and constraining its response at a time when it is needed the most. While other exporters of staple food commodities should—at least partially—be able to make up for the shortfall in supplies to global markets from the Black Sea region, these commodities are not only higher priced, but have added operational costs. Buying from farther afield implies higher transport costs and delivery times—for WFP and everyone else dependent on purchases in international markets.

In view of the recent hikes in container costs, this is an important consideration. The cost per container reached US\$4,000 in 2021, four times as much as its cost in 2019 (US\$1,000). With rising prices in international markets for food commodities, WFP's food procurement costs were already up by US\$42 million per month at the end of 2021 compared with their 2019 average. Together with an estimated US\$29 million increase in WFP's monthly costs for food and fuel due to the price increases related to the Ukraine conflict, this means that WFP's monthly costs are expected to be US\$71 million above their 2019 average. This is an increase by 44 percent and enough to cover one daily ration for 3.8 million beneficiaries for a month.

Conclusion

Unless the Ukraine crisis is resolved soon and stops pushing up needs while simultaneously making the humanitarian response more expensive, the global repercussions of the conflict could become much worse. As needs rise and the economic environment undermines assistance, WFP is increasingly confronted with the decision of who to support out of those in need—and who not to support.

The costs of humanitarian inaction are tremendous, especially for people in need, who in the worst case pay with their lives. Failing to mobilize sufficient and timely funds for humanitarian assistance also means that donors bear the costs of inaction. As soon as refugees arrive at donor countries' borders, the new host governments start—literally—paying for not having acted earlier.

Looking back at the Syrian refugee crisis, Germany's total refugee-related costs from 2016 to 2020 amount to a shocking US\$125 billion at the Federal level. While this includes funds designated to fighting the root causes of forced displacement, more than US\$80 billion went into domestic social transfers, transfers to states and municipalities, integration, as well as arrival, registration, and asylum procedures. For every U.S. dollar spent on a forcibly displaced person in the developing world, US\$70 goes to an asylum seeker in a donor country.

Not even a decade after the Syrian refugee crisis, the world risks repeating it. With the Ukraine conflict contributing to a deterioration of existing crises, such as in Afghanistan, regional destabilization and a massive influx of refugees to western countries could soon become a reality. The war has food security implications not only in Ukraine but risks causing collateral damage all over the world, putting up to an estimated 323 million people in a situation of food insecurity in 2022. The world does not need another crisis in the current context that is already beset by extreme difficulties.

Despite the very bleak situation, WFP is encouraged about USG's efforts to leverage the resources available under the Bill Emerson Humanitarian Trust and the sustained commitment from the American people to respond to some of these urgent crises around the world.

The CHAIRMAN. Well, thank you, Dr. Husain for your time and also the comparative analysis that you provided us with regards to the challenges the World Food Programme has had in the past compared to the challenges today and the resources available.

The Members at this time will be recognized in the order of seniority, alternating between the Majority and the Minority Members. We have heard our four witnesses who have done a terrific job, and every Member will be recognized for 5 minutes to ask questions, and for those of you who are operating remotely, please keep your microphones muted until you are recognized so that we can minimize background noise.

Ms. Harden, you talked about the sustainability, which is very important to me. How does the sustainability factor into USDEC's work to market and promote dairy products globally?

Ms. HARDEN. Thank you, Mr. Chairman. I will tell you, I am so proud of the dairy farmers and our dairy industry for their commit-

ment to sustainability. I believe that we have the most sustainable dairy in the world. Our farmers and processors have set goals. This is a journey. We don't have all the answers today, but I do believe it is a big part of who we are and who we are going to be as a trading partner.

And sir, we are asked all the time. Our customers ask us about sustainability, and they understand we are good for people, but we also have to be good for the planet and we are committed to that.

The CHAIRMAN. Right, and we have challenges and I am very familiar with them, three-generation dairy family in California.

We have kind of a bit of humor that we use oftentimes, and this relates to the famine and the shortage of food products that we are anticipating, that what a dairyman does when prices are up, they produce more milk. What do dairy folks do when prices are down, they produce more milk. I am not sure that model works anymore, but I know there is a lot of production in powder, and I am wondering as I said earlier, you may have heard, commodities that we have surpluses of, I am wondering what your thoughts might be on how this dry powder can be used, it has a long life and it can be used for protein in areas where we are having hunger and food shortages.

Ms. HARDEN. Most definitely, sir, and I love your anecdote, and that is one I have heard my whole career in dairy.

I believe we can be a part of helping with malnutrition and hunger. Dr. Husain can verify this, but I was told that some of the biscuits that are going to Ukraine do include skim milk powder in them, and I believe there is more opportunity for the U.S. RUTF products that have such high protein, high energy. I believe dairy can play a bigger part in—

The CHAIRMAN. Well, let's take a look at that.

Mr. O'Keefe and Ms. Berg, CRS is requesting full flexibility for non-emergency in Title III Food for Peace programming. This would mean that all of the non-emergency Title III funds could be used in cash vouchers instead of commodities. Can you walk us through CRS's rationale behind this recommendation, and would that flexibility in use of commodity food aid for non-emergency programming together make sense? I am just—there were—not all the funds were spent on those commodities in the last year. Go ahead.

Mr. O'KEEFE. Thank you so much. Great question. Let me—we fully support the use of commodities in Title III programs where it is appropriate, and what we are recommending is that decisions about the mix of cash and commodities be made at the local level based on the very different contexts in each country.

The way the program is now with 20 percent cap on 202(e), which was mentioned by Assistant to the Administrator Charles, USDA and USAID are forced to make decisions country-by-country based on these aggregate—

The CHAIRMAN. Do you think we should lift that cap?

Mr. O'KEEFE. I do think we should lift that cap, and I think it would allow better, more effective programs in many situations that are more responsive.

Whether it would result in more or less total U.S. commodities would remain to be seen, but it would result in more efficient and effective programs country-by-country.

The CHAIRMAN. Ms. Berg?

Ms. BERG. So yes, I know that they did have some flexibility in the last farm bill. Having been to Africa and witnessed a refugee camp, we definitely support in-kind commodities. We promote it. It was great to see that big bag of U.S. wheat sitting there and everybody embracing the fact that we are there.

We do want a balance between the two. We did see the need for cash in how they create their camps and how they create the self-worth for the refugees as well, and it helps out with hospitals and different things.

The CHAIRMAN. Well, we have a lot of refugees from Ukraine, over four million now in Europe.

Dr. Husain, do you care to comment?

Dr. HUSAIN. Sir, I agree with both. I mean, essentially it is about having the in-kind assistance, in-kind commodities. There is space for that, but also, you would need the cash-based on—the additional cash because what it does is it helps for people to keep the food, because sometimes people will have to sell their food on discount to get to other basic necessities, maybe health stuff, maybe school stuff, maybe something else.

So, as long as these decisions are made where food aid also goes together with cash assistance and it is well thought out, it is in benefit of everybody, including the American farmer.

The CHAIRMAN. Yes, I don't know if you—my time has expired, but quickly comment. The previous panel talked about our efforts to cooperate with the European Union and the initiatives that are going on as a result of this invasion of Ukraine and the impacts. Was the World Food Programme also with the UN and others a part of this collaborative effort?

Dr. HUSAIN. Yes, sir, they are listening to us. We are in an advisory role, basically, and what we are seeing is that it is maybe a production problem, but it is also economic access and physical access problem.

Right now, there may be food in different parts of the world, but to get that food to the places where it is needed is really expensive, both in terms of cost, but also in terms of time.

The CHAIRMAN. Good point.

My time has expired. I want to recognize my friend, the gentleman from South Dakota, who is always focused, Representative Dusty Johnson.

Mr. JOHNSON. Thank you, Mr. Chairman. Now, that is a lot of pressure. My line of questioning has to be focused or I make us both look silly.

My questions will be for Ms. Harden. I noted with some disappointment that last week Ambassador Tai had noted that the Indo-Pacific Economic Framework was not going to have any reduction in tariffs, and this is coming with a backdrop where I think American producers are increasingly facing some uneven playing fields. Of course, competitiveness is really a relative measure, right, so the extent other countries are entering into quality trade deals, that can disadvantage American producers if we are not also out there trying to make sure that we are opening up new markets and reducing barriers.

So, Ms. Harden, I have a two-part question for you. Number one, give us some sense of the barriers that American dairy producers and processors face in the Indo-Pacific region, number one, and then number two, give us sort of the state of play as you understand it, and do you think that Ambassador Tai and others will aggressively pursue the reduction and elimination of non-tariff trade barriers, and any other thoughts on that topic?

Ms. HARDEN. Thank you, sir, and thank you for your support in continuing to make sure that agriculture is a focus of the framework.

There are certain things that I hope are on top of their list and want to streamline really overly burdensome regulatory requirements on our dairy facilities and plants, trying to get product in there. We believe that is something that can be addressed and should be addressed.

I talked about it in my comments briefly about really protecting our common food names, so the Europeans have really made it very hard for us to have an even playing field with products like parmesan and feta, so that is another area we really hope the Administration will focus on. And we just—we really do. We are going to continue to keep pressuring on to lower this most favored nation tariffs to really ensure we have a level playing field, because we do not in so many of those cases, sir.

Mr. JOHNSON. So, in the Indo-Pacific region, are there particular markets that your members are most excited about, interested in, and that this Committee should focus on most attentively?

Ms. HARDEN. Certainly. Indonesia, as I mentioned, Malaysia, the Philippines, Vietnam, all of those we believe have great potential. The customers there, the consumers there love our products. They want our products. We want to be able to get them to them.

Mr. JOHNSON. So, do you have—I mean, what is your sense of where we—I mean, are we making progress on this front, and where do you—what do you see the developments looking like here in the weeks and months to come?

Ms. HARDEN. Well, progress—we certainly are continuing. If you look globally, I would say we do have progress. We continue to be very aggressive in key markets, certainly in Indonesia, Pacific, and Southeast Asia, Mexico, Latin America, the Middle East, Northern Africa, but we are at a disadvantage in many of those places. So, keeping the pressure on to make sure there is a level playing field. We have great products. There is demand. It is a tight market right now, as you probably know, with product because of production from the EU and New Zealand, as well as the U.S. being very tight, but we are excited about exports. If you look at even our numbers that just came out this week, dairy farmers—U.S. dairy farmers and manufacturers are stepping up and trying to meet the demand globally.

Mr. JOHNSON. Now, my friend, the Chairman, he and I have been working together on a number of supply chain issues, and so, my last question, Ms. Harden. I mean, any reactions or things you can share with us? I mean, I know the dairy industry has been hit hard by the supply chain disruptions. In fact, I think the number for the first half of last year was \$1.3 billion. What else can you tell us?

Ms. HARDEN. It was a little better right after Christmas and some of the efforts led by you, frankly, and other Members of this Committee have been tremendously helpful. The legislation that is passed, introduction of additional legislation by you and Chairman Costa are sending a message to customers around the world that the U.S. is taking this issue very, very seriously.

But we don't—we are not out of the woods. It is still very [inaudible].

Mr. JOHNSON. We lost you for a minute there, Ms. Harden, but you know, amen.

Ms. HARDEN. I am sorry. We have suggested other locations as well.

Mr. JOHNSON. Very good. Thanks, Ms. Harden. That is well said. Mr. Chairman, I yield back.

Ms. HARDEN. Thank you.

The CHAIRMAN. Good points, Mr. Johnson, and we will continue to work on the supply chain issue. It is so important.

The chair will now recognize the gentleman from Pennsylvania, Mr. GT Thompson, for his continued attention to this important hearing today. We thank you.

Mr. THOMPSON. Mr. Chairman and Ranking Member, thank you so much. This has been great, and thank you to the panel. I really appreciate the experience that you all bring.

Ms. Berg, your testimony mentions concerns with staffing in overseas FAS offices. I mean, we can do all kinds of great programs but if we don't have the people on the ground in different places, whether it is in the fields here at home or overseas, it is all for naught. Can you expand upon this concern, including what you have seen and heard, and your suggestions to USDA FAS to rectify these shortages?

Ms. BERG. So, one of the things we are looking for is to double MAP and FMD funding to help with resources overseas. One of the things that we have noticed with MAP and FMD funding is that 15 years ago, you had certain cooperators and now through specialty crops it is just kind of growing and growing. And so, pieces of the pie are kind of getting smaller and smaller to each commodity. So, that is why we definitely need more funding for these programs to get boots on the ground and have a presence in these countries. So, we definitely want to have some sort of funding mechanism to help with staffing levels.

Mr. THOMPSON. So, we have actually been a victim of our own accomplishments of expanding innovation and science with—and I think that is a great point.

Dr. Husain, thank you for your service. Please give my best to Mr. Beasley when you see him, a dear friend.

I appreciate your recognition of the role of American farmers in making your work of feeding those in need around the world possible. Likewise, you acknowledged the importance of a “balanced toolbox of food assistance modalities.” Can you elaborate on what you mean by that, and do you worry that it is kind of shortsighted of your colleagues to continue to chip away at the in-kind donations required under Food for Peace?

Dr. HUSAIN. Sir, what I mean by that is that if you go back about 10 years, the cash-based programs were very, very small part of

the World Food Programme, which was about \$210 million. Today, that is \$2.3 billion, so there has been a substantial growth on that side.

But that growth has not meant that the food aid—in-kind food aid went down. In-kind food aid also went up from about 3.6 million tons to about 4.3–4.4 million tons right now over the same time period. So, what we are seeing is that there is—because of these rising needs, it is the base of what is required is becoming bigger and bigger. And the way I see this is that because we are sitting at a 50 percent gap in terms of what we expect to get *versus* what is needed, there is opportunity for growth both on the in-kind side, as well as on the cash side. Because again, I would say is that what we don't want to do is have people sell their food because they needed to meet some other essential need. So, provision of both of them hand in hand goes very far.

Thank you.

Mr. THOMPSON. Thank you.

Mr. O'Keefe, thank you for your service with Catholic Relief Services. You are a force for good around the world.

Your testimony alludes to the idea of resiliency and resilience building. Can you tell us how these efforts are unfolding in CRS's work, and how each of the CRS farm bill recommendations build resiliency?

Mr. O'KEEFE. Sure. So, thank you so much, Congressman, and thanks for the kind compliment.

So, I am going to talk about our program—McGovern-Dole program in Sierra Leone. The President of Sierra Leone, who I had the opportunity to meet a year and a half ago at the Department of Agriculture here, thanked CRS because he is trying to build a nationwide local school feeding program on the foundation and the spine of the USDA-supported McGovern-Dole program. And that is a key ingredient to how he sees resilience of government services, and particularly food support for the most vulnerable people in his country. We are using U.S. commodities mixed with cash to build the capacity to link schools with farmers to buy local produce so that at the end of the 5 year program, the country of Sierra Leone will be self-sufficient in its school feeding program. That is going to make that country more resilient, make those schools more resilient, and we think it is a huge contribution to the development of that society.

Mr. THOMPSON. Okay. My time has expired, but I don't want to miss the opportunity just to say thank you to Ms. Harden for your leadership and your service with USDA formerly, and now with the U.S. Dairy Export Council. As someone who comes from a long line of dairy farmers, some days I think there is milk flowing through my veins. I am just really appreciative of your leadership and your service there. So, I look forward to continuing to work with you.

Ms. HARDEN. Thank you.

Mr. THOMPSON. Mr. Chairman, my time has expired.

The CHAIRMAN. Well, thank you very much, Representative Thompson. We really appreciate all of your contributions, and we all thank the witnesses and the efforts on mission for mobilization on Catholic Relief Services. We really appreciate the good work you folks do as well.

Our next Member is Representative Barry Moore from Alabama, and then I believe we have one other Member who is in queue, and if that is the extent of it, then we will close the hearing.

Mr. Moore from Alabama's 2nd District.

Mr. MOORE. Thank you, Mr. Chairman. I appreciate it.

Dr. Husain, each day reveals more dire news from Ukraine. Your testimony spent some time addressing the conflict and its current and potential implications. Can you please expound on that testimony a little, and also include any updates that you might have from yesterday or maybe this morning?

Dr. HUSAIN. Yes, sir. In Ukraine, sir, it is one of the worse crises which I have seen, and I have seen many. What is happening there is unacceptable, and being right in the middle of that at World Food Programme, we are assisting about one million people already inside the country. Our goal is to get to at least three million people very, very soon, within weeks, and up to six million people by June.

Sir, in our supply chains, we already have 40,000 metric tons of commodities which we are trying to move. It is not only about when you are displaced, and over ten million people are internally displaced. It is not about giving wheat or flour; it is about giving commodities which they can eat right away. So, prepared commodities and doing that supply chain is a big task, but we are up to it. We have over 176 people inside and in the six neighboring countries doing this job.

And I would like to say that, sir, what is happening in Ukraine has huge ramifications for the rest of the world. Where in country after country, 44 million people are one step away from famine, 44 million people one step away from famine. We are cutting their rations by half. Why? Because we don't have enough resources. And sir, this is not going to go away until we sort out the root causes, and what is the biggest root cause? It is conflict. Conflict everywhere. In Ukraine, that is the latest. But Yemen is still there. Syria is still there. Northeast Nigeria is still there. Ethiopia is still there.

And sir, the other last thing that I want to say is that because of Ukraine, it doesn't mean that other conflicts stop. We have climate shocks. I am seeing things out of Ethiopia in the Somalia region which remind me of 2011 Somalia where 260,000 people died before a famine was declared according to Johns Hopkins University. So, we are looking at some very nasty things, and I don't think it is going to improve, because if this war doesn't get resolved in the next couple of months, fall is going to be worse than what we are seeing right now. I am sorry to be saying all of these things, but that is what is out there.

Mr. MOORE. Well, we appreciate it, obviously, and I was in Ukraine in August, and I know that us as a Committee and as a nation, we appreciate your efforts, and we will continue to keep you in our prayers. But thank you for the work you do.

Dr. HUSAIN. Thank you.

The CHAIRMAN. The Chairman still has time on your clock, unless you yield the balance of your time.

Mr. MOORE. Yes, Mr. Chairman, with that I will yield back. Thank you.

The CHAIRMAN. All right, thank you. That was good questions, good focus, good response, Dr. Husain.

The next Member that I have on my queue line is Representative Baird from Indiana's 4th.

Mr. BAIRD. Thank you, Mr. Chairman. I really appreciate you holding the second part of this panel and this hearing.

My first question really goes to Ms. Harden, and it deals with the fact that Ambassador Tai recently stated that free trade agreements are a 20th century tool, and that our competitors, notably the European Union, are forging ahead and securing preferential market access for their agricultural producers through comprehensive trade agreements.

So, Ms. Harden, are you concerned about where we are in making those kinds of trade agreements, and how that impacts American produced products?

Ms. HARDEN. Yes, sir. To be perfectly honest, I believe we have to use every tool available. We do feel like we are falling behind. Our largest competitors, as I mentioned earlier, with the EU and New Zealand, they take full advantage of all of the tools and I believe we just have to as well. We know we have good products. We know we can be competitive, but it has to be a level playing field. So, everything that can be available, we actually need to be using, sir.

Mr. BAIRD. I really agree with you. One of the things that we have in our favor in addition to being able to really get products to other countries is we really have high quality products. We have the ability to produce and our farmers and ranchers can really be proud of that, and we can be proud of our products moving overseas.

I guess I might change direction just a little bit, and Dr. Husain, the World Food Programme is a critical partner for U.S. and getting food into the disaster zones, and delivering longer-term assistance through USDA's McGovern-Dole Food for Education Program. Can you tell us a little bit about your success in using these nutritionally dense U.S. grown food in your McGovern-Dole projects, like fortified rice, corn-soy blend, and dry beans? Give us some idea how successful those programs are.

Dr. HUSAIN. Sir, we are, in fact, McGovern-Dole, we are proud partners of that. Of the 40 or so countries where it is helping school children, we are in ten countries, so about $\frac{1}{4}$ of all countries we are working with McGovern-Dole. And that itself says we do that because we believe in it. We are—we see—like Mr. O'Keefe was saying, we see the value of the child providing that nourished meal, not only as something which is for the child, but really is for the community. And that—bringing in the community support on that side. Essentially, putting the seeds for that is critical, because then communities can take over. They can build. And I think this is the real value of the McGovern-Dole initiative, and the more we can do, the better it is.

And the other thing, sir, I would suggest is that we are present in 80 countries. We know these people. We know these markets, and sometimes, we can offer advice on which countries to prioritize, where to prioritize, and I think that would also be quite helpful in

terms of taking these really trusted and proven programs to another level.

Thank you, sir.

Mr. BAIRD. Well, I think it is really—I am glad to hear because I think one way that we can advance civilizations to help themselves is through the children and give them exposure to how to produce food and that sort of thing, and I think that is a real asset.

Dr. HUSAIN. That is true, sir.

Mr. BAIRD. Yes. Well, I thank you very much and appreciate the opportunity to be with you, and I yield back, Mr. Chairman.

The CHAIRMAN. The gentleman yields back, and we thank him for his focus and his participation.

I will now, for closing comments, recognize my colleague, the gentleman from South Dakota, and then I will follow and again, we want to thank our witnesses.

Mr. JOHNSON. There have been a number of references made today, Mr. Chairman, to McGovern-Dole initiatives, and in fact, our colleague from the big 1st of Kansas noted that Bob Dole had held that seat prior to Tracey Mann. I would just note that George McGovern held my seat in Congress. He was not my immediate predecessor, but in the final years of his life, he and I struck up quite a relationship. I think we got to know each other relatively well, and clearly, George McGovern's politics were not my politics. But there were a number of areas upon which we agreed, and three of them were, first off, recognition of the unbelievable efficiency and effectiveness of the American farmer and rancher. Number two, the incredible importance of access to markets, giving those producers an opportunity to help feed the world; and then number three, the incredible power of food, of sustenance, to help link together people with shared values that you spoke about earlier, Mr. Chairman, and about how that humanitarian aid can be a tremendous soft power that makes the world more secure, safer, and freer. And it is not just George McGovern and I that shared those values, Mr. Chairman, they are values that you and I share as well, and shared values of a huge swath of bipartisan Members on this Committee.

So, I just want to close by thanking the panelists on both halves of the panel for so clearly articulating the key issues that are impacting those shared values, and what we can do together in the weeks and months to come to make sure that American producers have avenues for their yields, that communities in crisis receive the help they need, and that shared values are advanced.

The CHAIRMAN. I thank the gentleman for his comments, and I concur on all of the above. And I think this has been a very good hearing. It has been a very good hearing not only because of participation of the Members this morning, but also because of the witnesses. We have had a tremendous level of experience and expertise from this second panel as well as from the first panel, and it certainly resonates on the complex issues that we are dealing with.

And of course, we have discussed this morning how the catastrophic events that have taken place as a result of Russia's invasion of Ukraine without reason, and the effects it is having not only for the courageous, valiant people in Ukraine, but the ripple effect

is it having elsewhere and the added refugee problems that we are dealing with.

Obviously, we are going to continue to find ways to support Ukraine and find ways to, as Dr. Husain pointed out and others, prop up the global food supply chain. I think, while we have not discussed it too much this morning, tapping into the Bill Emerson Humanitarian Trust is one step that could have an immediate impact. But we talked about lifting caps. We talked about a host of other ideas and thoughts dealing with commodities in which we have surpluses here in the United States, and I am heightened to hear how as we look at next year's effort for the reauthorization of the farm bill, the suggestions that our witnesses have made on how we can improve Title III and Title II, and how we can improve the way these programs work.

I am reminded of the fact that the iteration of our flagship international food aid programs was Food for Peace, conceived by another significant American statesman, Hubert Humphrey. Senator Humphrey signed that law in by President Dwight Eisenhower. That takes us back a ways, but it is an indication—and I want to close on this note—on what we can do in this incredible country of ours when we work together on a bipartisan basis. Over the years, our success, I believe, has best been demonstrated when we work together on a bipartisan basis, and certainly, as a colleague of ours once said—I believe he is the ambassador to Japan right now—never let a crisis go to waste. As horrific as this crisis is, it gives us an opportunity to restore the notion that we put our politics—we leave it behind at the water's edge, and these global challenges we are facing not only in Ukraine, but as Dr. Husain mentioned in Yemen and elsewhere around the world, conflict is the source of this and therefore, we as America are stronger and better and more able to work with our allies if we together here in Washington are united and we put our politics aside. And that is part of our challenge. But we have an opportunity here. We know that the storm is in front of us, and we can anticipate because of that what we need to do to address the challenges that we are facing.

As I said earlier this morning, historians will look back 20 years, 25 years from now and they will make determinations on whether or not we made more good decisions than poor decisions. I believe we have an opportunity to work together to make good decisions as it relates to the programs not only in Title III, but the other titles within the farm bill authorization. And we can find ways to use emergency initiatives to address the current crisis that we are facing.

So, with that said, I want to thank the Members of the Committee. I want to thank our witnesses for the good work that you have done, and we will keep all of these thoughts in mind not only today, tomorrow, but as we write the next farm bill next year.

So, with that, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from any witness or any question posed by a Member.

So, with that understood, I thank the witnesses for the terrific job you have done, and this hearing of the Subcommittee on Livestock and Foreign Agriculture is now adjourned.

[Whereupon, at 12:52 p.m., the Subcommittee was adjourned.]

Russia's War On Ukraine¹

'We see the storm coming': U.S. struggles to contain a deepening global food crisis

Biden officials are scrambling to limit the damage from fast-spreading food shortages sparked by Russia's war in Ukraine, but they face complex political and logistical challenges.

04/05/2022 03:24 p.m. EDT

As Russian forces refocus the brunt of their military assault on Ukraine's food-producing southeast, U.S. officials and lawmakers are struggling to help ward off a deepening crisis both inside Ukraine and for fragile economies around the world already reeling from climate disasters and [COVID]-19.

Russia's military is pushing further into Ukraine's wheat fields, which could jeopardize millions of tons of grain set to be harvested in July—threatening sustained shortages in countries across Africa and the Middle East that rely on Ukraine as a major source of their grain and sunflower oil to feed millions of people. The crisis has also contributed to sky-rocketing grain prices, which has made it harder for humanitarian organizations like the United Nations' World Food Program, to respond; the agency says it needs an additional \$16 billion to feed a record 137 million people for the rest of the year.

Ukrainian President Volodymyr Zelenskyy told the U.N. Security Council Tuesday that Moscow has provoked "a global food crisis that could lead to famine in Africa, Asia and other [regions] and large scale political chaos in many countries."

White House and State Department officials are working with USAID and WFP to counteract the shortages, and President Joe Biden has pledged \$1 billion in hu-

¹<https://www.politico.com/latest-news-updates/2022/03/russia-war-on-ukraine-2022-2022-03/>.

²<https://www.politico.com/staff/meredith-lee>.

manitarian assistance “for those affected by Russia’s war in Ukraine and its severe impacts around the world.” But after Congress approved \$4 billion in humanitarian assistance for Ukraine and refugees in nearby countries in the omnibus spending package last month, many GOP lawmakers have little political appetite for further global food aid funding. And while the Administration has some resources it can tap without Congress to send American-grown food to regions in need, agricultural realities, including widespread drought last year, the timing of the planting season and the rising cost of inputs such as fertilizer and fuel, limit how much U.S. crops can help fill the gap created by the crisis in Ukraine.

According to two people familiar with the plans, the Administration plans to unlock additional international food aid in the coming days, including the Bill Emerson Humanitarian Trust—a Federal cash reserve of \$260 million the government keeps to buy U.S. grain and other commodities to send to foreign countries in crisis. Lawmakers are pressing Agriculture Secretary Tom Vilsack to approve a withdrawal of the funds for USAID, which first needs to formally request it. But Congressional aides acknowledge the available funding is a drop in the bucket compared to the total aid that’s needed.

Meanwhile, a push for Congress to provide additional foreign aid fell apart this past weekend. A small group of senators were trying to revive efforts to squeeze \$1 to \$2 billion in international funding into a [COVID]-19 package, including some \$200 million in global food aid. But the plan crumbled after Republicans rejected Democrats’ suggested methods to pay for the aid and several Republicans demanded the Biden Administration reverse a move to lift a Trump-era deportation policy for migrants, the Title 42 public health order being enforced at the southern border, according to three Congressional aides.

Sen. Chris Coons speaks during a Senate Judiciary Committee confirmation hearing on Capitol Hill in Washington, Wednesday, March 23, 2022. (Alex Brandon/AP Photo.)

Chris Coons (D-Del.), one of the senators pushing for the additional food aid, lamented the move as “a serious mistake” and argued that “mass starvation is a real, impending threat.” On top of that, Coons, Republican *Lindsey Graham* of South Carolina and other like-minded senators are warning that such widespread food shortages could trigger mass migration and political destabilization across North Africa and the Middle East, which could in turn threaten U.S. national security. Coons said he will push for a stand-alone bill with global vaccine and food aid funding.

“We see the storm coming and we feel under-prepared to deal with this,” said a senior Senate aide.

Sens. *Bob Menendez* (D-N.J.) and *Jim Risch* (R-Idaho), the top lawmakers on the Foreign Relations Committee, *sent a letter*³ Tuesday asking the Biden Administration to develop a strategy to address the global food insecurity fallout, including “fully leveraging” the Bill Emerson Humanitarian Trust and other programs. But they stopped short of calling for additional funding from Congress.

Officials at the State Department’s Bureau of Economic and Business Affairs are tracking the global food insecurity fallout from Russian President Vladimir Putin’s invasion of Ukraine.

“Vulnerable groups, particularly in the Middle East and Africa, are at higher risk because of Russia’s war,” said Ramin Toloui, who heads the bureau.

Toloui said U.S. diplomatic posts are in close contact with countries whose people are at risk of increased food insecurity and American officials are working with allies, multilateral agencies and international financial institutions to address food insecurity.

We see the storm coming and we feel under-prepared to deal with this.

Senior Senate aide

U.S. officials are particularly concerned about countries such as Afghanistan and Yemen, which are already suffering severe hunger crises, as well as Lebanon, where $\frac{3}{4}$ of the population lives in poverty. The latter country, already in an economic free fall, received about 80 percent of its grain from Russia and Ukraine before the war. In another blow, Lebanon can only store about one month’s worth of wheat after the 2020 Beirut blast that destroyed its major grain silos.

With shortages stacking up, the U.S. is pressing India, Argentina, China and other countries with significant grain reserves to donate some of their supply to the World Food Program or at least release it into global markets. Biden, after meeting with G7 leaders late last month, warned of “real” food global shortages. Biden added that the U.S. and Canada, two major grain exporters, discussed how the two countries could send more grain abroad to help fill supply gaps.

But as U.S. officials are working to alleviate shortages, they’re running into other challenges: namely that global wheat reserves, including in the U.S., are running lower than normal after record drought last year. Governments with grain surpluses have been reluctant to release too much of their supply, including Canada.

The higher demand for wheat, corn and other food supplies are also hitting at a time when farmers across the world are under immense financial pressure from high costs for fuel, fertilizer, seed and other agricultural inputs.

Cecilia Rouse, chair of the Council of Economic Advisers, speaks during a press briefing at the White House, Monday, March 28, 2022, in Washington. (Patrick Semansky/AP Photo.)

³<https://www.foreign.senate.gov/download/04-05-22-rm-and-risch-letter-to-president-biden-re-ukraine-global-food>.

In the U.S., Cecilia Rouse, chair of Biden’s Council of Economic Advisers, indicated to reporters last week that the White House expected U.S. farmers to increase production in order to benefit from higher commodity prices, which shot up after Russia invaded Ukraine.

“With the price of food rising, they will be responding by making additional plantings and trying to take advantage of the increased price signals,” Rouse said. “So the market will work as the market will work.”

Rouse added that the U.S. Government, including USAID, was working with partners and other international organizations “to get the food and ease the price pressures” for countries in need.

But U.S. farmers, who generally make plans and order supplies in the winter for the spring planting season, are already in the fields in some states. The Agriculture Department released a report just days after Rouse’s remarks indicating U.S. farmers planned to plant roughly the same number of acres as the year before, but with less corn—adding to concerns about grain reserves.

G.T. Thompson of Pennsylvania, the top Republican on the House Agriculture Committee, said it was “completely naive” of the White House to say that farmers would be able to ramp up production amid high fuel and other production costs.

“We’re not talking about just producing what we’ve always done,” Thompson said. “With the hunger, and the starvation, and the death that’s going to occur, we would need to give [U.S. farmers] the tools to increase their yield.”

Thompson, other Republican lawmakers and some farm groups say they want Vilsack to allow farmers to plant crops on land currently in Federal conservation programs in an effort to meet the global demand. Vilsack recently rejected the request, arguing the impact of such a move would be limited since a “considerable proportion” of the land is in regions suffering drought. The land is also, by design, often located in hard to reach places to help mitigate soil erosion and capture carbon. Environmental groups have been *pressing Vilsack to seek alternatives*.⁴

With the price of food rising, they will be responding by making additional plantings and trying to take advantage of the increased price signals. So the market will work as the market will work.

CECILIA ROUSE.

If the U.S. fails to respond to the food crisis abroad, some lawmakers worry China or other rival countries could use their grain reserves to gain additional political influence across Africa and Asia.

“They are predators. They are extorters,” Sen. *Kevin Cramer* (R-N.D.) said of China, noting Beijing’s previous efforts to use commodities and their own assets as a sort of “predatory lending” tool.

China isn’t likely to be in a position to export significant amounts of grain anytime soon, according to economists tracking the situation. But it’s possible Russia could try to fill a small segment of the food supply gaps left behind by Ukraine. U.S. officials worry that Russia’s recent threat to export its agricultural products only to “friendly” nations will lead some vulnerable countries to remain silent about the Russian invasion.

“This is why we—as a peace loving, freedom loving, generous nation—cannot abandon our post in these fragile areas,” said Cramer, adding he would be inclined to support a stand-alone funding bill. “The leadership voids will be met by others that will exploit it for much less noble purposes.”

For now, Cramer is in the minority of his GOP colleagues, many of whom note the U.S. is already a top provider of global food aid and that the Administration still has money it can spend from current aid programs—including Cramer’s own home-state colleague, *John Hoeven*.

Hoeven, asked if the U.S. should increase funding for programs that purchase and send U.S. commodities abroad, replied, “We should use the existing programs.”

Abstract

This report presents results from the United States Department of Agriculture (USDA), Economic Research Service's (ERS) International Food Security Assessment (IFSA) analysis, which uses a demand-driven framework that evaluates consumer responsiveness to changes in prices and incomes for 76 low- and middle-income countries. Reflecting 2021's anticipated lower income levels, despite anticipated growth for most countries, the number of food-insecure people is estimated at 1.2 billion, almost 291 million higher than in 2020. A sharp increase in global food insecurity was experienced in 2020, as compared to 2019, due to the COVID-19 pandemic. Most of the additional food-insecure people in 2021 are located in the Central and South Asia (64.1 percent or 186.8 million) sub-region—including India, which drives food security trends in the Asia region. While the Sub-Saharan Africa region is projected to account for 20.6 percent (60 million) of the additional food-insecure population. The remaining additional 15.3 percent (44.7 million) food-insecure people in 2021 are located in other Asian sub-regions, Latin America and the Caribbean, and North Africa. The prevalence of food insecurity in 2021 for the countries in the assessment is estimated at 30.8 percent of the overall population in the countries, an increase of 6.8 percentage points relative to the 2020 estimate. In 2031, the number of food-insecure people is projected to decline from the 2021 estimate by 47.4 percent (637.7 million people), which is 14.0 percent of the projected population of the countries included in this assessment. Given the evolving nature of the impacts from the COVID-19 pandemic and the long-term effects on individual country economies, the estimation results presented in this report contain a high degree of uncertainty. It is important to note the projections do not consider the impacts of unknown future events—such as climate change, armed conflict, and political and economic instability.

Acknowledgments

Appreciation is extended to Shida Henneberry and Utpal Vasavada, USDA, Economic Research Service, for their guidance in the drafting of this report. We would also like to thank the reviewers for their feedback and helpful comments, especially Johanna Trevino and Clara Cohen, U.S. Agency for International Development; David Boussios and Sharon Sydow, USDA's Office of the Chief Economist; Hui Jiang and Pace Lubinsky, USDA's Foreign Agricultural Service; Keith Wiebe, International Food Policy Research Institute; and Sonja Perakis and Peter Thomas, Famine Early Warning Systems Network. We also thank Christine Williams, Christopher Whitney, and Casey Keel for editorial assistance, David Marquardt and Rodney Odom for map design, and Chris Sanguinett for layout and cover design.

Preface

This report continues the series of Global Food Assessments (GFA) in developing countries that begun in the late 1970s by USDA's Economic Research Service (ERS). In 1993, the title of the series was changed to Food Aid Needs Assessment (FANA) to reflect the reports' contents more accurately, which assess selected developing countries with recent or ongoing food deficits. However, not all countries experiencing significant food deficits are included due to lack of data on key metrics such as average caloric consumption, prices, or macroeconomic figures. In 1997, ERS widened the analysis beyond the assessment of aggregate food availability to include more dimensions of food security and the title was revised again to Food Security Assessment (FSA). Starting with the report published in July 2011, ERS changed

the name to International Food Security Assessment (IFSA) to clarify the geographic scope of the analysis.

A report summary from the Economic Research Service

What Is the issue?

Millions of people around the world are food-insecure and do not consume sufficient calories to sustain an active and healthy life. What factors affect the present and future prevalence of international food security? Agricultural production and market conditions affect the supply of food available in a given country. And, income, food prices, and economic inequality are major factors determining the ability of people to access food. Widespread food availability, rising income, and low food prices improve a country's food security by increasing access, although the extent of these gains are dependent on the distribution of income within countries. On the other hand, adverse income, prices, or food supply shocks can increase food insecurity, as these factors collectively impact low- and middle-income consumers' access to food. Measuring the shifts in consumer demand in response to these factors can help measure progress in food security. Even if demand may be fully met, a person could remain food-insecure—as they might not be able to purchase enough calories to sustain an active and healthy life for their level of income. This report uses a demand-driven model that integrates income, price, and food supply shocks to assess current-year levels of food security and projected changes over the next decade for 76 low- and middle-income countries in Sub-Saharan Africa, North Africa, Latin

America, the Caribbean, and Asia. The report helps USDA and its stakeholders estimate medium-term projections of food security in the selected countries. The 2021 report also analyzes the combined impact of lower incomes and price shocks associated with the lingering effects of the Coronavirus (COVID-19) pandemic on present and future food security.

What did the study find?

The report's results reflect the country and global level estimates of economic shocks from the COVID-19 pandemic at the time of estimation. The results are based on macroeconomic trends up to August 2020, consumption and production data up to January 2021, and price trends from January 2018 to December 2020. The report's projections do not consider the impacts of certain types of possible unknown events in the future, such as climate change, armed conflict, and political and economic instability.

The main findings for the 76 countries covered by this report are:

- Despite the anticipated overall rebound in per capita gross domestic product (GDP) growth in 2021, income is projected to remain below pre-pandemic levels for most countries in the assessment. This projected lower per capita GDP level in 2021 is the main underlying factor for the continued decline in food security.
- Due to the persistent effects of COVID-19 on income levels, the number of food-insecure people in 2021 is estimated at 1.2 billion, an increase of almost 32 percent (291 million people) from the 2020 estimate. This suggests 30.8 percent of the estimated population of the 76 countries is unable to consume 2,100 kilocalories (kcal) a day, an average caloric level necessary to sustain a healthy and active lifestyle.
- Most of the additional 291 million people estimated to be food-insecure are in Asia (72 percent of the total)—particularly in Bangladesh, India, Pakistan, and Indonesia—and in Sub-Saharan Africa (21 percent of the total).
- Despite the COVID-19-induced income shocks, food security is projected to improve in all 76 countries over the next 10 years. By 2031, the share of the population that is food-insecure in the 76 countries studied is projected to fall to 14 percent (637.7 million people), a 47.4 percent drop in the number of food-insecure people from 2021.
- The anticipated improvement in food security over the coming decade is driven by a projected steady income growth, relatively stable prices for major grains, and lower population growth, particularly in Asia, Latin America, and the Caribbean.

How was the study conducted?

The USDA, Economic Research Service (ERS) demand-oriented International Food Security Assessment (IFSA) model (described in the appendix) projects food demand and food gaps in 76 low- and middle-income countries through 2031. Food security is evaluated for each country by estimating the share of the population unable to reach a caloric target of 2,100 kilocalories per person per day. The intensity of food insecurity is measured by determining the gap between projected food demand for those falling below the threshold and the caloric target. Food demand is expressed in grain equivalents, based on caloric content to allow aggregation across four separate food groups: the major grain consumed in the country, other grains, roots and tubers, and all other food. Average per capita food consumption data are from the United Nations' Food and Agriculture Organization (FAO) Food Balance Sheets and FAO's Global Information Early Warning System's (GIEWS) Country Cereal Balance Sheet. Observed domestic prices are from FAO-GIEWS Food Price Monitoring and Analysis Tool. Tariff data are from the World Bank's World Integrated Trade Solution (WITS). Incomes, exchange rates, and Consumer Price Indexes (CPI) are from the ERS International Macroeconomic Dataset. World prices are from USDA's Agricultural Projections to 2030.

ERS is a primary source of economic research and analysis from the U.S. Department of Agriculture, providing timely information on economic and policy issues related to agriculture, food, the environment, and rural America.

Introduction

The U.S. Department of Agriculture's Economic Research Service's (ERS) International Food Security Assessment (IFSA) analysis¹ estimates per capita food de-

¹The results from the IFSA model are not directly comparable with other analyses such as FAO's modeling work for its report on the State of Food Insecurity (SOFI), which has a broader

mand and compares the estimations against a global nutritional target of 2,100 kilocalories² (kcal) per person per day. The nutritional target, set by the United Nations,³ is an average Calorie level necessary to sustain a healthy and active lifestyle. The aim of the IFSA is to help USDA and its stakeholders estimate long-term projections of food insecurity in 76 low- and middle-income countries using income projections from ERS's International Macroeconomic Data Set, international and domestic food prices over the medium term,⁴ and international food insecurity projections through 2031.

The current report incorporates current assumptions for key macroeconomic variables (*e.g.*, income growth, inflation, and exchange rates) and population, reflecting the economic consequences of the global COVID-19 pandemic. The economies of the countries included in the assessment sharply contracted in 2020 due to the widespread pandemic, resulting lockdowns, and other control measures impacting business activity,⁵ employment, and incomes. Although growth is projected to return to positive rates in 2021, real Gross Domestic Product (GDP) levels are anticipated to remain below levels seen before the global pandemic in 2021 and in years to follow.⁶ The medium- to long-term path to economic recovery cannot be known with certainty, and the pace of economic recovery will vary across countries. Therefore, the report's results assume that the macro-economic trends—determined using the 2018–2020 period as a baseline—will not significantly vary from the anticipated trend over the 10 year projection period. In addition, this report's projections do not consider the impacts of possible unknown events in the future. These events could include: catastrophic weather, armed conflict, political and economic instability, as well as the potential for protracted effects from the COVID-19 pandemic.

Reflecting the continued effects of the COVID-19 pandemic on economic growth, food insecurity in 2021 is anticipated to further decline from last year for the population in the 76 countries included in the IFSA. However, over the next decade, the food security status is projected to improve for most countries covered by the assessment. Principal findings for the countries covered by this report are:

- GDP per capita growth is anticipated to rebound in 2021. However, income is projected to remain mostly below levels achieved during the pre-pandemic period of 2017–2019. Moreover in 2021, GDP per capita is projected to be lower than in 2020 in 23 countries covered by the assessment—including India and Indonesia—which account for 40.8 percent of the population covered in the assessment. The projection for lower GDP per capita levels is the main underlying factor for the continued decline in food security in 2021.
- For the 76 countries included in IFSA, the prevalence of food insecurity in 2021 is estimated at 30.8 percent—or 6.8 percentage points higher than the estimate for 2020. The prevalence of food insecurity is estimated to be higher in 2021 than in 2020 in 56 of the 76 countries.
- The high prevalence of food insecurity in 2021 translates to more than 1.2 billion people potentially not having consistent access to the daily caloric target of 2,100 kcal.⁷ The number of food-insecure people in 2021 is estimated to be

country coverage and different methodology. Because the IFSA also uses aggregate data, IFSA cannot be compared directly with evaluations using household-level surveys. It is also difficult to extrapolate our results to Food Security Information Network's (FSIN) report on global crises, which uses the five-phase food insecurity measure—a consensus approach across international organizations and development practitioners directly responding to major crises. For a more in-depth discussion and comparison of USDA's IFSA model with other modeling approaches, see Tandon, *et al.* (2017).

²A kilocalorie is the same as one Calorie. A kilocalorie is the amount of heat required to raise the temperature of one kilogram of water 1° Celsius.

³The 2,100 Kcal per capita per day threshold was an internationally agreed upon level set by United Nations as the recommended level of dietary energy intake for a healthy, well-nourished individual (FAO, 2004).

⁴Medium-term price projections are taken from USDA Agricultural Projections to 2030, long-term projections report OCE-2021-1. These projections are then used to project medium-term domestic price trends, using data from the Global Information and Early Warning System (GIEWS) of the United Nations Food and Agriculture Organization.

⁵Some of the control measures that impacted business included, but not limited to, curfews, closures of large venues, restrictions on operations of hotels and restaurants, closures of borders.

⁶See the macroeconomics assumptions box at the end of this section for more details.

⁷The caloric target considered in the assessment is an average across men and women, age groups, regions, and activity levels.

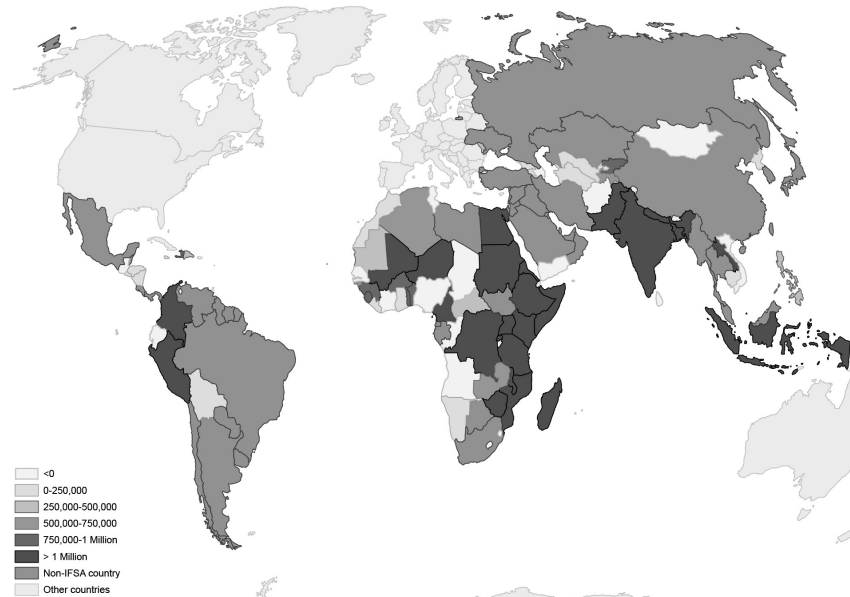

almost 291 million higher⁸ than the 2020⁹ estimate, an increase of 32.0 percent (figure 1).

- Central and South Asia sub-region (186.8 million people)—and in particular India—and Sub-Saharan Africa (60 million people) are estimated to account for almost 85 percent of the additional 291 million people estimated to be food-insecure in 2021.

Figure 1

In 2021, as the impacts of the COVID-19 pandemic on income levels linger, the number of food-insecure people increases for some countries

Change in number of food-insecure population

Notes: COVID-19 = Coronavirus disease of 2019; IFSA = International Food Security Assessment.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

- By 2031, the share of the population that is food-insecure in the 76 countries studied is projected to fall to 14.1 percent, a 54.4 percent drop from its 2021 estimate. The number of people considered food-insecure is projected to decline by 47.4 percent from 2021 to 637.7 million people.
- The food gap—defined as the amount of food needed for all food-insecure to reach the caloric target of 2,100 kcal/day—indicates the intensity of food insecurity. The gap can be expressed in calories per capita per day or in grain-equivalent quantities. In addition, the food gap is used to measure the annual national food shortfall. For the 76 countries examined—on average—the daily caloric food gap is projected to decline by 19 percent, from 380 kcal (18.1 percent of the caloric target) in 2021 to 308 kcal (14.7 percent of the caloric target) in 2031.

⁸The United Nations Office for the Coordination of Humanitarian Affairs (2021), estimates a similar trend to the assessment and anticipate that acute food insecurity in 2021 will increase by 235 million people. For more details see: United Nations Office for the Coordination of Humanitarian Affairs (OCHA), 2021. Global Humanitarian Overview 2021. Geneva, Switzerland.

⁹For more on the ERS results of the impact of COVID-19 on food insecurity in 2020 see: Baquedano, F., Zereyesus, Y.A., Christensen, C., and Valdes, C., 2021. COVID-19 Working Paper: *International Food Security Assessment, 2020-2030: COVID-19 Update and Impacts on Food Insecurity*. COVID-19 Working Paper #AP-087, January 2021. U.S. Department of Agriculture, Economic Research Service.

Country coverage and observed food security trends

The 76 countries in this study are sub-divided across 4 major regions: 39 countries and 4 sub-regions in Sub-Saharan Africa (SSA), 22 countries and 4 sub-regions in Asia, 11 countries and 2 sub-regions in Latin America and the Caribbean (LAC), and 4 countries in North Africa (NAF). Estimated levels of food insecurity for 2021 vary greatly across these regions. Asia (647 million people) and SSA (491 million people) account for 94 percent of the total number of food-insecure people in 2021 (*figure 2*). However, in 2021, SSA has the highest share of the population that is food-insecure of any region at 44.9 percent (*figure 3a*). By contrast, 26.2 percent of the population in Asia is considered food-insecure in 2021—with the prevalence of food insecurity being the highest in Mongolia, North Korea, and Yemen—averaging 72 percent across the 3 countries. The LAC region (with 44.7 million people) and NAF region (with 28.6 million people) account for the remaining 6 percent of food-insecure people identified in the 2021 assessment (*figures 2 and 3b*). The prevalence of food insecurity in the LAC region averaged almost 26 percent in 2021—whereas in the NAF region, the same metric averaged 14.5 percent—making the latter region the most food-secure in the study sample (*figure 3a*).

Figure 2

Asia accounts for 63.0 percent of the population of the 76 countries studied and 53.0 percent of the food-insecure people in 2021

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

Despite the projected lower income levels in 2021 (resulting from the COVID-19 pandemic), food security is projected to improve across all 76 countries over the next 10 years as GDP growth continues to recover. The share of the population that is food-insecure is projected to fall to 14.0 percent (637.7 million people) by 2031, a 54.6 percent drop from the 2021 share of the food-insecure population (*figures 3a and 3b*). By 2031, food security in Asia is projected to improve the most of all regions. The prevalence of food insecurity (6.4 percent of the population) and the number of food-insecure people (175.7 million) are projected to decline by 72.9 percent and 75.4 percent, respectively, over 10 years. This projected improvement mainly reflects an estimated strong economic recovery from the COVID-19-induced recessions after 2021 for most of the region, particularly in India. By contrast, over the next decade, SSA is anticipated to make the least progress at improving its food security metrics. While robust economic growth is projected after 2021 for SSA, population growth¹⁰ is anticipated to outpace income growth over the coming 10 year period. The higher growth in population over income will likely result in lower real purchasing power of the average person in SSA. As a result, the decline in the prevalence of food insecurity in SSA is projected to be moderate. By 2031, in SSA the prevalence of food insecurity is projected to be 29.7 percent— $\frac{1}{3}$ lower than in 2021 (*figure 3a*). Despite the moderate decline in the prevalence of food insecurity by

¹⁰Population growth projections for Sub-Saharan Africa, and all regions in the assessment, are obtained from the International Data Base (IDB) of the U.S. Department of Commerce, Bureau of the Census.

2031, SSA is projected to reduce the number of food-insecure people by 71 million from 2021 (figure 3a). In LAC, the prevalence of food insecurity is projected to decline by more than half to 12.3 percent, and the number of food-insecure people will decline by almost half to 23.5 million by 2031. In NAF, food security is projected to improve over the next 10 years, with the prevalence of food insecurity falling below 8.0 percent and the number of food-insecure people falling to less than 18 million in 2031 (figures 3a and 3b).

Gross Domestic Product and international food price trends

The macroeconomic assumptions underlying the 2021–2031 IFSA reflect the economic impact from the global spread of the COVID–19 pandemic, that began during the last quarter of 2019. Nearly all 76 IFSA countries were affected by decreased economic growth in 2020. Although, growth is projected to return to positive rates in 2021 for most IFSA countries, real per capita Gross Domestic Product (GDP) is expected to remain below levels seen before the global pandemic in 2021 and in years to follow. GDP per capita in 2021 is estimated to sharply increase¹¹ from 2020 in Asia and estimated to moderately improve in LAC (*table 1*). By contrast, in NAF, GDP per capita is estimated to decline from 2020. GDP is projected to remain relatively unchanged in SSA for 2021. For all regions, however, GDP per capita in 2021 remains below its pre-pandemic level of 2019 (*table 1*). Between 2021 and 2031, strong to moderate annual growth in GDP per capita is projected for Asia and LAC. Conversely, between 2021 and 2031, NAF and SSA are anticipated to have moderate income growth. By 2031, SSA is projected to lag the other IFSA regions in terms of GDP per capita, as GDP growth is outpaced by population growth.

Table 1

Source: USDA, Economic Research Service based on results from the USDA, ERS International Macroeconomic Data Set.

International food commodity prices are expected to remain relatively stable in inflation-adjusted terms over the coming decade¹² (*figure 4*). The price for sorghum is the only commodity price projected to decline over the coming 10 year period. In contrast, the projected prices for rice from 2021 to 2026 are anticipated to increase before stabilizing towards the end of the 10 year period. The relative price stability mainly reflects ample food supplies in world markets that will outweigh global demand (USDA, OCE, 2021). In some markets, world and domestic food prices are integrated through trade. In other cases, barriers to trade can cause domestic prices to move independently of world prices. Twenty-six of the 76 countries¹³ covered in IFSA are projected to have rising real domestic prices of their major grain between 2021 and 2031. Fifteen of these countries are in SSA.

Figure 4

Grain demand, production trends, and the Implied Additional Supply Required (IASR)

In 2021, total grain demand for IFSA countries is estimated at 1 billion tons. The demand for grains is projected to grow to 1.3 billion tons by 2031 (*table 2*). Food demand is the largest component of total grain demand. Asia accounts for most of

¹²Price projections come from USDA's long-term agricultural projections to 2030, (USDA, OCE, 2021) and are converted to prices in 2015 to adjust for inflation.

¹³The full set of projections at the country, subregional, and regional level of anticipated price changes of their major grain are presented in *Appendix III*.

the food demand in 2021, as Asia has the largest share of the population of the 4 major regions defined in IFSA. From 2021 to 2031, grain demand is projected to increase by 2.7 percent per year across all 76 countries. Demand for grains is expected to increase the most in SSA (3.5 percent per year) and Asia (2.5 percent per year). Food demand is also projected to grow faster than grain demand for other uses (including feed) over the 10 year period. Across the 76 countries in the study, food demand is projected to grow at an annual rate of 2.8 percent over the coming decade. Grain demand for other uses is projected to grow at a pace of 2.5 percent per year from 2021 to 2031. But at the regional level, the SSA region's demand for food (3.8 percent per year) is projected to grow faster than demand for other grains (3.2 percent per year). However, in LAC and NAF, demand for grains for other uses are projected to grow faster on an annual basis than food demand between 2021 and 2031. In Asia, demand for food and grains for other uses is projected to grow evenly year-to-year over the next decade.

From 2021 to 2031, grain production is expected to increase by 2.5 percent per year (*table 2*). This projected increase is slightly below the growth rate for total grain demand and the demand for food grains. The annual rate of growth for grain demand for other uses is on par with the growth in production. Over the decade, the LAC region is projected to see the highest annual growth-rate of grain production relative to all other IFSA regions. Moreover, the annual rate of growth of grain production in LAC is projected to surpass both the rate of annual growth for food grains and grains for other uses. By contrast Asia is projected to see the lowest rate of growth in grain production (2 percent a year) of any region. Asia's anticipated annual grain-production growth will fall below the growth of demand for grains for food and other uses (*table 2*). The NAF region's grain production is projected to grow 2.5 percent year, a rate that is almost 10 percent higher than the rate of growth for total grain demand and grain demand for other uses. The SSA region is projected to see grain production grow 3.6 percent a year from 2021 to 2031, mostly on par with the growth-rate of demand for grains for food and other uses.

Despite the projected robust growth in production—in absolute terms—the gap between domestic grain production and demand for grain is anticipated to widen for the 76 countries in the assessment over the coming decade (*table 2*). The Implied Additional Supply Required (IASR)—which provides an estimate of the gap between demand and supply for grains—is projected to increase by 3.3 percent per year between 2021 and 2031. Through the upcoming decade, IASR will annually grow the fastest in the Asia (4.9 percent) and Sub-Saharan Africa (3.4 percent) regions. By 2031, these same two regions are also projected to have the highest IASR of any other regions included in IFSA.

Table 2

Demand for grains is projected to outpace grain production over the 2021–2031 period, driven mainly by demand from Asia and Sub-Saharan Africa regions

How food security is assessed: Method and definitions (for more detailed information on the model, see *Appendix I*)

Food demand is projected for 76 low- and middle-income countries—39 in Sub-Saharan Africa, 4 in North Africa, 11 in Latin America and the Caribbean, and 22 in Asia. Food is divided into four groups: (1) the major grain consumed in the country, (2) other grains, (3) root crops, and (4) all other food. The IFSA model's projections of food demand are expressed in grain equivalent, based on the caloric content of food items to allow for aggregation across food groups; this grain equivalent may be expressed in either kilograms or kilocalories. For example, grains have roughly 3.5 Kcal per gram, and tubers have about 1 calorie per gram. One ton of tubers is therefore equivalent to 0.29 tons of grain.

The IFSA model analyzes the gap between projected food demand, which is a function of per capita income and food prices, and a nutritional target of 2,100 Kcal per capita per day. This report uses three indicators of food insecurity. The *food gap* measures the food needed to raise consumption at every income level to the nutritional target. In many countries, per capita consumption in the lower income deciles is significantly less than per capita consumption for the country. In these countries, the distribution gap provides a measure of the intensity of hunger—the extent to which the food security of already hungry people deteriorates as a result of income declines or other negative economic conditions. This measure can be expressed on a per capita basis (in Kcal per day), or as an aggregate measure (the total tons of food needed to fill the gap in each country).

The second indicator is the **share of the population that is food-insecure**. Food demand is assumed to be met and equal to consumption. We no longer assess consumption by income decile, but instead in a continuous manner across all income levels.

Finally, the number of food-insecure people—those who cannot meet the nutritional target—is based on total population and the population share that consumes less than the nutritional target. Terms commonly used in this report include:

Food consumption—equal to food demand if we assume that the demand is met.

Food access—depends on a consumer's purchasing power. Food access is estimated based on income level and food prices within each country according to an income-consumption relationship.

Food insecurity—occurs when estimated per capita food consumption for a consumer at a certain income level falls short of the nutritional target of 2,100 Kcal per person per day.

In 2021 the continued impacts on income from the COVID-19 pandemic are anticipated to increase food insecurity at a higher rate in low-income countries

The Prevalence of Food Insecurity (PFI) for 2021 across the 76 countries included in the assessment is estimated at 30.8 percent, 6.8 percentage points higher than the 2020 estimate. The distributions of the PFI relative to GDP per capita for the 2021 and 2020 estimates is shown in the graph below. The 2021 and 2020 trend lines are indicated by the solid and broken lines, respectively. Two points are clear, based on the information contained in the graph. First, the PFI has on average increased in 2021 for all income levels relative to 2020. Second, the combined effect of the per capita income and price shocks due to the pandemic is not uniform across the countries in the assessment. More specifically, the increase in food insecurity is more prevalent in low-income countries compared to high-income countries. The trends for 2020 and 2021 reveal that the gap between the two trendlines for high-income countries is significantly smaller, relative to low-income countries.

Percent food-insecure
Per capita Gross Domestic Product (2015 Dollars)

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

Macroeconomic assumptions for the International Food Security Assessment, 2021–2031

The macroeconomic assumptions underlying the 2021–2031 International Food Security Assessment (IFSA) reflect the economic consequences from the global spread of the COVID–19 pandemic, that began in 2019. Nearly all 76 IFSA countries were affected by decreased economic growth in 2020. Although, growth is projected to return to positive rates in 2021, real gross domestic product (GDP) is expected to remain below levels seen before the global pandemic in 2021 and in years to follow.

The macroeconomic assumptions are taken from multiple forecast services, U.S. Government projections, international agency projections, and ERS regional and country experts. The projections assume no policy changes and no additional shocks (*e.g.*, political crises, conflicts, disease outbreaks, weather events). The macroeconomic projections were completed in August 2020 and were based on expectations at that time.

Worsening fiscal and external accounts brought on by the pandemic have impacted government and private consumption, resulting in weaker economic growth. Pandemic-related restrictions have exacerbated unemployment, food supply shortages, and increased inflation. Most countries are showing real depreciation against the U.S. dollar (in the near term) but weak agricultural sectors, market, and port lockdowns restrict exports in the longer term. In addition, the collapse in global oil demand has reduced oil production and revenue for oil-dependent IFSA countries. Continued uncertainty in a few IFSA countries in 2021 could generate future economic recessions.

The economic projections suggest the recovery will be gradual and uneven, with economic growth across all 76 countries projected at 2.3 percent over the 2021–31 period. On a regional basis, Asian countries are projected to average 3 percent per capita income growth annually during the 2021–31 period, fol-

lowed by Latin American and Caribbean (LAC) countries at 2.3 percent. In North Africa, per capita income is projected to grow at an average rate of 2.2 percent, whereas in Sub-Saharan Africa per capita income growth is projected to average 1.7 percent per year. Despite the slower economic growth, the share of global real GDP by IFSA countries is projected to increase from 12 percent to 14 percent between 2021 and 2031.

Asia is projected to have the most rapid long-term growth than any other IFSA region. Based on continued investment in infrastructure, India is expected to recover after 2021. Economic recovery in Georgia is less encouraging due to the weakened outlook for export demand, whereas in Kyrgyzstan's and Turkmenistan' loss of labor remittance inflows impacts GDP growth.

In contrast, in LAC, North Africa, and Sub-Saharan Africa growth rates are projected to remain below what is needed to restore 2020 pandemic losses. In Sub-Saharan Africa, lower external donor support and internal trade are factors behind the GDP contraction and Congo and Sudan (oil-dependent economies) are adversely impacted by decreasing global oil prices. Landlocked Mali's economy is severely hit by being denied access to ports in neighboring countries.

The LAC region was severely affected by the COVID-19 pandemic, on account of strict lockdowns and limited government support to counter reduced incomes. Both Bolivia and Colombia face a challenging recovery, given the slowdown in the hydrocarbons sector. Slow recovery reflects the halt in tourism in Jamaica. In El Salvador, Guatemala, Honduras, and Nicaragua the drop in family remittances reduced private-sector domestic consumption. Within the LAC region, the major exception is Peru where projections indicate a modestly fast recovery in the near term based on export revenues.

Regional Overview

The food security indicators and model projections presented here (for 2021 to 2031) are based on historical macroeconomic data and projections from the ERS International Macroeconomic data set. The macroeconomic assumptions underlying the 2021-2031 IFSA reflect the economic consequences of the COVID-19 pandemic throughout the world. All 76 countries were affected by significantly lower economic growth in 2020, but growth is projected to return to positive rates in 2021. However, real GDP growth is expected to remain below pre-pandemic levels in nearly all countries covered by the assessment in 2021 and in years to follow. The production and consumption data are from January 2021. This means events since January 2021—including droughts, flooding, and any shocks to supply or demand—are not reflected in these data or the following analysis.

Changes in food security vary across regions. In Sub-Saharan Africa (SSA), food security is projected to slowly improve due to rapid population growth and relatively low per capita income growth. Nonetheless by 2031, SSA is anticipated to remain the most food-insecure region in the assessment, as SSA is projected to have the highest prevalence of food insecurity of any region. Reflecting the impact of the COVID-19 pandemic on the economies of Asia, the region is estimated to have the highest number of food-insecure people in IFSA for 2021. However, the estimated prevalence of food insecurity in Asia is only slightly more than half the same metric for SSA. By 2031, the 22 countries in Central Asia, East Asia, Other Asia and Southeast Asia included in this assessment—collectively referred to in this report as Asia—are projected to experience the fastest food security improvement, as the region's largest economies continue to benefit from rapid income growth. The 4 North African countries assessed are also projected to experience improvements in food security, though levels of food insecurity there are relatively low to begin with. In the 11 countries in the Latin America and the Caribbean (LAC) region—8 in Central America and the Caribbean and 3 in South America—the share of population experiencing food insecurity is projected to fall by more than half by 2031.

Sub-Saharan Africa

The population of Sub-Saharan Africa (SSA) in 2021—currently estimated at one billion—is projected to reach 1.4 billion by 2031. The anticipated increase in the region's population (2.6 percent a year) over the next decade makes it the fastest growing region in the assessment. Countries in SSA continue to face significant food security challenges. Since the outbreak of the COVID-19 pandemic—conflict, reduced agricultural output (due to weather events and pest infestations) and lower per-capita income—continue to generate high levels of severe food insecurity in SSA (Food and Agriculture Organization of the United Nations (FAO), 2020).

The COVID-19 pandemic has further aggravated food insecurity in the SSA region by limiting income generating activities and restricting access to agricultural inputs. In 2021, GDP in the SSA region is estimated to grow 3.4 percent to \$1.4

trillion USD, a 0.4 percent increase from its 2019 level (*table 3*). The anticipated slow economic recovery of the SSA region has a significant effect on the estimates of its food security metrics. For 2021, SSA is estimated to have the highest share (44.9 percent) of its population considered food-insecure among the 4 regions covered by the assessment (*table 4*). The SSA region has the second highest number of food-insecure people (491.5 million). The 2021 estimate of the number food-insecure people is 62 million higher than the 2020 estimate, highlighting the lingering effects of the COVID-19 pandemic on local economies (*figure 5*). However, the change in the number of food-insecure people in 2021, relative to 2020, varies across countries in SSA. Compared to the 2020 assessment, several countries are estimated to see an increase in the number of food-insecure people. For example, in Uganda, the Democratic Republic of the Congo, and Kenya, the number of food-insecure people is estimated to increase by more than 10 million in 2021 in each country compared to 2020. By contrast, countries—such as the Sudan, Nigeria, Angola, and Burundi—will experience a moderate reduction in their estimated food-insecure people in 2021, relative to 2020.

Table 3

Inflation adjusted per capita income for Sub-Saharan Africa region, 2021 and 2031

Region/subregion	2019 (pre- COVID-19)	2021	2031
	Dollars (2015 U.S.)

Figure 5

Sub-Saharan Africa: Change in the number of food-insecure people in 2021, from 2020

Change in the number of food-insecure population

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

Despite the economic contraction from the COVID-19 pandemic, GDP per capita over the next decade is projected to annually grow by 1.4 percent in the SSA region (an improvement from -1.1 percent during the 2015-2020 period from \$1,311 in 2021 to \$1,505 in 2031 (table 3). By 2031, West Africa is projected to have the highest GDP per capita in SSA at \$2,024, surpassing the SSA regional average. However, despite the anticipated growth in SSA's GDP per capita over the next decade (both in absolute and relative terms), the region will still have the lowest estimated income of the four regions included in IFSA. Moreover, SSA is projected to have the highest population growth of any region, countering the impact of income gains on food security. As a result, by 2031, the SSA region is expected to make the least

progress in its food insecurity metrics (*table 4*). From 2021 to 2031, the share of food-insecure people is projected to decline from 44.9 percent to 29.7 percent (or by 420.8 million people). Driven by trends in Nigeria, the West African sub-region is projected to make the most gains in its food security metrics by 2031. However, the Central Africa sub-region is projected to make the least progress. Over the next decade, the share of the population that is food-insecure is projected to decline in Central Africa. However, because of an anticipated high population growth, there will be more food-insecure people in Central Africa in 2031 than in 2021 (*table 4*). Over the next decade, the daily caloric food gap—the difference between estimated consumption and the daily consumption target—is projected to decline by 17.8 percent from 444 kcal in 2021 to 365 kcal in 2031.

Table 4

Note: * Measured in grain equivalents.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

Grain demand in SSA for both food and other uses (including feed) is projected to increase by 45.0 percent in the next decade, from 141.2 million tons to 204.1 million tons, which is the highest of the four regions (*table 4*). This increase in demand

is driven mainly by the anticipated growth in population and improved per capita income (tables 3 and 4). From 2021 to 2031, grain demand is projected to increase 41.0 percent and reach 337 million tons. Demand for food grain is projected to grow at a higher rate (3.8 percent a year) relative to the demand for grain for other uses (3.2 percent a year). Moreover, the share of food demand (60.0 percent) of total grain demand is anticipated to remain relatively unchanged over the 10 year period. From 2021 to 2031, grain production is projected to grow (3.6 percent a year), on par with total grain demand (3.5 percent a year). However, driven by population growth, in absolute terms total grain demand will outpace production by 99.4 million tons by 2031, a projected increase of 39.0 percent in the gap between production and demand from 2021.

Central Africa (CAF)

In 2021, the Central Africa (CAF) sub-region is estimated to have the highest prevalence of food insecurity in Sub-Sahara Africa region (SSA). Ninety-nine million people (*i.e.*, 69.0 percent of the population) in CAF are estimated to be food-insecure in 2021 (table 5). These substantial levels of food insecurity for 2021 in CAF are underpinned by continued armed conflicts, the COVID-19 pandemic, and incomes that are still below their pre-pandemic levels. The Democratic Republic of the Congo (DRC) accounts for 86.4 percent of the food-insecure population in the CAF sub-region. However, Cameroon is estimated to have the lowest prevalence of food insecurity of any country in the CAF sub-region at 21.1 percent of the population. The estimated number of food-insecure people in CAF for 2021 is 11.8 million higher than last year's calculation. The 2021 increase in food insecurity in the sub-region is largely driven by the anticipated rise in the number food-insecure people in the DRC. In 2021, GDP per capita in the sub-region is estimated to remain stagnant (-0.1 percent growth) and 3.4 percent lower than the average for the 2018-2020 period. The CAF sub-region is also estimated to have the lowest GDP per capita of the 4 regions in the assessment, \$630 annually, compared to the SSA average of \$1,311 (table 3).

Table 5
Food security indicators for Central Africa (Sub-Saharan Africa), 2021 and 2031

Year	Food grain demand	Other grain demand*	Total grain demand	Grain production	Implied additional supply required**
Million tons					
2021	7.8	7.7	15.5	7.0	8.5
2031	11.3	9.3	20.6	8.5	12.1

Notes: *Other grain demand includes seed, feed, waste, and processing. **The gap between grain demand and domestic grain production.

By 2031, GDP per capita is anticipated to grow 1.2 percent a year, reversing the negative trend during the 2015–2020 period, possibly reaching \$710 in the CAF sub-region (table 3). However, at the projected level, CAF will continue to have the lowest GDP per capita of any sub-region in IFSA. As a result of the projected slow growth in GDP per capita, the CAF sub-region is projected to see small improvements in its food security metrics by 2031. By 2031, the prevalence of food insecurity is anticipated to decline by 14.7 percent to 58.7 percent of the population, the highest of any sub-region (table 5). Excluding the DRC—the most food-insecure and largest country in CAF—the prevalence of food insecurity by 2031 is projected to decline by 46.4 percent to 18.2 percent of the population of the sub-region. The Central African Republic (CAR) is expected to reduce the prevalence of food insecurity the most, declining by 58.0 percent over the decade. But Cameroon is projected to have the lowest share (11.7 percent) of its population experiencing food insecurity by 2031.

By 2031, the number of food-insecure people in the sub-region is projected to be 114 million, about 14.3 million higher than in 2021. The anticipated increase in the number of food-insecure people in CAF is mainly driven by trends in DRC, where population growth is projected to outpace GDP per capita growth. Excluding DRC, CAF is expected to see a decline in the number of food-insecure people by 45.1 percent to 9.4 million by 2031. Over the next decade, the daily caloric food gap—the difference between observed consumption and the daily consumption target—is projected to decline by 18.6 percent from 538 kcal in 2021 to 437 kcal in 2031. However, there is significant variation in the sub-regional projections. By 2031, DRC is anticipated to see a 10 percent decline in the daily caloric food gap. By contrast, CAR is projected to see a 36.8 percent decline in its daily food Calorie gap, the highest in the sub-region by 2031.

Total grain demand in Central Africa—mainly driven by population growth—is projected to increase by 45.0 percent in the next 10 years, from 7.8 million tons in 2021 to 11.3 million tons in 2031. During the same period, the demand for feed and other uses will increase by 21.0 percent and the demand for food grain production will increase by 22.0 percent. Given the projected growth trends for grain demand

and production for both food and other uses, the gap between supply and demand is anticipated to grow throughout the decade. The additional supply required to meet sub-regional demand, either from imports or stocks, is projected to increase by 42.0 percent, reaching 12.1 million tons in 2031.

Cameroon is the most food-secure country in the CAF sub-region. However, the country's food security environment continues to be challenged by ongoing conflict and the COVID-19 pandemic (Global Network Against Food Crises (GNAFC), 2020). Cameroon's ability to respond to the pandemic has been limited by decreased oil prices—the country's main export—and continued internal conflict (GNAFC, 2020; FAO, 2020; World Food Programme (WFP), 2020). In 2021, Cameroon's GDP per capita is estimated to remain stagnant and 2.5 percent below the average for the 2018–2020 period. In 2021, the share of the population estimated to be food-insecure is 21.1 percent (6 million people). From 2021 to 2031, GDP per capita is projected to grow by 1.2 percent a year, lower than the anticipated growth for population (2.7 percent a year). However, real domestic prices of major grains are expected to steadily decline by an annual rate of 0.8 percent over the decade. By 2031, the share of food-insecure people is projected to decline 44.7 percent to 11.7 percent, and the number of food-insecure people is projected to be 4.3 million. Over the next decade, the daily caloric per capita food gap is expected to decline from 303 kcal in 2021 to 264 kcal in 2031.

The Central Africa Republic's (CAR) increasing insecurity due to armed conflict and economic impacts of the COVID-19-related restrictions are likely drivers of acute food insecurity (FAO and WFP, 2020). The CAR has the lowest GDP per capita in the CAF sub-region, making the population less resilient to income shocks. The CAR's GDP per capita is estimated to grow 1.1 percent to \$335.50 in 2021. However, GDP per capita is estimated to remain unchanged from the 2018–2020 period average of \$335.20. Reflecting the low-income levels in CAR, the country has the second highest estimated prevalence of food insecurity in the CAF sub-region. In 2021, the prevalence of food insecurity is estimated at 73.9 percent of the population. The number of food-insecure people in 2021 is estimated at 4.5 million. From 2021 to 2031, GDP per capita is projected to grow 2.4 percent a year, slightly higher than the anticipated population growth (2.0 percent a year) during the same period. By 2031, CAR's prevalence of food insecurity is projected to decline by 58.0 percent to 31.0 percent. The number of food-insecure people is anticipated to decline by 48.0 percent to 2.3 million. By 2031, the daily caloric food gap is expected to decline by 37.0 percent from 555 kcal in 2021.

The Democratic Republic of the Congo (DRC) is the largest country in Sub-Saharan Africa in terms of area and is the largest economy in the CAF sub-region. The Global Food Network Against Food Crises (GNAFC; 2020) estimates classify the DRC as the country that has the largest food crisis in absolute terms of any country globally. The DRC's food security situation continues to be affected by conflict and large numbers of internally displaced people. The COVID-19 restrictions have compounded the negative effects of the protracted economy and armed conflicts. Urban and peri-urban¹⁴ areas—which are areas more dependent on labor markets for their livelihood—were the most affected by the pandemic (GNAFC, 2020). In 2021, GDP per capita is estimated to marginally decline 0.2 percent from 2020 and remain 3.6 percent below the 2018–2020 period average. In 2021, it is estimated that the DRC has the highest prevalence of food insecurity (82.0 percent of the population) and the most food-insecure people (86.3 million) of any country in the CAF sub-region.

From 2021 to 2031, GDP per capita is projected to grow 1.5 percent a year, less than half the anticipated population growth rate (3.1 percent) over the same period. Given the anticipated slow growth of income, the DRC is not expected to see a significant improvement of its food security metrics by 2031. In 2031, the share of the population considered food-insecure is projected to decline by 10.8 percent to 73.3 percent of the population. However, the number of food-insecure people is anticipated to increase by 18.5 million in 2031. The projected increase in the absolute number of food-insecure people is mainly supported by the anticipated high population growth rate that outpaces income growth. Over the next decade, the daily per capita caloric food gap is expected to decline by 10.6 percent from 892 kcal in 2021 to 798 kcal in 2031—the highest projected daily per capita caloric food gap of any country in IFSA.

The Republic of the Congo (COG) has the smallest economy and population of any country in the CAF sub-region. The Republic of the Congo's food security situation is continually affected by the conflicts in neighboring DRC and CAR, as COG is a major recipient of large refugee populations. Moreover, COG's small economy was particularly impacted by the pandemic, as the country's GDP was estimated to have

¹⁴Relating to an area immediately surrounding a city or town.

declined by 4.5 percent in 2020 (Baquedano, *et al.*, 2021). In 2021, GDP per capita is estimated to marginally decline from 2020 (−0.2 percent) and remain 5.8 percent below the 2018–2020 period average. The prevalence of food insecurity for 2021 is estimated at 56.7 percent of the population. In 2021, the number of food-insecure people is estimated at 3.1 million in COG.

From 2021 to 2031, GDP per capita in COG is projected to grow at a rate of 0.2 percent a year, below the anticipated rate of growth of population (2.3 percent a year). As a result of the projected slow income growth, only moderate improvement in the country's food security metrics is anticipated over the next decade. By 2031, the share of the population considered food-insecure is expected to decline by 30.2 percent and reach almost 40 percent. The number of food-insecure people is projected to decline by 11.9 percent from its 2021 level and reach 2.7 million. Over the next decade, the daily caloric food gap is projected to decline by 16.2 percent from 402 kcal in 2021 to 337 kcal in 2031.

East Africa (EAF)

In East Africa (EAF) the overlap of shocks has exacerbated food insecurity and poverty conditions in the EAF sub-region (FAO and WFP, 2020). These shocks include reduced agricultural output, protracted conflicts in some countries, the socio-economic effects of the COVID-19 pandemic and the effects of pandemic containment efforts. In 2020, EAF's GDP per capita declined by 2.9 percent from 2019. In 2021, it is estimated that EAF's GDP will grow by 4.0 percent and be 5.3 percent above the 2018–2020 period average. There is some variation from this trend as GDP growth in Burundi, Chad, and Eritrea is estimated to grow marginally in 2021 and remain below the 2018–2020 period average. In Sudan, GDP is estimated to grow 5.1 percent in 2021, but growth is anticipated to remain below the 2018–2020 average. As a result of the variation of GDP growth across countries in the EAF sub-region and continued population growth, GDP per capita in 2021 is estimated to be 1.6 percent below its 2019 level.

In 2021, because of the estimated GDP per capita levels for EAF, 46.3 percent of the population in the sub-region is anticipated to be food-insecure (*table 6*). The number of food-insecure people in EAF is estimated at 177.2 million people in 2021. Ethiopia, with a population of 111 million people, is estimated to have 37.7 million of its population considered food-insecure. Uganda is estimated to have the second highest number of food-insecure people in EAF, with 26.5 million food-insecure people.

Table 6
Food security indicators for East Africa (Sub-Saharan Africa), 2021 and 2031

Year	Food grain demand	Other grain demand*	Total grain demand	Grain production	Implied additional supply required**
Million tons					
2021	50.6	23.3	73.9	61.3	12.7
2031	73.4	30.0	103.4	84.2	19.2

Note: * Measured in grain equivalents.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

Over the next decade, the population of EAF will increase from 382.4 million to 489.7 million people, a projected growth rate of 2.5 percent a year (*table 6*). By contrast, GDP is anticipated to grow by 4.7 percent a year from 2021 to 2031 and reach \$620 billion. Reflecting the anticipated trends in population and GDP growth, GDP per capita is projected to grow at a rate 2.1 percent a year and increase from \$1,025 in 2021 to \$1,267 in 2031 (*table 3*). East Africa's projected GDP per capita growth rate is the fastest in the SSA region. Due to the anticipated income growth, the prevalence of food insecurity is projected to decline by 40.5 percent by 2031. In addition, the number of food-insecure people is projected to decline by almost 24.0 percent to 134.9 million (*table 6*). In absolute terms, Tanzania and Uganda are anticipated to have the highest numbers of food-insecure people in the EAF sub-region for 2031. Over the next decade all countries in the sub-region are expected to see an improvement in their daily per capita caloric food gap—defined as the difference between the estimated level of consumption and the recommended target of 2,100 kcal per day. In 2031, the daily Calorie food gap for the sub-region is projected at 407 kcal, a 16.3 percent decline from 2021.

Food grain demand in EAF—mainly driven by population growth—is projected to increase from 50.6 million tons in 2021 to 73.4 million tons in 2031 (*table 6*). Grain demand for feed and other uses is projected to increase moderately from 23.3 million tons in 2021 to 30 million tons in 2031. Although projected growth for total grain demand and production are both anticipated to average 3.3 percent over the next decade, demand is expected to outpace production in absolute terms. By 2031 an additional 19.2 million tons, either from imports and/or stocks, are projected to be required to meet the sub-regions consumption needs (*table 6*).

For 2021, Burundi is estimated to have the second-lowest GDP per capita in EAF, after Somalia. From 2021 to 2031, Burundi's population is projected to grow at a rate of 3.0 percent a year, an increase from the 2.3 percent annual rate of growth

over the 2015–2020 period. By contrast, GDP is anticipated to grow at a rate of 2.0 percent a year over the next decade. Given population and GDP growth trends, GDP per capita is projected to decline in the coming decade, by an annual rate of 1.0 percent from \$250 to \$226. As a result of the projected macroeconomic and population trends, the prevalence of food insecurity in Burundi is expected to remain high at 78.9 percent of the population by 2031. Over the coming decade, the country is anticipated to make little progress in reducing the per capita food gap in kcal, which is projected to decline by less than 1.0 percent from 580 kcal in 2021 to 577 kcal in 2031.

In Chad, an expected decline in population growth, increase in per capita GDP, and downward trend in real domestic prices of major grains are expected to contribute to the country's improved food security metrics. However, the improvement in the country's food security situation over the next decade is projected to be moderate. Over the next decade, the share of the population projected to be food-insecure is expected to decline from 67.0 percent in 2021 to 58.4 percent in 2031. Moreover, the projected prevalence of food insecurity for 2031 is anticipated to be more than double the projected sub-regional average for the same year. The per capita Calorie per day food gap is projected to decline by 8.7 percent from 607 kcal in 2021 to 554 kcal in 2031.

Eritrea's population is expected to grow annually by 1.2 percent in the next 10 years, an increase from 0.9 percent a year during the 2015–2020 period. Eritrea is among the countries with higher prevalence of food insecurity in the EAF sub-region. In 2021, 3.8 million people (62.5 percent) of the country are estimated to be food-insecure. The per capita daily Calorie food gap is projected to decline from 442 kcal in 2021 to 276 kcal in 2031.

In Ethiopia, the impacts of the Tigray conflict and heightened insecurity in other regions are expected to continually hamper access to key income and food sources, such as labor migration and livestock sales in 2021 (FAO, 2020 and Famine Early Warning Systems Network (FEWS NET), 2020). Moreover, according to the African Center for Diseases Control and Prevention (2021), Ethiopia is the country with the highest number of reported COVID–19 cases in the sub-region. The country is also estimated to see only moderate growth in its economy in 2021. With an annual growth rate of 2.4 percent, Ethiopia's population is projected to reach 140 million by the end of 2031. However, Ethiopia's GDP is projected to grow at a faster pace of 6.1 percent a year, among the highest in the sub-region and on par with Uganda. As a result of income and population trends, per capita GDP is anticipated to grow by 3.7 percent during the 2021–2031 period. The real domestic price for major grains is projected to follow a declining trend, decreasing at a rate of 1.4 percent a year. By 2031, Ethiopia is expected to have the lowest prevalence of food insecurity (11.0 percent) in the EAF sub-region. The number of food-insecure people is projected to decline by almost 60.0 percent over the next decade. However, given that Ethiopia has the largest population in EAF, the country will still account for the largest number of food-insecure people (16 million) by 2031.

In Kenya, GDP per capita is anticipated to increase 1.8 percent in 2021 from its sharply reduced 2020 level, but income is expected to remain below its pre-pandemic level. It is estimated that 46.0 percent of the country's population could be food-insecure in 2021. However, by 2031, the prevalence of food insecurity is projected to decline by 68.0 percent because of a decline in real domestic prices for major grains and annual GDP per capita growth of 2.5 percent. The daily caloric food gap is projected to decline from 372 Kcal in 2021 to 260 Kcal by 2031.

Rwanda is among the fastest growing economies in the sub-region and is expected to maintain its pace of sustained GDP growth (4.4 percent, annually) in the coming decade. Moreover, in 2021, GDP per capita is estimated to be above the period average of 2018–2020. The prevalence of food insecurity in 2021 is estimated at 41.8 percent and is projected to decline by 56.8 percent to 18.0 percent by 2031. The estimated daily Calorie food gap in 2021 is projected to decline by 23.3 percent over the next decade and remain below the EAF sub-regional average.

Somalia is estimated to have the lowest GDP per capita of all countries included in the assessment, at \$101 in 2021. This figure is projected to slightly increase, at a rate of 0.4 percent a year during the next 10 years and reach \$105 in 2031. With real domestic price of major grain commodities expected to remain unchanged, Somalia's prevalence of food insecurity is projected to fall by 8.1 percent to 77.2 percent of the population by 2031. The estimated daily Calorie food gap in the country for 2021 is among the highest in the sub-region. By 2031, the daily Calorie food gap is projected to decline by 9.4 percent from 727 kcal in 2021 to 659 kcal in 2031.

In Sudan, food and transport prices have followed an upward trend since the last quarter of 2020, and grain prices (*e.g.*, sorghum and millet) were approximately seven times higher than the 5 year average at the end of the year 2020 (FEWS

NET, 2020). In addition, persistently low foreign currency reserves and high-import demand for essential food and non-food items led to a sharp depreciation of the Sudanese pound relative to the U.S. dollar (FEWS NET, 2020). The current projection for Sudan estimates a 4.6 percent decline in GDP per capita from 2021 to 2031, and prices for major grains are expected to increase at an annual rate of 1.2 percent. However, the anticipated rate of decline in GDP per capita (−0.5 percent a year) over the period of 2021–2031 is an improvement over the rate (−3.5 percent a year) observed during the 2015–2020 period. The population growth rate is projected to decline from 2.9 percent in 2021 to 2.6 percent in 2031. As a result of an anticipated slowed growth rate and a less rapid decline in per capita income, some improvement is expected for Sudan's food security metrics over the next decade. The prevalence of food insecurity is projected to decline by 46.0 percent from its 2021 estimate to 20.6 percent of the population. By 2031, the number of food-insecure people is anticipated to decline by 30.0 percent from the 2021 estimate to 12.5 million.

The United Republic of Tanzania has the second-highest population in EAF, after Ethiopia, with an estimated 60 million people in 2021. At a projected annual rate of growth of 2.6 percent year, the country's population is expected to reach to 78 million by 2031. The rate of growth of GDP per capita is expected to slow to 1.0 percent a year during the 2021–2031 period from 2.5 percent for the 2015–2020 period. The prevalence of food insecurity is projected to decline by 16.6 percent from its 2021 estimate, to 35.3 percent of the population. This projected decline reflects an anticipated higher population growth and lower income growth over the next decade. However, the number of food-insecure people is projected to grow by 8.0 percent from 2021 to 2031. The daily Calorie food gap is anticipated to decline by 6.8 percent from 495 kcal in 2021 to 461 kcal in 2031.

Uganda's GDP is projected to grow at an annual rate of 6.1 percent in the coming decade, on par with Ethiopia, and the highest in the sub-region. Uganda's population is expected to grow by 3.1 percent a year from 2021 to 2031, lower than the rate of growth (3.7 percent) for the 2015–2020 period. The share of the food-insecure population in Uganda is projected to decline by 23.9 percentage points, from 59.2 percent in 2021 to 35.2 percent in 2031, the second-highest decline in the EAF sub-region. The number of food-insecure people is expected to decline by 19 percent from its 2021 estimate, to 21.5 million in 2031. Over the next decade the daily per capita Calorie food gap is projected to decline by 21.5 percent from 522 kcal in 2021 to 410 kcal.

Southern Africa (SAF)

In 2021 the food security environment in the Southern Africa (SAF) sub-region continues to be affected by a number of factors including but not limited to natural hazards, pest infestations such as locust, and the slowdown in economic activities due to COVID–19-related restrictions (FAO and WFP, 2020). Although food-supply chains have remained functional, COVID–19-related border closures and movement restrictions, combined with reduced harvests in some countries, have led to above-average food prices and hindered food access (FAO and WFP, 2020).

Notwithstanding the difficult food security environment, in 2021, SAF's economy is estimated to grow 2.8 percent, but GDP is anticipated to remain below the 2018–2020 period average. Moreover, GDP per capita in 2021 is estimated to remain unchanged from 2020 and below the 2018–2020 period average. However, there is some variation in the estimates of economic growth across the SAF sub-region. For example, the estimates for GDP per capita growth in 2021 for Madagascar, Malawi, and Mozambique are anticipated to be above the 2020 values and the 2018–2020 period average. But only in Madagascar is the GDP per capita estimated to follow the same trend as GDP in 2021. By contrast, Zambia and Zimbabwe are anticipated to see moderate growth of GDP, but a contraction of GDP per capita in 2021.

The SAF sub-region is estimated to have the second-highest prevalence of food insecurity in SSA after CAF. In 2021, 58.8 percent of the population (89.7 million people) of the SAF sub-region is estimated to be food-insecure (*table 7*). The most food-insecure country in the SAF sub-region is estimated to be Zimbabwe (83.2 percent of the population) and the most food-secure country is estimated to be Eswatini, formerly known as Swaziland (31.1 percent of the population).

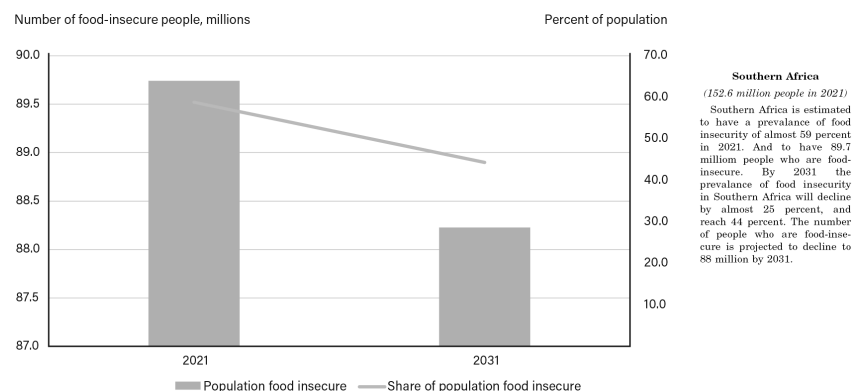

Table 7
Food security indicators for Southern Africa sub-region, 2021 and 2031

Year	Food grain demand	Other grain demand *	Total grain demand	Grain production	Implied additional supply required **
Million tons					
2021	19.1	21.7	40.8	24.3	16.5
2031	27.1	29.8	57.0	34.1	22.9

Notes: *Other grain demand includes seed, feed, waste, and processing. **The gap between grain demand and domestic grain production.

From 2021 to 2031, the SAF's GDP is projected to expand 3.5 percent a year, a reversal of the previous trend of a contraction of 0.6 a year during the 2015–2020 period. With a projected annual population growth rate of 2.7 percent—a slight decline from 2.8 percent a year during the 2015–2020 period—the population in Southern Africa will increase from 153 million in 2021 to 199 million people in 2031. The anticipated population and GDP growth trends imply that, over the same period, annual GDP per capita is anticipated to slightly expand by 0.8 percent a year, which is an improvement from –3.3 percent a year during the 2015–2020 period. GDP per capita in SAF is estimated to grow from \$1,367 in 2021 to \$1,479 in 2031. Reflecting the projected income growth by 2031, the prevalence of food insecurity is expected to decline by 25.0 percent from its 2021 level to 44.3 percent (table 7).

By 2031, Lesotho and Malawi are projected to make the most progress at reducing the prevalence of food insecurity, reducing food insecurity by 69.4 percent and 52.3 percent, respectively. By contrast, Zambia is projected to make the least progress over the decade, reducing its share of its population considered food-insecure by 9.0 percent. Both Zambia (65.0 percent) and Zimbabwe (56.0 percent) are projected to have the highest share of their population considered food-insecure in 2031. The number of food-insecure people in the SAF sub-region is expected to marginally decline, going from 89.7 million people in 2021 to 88.2 million people in 2031. The projection of a small decline in the number of food-insecure people mainly reflects the anticipated slight decline in the population growth rate. Angola and Zambia are anticipated to follow an opposite trend from the sub-regional trend and see an increase in the number of food-insecure people between 2021 and 2031. All countries in the SAF are projected to see an improvement in their daily per capita Calorie food gap in the next decade. The daily per capita Calorie food gap—which represents the difference between estimated consumption and the daily requirement of 2,100 kcal—is projected to decline 16.8 percent, from 471 kcal in 2021 to 391kcal in 2031 (*table 7*).

Over the next decade, grain demand in SAF is projected to increase by 36.6 percent, from 40.8 million tons in 2021 to 57 million tons in 2031 (*table 7*). From 2021 to 2031, demand for food is projected to grow (3.6 percent a year) at a faster pace than demand for grain for other uses (3.2 percent a year). In absolute terms demand for grain for other uses in 2031 is projected to be 2.7 million tons higher than the demand for food grains. Over the decade production is projected to increase almost 40.0 percent, growing 3.4 percent a year on par with the projected annual growth of grain demand. In absolute terms demand is anticipated to exceed production by almost 23 million tons (*table 7*).

Angola has the third largest economy in Sub-Saharan Africa, with an estimated GDP of \$108 billion in 2021. With a projected annual growth rate of 3.2 percent, GDP is expected to reach \$149 billion by 2031. Angola is also among the countries with the highest projected population growth rates in the sub-region. Although lower than the 2015–2020 period average (3.6 percent), the annual population growth rate between 2021 and 2031 is expected to be 3.4 percent. Reflecting projected population growth trends over the decade GDP per capita is anticipated to experience a net decline (–0.2 percent a year). GDP per capita is projected to decline from its 2021 estimate of \$3,233 in 2021 to \$3,177 in 2031. The real domestic price of major grains in the country is also projected to increase by an annual rate of 4.0 percent, reversing the annual downward trend of the 2015–2020 period (–0.2 percent). More than half of Angola's population (51.0 percent) in 2021 is estimated to be food-insecure. By 2031, this metric is projected to remain relatively unchanged. Half of Angola's population (23.6 million) is projected to fall short of the daily Calorie requirement by 2031, the highest number in the SAF sub-region. The daily per capita Calorie food gap is also anticipated to remain relatively unchanged, from 442 kcal in 2021 to 440 kcal in 2031.

Lesotho has the second smallest population in the SAF sub-region, and it is the only country in SSA whose population is anticipated to decline over the next decade. Lesotho's population is projected to hover around 2 million between 2021 and 2031, declining annually by 0.1 percent. The country's GDP is projected to expand annually by 2.9 percent, resulting in an expected increase in GDP per capita from \$1,209 in 2021 to \$1,629 in 2031. The real domestic price of major grains is projected to decline between 2021 and 2031, at a rate of –0.9 percent a year. The combined effects of the projected population, income, and price trends over the next decade are anticipated to reduce the prevalence of food insecurity by 69.4 percent. The number of food-insecure people is projected to also decline sharply, from about 800,000 people in 2021 to 200,000 in 2031. By 2031, Lesotho is projected to be the least food-insecure country in SAF.

The Republic of Madagascar—an island country in the Indian Ocean—is projected to grow in population from 28 million in 2021 to 34 million in 2031, at an annual growth rate of 2.1 percent. Surpassing the anticipated population growth rate, Madagascar's GDP is anticipated to grow by 3.5 percent a year and reach \$20.1 billion by 2031. Although GDP per capita is projected to grow by 1.5 percent a year by 2031, the expected growth in income is dampened by an anticipated trend of increasing real domestic prices for major grains (0.5 percent a year). These macroeconomic trends are expected to lead to a moderate decline in the prevalence of food insecurity over the next decade. The share of the population considered food-insecure is projected to decline from its estimate of 66.5 percent in 2021 to 51.0 percent in 2031. After Angola, the Republic of Madagascar is projected to have the second highest number of food-insecure people (17.4 million) in SAF by 2031. The daily per

capita Calorie food gap is expected to decline 15.0 percent, from 493 kcal in 2021 to 418 kcal in 2031.

Malawi—a landlocked country—has the lowest estimated GDP per capita in SAF for 2021. Driven by projections of annual population and GDP growth rates of 3.3 percent and 4.1 percent, respectively, Malawi's GDP per capita is anticipated to increase from \$338 in 2021 to \$366 in 2031. The increasing income trend is complemented by an anticipated declining trend in real domestic price of major grains (−2.6 percent annually) between 2021 and 2031. The anticipated income and price trends are expected to sharply reduce food insecurity in the country over the coming decade. The prevalence of food insecurity is projected to decline from 39.5 percent to 18.8 percent in the next 10 years, the third lowest after Eswatini and Lesotho.

Over the coming decade, Mozambique's GDP is projected to grow at the fastest rate of any country in SAF, growing by 5.2 percent annually. However, Mozambique's population is projected to grow at half that rate. As a result of these trends, GDP per capita in the country is projected to increase significantly, from \$599 in 2021 to \$774 in 2031. Reflecting the projected income trend, the share of the population considered food-insecure is expected to decline by 36.9 percent to 37.0 percent in 2031. The number of food-insecure people is projected to decline by 18.5 percent to 14.8 million people. By 2031, the daily per capita Calorie food gap is expected to decline by 19.6 percent, from 519 kcal in 2021 to 417 kcal in 2031.

Namibia's population over the next decade is projected to hover around 3 million, growing at 1.8 percent a year. Accounting for population and GDP growth rates of 1.8 percent and 2.7 percent, respectively, the country's GDP per capita is projected to increase by 0.9 percent from \$3,914 in 2021 to \$4,288 in 2031. The real domestic price of major grains in Namibia is projected to decline annually by 0.6 percent. As a result of the anticipated income and price trends, the prevalence of food insecurity in Namibia's population is expected to decline from 42.9 percent to 26.2 percent, *i.e.*, from 1.2 million to 800,000 people by 2031.

Eswatini—formerly known as Swaziland until 2018—has the lowest population in SAF, estimated at one million in 2021. Over the next decade, Eswatini's economy is projected to expand (GDP growth of 2.0 percent a year) at more than 3 times the pace of population growth (0.6 percent a year). As a result, the country is expected to make significant income gains, with GDP per capita anticipated to grow at a pace of 1.4 percent a year between 2021 to 2031. Eswatini's GDP per capita is projected to be the highest in Southern Africa at \$4,396 in 2031. The anticipated macroeconomic trends, coupled with declining real domestic prices of major grains (−0.5 percent a year between 2021 to 2031), are expected to support Eswatini's improved food security conditions. By 2031, the prevalence of food insecurity is projected to decline by 44.7 percent to 17.2 percent of the population. By 2031, the country is projected to have the second lowest per capita per day Calorie food gap in Southern Africa after Lesotho. The per capita daily Calorie food gap is projected to decline 16.0 percent over the decade, going from 308 kcal in 2021 to 260 kcal in 2031.

Zambia is estimated to have the second-highest share of its population, after Zimbabwe, considered food-insecure in the SAF sub-region. In 2021, 71.7 percent of Zambia's population is considered food-insecure. The estimated high prevalence of food insecurity for 2021 is driven by an expectation of GDP per capita to remain about 7.5 percent below its 2019 levels. By 2031, the prevalence of food insecurity is projected to remain high at 64.9 percent. The anticipated high level of food insecurity at the end of the decade mainly reflects slower projected per capita GDP growth (0.7 percent a year from 2021 to 2031) and an increasing price trend for major grains (one percent a year). The number of food-insecure people is projected to increase by 2.6 million from 2021 to 2031.

Zimbabwe is Southern Africa's most food-insecure country in 2021, with an estimated 83.2 percent of its population unable to meet the daily caloric requirement. Continued macroeconomic crises, coupled with the socioeconomic impacts of the COVID-19 pandemic, will drive the acute food insecurity situation in the country in 2021 (FAO and WFP, 2020). Over the next decade, GDP per capita growth is projected to recover from a declining trend of 2.8 percent a year during the 2015–2020 period to growth of 1.9 percent a year. As a result of the anticipated improvements in income, the prevalence of food insecurity by 2031 is projected to decline a third to 55.9 percent of the population. Over the next decade the daily per capita food gap is anticipated to decline 28.2 percent, from 685 kcal in 2021 to 492 kcal in 2031.

West Africa (WAF)

Food insecurity across West Africa (WAF) and the Sahel has risen dramatically, due to increasing conflict and the impact of COVID-19-related restrictions (FAO and WFP, 2020). COVID-19 decreased income, increased poverty, disrupted regional trade, supply chains, and cross-border pastoralist activities, and inflated food prices in the Sahel (e.g., Burkina Faso, Niger, and Nigeria) and some coastal countries (e.g., Sierra Leone and Liberia) (FSIN and GNFAAC, 2020). In high-conflict zones (such as the Central Sahel and northern Nigeria) civilians are increasingly affected by violence and conflict, with rising levels of displacement (FAO and WFP, 2020).

In 2020, the GDP of the WAF sub-region declined by 4 percent (Baquedano, *et al.*, 2021). In 2021, GDP is estimated to grow by 3.3 percent and be 1.6 percent above the SSA average for the period 2018–2020. However, GDP per capita in 2021 is estimated to remain 5.8 percent below its pre-pandemic level of \$1,905 in 2019 (table 3). The number of food-insecure people in 2021 is estimated at 124.7 million, an increase of 8.6 million from last year's estimate (table 8). The largest estimated increase in the number of food-insecure people are in Côte d'Ivoire (2.1 million people) and Niger (2.9 million people). By contrast, Gambia (–0.2 million people) and Nigeria (–4.1 million people) are estimated to experience a decline in the number of food-insecure people from 2020's values. Despite the anticipated high numbers of food-insecure people, in 2021, the WAF sub-region is estimated to have the lowest prevalence of food insecurity in SSA. The share of the population considered food-insecure is estimated at 30.1 percent, 1.2 percentage points higher than last year's estimate. Guinea is estimated to be the most food-secure country in the sub-region—with a prevalence of food insecurity of 8.6 percent—and Liberia the least food-secure (table 8).

Table 8
Food security indicators for West Africa sub-region, 2021 and 2031

Year	Food grain demand	Other grain demand *	Total grain demand	Grain production	Implied additional supply required **
Million tons					
2021	63.7	45.8	109.5	74.7	34.8
2031	92.3	65.8	158.1	111.3	46.8

Notes: *Other grain demand includes seed, feed, waste, and processing. **The gap between grain demand and domestic grain production.

Note: * Measured in grain equivalents.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

By 2031, the population of WAF is projected to increase by 118 million from its 2021 estimate, growing annually at a rate of 2.5 percent. From 2021 to 2031, GDP is expected to expand at a rate of 3.8 percent a year and reach close to \$1.1 trillion. Given the anticipated fast pace of expansion in WAF's economy, relative to population growth, GDP per capita is projected to increase from \$1,794 in 2021 to \$2,024 in 2031 (*table 3*). The WAF sub-region is projected to see a 47.8 percent decline in its prevalence of food insecurity, with the share of the population considered food-insecure dropping to 15.7 percent by 2031 (*table 8*). By 2031, Benin, Ghana, Guinea, Mauritania, and Senegal are projected to be among the least food-insecure countries in the WAF sub-region. By contrast, Sierra Leone is projected to be the most food-insecure country in the sub-region, with 31.3 percent of the country's population projected to be food-insecure by 2031. Over the next decade, the number of food-insecure people in WAF is projected to decline by 41.2 million people, with Nigeria accounting for more than half of this estimated decline. Mali is projected to make the least progress over the next decade, with the country's number of food-insecure people remaining relatively unchanged at around 4 million. All WAF countries included in IFSA are anticipated to see an improvement in their daily per capita Calorie food gap in the next decade (*table 8*). By the end of the decade, the per capita daily Calorie food gap is projected to decline 19.2 percent, from 379 kcal in 2021 to 306 kcal in 2031.

Total grain demand in the WAF sub-region is projected to increase by an additional 48.6 million tons over the next 10 years, from an estimate of 109.5 million tons in 2021, to 158.1 million tons in 2031 (*table 8*). Demand for food grain is anticipated to account for 59.0 percent of the growth in grain demand and increase by 28.6 million tons by 2031. By contrast, over the next decade, the demand for grain for other uses (including feed) is projected to increase by a lower amount, 20 million tons. Grain production is projected to increase less than total grain demand, increasing by 36.6 million tons by 2031. To cover the estimated growth in the gap between grain demand and production by 2031, the WAF sub-region is projected to need an additional supply of 12 million tons of grain.

Nigeria is the largest economy and the most populous country in the WAF sub-region. The country is highly susceptible to global economic shocks, as it is highly dependent on export revenues from crude oil sales. In addition to the widespread socioeconomic effects from the COVID-19 pandemic, conflict in the north-eastern and north-central parts of the country continue to impact food security (FSIN and GNFA, 2020). Over the next decade, Nigeria's economy is expected to expand at an annual rate 3.4 percent, a reversal of the declining trend in GDP growth rate of -0.5 percent a year during the 2015-2020 period. Over the next decade, Nigeria's population is projected to grow at a rate of 2.5 percent a year, to add 61 million people. Given that the growth rate of the Nigerian economy is anticipated to outpace population growth rate by 2031, GDP per capita is expected to increase from an estimated \$2,259 in 2021 to \$2,475 in 2031. Driven by anticipated income growth over the coming decade, the prevalence of food insecurity is projected to decline, from 33.9 percent of the population in 2021 to 18.2 percent in 2031. The number of food-insecure people by 2031 is expected to decline by roughly 30 percent, to 51 million.

Ghana and Côte d' Ivoire have the second- and third-largest economies, respectively, and together account for 14 percent of the WAF sub-region's population. While the economies of both countries were estimated to have shrunk by less than 2.0 percent in 2020, their GDP is expected to grow by more than 5.0 percent in 2021, and, in absolute terms, remain above the 2018–2020 period average. Moreover, GDP per capita in 2021 is estimated to be marginally below their pre-COVID–19 pandemic levels. Both countries are anticipated to see real income gains over the next decade, as GDP growth is projected to outpace population growth. By 2031, Ghana is projected to make the most gains in its food-security metrics, with both the prevalence of food insecurity in the population and the number of food-insecure people projected to decline by more than 70.0 percent. Over the next decade, Côte d' Ivoire's progress is anticipated to be more moderate, with the share of the population considered food-insecure projected to decline by almost $\frac{1}{3}$ and the number of food-insecure people declining by 15.0 percent.

The food security environment of the Central Sahelian countries of the WAF sub-region—including Burkina Faso, Mali, and Niger—continues to be impacted by protracted armed conflicts, as well as the socioeconomic effects from the COVID–19 pandemic. Burkina Faso and Mali were also impacted by decreased cotton prices in 2020, a major source of export revenues for both economies. In the conflict areas of the Central Sahelian countries, displaced populations face limited access to food (FSIN and GNFAC, 2020). Moreover, severe disruptions to marketing chains have also been reported because of the pandemic, affecting price levels of the general populations of Central Sahelian countries. Despite the challenging macroeconomic and food security environment in 2021, all countries are projected to see a moderate rebound in their economic growth prospects over the next decade. By 2031, the prevalence of food insecurity across the 3 countries is projected to decline by 47.5 percent to less than 16.0 percent, with the sharpest declines projected in Burkina Faso and Niger. The number of food-insecure people in these 3 countries in 2031 is projected at 13.9 million, 29.3 percent lower than in 2021.

In Liberia and Sierra Leone, the COVID–19 pandemic put further pressure on their already declining economic environment. The economies of the two countries continue to be impacted by high inflation and a strong depreciation of the local currency (Food Security Information Network (FSIN) and GNFAC, 2020). Moreover, shortages of inputs in 2020—particularly fertilizers—depressed crop outputs (FAO and WFP, 2020). In 2021, Liberia and Sierra Leone are estimated to have a large share of their population considered food-insecure. However, by 2031, the prevalence of food insecurity is projected to decline by at least 30.0 percent in both countries, which would likely be driven by an anticipated recovery in the economic prospects of both countries. By 2031, the number of food-insecure people across both countries is expected to decline by 38.0 percent, to less than 5 million.

Gambia and Guinea-Bissau have the smallest economies in the WAF sub-region and account for 1.0 percent of the sub-region's population. Before the COVID–19 pandemic, the two countries faced an already challenging macroeconomic and food security environment. Decreased oil prices in 2020—Gambia's main export—and an anticipated decline in remittances for Gambia and Guinea-Bissau, both limited their responses to the COVID–19 pandemic and may have increased poverty levels (FSIN and GNFAC, 2020). By 2031, GDP per capita in Gambia is projected to make a strong recovery and grow at a rate of 3 percent a year. Guinea-Bissau's income growth is anticipated to be more moderate than Gambia's, with GDP per capita growth projected at 1.1 percent per year from 2021 to 2031. Given the expected robust income gains in Gambia, the prevalence of food insecurity is projected to decline by 81.0 percent and the number of food-insecure people by 77.0 percent. By contrast, Guinea-Bissau is anticipated to make less progress over the same period. The share of the country's population considered food-insecure, and the number of food-insecure people, are projected to decline by 49.0 percent and 34.0 percent, respectively.

North Africa

North Africa (NAF) is the most food-secure region in the IFSA analysis, with only 14 percent of its regional population estimated to be food-insecure in 2021. However, the countries of the region continue to be affected by the economic slowdown due to the COVID-19 pandemic. The impact on the energy and tourism sectors of North Africa—both main sources of government revenues and employment for low-income workers—continues to affect the purchasing power of households, especially in urban areas (Food and Agriculture Organization of the United Nations (FAO), 2021). Continued subsidies for basic food commodities have mitigated income decline, while also buffering consumers from recent international food price increases (FAO, 2021). Driven by an estimate of incomes that are still lower than 2019 (*table 9*), the prevalence of food insecurity is anticipated to increase sharply for 2021. The share of the population estimated to be food-insecure in the NAF region (for 2021) increased by 5.5 percent from its 2020 value (*table 10* and *figure 6*). Egypt is estimated to have both the highest prevalence of food insecurity (18.9 percent) and the highest number of food-insecure people (20.1 million) in the region (*table 10*). By contrast, Tunisia is estimated to have the lowest levels of food insecurity in both relative (6.0 percent of the population) and absolute terms (less than one million people).

Figure 6

North Africa: Change in the number of food-insecure people in 2021, from 2020

Change in the number of food-insecure population

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

The NAF region's GDP is projected to annually expand by 3.3 percent (an improvement from 2.3 percent during the 2015–20 period), from \$699.5 billion in 2021 to \$966.8 billion in 2031. With an anticipated annual growth rate of 1.4 percent—a decline from 1.9 percent during the 2015–20 period—the population in the NAF region is projected to increase from 198 million to 228 million people over the next decade. During the same period, GDP per capita is anticipated to expand by 1.8 percent (an improvement from 0.4 percent from the 2015–2020 period) annually from \$3,537 to \$4,240 (table 9). By 2031, reflecting income and population trends over the decade, 17.7 million people are projected to be food-insecure in the NAF region, a 38 percent decline from 2021 (table 10). Egypt is expected to account for most of the region's food-insecure population in 2031. The per capita daily Calorie food gap, defined as the difference between estimated consumption and the daily nutritional target of 2,100 kcal, in the NAF region is projected to decline from 280 kcal in 2021 to 245 kcal in 2031 (table 10).

Total grain demand in the NAF region is projected to increase, from 92.1 million tons in 2021 to 114.9 million tons in 2031, driven mainly by Egypt's growing demand for grains (table 10). Over the next decade, the annual growth rate of grain production (2.5 percent a year) is projected to outpace the growth rate in total grain demand (2.2 percent a year). In absolute terms, total grain demand is expected to be 2.5 times higher than production by 2031, resulting in an anticipated 23.0 percent increase in the implied additional supply requirement.

In 2021, Algeria is NAF's second most food-insecure country, with estimated food insecurity rate at 12 percent and this figure is projected to decline to 5 percent by 2031. The number of Algerian food-insecure people is projected to decline by more than half from its 2021 estimate, from 5.2 million to 2.3 million.

Considering the economic fallout from the COVID–19 pandemic, and as a country that is dependent on petroleum and natural gas exports for export earnings, Algeria's GDP contracted by an average of 0.9 percent during the 2015–20 period. Over the next decade the country's economy is projected to grow by 2.4 percent a year, the lowest anticipated GDP growth among the NAF countries. The food gap expressed as a percentage of the daily per capita nutritional target of 2,100 kcal is projected to decline from 13.4 percent (281.5 kcal) in 2021 to 11.5 percent (240.3 kcal) to 2031.

Egypt in 2021, is estimated to have the highest share and the greatest number of food-insecure people in the NAF region. The Egyptian GDP per capita in 2021 is estimated at \$3,551 and projected to grow at an annual rate of 1.7 percent during the next decade. The real domestic price of major grains is projected to decline at annual rate of 0.9 percent over the decade, the smallest decline in the NAF region. Reflecting income and price trends over the next decade, the number of food-insecure people is projected to decline by $\frac{1}{3}$, to 13.7 million by 2031. The prevalence of food insecurity is projected to decline from an estimated 18.9 percent of the population in 2021 to 10.7 percent in 2031. The depth of food insecurity in the country in 2021 is also estimated to be the highest in the region, with an average food gap of 331 kcal per capita per day. By 2031, the daily Calorie food gap is projected to decline to 292 kcal but remain the highest in the NAF region.

Morocco is the second most food-secure country in the NAF region, with the estimated prevalence of food insecurity estimated at 7.4 percent of the population in 2021, and it is projected to decline to 3.5 percent by 2031. Some 2.7 million people are estimated to be food-insecure in 2021, and over the next decade, this number is anticipated to decline by 48 percent. The daily per capita Calorie food gap is estimated at 266 kcal in 2021, the second lowest in the NAF region. By 2031, the per capita per day Calorie food gap is projected to decline 10.6 percent to 238 kcal.

Tunisia, a lower middle-income country, is the least food-insecure country in the NAF region with an estimated 6 percent of its population food-insecure in 2021. By 2031, the prevalence of food insecurity is projected to decline to 2.3 percent of the population. The anticipated improvement in the country's food security status over the next decade is supported by anticipated sustained growth in income and lower food prices. Tunisia's GDP per capita is projected to grow from \$3,732 to \$5,144 in the coming decade. The real domestic price of major grains is expected to steadily decline at a rate of 2.0 percent a year.

Latin America and the Caribbean

The COVID–19 pandemic's effect on the economies of Latin America and the Caribbean (LAC)¹⁵ region was unprecedented in 2020. The real gross domestic product (GDP) contracted by 9.1 percent, making it the “worst recession in the region in a century” (Food and Agriculture Organization of the United Nations (FAO) and World Food Programme (WFP), 2020). A rebound in economic activity is anticipated to sustain 2.9 percent growth in real GDP in 2021 and 3.2 percent growth by 2031 (*table 11*). However, economic growth for LAC will remain below the projections made prior to the global COVID–19 pandemic (USDA, ERS, 2021). The speed of the economic recovery remains uneven across countries—as Bolivia, Dominican Republic, Guatemala, and Honduras experienced less pronounced collapses at the height of the crisis in 2020 than other LAC countries. By contrast, Colombia, Ecuador, El Salvador, Haiti, Jamaica, Nicaragua, and Peru suffered large contractions—and estimated long-term recovery remains limited through 2031.

¹⁵The countries studied include four Central American countries: El Salvador, Guatemala, Honduras, and Nicaragua; three Caribbean countries: the Dominican Republic, Haiti, and Jamaica; and four South American countries: Bolivia, Colombia, Ecuador, and Peru.

To counter the effects of COVID-related restrictions, all countries in LAC—as was the case for various other countries around the globe—implemented several comprehensive policy responses to support households' and businesses' incomes. These fiscal support expenditures have included subsidies, grants, loans, guarantees, and forgone tax revenue. In 2020, the emergency fiscal support granted by all 11 LAC countries amounted to about 5.0 percent of GDP, on average (International Monetary Fund (IMF), 2021). Although these fiscal measures have successfully mitigated some of the COVID-19 impacts on the most vulnerable, the pandemic has exacerbated the structural problems the LAC region has historically suffered from, including narrow fiscal space, high inequality, limited social protection, a high degree of labor informality, and high prevalence of food insecurity.

The current food-security assessment estimates 25.6 percent of the LAC population is food-insecure in 2021, 4.5 percentage points higher than in 2020 (*table 12* and *figure 7*). The estimated prevalence of food insecurity during 2021 ranged from 11.2 percent in the Dominican Republic to 65.2 percent in Haiti. Food-insecurity levels and rates differ across countries in the LAC region due to their populations, economic conditions, and policies. The population of the LAC region in 2021 is estimated at nearly 175 million and is projected to reach to 191 million by 2031. The average population growth rate for LAC countries is projected to decline from 1.1 percent during 2015–2020, to 0.9 percent from 2021 to 2031. Slowing population growth is associated with rising incomes, literacy rates, and life expectancy—all of which tend to lower birth rates.

Across LAC countries, population growth rates vary inversely with per capita income. Colombia, Dominican Republic, and Peru all have relatively higher incomes and are projected to have an annual population growth rate near 0.7 during 2021–2031 (table 12). Lower income countries, including Guatemala (1.4 percent), Bolivia (1.3 percent), Ecuador (one percent), and Nicaragua (0.8 percent) have higher projected annual population growth rates. Population growth rates in Haiti and Honduras, two countries with the lowest income in the LAC region, are projected to average 1.1 percent of growth per year during 2021–2031. In El Salvador, population growth for 2021–2031 is at its lowest level (0.23 percent) because of the country's continued emigration rates. In most all cases, population growth is projected to slow

during 2021–2031, compared to previous decades. The exception is Jamaica, where population is projected to continue to decline.

The COVID–19 pandemic has resulted in an erosion in income levels. LAC’s real income per capita growth for the 2021–2031 period is projected to reach 2.3 percent per year, an improvement over the 0.9 decline in per capita GDP experienced in 2015–2020. Colombia, Dominican Republic, and Peru are all expected to drive much of the aggregate per capita GDP growth in the LAC region. Growth in Colombia and Peru is supported by fiscal spending and exports. On the aggregate for the region, per capita income increases from \$4,936 in 2021 to \$6,222 in 2031 (*table 11*). Despite the positive impact from fiscal packages and other measures implemented to boost economic activity, LAC’s income per capita will remain below pre-COVID–19 levels until 2025, returning to its long-term trend levels through 2031.

The pandemic has dramatically increased food insecurity in the LAC region in 2021, compared to 2020. This situation is reflected in the region’s increased share of the food-insecure people among all four regions in 2021 and the region’s increase in its food-insecure population. In 2021, the LAC region accounts for more than ¼ (25.6 percent) of global food-insecure people, slightly below Asia’s global share (26.2 percent), but nearly double that of North Africa’s (14.5 percent).

In 2021, the number of people in the LAC region estimated to have consumed less than the per capita daily recommended caloric target of 2,100 kcal is 44.7 million (*table 12*). Stricter lockdowns and high levels of informal employment impact economic activity and per-capita incomes. This situation—compounded by the resurgence of inflation—changes the sustained food security gains of past years. As a result of the pandemic, an additional 2.4 million LAC people are estimated to be food-insecure in 2021—which represents about a 6.0 percent increase from the 2020 estimate. Food insecurity in the LAC region is also aggravated by the almost 9.6 million Venezuelans who emigrated within the region—principally to neighboring Colombia (3.3 million), Ecuador (2 million), and Peru (4.3 million)—and are disproportionately affected by unemployment and the lack of access to food safety nets (FAO and WFP, 2020).

Looking ahead, as the LAC economies recover from the COVID–19 induced economic recession, all 11 countries in the region improve their food availability during the next decade. Rising per capita demand for diversified diets and protein support increases in LAC’s food grain demand, which rises from 24.4 million tons in 2021 to 29.4 million tons in 2031 (*table 12*). Demand for grain for other uses (including feed use and seed use) is projected to increase from 21.9 million tons in 2021 to 29 million tons by 2031. The combined grain demand (food and other uses) is projected to increase from 46.3 million tons in 2021 to 58.3 million tons in 2031. As a result of the strong demand growth, the production of grains is expected to increase from an estimate of 20.1 million tons in 2021, to 29.4 million tons in 2031. The projected difference between overall demand and domestic production is anticipated to grow by 2.8 million tons to 29 million tons by 2031.

Under this scenario, on a regional basis, the food gap—the difference between estimated consumption and the nutritional target of 2,100 kcal—is estimated at 345 kcal per capita, per day in 2021. But this figure is projected to decrease to 284 kcal per capita, per day by 2031 (*table 12*).

Central America and the Caribbean (CAC)

The Dominican Republic has a population of 10.6 million in 2021, which is projected to rise to 11.5 million by 2031 (*table 13*). Results from the food security assessment model indicate that, in 2021, 11.2 percent of the country’s population is estimated to be food-insecure, or less than half the LAC’s regional average of 25.6 percent of food-insecure people. The Dominican Republic is estimated to have 1.2 million food-insecure people in 2021, a number projected to fall to just 0.3 million food-insecure people in 2031. Results in this study indicate that the Dominican Republic has the lowest estimated food gap in the LAC region, with 227 kcal per capita, per day. The daily per capita calorie gap is projected to decline to 179 kcal by 2031.

The economy of the Dominican Republic is largely reliant on the service and tourism sectors and, as a result, its economy was severely impacted by the COVID-19 pandemic in 2020. After contracting 4.7 percent in 2020, economic activity is projected to recover to 3.3 percent growth in 2021. Annual GDP growth is projected to average 4.2 percent in the next decade, the highest anticipated economic growth in the region. GDP per capita income in the Dominican Republic is also the highest in the region, estimated at \$8,295 in 2021 and is projected to grow to \$11,571 in 2031. Unfavorable weather conditions in the Dominican Republic in 2020 led to a reduction in the area of planted rice—a key component of the Dominican diet—and lower yields, which aggravated the food security situation. However, with improved weather and yields in 2021, rice production and consumption are projected to resume their normal growth rate (FAO, 2020; USDA, FAS, 2021a).

El Salvador, with a total population of 6.5 million, is the only country in the region where the population growth rate is projected to decline between 2021 and 2031 (which reflects emigration rates). In 2021, 22.9 percent of the population is estimated to be food-insecure (*table 13*). However, this number is anticipated to decline by 50.1 percent, to 11.4 percent by 2031. Food consumption levels in El Salvador have worsened since the pandemic, with the number of food-insecure people estimated at 1.5 million in 2021, a seven percent increase from the 2020 estimate. The number of food-insecure people, however, is projected to fall to about 800,000 by 2031. The daily per capita Calorie food gap in El Salvador is projected to fall from 290 kcal in 2021 to 246 kcal by 2031.

Annual GDP per capita growth through the next 10 years is projected to be 1.5 percent, which is an improvement over the 2015–2020 period, when per capita income declined 0.5 percent. GDP per capita in El Salvador in 2021 is estimated at \$3,758 in 2021 and projected to increase to \$4,354 by 2031.

During the COVID–19 pandemic, El Salvador’s economy experienced a decline in export and tourism revenues. However, this decline was compensated with larger flows of family remittances. Moreover, the El Salvadorian Government provided fiscal support to low-income households. Family remittances contributed the most to support incomes and totaled \$4.8 billion in 2020. The torrential rains from hurricanes Eta and Iota affected cereal and bean crops in El Salvador. However, the adverse effects in El Salvador were not as severe as the effects experienced in Nicaragua, Honduras, and Guatemala, where food and commercial crops and livestock productions suffered devastating losses. The reduction in agricultural production—further hindered by the lack of operational credit—led to high food inflation, further aggravating food insecurity (Economic Commission for Latin America and the Caribbean (ECLAC), 2020).

Guatemala is the largest economy and most populous country in the CAC region. With 17.4 million people in 2021, Guatemala’s population is projected to increase by 2.7 million by 2031 (*table 13*). The country’s annual population growth rate is estimated at 1.4 percent between 2021 and 2031, compared to 1.8 percent annual growth during 2015 and 2020. Indigenous people make up more than half of Guatemala’s population and are disproportionately affected by persistent income inequality and poverty (World Bank, 2021). In 2021, 29.8 percent of Guatemala’s population is considered food-insecure, but the prevalence of food insecurity is projected to fall to 15.1 percent by 2031. The number of food-insecure people in Guatemala is estimated to have increased by 2.0 percent from 2020, to 5.2 million people in 2021. The number of food-insecure people, however, is projected to fall to 3 million people by 2031. The daily per capita Calorie food gap in Guatemala is anticipated to decline moderately over the decade, from 356 kcal in 2021 to 297 kcal by 2031.

Although Guatemala is the largest economy in Central America, it is also the fifth poorest economy in the LAC region. Guatemala’s GDP per capita is estimated at \$4,104 in 2021 and projected to increase to \$4,987 by 2031—equivalent to a 2.0 percent annual growth in per capita income over the next decade, compared to the 0.3 percent annual growth in income during the 2015–2020 period. The COVID–19 pandemic impacted the Guatemalan economy considerably, contracting 2.4 percent in 2020. In 2021, Guatemala is projected to experience a 4 percent increase in economic recovery and the county’s longer-term growth is projected at 3.5 percent in 2031 (USDA, ERS, 2021). Prior to the pandemic, Guatemala experienced economic stability and relatively higher real GDP growth rates, compared to neighboring economies. This economic stability was anchored by conservative fiscal management, inflation targeting, and a managed floating exchange rate (World Bank, 2021). The COVID–19 lockdown measures resulted in falling demand, disruptions to supply chains, and lower fiscal revenues. The government has been able to provide fiscal support, to expand social programs for families, and to supplement family remittances.

Agriculture is one of Guatemala’s largest economic sectors, and the participation of multinational companies in the sector ensured less disruption to supply chains during the pandemic. The impact of Hurricanes Eta and Iota, which made landfall in neighboring Nicaragua and caused heavy rainfall, damaged bean and cereal crops, as well as coffee and sugarcane plantations. Although the damage was less extensive than in Nicaragua and Honduras, substantial crop losses aggravated the food insecurity situation, particularly in rural areas of the country (FAO, 2020).

Haiti is estimated to have the highest share of food-insecure people in the LAC region (*table 13*). Since 2019, Haiti has been named among the 10 countries experiencing acute food crises in the world (FAO and WFP, 2020). Of the 11.2 million people in Haiti, 65.2 percent are estimated to be food-insecure in 2021. The prevalence of food insecurity in Haiti is 39.6 percentage points higher than the regional average of 25.6 percent. Over the next 10 years, Haiti is projected to make the least progress

in terms of its food security metrics, despite an anticipated drop in the prevalence of food insecurity to 53.7 percent by 2031.

About 7.3 million people in Haiti are estimated to be food-insecure in 2021 and this figure is projected to decline to 6.7 million by 2031. Haiti also has the highest estimated per capita Calorie food gap in the LAC region, estimated at 753 kcal per capita per day. By 2031, Haiti's food gap is projected to fall 10.6 percent to 673 kcal per capita, per day.

Haiti's GDP per capita in 2021 is estimated at \$761 in 2021 and is projected to increase to \$832 by 2031, equivalent to a 0.9 percent annual growth in per capita income, reversing the 1.8 percent annual decline in income in the 2015–2020 period. Although Haiti produces small quantities of food for domestic consumption, the combination of irregular rains and low agricultural productivity constrain the country's ability to supply a greater share of its own food.

Haiti has been facing challenging macroeconomic conditions since 2019, as real GDP contracted 0.9 percent. The economic recession was further complicated by the COVID–19 pandemic and—in 2020—GDP contracted for a second year in a row, by more than 4.4 percent. Since 2020, the economy has been sustained by an increase in the flow of family remittances (FAO, 2020). Despite dire fiscal conditions, the government was able to provide cash transfers and food assistance to some of the most vulnerable, which partly helped alleviate the food insecurity condition in Haiti.

Honduras—with more than 9.4 million people—is Central America's second most populous country, after Guatemala (*table 13*). In 2021, Honduras is estimated to have 26 percent of its population experiencing food insecurity, which is similar to the LAC regional average. The prevalence of food insecurity in 2031 is projected to fall by 60.0 percent to 10.4 percent, surpassing the regional average reduction of 51.8 percent. About 2.4 million people are estimated to be food-insecure in 2021, which is projected to decline to 1.1 million by 2031. Honduras also has the third highest daily per-capita Calorie food gap in the region, estimated at 341 kcal per capita per day in 2021. By 2031, the food gap in Honduras is projected to fall by 19.6 percent to 274 kcal per capita, per day.

Honduras was the only country among the four Central American countries included in IFSA to register the highest sustained economic growth for the past decade and be above the LAC regional average. The economy of Honduras is projected to sustain an annual 3.7 percent GDP growth in the 2021–2031 period, well above the LAC average of 3.3 percent growth for the region. However, Honduras faces high levels of poverty and inequality, and the COVID–19 pandemic aggravated the situation of the most vulnerable. As a result of the pandemic-related declines in trade, investment, and consumption—further aggravated by a fall in family remittances—real GDP fell 3.7 percent in 2020. In 2021, the economy in Honduras is projected to rebound to 2.5 percent annual GDP growth.

GDP per capita is projected to grow annually by 2.5 percent in the 2021–2031 period, a much higher rate than the 0.9 percent annual growth in GDP per capita in the 2015–2020 period. Honduras was able to authorize new borrowing from the World Bank for \$2.5 billion, equivalent to ten percent of the country's GDP (World Development Indicators (WDI), 2021), to support households and businesses in order to counteract the pandemic's impact. The economy of Honduras is based mostly on agriculture, accounting for about 15.0 percent of the country's GDP (World Bank, 2021). Honduras is a leading exporter of coffee and bananas. In recent years, agricultural diversification has led to increased plantings of sugarcane, horticultural crops, pineapples, palm oil, and aviculture production. In late 2020, Hurricanes Eta and Iota severely affected agricultural production in Honduras, causing substantial crop losses, particularly bean crops, coffee and palm oil plantations, as well as horticulture crops, further aggravating the food security situation in the country.

Jamaica, with 2.8 million people, is the Caribbean and Central America's tenth most populous country. In 2021, Jamaica is estimated to have 15.6 percent of its population experiencing food insecurity, to represent the third least food-insecure country in the LAC region (after Colombia and the Dominican Republic) (*table 13*). The important tourism sector—which contributes about 35.0 percent to GDP income—was significantly impacted by pandemic-related border closures. Economic activity contracted 7.2 percent. However, the contraction was less than what would have been expected, had it not been for Jamaica's strong fiscal position at the beginning of the pandemic, which allowed the economy to provide an additional fiscal stimulus in 2020 (equivalent to 1.2 percent of GDP). As the economy reopens and tourism restarts, the economy is expected to recover in 2021–22 and maintain sustained growth of 2.5 percent through 2031.

Jamaica is expected to make the most progress in its food security status over the next decade. From the estimated 15.6 percent in 2021, the prevalence of food insecurity is projected to decline by 81.9 percent—the highest decline in the region—to 2.8

percent by 2031. The daily per capita Calorie food gap in Jamaica is among the lowest in the world and the second lowest in the LAC region, after the Dominican Republic, estimated at 235 kcal for 2021. By 2031, the food gap is projected to drop by nearly 26 percent to 175 kcal per capita per day, the highest reduction in the LAC region.

Nicaragua—with 6.3 million people—is Central America’s smallest economy and 40 percent of Nicaragua’s population is estimated to be food-insecure in 2021 (*table 13*). The prevalence of food insecurity in 2031 is projected to decline 40.4 percent, to 24 percent. About 2.5 million people are estimated to be food-insecure in 2021, which is projected to decline to 1.6 million people by 2031. In addition, Nicaragua has the highest daily Calorie per capita food gap in the region. With the Calorie food deficit of 428 kcal per capita per day in 2021. By 2031, Nicaragua’s food gap is projected to fall 15.7 percent to 361 kcal per capita per day.

The COVID–19 pandemic crisis impacted both GDP per capita and remittance inflows, significantly reduced trade and tourism, and disrupted food distribution. Nicaragua’s economy, which has been experiencing a recession since 2018, registered an 8.2 percent decline in 2020. Nicaragua’s economy is projected to recover in 2021, with GDP growth of 3.9 percent. GDP per capita is projected to grow annually by 2.2 percent in the 2021–2031 period, a recovery from the 2.5 percent decline in per-capita income in the 2015–2020 period.

Nicaragua’s economy is primarily driven by the agricultural sector. The landfall of Hurricanes Eta and Iota in late 2020, resulted in flooding and landslides that were responsible for severe damage to an estimated 80.0 percent of standing crops and Nicaragua’s agricultural infrastructure. Farmers reported significant losses of food grains and legumes, coffee, sugarcane, fruits, vegetables, and grazing areas for livestock. These losses threaten the country’s food security situation and the prospects for exports. Both hurricanes also destroyed homes, roads, bridges, and communications infrastructure.

South America (SA)

Bolivia is the second highest food-insecure country in the LAC region—after Haiti—and the most food-insecure among the South American countries considered in this assessment (*table 14*). Bolivia was also the country in the LAC region most affected by the pandemic as measured by the high prevalence of food insecurity in 2021, which was estimated at 45.0 percent. The South American countries saw an increase of 1.2 million food-insecure people in 2021, compared to a year earlier. The prevalence of food insecurity in Bolivia is projected to decline to 19.7 percent by 2031, 25.3 percentage points lower than in 2021, the sharpest decline in the South American sub-region. The daily per capita Calorie food gap is projected to fall from 343 kcal in 2021 to 259 kcal by 2031.

The COVID-19 pandemic affected both GDP per capita and remittances. However, with an anticipated economic recovery GDP per capita is projected to grow annually by 1.9 percent during the 2021–2031 period, a much higher rate than the 0.2 percent annual growth in GDP per capita in the 2015–2020 period. Bolivia is one of the few countries in the region able to sharply increase its fiscal expenditures to counteract the effects of the pandemic, which supported sustained economic activity. While food prices remained stable during most of 2020, emerging food supply problems in 2021 are projected to lead to rising food prices in the longer term. As a result, food prices are projected to increase rapidly (5.5 percent annually) over the 2021–2031 period.

Colombia is the most populous country of the LAC countries covered in IFSA, with 49.5 million people in 2021 (table 14). By 2031, the country is projected to gain an additional 3.7 million people to reach a population of 53.3 million people. A large share of the projected population increase is driven by more than 3 million migrants from Venezuela who were granted residence status in 2021. In 2021, Colombia accounts for the third highest number of food-insecure people (6.3 million) in the region, and the prevalence of food insecurity is estimated at 12.6 percent, significantly below the regional average for LAC of 25.6 percent. By 2031, Colombia is projected

to have 3.0 percent of its population considered food-insecure. The daily per capita Calorie food gap is projected to fall from 260 kcal in 2021 to 205 kcal by 2031.

Although Colombia has experienced many economic crises and the country's history is punctuated by economic volatility, the recession arising from the COVID-19 pandemic and subsequent lockdowns has been labeled the country's worst in decades. As a result, in 2020, the pandemic-related recession shrank Colombia's GDP by 9.5 percent. Ample fiscal measures (geared to support the most vulnerable households and businesses) were successful in softening the impact of the drastic reduction in economic activity. The Colombian economy is projected to recover in 2021, with GDP growth anticipated to reach 2.8 percent. This growth rate is projected to be generated from an expansion in public spending, a faster pace of economic activity, and reduced unemployment. Although oil prices are projected to remain below pre-pandemic levels, after 2021, export revenues are anticipated to be boosted by a recovery in external markets, higher projected oil prices, and a heightened import demand from major trading partners. Colombia's economy is estimated to sustain 3.2 percent real GDP annual growth over the next decade (USDA, ERS, 2021).

Colombia is a significant agricultural producer and exporter. Unlike other sectors, the agricultural sector was less impacted by the pandemic and had recorded positive growth for 2020. Although food production faced fewer operational restrictions, the marketing and distribution of food was significantly impaired by extended lockdowns to contain the pandemic. A large depreciation of Colombia's currency and the increased price of coffee—the country's principal export—boosted export revenues. Colombia's daily per capita Calorie food gap is projected to substantially shrink from 260 kcal in 2021 to 205 kcal in 2031, as the country continues to improve food production and distribution.

Ecuador is the third most populous country among the South American countries included in IFSA, with 28 percent of its population (17 million people) estimated to be food-insecure in 2021 (*table 14*). By 2031, Ecuador is expected to see a reduction of 53.7 percent in food insecurity prevalence, to nearly 12.8 percent of the population—which is projected to be driven by anticipated increases in GDP per capita, higher export revenues, and increased food production. Agriculture has traditionally employed a large proportion of the population in the production of subsistence food crops—including food grains, potatoes, beans, and cassava. Commercial production of tropical crops (such as coffee, cacao, and bananas) provide Ecuador with foreign exchange to buy rice and wheat imports. Ecuador has a daily per capita Calorie food gap of 264 kcal, which is projected to see a moderate decline to 216 kcal by 2031.

Ecuador derives an important share of its GDP from crude oil exports. The recent slump in oil and energy prices have considerably affected Ecuador's economy—as was the case for other countries like Colombia and Bolivia—who also depend on energy exports. In all three countries, negative terms-of-trade for energy products hampered economic growth in 2020. Ecuador (which was facing economic challenges before the pandemic and with less room to increase fiscal expenditures), suffered large contractions in economic activity compared to other countries in the South American region. Over the next 10 years (2021–31), per capita GDP is projected to grow 1.4 percent a year, the second slowest growth rate in the LAC region and comparable to Haiti.

Peru is classified by the World Bank as a middle-income country. Agricultural production in Peru has been hindered in the near term by low market prices, which has resulted in reduced 2021 plantings (FAO, 2021). However, with an anticipated increase in production over the medium term, food insecurity is estimated to drop significantly—also reducing the number of food-insecure people from 7.8 million in 2021 to just over 3.3 million in 2031 (*table 14*). With a total population of 32 million in 2021, Peru is estimated to have 24 percent of its population considered food-insecure in 2021. By 2031, the prevalence of food insecurity will drop by 60.9 percent to 9.5 percent. The daily per capita Calorie food gap is projected to fall from 295 kcal in 2021 to 237 kcal by 2031.

In the LAC region, Peru experienced the largest economic decline by the COVID-19 induced recession. After contracting more than 14.0 percent during 2020, GDP growth is projected to recover to 3.5 percent in 2021, with a sustained annual growth of 3.1 percent through 2031. As a result, GDP per capita is projected to annually increase 2.5 percent during the 2021–2031 period, compared to a 1.6 percent decline in the 2015–2020 period. Peru had better economic fundamentals than all other countries in the LAC region, which allowed for an unprecedented expansion of fiscal and monetary transfers to counter the effects of strict lockdowns, which lasted for several months and resulted in massive job losses. The depreciation of the currency also helped increase foreign exchange revenues from agricultural exports.

Asia

In 2021, food security of the Asian countries covered by the assessment is anticipated to deteriorate further from 2020. In the Asia region, the main driver for the estimated increase in food insecurity is incomes that remain below their pre-pandemic levels (*table 15*). The COVID-19 pandemic caused significant income losses and reduced remittances, resulting in the deterioration of food-security for a large segment of the population (Food and Agriculture Organization of the United Nations (FAO), 2020). In 2020, GDP in Asia declined by more than 5.0 percent and the decline in per capita income was more than double at 10.6 percent (Baquedano, *et al.*, 2021). While robust growth for GDP per capita (4.0 percent) in 2021 is anticipated for most countries in the region, in absolute terms income will be 2.5 percent lower than in 2019 for most countries.

Table 15

Inflation adjusted per capita income for the Asia region, 2021 and 2031

	2019 (pre-COVID-19)	2021	2031
	Dollars (2015 U.S.)		
Asia	2,279	2,221	3,400
Commonwealth of Independent States	3,591	3,502	4,584
Central and Southern Asia	1,923	1,861	2,914
Other Asia	1,092	1,068	1,233
South East Asia	3,516	3,484	5,304

Source: USDA, Economic Research Service International Macroeconomic Dataset.

In 2021, the Asia region is estimated to have 647 million people (26.4 percent of its population) considered food-insecure, the most of any region (*table 16*). The Central and South Asia (CSA) sub-region, which includes India, accounts for 78.6 percent of the food-insecure population in the Asia region. In 2021, the number of food-insecure people within the Asia region is estimated to have increased by 48.0 percent from 2020, 16 a year that also saw a sharp increase in the region's food-insecurity metrics after the onset of the COVID-19 pandemic (*figure 8*).

Asia indicators of food insecurity

Asia
(4.9 billion people in 2021)
In 2021, ERS estimates that 647 million people are food-insecure in Asia, mainly reflecting the large numbers in the Central and Southern Asia sub-region, which includes India. The prevalence of food insecurity in Asia is estimated at 26.2 percent. By 2031, ERS projects that the prevalence of food insecurity will decline by $\frac{3}{4}$ to 6.4 percent. The number of food-insecure people in 2031 is projected to be 176 million, 73 percent less than 2021.

Figure 8

Asia, change in the number of food-insecure people from 2020 to 2021
Change in the number of food-insecure population

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

By 2031—driven by an expectation for sustained economic growth (5.4 percent annually) coupled with low population growth rates (1.0 percent annually)—the Asia region is projected to see a 75.4 percent reduction in its prevalence of food insecurity to 6.4 percent, and the number of food-insecure people is anticipated to decline to less than 176 million (*table 16*). Moreover, the per capita daily Calorie food gap—the difference between estimated consumption and a nutritional target of 2,100 kcal—is projected to decline by 23.9 percent, from 304 kcal in 2021 to 231 kcal in 2031. Most of the food security improvements over the next decade are driven by trends in the CSA sub-region, where the number of food-insecure people is projected to decline by 78.9 percent over the next decade, to less than 108 million. Moreover, the CSA's prevalence of food insecurity is anticipated to decline by 81.0 percent to 5.3 percent. By contrast, Other Asia (OA), which includes North Korea and Yemen, is projected to make little progress in its food insecurity metrics over the next decade. By 2031, OA is anticipated to reduce the prevalence of food insecurity by 18.3 percent (to 58.7 percent of the total population) and the number of food-insecure people by 9.0 percent (to less than 43 million people).

Because of productivity gains for most countries, Asia has experienced strong growth in grain output. In 2020, Asia recorded a 1.6 percent growth in grain production, and early prospects are favorable for 2021 (FAO, 2020). Grain production over the next decade is projected to annually grow by 2.0 percent (*table 16*). By contrast, the total demand for grains—both for food and other uses, including feed—will grow at a rate of 2.5 percent a year. The anticipated stronger growth in total grain demand will increase the region's implied additional supply requirements (accounting for both the need of stocks and imports) by almost 62.0 percent over the next decade.

Food and Agriculture Organization of the United Nations (FAO). 2020. *Crop Prospects and Food Situation #4*, December 2020. Rome, Italy.

Commonwealth of Independent States (CIS)

In 2021, the CIS is estimated to be the most food-secure sub-region in Asia. The number of food-insecure people is estimated at 10.1 million, or 13.8 percent of the CIS population (*table 17*). Relative to 2020, it is estimated that the CIS sub-region may see an increase of 27.6 percent in the number of food-insecure people. The increase (in the estimated number of food-insecure people) mainly reflects incomes that are 2.5 percent lower than their 2019 levels. Tajikistan accounts for close to half of the population estimated to be food-insecure in the CIS sub-region. Tajikistan is also estimated to have the highest rate of food insecurity (53.6 percent of the population) in the sub-region. The pandemic-related global economic slowdown resulted in a strong decline in prices for the sub-region's main commodity exports—particularly energy products—and resulted in a decline of 4.0 percent in GDP in 2020. Although economic activity is expected to recover in 2021, the effects of the COVID-19 pandemic will linger, with both GDP and GDP per capita anticipated to remain below the 2019 levels.

Table 17

Food security indicators for the Commonwealth of Independent States sub-region, 2021 and 2031

Year	Food grain demand	Other grain demand *	Total grain demand	Grain production	Implied additional supply required **
Million tons					
2021	13.5	23.8	37.3	21.0	16.3
2031	16.2	31.8	48.1	33.0	15.1

Notes: *Other grain demand includes seed, feed, waste, and processing. **The gap between grain demand and domestic grain production.

By 2031, the prevalence of food insecurity (6.1 percent of the population) and the number of food-insecure people (4.7 million) in the CIS sub-region is projected to decline by more than half (*table 17*). The anticipated improvement in the sub-region's food security metrics over the decade are linked to a projected acceleration in income growth. During the 2021–2031 period, GDP per capita is projected to grow at an annual rate of 4.6 percent, almost double the rate of the 2015–2020 period. By 2031, the per capita daily Calorie food gap is projected to decline by 23.3 percent, from 244 kcal in 2021 to 187 kcal in 2031. However, relative to the sub-regional food security trends over the coming decade, Tajikistan is anticipated to make the least progress in absolute terms (*i.e.*, number of food-insecure people) and relative terms (*i.e.*, prevalence of food insecurity). Over the coming decade, Tajikistan's population growth rate (1.3 percent a year) is projected to be more than double the CIS average (0.6 percent a year), resulting in GDP per capita growth that is less than half the regional average—1.2 percent a year for Tajikistan, *versus* 2.7 percent a year for the CIS sub-region).

The CIS sub-region is a large producer and exporter of grains, particularly wheat. By 2031, the sub-region is projected to make productivity gains, with grain output growing 4.6 percent a year (*table 17*). Although most of the CIS sub-region's future demand growth for grains is projected to come from other uses (including feed), the anticipated growth in output far exceeds the annual growth of 2.6 percent in total grain demand. And while the sub-region is not anticipated to be self-sufficient in grain production by 2031, the implied additional supply requirement—which includes stocks and imports—will be lower than in 2021.

Central and Southern Asia (CSA)

The CSA sub-region accounts for 47 percent of the total population of the Asia region in IFSA, as it includes India. Because of its population size, India tends to distinctly influence food-insecurity trends in the Asia region. In 2021, it is estimated that the CSA will have a larger population of food-insecure people than the Sub-Saharan Africa (SSA) region, with the current estimate for 2021 reaching almost 509 million people who are food-insecure (*table 18*). India is estimated to account for 68 percent of the food-insecure population in 2021 in the sub-region. By contrast, Afghanistan has the highest estimated prevalence of food insecurity in 2021 in CSA. Almost 59 percent of Afghanistan's population is estimated to be unable to meet the daily Calorie requirement of 2,100 kcal. Sri Lanka is estimated to be the most food-secure country in the CSA sub-region in 2021. Because of the lingering effects of the COVID–19 pandemic on income levels and economic activity, the CSA sub-region is estimated to have 58 percent more people considered food-insecure in 2021 than in 2020. Like the rest of the world, the CSA saw a sharp decline in GDP as a result of the global COVID–19 pandemic, with economic growth declining by an average 5.9 percent at a sub-regional level and by 6.9 percent in India (Baquedano, *et al.*, 2021). While strong economic growth is estimated in 2021 for the CSA sub-region (5.4 percent), in absolute terms both GDP and GDP per capita will remain below the 2018–2020 trend for most countries in the sub-region.

Table 18*Food security indicators for the Central and Southern Asia sub-region, 2021 and 2031*

Year	Food grain demand	Other grain demand *	Total grain demand	Grain production	Implied additional supply required **
Million tons

Note: * Measured in grain equivalents.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

By 2031, the prevalence of food insecurity in the CSA sub-region is projected to decline by about 81 percent from 2021 to 5.3 percent (table 18). The improvement in food security is largely driven by an anticipated stronger recovery in GDP per capita growth after 2021, slower population growth, and stability in food prices. In the CSA sub-region, Bangladesh, India, and Pakistan are projected to account for most of the improvement in the food security metrics by 2031. By contrast Afghanistan—relative to its CSA peers—is anticipated to make the least progress over the next decade. By 2031, CSA's food-insecure population is projected to decline by 78.9 percent to just over 107 million people. Pakistan, India, and Afghanistan are projected to account for most of the food-insecure people in 2031 in the region. However, Afghanistan is projected to have the highest prevalence of food insecurity in the coming decade. The daily per capita Calorie food gap in CSA—defined as the difference between estimated consumption and the nutritional target of 2,100 kcal—is projected to decline by 27.3 percent, from 315 kcal in 2021 to 229 kcal in 2031.

Grain demand over the next decade in CSA is projected to grow at a faster pace (2.9 percent a year) than production (1.7 percent a year) (*table 18*). Between 2021 and 2031, most of the growth in grain demand is projected to come from demand for other grain use, including feed. The demand for other grain use is projected to grow at a rate of 3.3 percent a year, 0.5 percentage points higher than the growth for food grain demand over the same period. In absolute terms, the demand for food (440 million tons) will be 4 times greater in 2031 than the demand for other grain use (109 million tons). This increased demand will require a significant growth in the sub-region's implied additional supply requirements.

India, as the largest country in the CSA sub-region of all countries included in IFSA, plays a major role in shaping the Asia's food-security indicators. The COVID-19 pandemic led to the worst economic slump in 4 decades for India (World Food Programme (WFP), 2020). The pandemic is expected to revert poverty levels in India to their 2016 estimate, with the poverty rate reaching 10.4 percent (World Bank, 2020). Per capita GDP for 2021 is estimated at \$2,009, roughly 3.0 percent below its 2019 level. As a result of the estimated macroeconomic trends, 25.8 percent of the population (345.4 million) is estimated to be food-insecure in 2021.

Despite the pandemic-induced decline in India's GDP growth in 2020 (–6.9 percent), the country's GDP per capita is projected to grow at an annual rate of 4.9 percent between 2021 and 2031. The anticipated higher income prospects are projected to result in a marked improvement in the country's food-security metrics. The number of food-insecure people in India is projected to decrease to 32.1 million by the year 2031, or 2.2 percent of India's population. The per capita daily Calorie food gap is projected to decline by 36.6 percent, from 289 kcal in 2021 to 183 kcal in 2031.

Afghanistan continues to be one of the most food-insecure countries in IFSA. The COVID-19 pandemic, coupled with an intensification of the armed conflict that began in 2001, has resulted in at least 3.4 million people being considered in an emergency acute food insecurity¹⁷ situation (Global Network Against Food Crises (GNAFC), 2020). Protracted armed conflict and generally deteriorating macro-economic conditions, coupled with increasing food prices, will continue to drive food insecurity in Afghanistan in 2021 (FAO, 2020; GNAFC, 2020). In 2021, more than 22 million people are estimated to be considered food-insecure, representing 58.9 percent of the Afghan population (*table 14*). Afghanistan is projected to make the least progress in its food security metrics in the CSA sub-region. By 2031, the prevalence of food insecurity is projected to decline by 34 percent to 38.8 percent of Afghanistan's population (*table 18*). By 2031, the total number of food-insecure people in Afghanistan is expected to decline by 18.2 percent to 18.1 million, the lowest decline of any CSA country. The ability of the food-insecure population to meet its daily per capita Calorie requirement is projected to improve by 2031, as the per capita food gap declines from 397 kcal in 2021 to 322 kcal in 2031.

Bangladesh has the third largest population in the CSA sub-region. Bangladesh's economy has been significantly impacted by the COVID-19 pandemic, as the economy is highly dependent on remittances from migrants residing abroad and a main exporter of garments. According to estimates compiled by GNAFC (2020), remittances are estimated to have declined some 27.8 percent in 2020, as migrants returned to Bangladesh or the economies that hosted them also saw pandemic-induced economic downturns. Of more concern to the country is the garment industry—which is both a source of export revenue and of employment for low-skilled workers. Some early estimates indicate a loss in revenue of at least \$3 billion for the garment industry (GNAFC, 2020). Bangladesh was estimated to experience a GDP growth of less than one percent in 2020 (Baquedano, *et al.*, 2021). Its GDP is predicted to decline almost 2.7 percent in 2021 and GDP per capita will likely remain 3.6 percent below its 2019 level. The weakened macroeconomic environment is anticipated to further affect the country's food-security metrics. In 2021, the prevalence of food insecurity is estimated to be 25.7 percent and the total food-insecure population is estimated to reach 42 million people. Driven by an improvement of economic growth and incomes by 2031, the prevalence of food insecurity is projected to decline by 77.1 percent to 5.9 percent of the population. By 2031, the number of food-insecure people in Bangladesh is projected to be 10.5 million, which is 75.1 percent lower than at the beginning of the decade. The intensity of food insecurity, indicated by the daily per capita Calorie food gap, is projected to decline by 27.1 percent, from 300 kcal in 2021 to 218 kcal in 2031.

¹⁷ According to IPC Global Partners (2019) an acute food insecurity situation identifies areas or populations with food deprivation that threatens livelihoods, regardless of the causes, context, or duration.

Pakistan is projected to be the second most food-insecure country in the CSA sub-region. Pakistan—like the other countries in the CSA sub-region—has been severely impacted by the COVID–19 pandemic. In addition, even though floods in 2020 did not cause significant food shortages, they did put upward pressure on local food prices (FAO, 2020). Moreover, an estimated sharp decline in remittances (26.8 percent) has severely affected incomes of vulnerable populations (GNAFC, 2020). Baquedano, *et al.* (2021) reported that Pakistan’s economy shrank by almost 2.4 percent in 2020. Even though GDP is anticipated to grow almost by 2.1 percent in 2021, GDP per capita is anticipated to remain 4.3 percent below its 2019 level. The prevalence of food insecurity in the country is estimated at 38.1 percent of the population in 2021, whereas the food-insecure population in Pakistan is estimated to be 90.7 million (*table 18*). From 2021 to 2031, GDP per capita is projected to grow faster (2.5 percent a year) than population numbers (1.8 percent a year). The projected steady income growth, coupled with anticipated price stability over the next decade, is expected to result in a sharp decline in the prevalence of food insecurity. In 2031, the share of the population considered food-insecure is anticipated to be 16.0 percent, a decline of 58.0 percent from 2021 (*table 18*). The number of food-insecure people in 2031 is projected at 45.6 million, a 49.7 percent decline from the 2021 estimate. The intensity of food insecurity, indicated by the daily per capita Calorie food-gap, is projected to decline by 22.7 percent, as the food gap changes from 389 kcal in 2021 to 301 kcal in 2031.

Other Asia (OA)

The Other Asia sub-region is estimated to be the most food-insecure of any sub-region in the assessment, as it includes both Yemen and North Korea. In 2021, it is estimated that almost 72 percent of the almost 60 million people in OA are food-insecure (*table 19*). Yemen is estimated to account for 60.2 percent of the food-insecure population in OA in 2021. Continued conflict—coupled with the effects of the COVID–19 pandemic on Yemen’s economy—are expected to further deteriorate per capita income in 2021, putting pressure on Yemen’s food security. The Democratic People’s Republic of Korea (DPRK) is estimated to account for 38.2 percent of the food-insecure population in the OA sub-region.

Note: ^a Measured in grain equivalents.

Source: USDA, Economic Research Service based on results from the International Food Security Assessment model.

By 2031, the sub-region is projected to see moderate income growth, helping improve the OA's food security metrics. The prevalence of food insecurity in OA is projected to decrease by 18.3 percent by 2031 (*table 19*). However, the prevalence of food insecurity is projected to remain high at the end of the decade at 58.7 percent. These results largely reflect trends in Yemen, as a greater improvement is anticipated in DPRK and Mongolia. The number of food-insecure people in the OA sub-region is projected to decline by 9.0 percent in 2031 to 39 million. The anticipated moderate decline in the number of food-insecure people over the next decade mainly reflects trends in DPRK. However, by 2031, the number of food-insecure people in both DPRK and Yemen is projected to remain close to their 2021 levels. By 2031, the daily per capita Calorie food gap for OA is projected to decline by almost 18.0 percent, from 457 kcal in 2021 to 375 kcal in 2031.

Yemen—with an estimated 25.8 million food-insecure people and a prevalence of food insecurity of 84.6 percent in 2021—is the most food-insecure country in the OA sub-region (*table 19*). Continued and intensified civil conflict has only compounded the effects of the COVID-19 pandemic and increased humanitarian assistance needs within the country (GNAFC, 2020). According to GNAFC (2020), at least 3.2 million people in Yemen are in acute food insecurity crisis.¹⁸ In 2020, the dual shock from the COVID-19 pandemic and the ongoing armed conflict reduced Yemen's GDP by an estimated 12.3 percent at the macro level (Baquedano, *et al.*, 2021). A marginal increase in GDP growth (1.5 percent) is anticipated for 2021. However, in absolute terms, GDP is estimated to be 24.0 percent below the 2018–2020 average. Over the next decade, if current trends continue, modest progress is expected in the country's food-security metrics. By 2031, the prevalence of food insecurity is projected to decline by 19.0 percent to 68.5 percent. In absolute terms, the number of food-insecure people is anticipated to decline by 3.7 percent to 24.8 million. By 2031, the daily

¹⁸ According to IPC Global Partners (2019) an acute food insecurity situation identifies areas and populations with food deprivation that threatens livelihoods, regardless of the causes, context or duration.

per capita Calorie food gap is projected to improve by 19.9 percent, declining from 631 kcal in 2021 to 505 kcal in 2031.

In the Democratic People's Republic of Korea (DPRK), large numbers of people have low levels of food consumption and poor dietary diversity (FAO, 2020). The economic constraints, exacerbated by the impact of the COVID-19 pandemic, have increased the vulnerability to food insecurity of the local population (FAO, 2020). North Korean economic growth estimates for 2021 point to a modest 3.7 percent recovery of GDP. However, DPRK's food insecurity indicators are estimated to be high for 2021. The prevalence of food insecurity for 2021 is estimated at 63.1 percent of the population and the estimate for the number of food-insecure people is projected to reach 16.3 million. By 2031, projections for DPRK point to modest improvements in the country's food-security metrics. The improvements in the DPRK's food-security prospects over the next decade are mainly driven by an expectation that GDP growth per capita (1.4 percent) exceeds population growth (1.1 percent). By 2031, the prevalence of food insecurity is projected to decline by 17.2 percent, but more than half of the population will continue to be considered food-insecure. In absolute terms, the number of food-insecure people is projected to decline by 14.5 percent to 14 million. The daily per capita Calorie food gap is projected to decline by 10.9 percent, from 446 kcal in 2021 to 397 kcal in 2031.

Southeast Asia (SEA)

South East Asia (SEA) is estimated to be the second most food-secure sub-region in Asia, with an average prevalence of food insecurity of 17.0 percent and less than 86 million people considered food-insecure in 2021 (*table 20*). Almost half of the food-insecure population in SEA is located in Indonesia (42 million), which represents 53.4 percent of the sub-region's population. However, the most food-insecure country in the sub-region is Laos, which has the highest estimated prevalence of food insecurity in 2021. GDP per capita in the sub-region is expected to recover in 2021, growing 3.6 percent from 2020 and almost on par with 2019 levels. However, Indonesia and the Philippines are the only two countries where incomes in 2021 are estimated to remain below their 2019 levels.

For the SEA sub-region's growth rate of GDP per capita over the next decade is projected to be 4.3 percent a year. By contrast, population growth is anticipated to be much lower, averaging less than 1.0 percent a year from 2021 to 2031. As a result of the anticipated robust income growth in SEA, the prevalence of food insecurity is projected to decline by 73.4 percent to 4.5 percent of the population (*table 20*). The number of food-insecure people is also projected to decline sharply (by 71.1 percent) to less than 25 million. By 2031, the daily per capita Calorie food gap is projected to decline by 25.7 percent, from 296 kcal in 2021 to 220 kcal in 2031.

In the Laos People's Democratic Republic (LAO), a reduction in remittances in 2020 from migrants returning from Thailand—due to the COVID-19 pandemic—is likely to severely affect incomes and livelihoods of the most vulnerable populations (GNAFC, 2020). Moreover, in northern parts of the country, cereal production shortfalls (for the second consecutive year) have limited the availability of food for households' own consumption and have reduced income from crop sales, further constraining access to food (Food and Agriculture Organization of the United Nations Global Information Early Warning Systems (FAO GIEWS), 2020). It is estimated that almost 31 percent of the LAO population (2.3 million) is considered food-insecure in 2021 (*table 20*). By 2031, LAO's GDP per capita is projected to grow (3.6 percent a year) at a greater pace than population growth (1.3 percent a year). As a result, the prevalence of food insecurity is projected to decline by 77.9 percent and reach 6.7 percent by 2031. The number of food-insecure people over the next decade is also projected to decline by almost $\frac{3}{4}$ to less than 600,000. By 2031, the daily per capita Calorie food gap is anticipated to decline by 29.6, from 294 kcal in 2021 to 207 kcal in 2031.

Indonesia experienced a sharp decline of its economy in 2020, due to the COVID-19 pandemic, with GDP shrinking by 3.0 percent (Baquedano, *et al.*, 2021). In 2021, GDP is estimated to grow by 3.3 percent and may reach \$1.05 trillion, 2.9 percent higher than the 2018–2020 average. However, GDP per capita in 2021 is estimated to be 1.3 percent below its 2019 level. The prevalence of food insecurity for 2021 is estimated at 15.7 percent and about 42 million people are estimated to be food-

insecure (*table 20*). From 2021 to 2031, Indonesian GDP per capita is projected to grow 4.3 percent a year. By contrast, over the same period, Indonesia population growth is anticipated to be 0.6 percent a year. As a result of the anticipated robust income growth over the next decade, the prevalence of food insecurity is projected to decline by 76.5 percent to 3.7 percent, with the food-insecure population to decline to below 11 million. By 2031, the daily per capita Calorie food gap is expected to decline by 22.6 percent, from 281 kcal in 2021 to 218 kcal in 2031.

In the Philippines, the COVID-19 pandemic severely affected livelihoods and the ability of households to purchase food (FAO, 2021). The food-security environment improved towards the end of 2020—as the Government of the Philippines refined its COVID-19 containment approach, maximized the operation of local food systems, and provided cash transfers to the most vulnerable populations (FAO, 2021). However, Baquedano, *et al.* (2021) reported that in 2020, the Philippines economy shrank by 8.3 percent. For 2021, GDP is estimated to grow by 7.7 percent, to \$391 billion, 3.7 percent higher than the average for the period 2018–2020. But GDP per capita in 2021 is estimated to remain some 4.2 percent below its 2019 level. As a result of the anticipated lower incomes levels for 2021, the prevalence of food insecurity is estimated at 25.0 percent and the number of food-insecure people is estimated to reach 27.7 million (*table 20*). From 2021 to 2031, the country's GDP per capita growth (3.6 percent a year) is projected to outpace population growth (1.4 percent a year). The expected strong economic growth over the next decade is projected to lead to a 62.1 percent decline in the prevalence of food insecurity to 9.5 percent. The number of food-insecure people is projected to decline by 56.5 percent from a decade earlier and reach 12.1 million. By 2031, the daily per capita Calorie food gap is expected to decline by 20.0 percent, from 347 kcal in 2021 to 278 kcal in 2031.

In Vietnam—early preparedness, contact tracing, isolation and testing, coupled with timely border closures, physical distancing and community adherence—have been key in controlling and mitigating the effects on the economy and health of the population of the COVID-19 pandemic (Tan, 2021). Despite early and proactive action by the country, Vietnam's economy was significantly impacted by the COVID-19 pandemic. GDP growth in 2020 was reported at just above 1.0 percent, but this is down from the 2018–2020 average of 5.1 percent (Baquedano, *et al.* 2021). The decline in economic growth mainly reflects the early impacts of closures of business and mobility restrictions.

Economic growth in 2021 is estimated at 5.5 percent and in absolute terms GDP is expected to reach almost \$268 billion, well above the average of \$247 billion for the period of 2018–2020. Despite the setbacks from the COVID-19 pandemic, Vietnam remains the most food-secure country in the SEA sub-region. In addition, in 2021, it is estimated that the prevalence of food insecurity will be less than 9.7 percent and 9.7 million people will be food-insecure (*table 20*). From 2021 to 2031, GDP per capita growth (5.9 percent a year) is projected to outpace population growth (0.6 percent a year). Moreover, the price of the main staple food, rice, is anticipated to remain relatively stable over the next decade. As a result, by 2031, the prevalence of food insecurity is projected to decline by 90.9 percent to 0.9 percent. The number of food-insecure people is expected to decline by 90.3 percent by 2031 to less than one million people. By 2031, the daily per capita Calorie food gap is projected to decline by 27.6 percent, from 263 kcal in 2021 to 190 kcal in 2031.

Appendix I: Food Security Assessment Model: Definitions and methodology

The IFSA model¹⁹ used in this report projects food consumption (food demand), food access, and food gaps in 76 low- and middle-income countries. Each country's food security metrics are estimated for the 2021 and projected to 2031. Food is divided into four groups, covering 100 percent of food consumption: the major grain (determined by calorie share), other grains, root crops, and all other food.

The food security of a country is evaluated based on the gap between estimated domestic food consumption (food demand) and a caloric target, which is set at 2,100 kcal per capita per day—a caloric level necessary to sustain life at a moderate level of activity. The modeling projections of food demand are expressed in grain equivalent, based on each food group's caloric content to allow aggregation across food groups, allowing this grain equivalent to be easily expressed in either kilograms or kcal.

Three food security indicators are provided: (1) the share of food-insecure, which is the share of the total population unable to reach the nutritional target; (2) the number of food-insecure people; and (3) the food-gap, which is the amount of food needed to allow each individual consuming below the threshold level to reach the caloric target. This caloric target indicates relative well-being and helps to quantify unequal food access within a country. Projection results provide a baseline for the food-security situation in each country, and the results depend on the model's specification and underlying assumptions. The simulation framework used to project food demand is based on partial-equilibrium models for each country in the assessment. Beghin, *et al.* (2015) introduce the methodology, and Beghin, *et al.* (2017) provide more detail on price transmission and food security projections.

Each country model comprises a price-independent generalized log-linear (PIGLOG) demand system for each of the four food groups (Deaton & Muellbauer, 1980; Muellbauer, 1975). The demand system is calibrated on a 3 year average of prices and incomes (2018–20), observed consumption levels, a measure of inequality, and income and price elasticities. Demand projections are based on projected prices and incomes; the model implicitly assumes that both the *preferences* represented by the demand system and the *income distributions* embedded in the calibration and projections are constant over time.

The distribution of consumption used to calculate food security measures is described by a constant coefficient of variation, which implies an increasing standard deviation of consumption, as consumption rises over the projection period. But this does not account for potential structural changes in an economy. The implied price and income elasticities evolve over the projection period, as prices and incomes change; generally, food groups become more income-inelastic because incomes rise.

Structural framework for estimating and projecting food demand in the aggregate Demand system definition and calibration

The demand q^h_i for a given food group i , for income-decile h is specified as:

$$1. \quad q^h_i = (x^h_i / p_i) (A_i(p_i) + B_i(p_i) \ln(x^h_i))$$

where p_i is the price (expressed in real local currency), and x^h is the decile-level income.

$$\text{And: } A_i(p_i) = a_{i0} + a_{i1}p_i \text{ and } B_i(p_i) = b_{i0} + b_{i1}p_i.$$

The PIGLOG demand formulation allows for aggregation of income decile-level demands in (1) into average per capita market demand for each food group i as shown in (2).

$$2. \quad \bar{q}_i = \left(\frac{x_i}{p_i}\right) ((a_{i0} + a_{i1}p_i) + (b_{i0} + b_{i1}p_i) (\ln(\bar{x}) + \ln\left(\frac{10}{z}\right)))$$

The latter in equation (2) is a function of average per capita income \bar{x} and Theil's entropy measure of income inequality z .

The average expenditure share for good category i is also defined as:

$$3. \quad \bar{w}_i = (a_{i0} + a_{i1}p_i) + (b_{i0} + b_{i1}p_i) (\ln(\bar{x}) + \ln\left(\frac{10}{z}\right))$$

The elasticity of average demand for good i with respect to average income (or total expenditure) is:

¹⁹The methodology to estimate the IFSA model indicators was replaced in 2016. To understand the changes to the model and impact on our food security estimates, see Rosen, *et al.*, (2016).

$$4. \quad \varepsilon_{\bar{q}_i \bar{x}} = 1 + (b_{i0} + b_{i1})/\bar{w}_i$$

The own-price elasticity of the average demand is:

$$5. \quad \varepsilon_{q_i p_i} = -1 + \left(\frac{p_i}{\bar{w}_i}\right)(a_{i1} + b_{i1}(\ln(\bar{x}) + \ln\left(\frac{10}{z}\right)))$$

In each country, consumers at different income levels have similar underlying preferences over good i as embodied in parameters a_{i0} , a_{i1} , b_{i0} , b_{i1} , but their respective consumptions vary because their respective incomes vary.

With a system of three linear equations (equations 3, 4, and 5), with four unknown variables, one parameter remains free. The free parameter (chosen to be b_{i0}) is used to ensure that decile demands behave consistently with stylized facts of food security as follows: price sensitivity and income responsiveness decline with income levels; own-price elasticities must be negative; and food expenditure shares tend to fall with increasing income. A range of values of the free parameters allows ensuring these stylized facts are satisfied by the calibrated demand system. Here b_{i0} is pinned down such that the ratio of price elasticities for the bottom and top deciles is equal to the ratio of the natural logarithm of their national income shares.

For any given free parameter value, the system of equations is solved for parameters b_{i1} , a_{i1} , and a_{i0} as a function of the free parameter. Once these three parameters are recovered, parameters \bar{a}_{i0} , \bar{a}_{i1} , b_{i0} , and b_{i1} , along with income x^h and price p_i , are used to generate the consumption level of good i for each decile specified in equation (1). In this initial calibration, the quality of any good i is assumed to be constant across the income distribution.

For each country, a demand system is calibrated for each of the four food groups—based on income, consumption levels, and prices from the 3 years preceding the projection period (2018–20). The *major grain* (which varies across countries) is determined, based on caloric share in the diet. The *other grains* food group contains all other grains; the prices for this food group are weighted by its components' caloric shares.

At the calibration stage, domestic food prices are either observed (including the components of a price index for other grains that is weighted by caloric share) or synthetic prices are created.

For the food prices not observed in the calibration stage, a synthetic domestic price, p_i^{ds} , that is linked to the world price, p_i^w , is created and expressed in local currency. The parameter θ is the price transmission slope, which is assumed 0.7. The parameter trc^{int} represents international transportation and market costs [e.g., cost, insurance and freight (CIF) and free on board (FOB)], which are assumed 10 percent, and trc^{dom} are domestic trade costs, which are assumed \$20 per ton in real terms:

$$6. \quad p_i^{ds} = \theta * p_i^w * (1 + trc^{int} trc_{int} / \theta) * (1 = tariff / \theta) + trc^{dom}$$

At this stage, the calibration also includes a price transmission equation that links the domestic price p_i^{dom} (either observed or synthetic) to the world price. The generic price transmission equation is:

$$7. \quad p_i^{dom} = \theta * p_i^w + I$$

During the calibration stage, the intercept, I , is solved in real terms, and is held constant during the projection period.

Projection of food demand calculation and food security indicators

The IFSA food security indicators (share of food-insecure population, number of food-insecure people, and food-gap) are derived from the levels of food demand projected, using the calibrated demand system.

For each country, the demand parameters and projected income, x_i , and prices, p_{it} , are used to project food demand, q_{it} , for each of the four food groups i in each year t so that $q_{it} = A_i(x_i/P_{it})/(P_{it}) + B_i(P_{it})\ln(x_i)$. The demand for the four food groups is aggregated into total food demand expressed in Calories, so that $\sum q_{it} = Q_t$, which is also referred as food or caloric consumption. This measure of total demand is used to calculate food security indicators.

The FAO (2019) is followed to estimate the distribution of caloric consumption—beginning with a coefficient of variation (CV) of food availability—which characterizes consumption distributed with a mean m and variance v , so that $CV = (\sqrt{v}/m)$.²⁰

²⁰ See the appendix of Beghin, *et al.* (2015b) for more detail.

Given the CV and the projected mean caloric consumption (Q_t), the variance, v , of the empirical distribution for a given year t can be recovered.

Assuming food consumption Q_t is distributed lognormal, then $\ln(Q_t)$ is distributed

$N(\mu, \sigma^2)$ with $\mu = \ln\left(\frac{m^2}{\sqrt{v + m^2}}\right)$ and $\sigma^2 = \ln(1 + v/m^2)$. Once μ and σ^2 are computed, the proportion of the population that falls below the calorie target (2,100 Kcal per capita per day) is recovered using the standard normal CDF, Φ : $\Phi^{insecure} = \Phi\left(\frac{\ln(2,100 - \mu)}{\sigma}\right)$.

Here, $\Phi^{insecure}$ indicates the share of the population that is food-insecure. Using this share and total population in the respective country, the total number of food-insecure people in this country is calculated.

Next, the expected average food intake of food-insecure people, $q_{cal\ average}^{food\ insecure}$, can

be recovered, using the partial mean of the calorie availability below the target (2,100), which is calculated as $q_{cal}^{food} = e^{\mu - \sigma} / \Phi \wedge^{2100[\phi(\ln(2100 - \mu)/\sigma)]}$, where ϕ is the standard normal density function.

The food gap is the difference between the caloric target of 2,100 and the average calorie availability for food-insecure people. This provides a measure of the food gap in kcal per day per food-insecure person. The latter, multiplied by the number of food-insecure people and converted into grain equivalent per year, yields a food-gap measure based on annual grain volume.

Data

The model is calibrated for each of the four food groups, based on average prices and income from 2018–20. Prices are expressed in real local currency units. Quantities are expressed in grain-equivalent units.

Calibrated parameters and variables

Demand parameters (\hat{a}_{io} , \hat{a}_{il} , b_{io} , and b_{il}), price intercepts, domestic prices (synthetic) projections are based on data from the *ERS International Macroeconomic Data Set* and the *USDA Agricultural Projections to 2030*. They utilize the calibrated demand parameters and price transmission between world and domestic prices.

Endogenous projection variables

Food Demand, Domestic Prices.

Exogenous variables used in Calibration and Projection

Average Consumption per capita—Food and Agriculture Organization (FAO) of the United Nations Food Balance Sheet (most recent available).²¹

Grain Shares—FAO Food Balance Sheet.²²

Elasticities of Price and Income—unpublished calculations by Jim Seale, using 2011 International Comparison Program (ICP) data, following the methodology in Muhammad, *et al.* (2011).²³

Domestic Prices (Observed)—FAO Global Information and Early Warning System (GIEWS), annual average; market depends on reporting.

²¹ Food Balance Sheets (FBS) are for 2018. There are no current FBS for Somalia, Eritrea, Burundi, and Democratic Republic of the Congo. Grain consumption levels share of grains are used in total Calories, as reported in the FAO–GIEWS *Cereal Supply and Demand Balance for Sub-Saharan African Countries: situation as of November 2020* report, to generate per capita consumption for each food group. We use grain consumption levels and share of grains in total Calories, as reported in the Food Agriculture Organization of the United Nations–Global Information Early Warning Systems *Cereal Supply and Demand Balance for Sub-Saharan African Countries: situation as of November 2020* report, to generate per capita consumption for each food group. We bring forward the reported consumption of all food groups, using information from FAO's grain supply data and changes in caloric intake.

²² For Somalia, we use an FBS from the original Food and Agriculture Organization Statistical Database, which is no longer maintained. The FBS of neighboring countries used (Burundi—Rwanda; DR Congo—Congo; Eritrea—Ethiopia) to approximate the shares of grains and roots and tubers in total Calories for the other countries.

²³ Elasticities are not available for all countries. Estimates used from neighboring countries (Somalia—Ethiopia; Eritrea—Ethiopia; Algeria—average Tunisia and Morocco; Afghanistan—average Tajikistan and Pakistan; Turkmenistan—average Tajikistan, Kyrgyzstan, Kazakhstan; Uzbekistan—average Tajikistan, Kyrgyzstan, Kazakhstan). We use less elastic values for major grain in: Vietnam, Philippines, Indonesia, India, Pakistan, and Bangladesh—and for other grain in India.

Tariffs—World Bank’s World Integrated Trade Solution (WITS).²⁴
 Exchange Rates and Consumer Price Indices (CPIs)—*ERS International Macroeconomic Data Set*.²⁵
 Population—U.S. Census Bureau.
 World Prices—*USDA Agricultural Projections to 2027*.²⁶
 Per Capita Income—generated using GDP and population from *ERS International Macroeconomic Data Set*.²⁷
 Income Distribution—World Bank Data Bank.²⁸ Assumed constant during the projection period.
 Coefficient of Variation (CV) of Food Consumption—FAO State of Food Insecurity (FAO, 2019). Assumed constant during the projection period.

Modeling Staple Cereal Production

The current production module of the IFSA model aggregates a panel of agricultural production data for all 76 countries in the assessment to provide a model-based estimation for the current year and a projection 10 years out for yield and area dynamics.

Agricultural production is decomposed into yield (production per hectare) and area for grains. Production (PR) for a given country c in year t is obtained by multiplying projected yield (YL) and area (AR).

$$PR_{ct} = AR_{ct} * YL_{ct}$$

The projections cover the period 2021–2031, based on producer price projections in local currency units and world price projections from the USDA Agricultural Projections.

Yield

Yield parameters are estimated econometrically, using panel data consisting of observations for each country and are calibrated to observed yields for the immediate past 3 years (*e.g.*, 2017–2019). Yields). The calibration procedure involves in-sample prediction using observed yield data and consensus estimates for expected return ratio—an indicator of the relative profitability of fertilizer use. Yields respond to expected relative return ratios per hectare (RR), autonomous technical change over time (T), and include a country-specific effect.

$$YL_{ct} = f(RR_{ct}, T_t)$$

The return ratios are the ratio of the return per hectare-revenue from yield divided by the price of fertilizer, $RR_{ct} = ((yp_{ct} * Y_{ct}) / fp_{ct})$ where yp and fp are yield and fertilizer prices, respectively. The expected return ratios include a current-year component and a long-term expectation component, expressed in real local currency unit ($rlcu$). USDA Agricultural Projection (to 2030) prices for superphosphate and the major grain by production volume (for grain) are used.

The domestic price for each grain is linked to its world reference price, expressed in real local currency unit, through the following price transmission equation:

$$P_{domestic} = 0.7 \times p_{world} + 0.3 \times I$$

²⁴Tariff rates are available through 2018. Tariff rates for Somalia, Turkmenistan, Eritrea, and North Korea are not available. For Eritrea, we use the Common Market for Eastern and Southern Africa (COMESA) average. Somalia has imposed a 12.3 percent tariff on commercial imports (LCU Logistics). Turkmenistan has no tariff, but imposes excise taxes that have historically been 10 percent. North Korea does not import on the open market, so we assume there are zero tariffs and do not quantify other trade frictions.

²⁵Ecuador and El Salvador are modelled in the currency of U.S. dollars (instead of local currency) as in the ERS International Macroeconomic Dataset, based on data from the International Monetary Fund (IMF), and Oxford Economics. Projections constructed for: Somalia, North Korea, and Zimbabwe—using data from International Monetary Fund (IMF), IHS Markit, and Oxford Economics.

²⁶The world price series are maize (U.S. gulf #2 yellow); rice (Thai, B, fob Bangkok); sorghum (U.S. Gulf, #2 yellow); wheat (gulf, #2 Hard Red Wheat); barley (E.C., French, Rouen); Oats (U.S. Farm); roots and tubers (cassava; tapioca, hard pellets, Rotterdam, fob); other food (represented by soybean oil, Dutch fob, ex-mill). World price projections are not available for all cereals represented in the Food and Agriculture Organization of the United Nations (FAO) Food Balance Sheets and the FAO Global Information Early Warning System price database. We use the world price of wheat to represent rye; and sorghum to represent all other cereals (*e.g.*, millet, teff, fonio).

²⁷Projections were constructed using information from IMF, Oxford Economics, and IHS Markit for Zimbabwe, Somalia, and North Korea.

²⁸Income distributions are not available for all countries. We use Eritrea—Ethiopia; Somalia—Ethiopia; Zimbabwe—Zambia; North Korea—Mongolia; and Afghanistan—average Uzbekistan, Pakistan, Tajikistan.

The expected domestic price is a weighted average of 70 percent of the current-year world price (p_{world}) and 30 percent of the mean domestic price (I) over the analysis time period. The grain production data used in the estimation come from USDA's Production Supply and Demand (PSD) database and from the Food and Agriculture Organization of the United Nations (FAO). The intercept, I , is the mean of the price over the regression time period (1985–2020).

Modeling Area

Crop area, AR_{ct} , is modeled with the widely used Nerlovian specification—in which lagged area, expected crop and fertilizer prices, and a time trend—enter into the equation as follows:

$$AR_{ct} = f(y_{p_{ct}}, fp_{ct}, AR_{ct-1}, T)$$

The expected prices are averages of contemporaneous and lagged relative prices. A time trend is included in the area equation to capture non-price factors in area, and a country fixed effect. The area equation is numerically calibrated to the base year average of the preceding 3 years of the report (*e.g.*, 2018–20), using consensus estimates for price and lagged acreage responses. Regional and sub-regional models are fitted to allow for heterogeneity among diverse countries included in the IFSA model. The regional specification disaggregates the estimation of area and yield by the four regional classifications of the IFSA countries: Sub-Saharan Africa (SSA), Asia, Latin America and the Caribbean (LAC), and North Africa (NAF). The sub-regional specification disaggregates the model to 10 sub-regions of the IFSA countries: Central Africa (CAF), East Africa (EAF), Southern Africa (SAF), West Africa (WAF), North Africa (NAF), Latin America and Caribbean (LAC), Commonwealth of Independent States (CIS), Central and South Asia (CSA), Southeast Asia (SEA), and Other Asia (OA).

Model-based projection performance is assessed in terms of how well the specified model can be expected to perform on an independent (out-of-sample) data set, often assessed by the actual estimate of the out-of-sample Mean Squared Error (MSE). When an independent out-of-sample dataset is not available, a Cross-Validation (CV) approach (used in this report) can be used to choose the best model—by estimating the out-of-sample MSE, using an in-sample data set. The out-of-sample error (often referred to as the test-error) is the average error that results from using the regression method to predict the response on a new observation that was not used in regression estimation. Given an in-sample dataset, the choice of a particular specification (in this report, the regional and sub-regional model specifications) is warranted if the model results in a low test error (James, *et al.*, 2017). The models are assessed with a “leave-one-out-cross-validation” (LOOCV) to simulate their out-of-sample prediction performance (James, *et al.*, 2017).

The performances of regional and sub-regional model specifications are assessed using the overall out-of-sample MSE scores. The model with the smallest out-of-sample MSE is selected for estimation.

Modeling IASR

The Implied Additional Supply Required (IASR) quantifies the total grain demand in each country that is not projected to be met through domestic production. Total grain demand (TD) is comprised of food demand (FD), generated by our demand-driven model and nonfood use (NFD)—which is comprised of seed, feed, processing, and other uses. The IASR for grains thus can be expressed as: $IASR = TD - PR$.

The demand for grain for processing, seed, and other uses, is assumed to grow at the same rate as production. The demand for grain feed grows at the average rate observed during 2006–20.

SUBMITTED STATEMENT BY HON. JIM COSTA, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA; ON BEHALF OF AMERICAN SOYBEAN ASSOCIATION

The American Soybean Association thanks the House Agriculture Committee's Livestock and Foreign Agriculture Subcommittee for the opportunity to provide written testimony to the hearing record for "A 2022 Review of the Farm Bill: International Trade and Food Assistance Programs." ASA, founded in 1920, represents U.S. soybean farmers on domestic and international policy issues important to the soybean industry. ASA has 26 affiliated state associations representing more than 500,000 farmers in 30 soybean-producing states.

International trade is one of the pillars of the U.S. soybean industry. Exports to foreign markets were more than 50% of U.S. soy production this last marketing year. Continued access to those existing markets, new markets, and international food aid markets are critical to sustaining U.S. soybean growers' success. To that end, ASA works to promote U.S. soy's quality and uses overseas through both its World Initiative for Soy in Human Health (WISHH)—ASA's long-term market development program—and partner organization, the U.S. Soybean Export Council (USSEC). Support from the Administration and Congress is vital to assure the free and fair trade needed to keep U.S. soybean growers competitive and bolster ASA's efforts with both WISHH and USSEC.

USSEC serves the U.S. soy family as our boots on the ground in soy markets overseas. Through a global network of international offices and strong support in the U.S., USSEC helps build a preference for U.S. soybeans and soybean products, advocates for the use of soy in feed, aquaculture and human consumption, promotes the benefits of soy use through education, and connects industry leaders. The activities of USSEC to expand international markets for U.S. soybeans and products are made possible through ASA's investment of cost-share funding provided by USDA's Foreign Agricultural Service, support from cooperating industries, and by producer check-off dollars invested by the United Soybean Board and various state soybean councils.

ASA participates in the farm bill's international food aid programs through WISHH. Knowing the essential role that access to protein plays in human nutrition, U.S. soybean growers founded WISHH in the year 2000 to serve as a catalyst in developing and emerging markets. WISHH brings the power of strategic partnerships to our unique market-systems approach. Local business leaders, governmental and non-governmental organizations as well as academic institutions join us in increasing demand and fueling economic growth for the sustained availability of nutritious and affordable human foods and livestock feeds. Over the past twenty years, WISHH has worked on the ground in developing and emerging markets, using dollars from farm bill programs such as Food for Progress and Food for Peace to deliver high-quality, nutritional soy protein to feed a global population.

The vital programs authorized in Title III of the farm bill, from the Agricultural Trade Promotion and Facilitation Program (ATPPF) to international food aid programs, are critical for the long-term success of U.S. soybean growers. We thank the Committee for the opportunity to share ASA's role in these programs, provide insight on perceived strengths and weaknesses, and offer recommendations in advance of the 2023 Farm Bill. We would also like to share ASA's written testimony as presented to a hearing of this Subcommittee November 17, 2021, "*Trade Policy and Priorities*."¹, which further outlines our overall trade policy and priorities.

Agricultural Trade Promotion and Facilitation Program

The long-term success of U.S. soy abroad would not be possible without the foresight of Congress to create public-private partnership programs at USDA to assist trade associations in promoting our products on a global stage. ASA is a longtime cooperator of these programs, particularly the Market Access Program (MAP) and the Foreign Market Development Program (FMD). Utilizing MAP and FMD funds, ASA—through WISHH and USSEC—has leveraged those dollars to increase market access, address technical barriers to entry, and create on-the-ground capacity and demand for U.S. soy.

Looking at our export numbers, the U.S. soybean industry is an excellent example of the success of these programs. Soybeans and soy products are America's leading agricultural export, with an export value of \$27.5 billion in 2021. A 2016 study commissioned by USSEC shows that international marketing activities conducted on behalf of U.S. soybean growers increased soybean exports each year by an average of

¹ <https://soygrowers.com/wp-content/uploads/2021/11/ASA-Testimony-to-House-Ag-trade-hearing-11-17-21.pdf>†

Editor's note: footnotes annotated with † are retained in Committee file.

993,600 metric tons (MT), or nearly 5%. For soybean meal and soybean oil, the average annual growth over that period was estimated to be somewhat larger at 15% (808,600 MT) for meal and 24% (149,600 MT) for oil.

These numbers translate to an additional \$29.60 in export revenue per \$1 spent on international promotion. At the producer level, that additional export revenue translates into a cost benefit ratio of \$10.10 additional grower profit per \$1 spent on international promotion. While this research was undertaken in advance of the 2018 Farm Bill, the results remain unchanged: International marketing activities contribute directly to increased exports and grower profitability.

U.S. soy has invested these dollars in a variety of projects across the globe. Recognizing the global demand for sustainably produced and verified soybeans, our industry used MAP dollars to create the U.S. Soy Sustainability Assurance Protocol (SSAP). SSAP is a benchmarking system that helps industry customers ensure U.S. soy is produced following a strong set of conservation regulations and best management practices. For Marketing Year (MY) 2021, the U.S. sold 28,432,763 MT of SSAP-verified soy. Every year, the number of SSAP-certified shipments to our export markets is only expected to increase. Eighty percent of U.S. soy shipments to the European Union are SSAP certified, and SSAP has recently passed independent benchmarking to confirm compliance with the European Feed Manufacturers' Federation (FEFAC) Soy Sourcing Guidelines 2021.

SSAP was also recognized for meeting the Olympic and Paralympic Games Tokyo 2020 Organizing Committee's sustainable sourcing code for agricultural products, the Global Seafood Alliance's Best Aquaculture Practices and the Consumer Goods Forum's Sustainable Soy Sourcing Guidelines.

U.S. soy has also used these funds to work in new and emerging export markets to grow the demand for U.S. soybeans, and we have seen great success. While we have carefully cultivated our largest export market, China, the past 5 years have also shown how important market diversification is for U.S. soy's long-term success. Using MAP and FMD dollars, our industry has invested in growing demand in export markets outside China.

A great example is Egypt. Over the past 5 years, the demand for U.S. soy has increased 178%. In MY 2016/2017, we exported 0.7 million metric tons (MMT). By MY 2020/2021, that demand had increased to 2.67 MMT. USSEC has used MAP and FMD dollars on the ground in Egypt to facilitate trade missions with Egyptian buyers, engage in-country with the local poultry and aquaculture industries, and build an understanding of the quality of U.S. soy with Egyptian customers.

As demand in Egypt for chickens has increased, so too has the soybean crush capacity in-country. As its crush and feed sectors have evolved in recent years—especially since 2016—Egypt has moved from primarily being a soybean meal importer to importing whole soybeans, which has led to growth in its domestic crush industry. As its crush industry has grown, preference for U.S. soybeans has grown alongside it. During the same timeframe, aquaculture in Egypt grew more than 700%, and aquafeed demand has approached 2 MMT, with soy demand of 750,000 metric tons.

Due to these critical investments made possible by MAP and FMD, Egypt now sources more than 80% of its soybean imports from the United States.

These programs, however, are in desperate need of an increase in funding allocations. The MAP program was officially created in 1996, but authorization can be traced back to 1978, while FMD was created in 1955. Available data about total export market development funding and partner contributions ends in 2019. However, MAP and FMD funding has not changed since Fiscal Years 2006 and 1997, respectively. Over that same time, partner funding continually grew to be about twice the level of Federal dollars.

MAP and FMD Funding

Source: USDA FAS.

For FY 2021, 67 organizations received MAP funding and 21 received FMD funding. With the increase in the number of cooperators and adjustments for inflation, a steady budget of \$200 million annually for MAP means the full pool of funding available to cooperators is more akin to \$129 million.

Impacts on MAP Funding 2001–2023

Additional funding provided to these programs will offer real benefits to U.S. agriculture. ASA was awarded funding through the 2018 Agricultural Trade Promotion program, which was created to help U.S. agricultural exporters develop new markets and mitigate the adverse effects of other countries’ tariff and non-tariff barriers. While not a farm bill program, these dollars were utilized by USSEC to complement ongoing investments initially made by MAP and FMD in global markets. Nearly half of the resources allocated to U.S. soy was earmarked for the creation of long-term legacy institutions called Soy Excellence Centers (SECs). U.S. soy has now opened five SECs across the emerging market space where protein deficits continue to be a major regional concern for food security—and therefore national and international security.

One of those SECs was opened in Egypt and will celebrate its second anniversary October 2022. In those 2 years (Sept. 2019–Sept. 2021), 46 programs with 4,680 participants have been implemented. SEC programs include poultry and aquaculture related webinars, in-pond raceway system (IPRS) aquaculture demonstrations, and strong coordination with local industry.

This is one example of what could be done with additional funding, but there are many more projects waiting in the wings. U.S. soy has multiple projects that are shovel-ready and awaiting more resources.

In addition, it is clear that our international competitors are outspending us in the trade promotion arena. A recent study released by Texas A&M University shows that, under the European Union's Common Agricultural Policy (CAP), the EU allocated \$1.28 billion from 2014 to 2018 on wine promotion alone. That amounts to an average of \$256.4 million per year for one product, while the entirety of ATPF allocations is \$255 million annually.²

It is critical for the continued success of U.S. agriculture that Congress invest additional dollars in the Agricultural Trade Promotion and Facilitation Program in the 2023 Farm Bill. ASA strongly recommends doubling the minimum annual mandatory funding for the Market Access Program to \$400 million and the Foreign Market Development Program to \$69 million.

Export Credit Guarantee Programs

International trade is impossible without financing. In 2018, Congress extended authorization for USDA's export credit guarantee program (GSM-102) and the Facility Credit Guarantee Program (FGP). Both programs were created to promote the export of U.S. agricultural products by reducing the financing risks when selling to emerging and developing markets. GSM-102 facilitates the financing of agricultural product sales, while the FGP is aimed at the financing of agricultural-related facilities in countries where there is demand for U.S. agricultural products but limited infrastructure to meet that demand.

Investments by Congress in these programs help ensure the U.S. remains a leader in reliability as a top exporter.

U.S. soy has been a strong supporter of these programs since their inception, and to this day, we continue to support their full utilization. By investing in our export markets and increasing their capacity for financing and infrastructure investments, U.S. agriculture would win on two fronts: (1) Increased infrastructure developments in emerging markets would lead to increased demand and capacity for U.S. soy, and (2) Increased utilization of GSM-102 would lead to a higher volume of U.S. agricultural sales—including soy—in developing countries. ASA supports continued authorization of GSM-102 and FGP in the 2023 Farm Bill.

Food for Peace Title II

The U.S. Government has mandated the use of U.S. commodities in the historic P.L. 83-480 program since its creation after World War II. With ongoing humanitarian crises in Ukraine, Yemen, Syria, Afghanistan, and Ethiopia, among others, programs like Food for Peace Title II's distribution of food aid are an act of U.S. diplomacy. U.S. farmers play an important role in growing crops that meet the high quality requirements for these foods to remain safe for people to eat months after they are shipped from the U.S.

WISHH has recently partnered with companies like Edesia Nutrition that produce ready-to-use therapeutic foods (RUTFs) and ready-to-use supplements (RTUSs) with U.S.-grown soy flour for more than 60 countries around the world. Edesia forecasts it will use 7.5 million pounds of soy flour this year, requiring the equivalent of 170,000 bushels of soybeans. Another WISHH partner, SEMO Milling/Tiger Soy, built a new processing plant in Mexico, Missouri, to meet the demand for soy flour in U.S. global food security programs.

ASA supports continued funding of the Food for Peace Title II program to allow U.S. soy to provide direct humanitarian assistance and valuable nutrition in new markets.

Food for Progress

USDA's Food for Progress (FFPr) funding has been an essential component of WISHH's mission to connect development and trade and thus create long-term demand and markets for U.S. soy. In 2015, WISHH kicked off a \$14.8 million FFPr poultry value chain project in Ghana to increase consumption of improved poultry feed. The Assisting the Management of Poultry and Layer Industries with Feed Improvements and Efficiency Strategies (AMPLIFIES) project worked along the value chain, starting with post-harvest loss to ensure locally produced grain was dried and stored properly to reduce aflatoxin and mycotoxin levels. The project worked with local feed mills and Ghanaian universities to increase feed testing capabilities that resulted in higher quality feeds available on the market. While working with poultry producers, the project held feeding demonstrations for layer and broiler production, focusing on proper feeding rations, biosecurity measures, best management

²Ribera, Luis A., and Bart Fischer. 2022. "Analysis of agricultural trade promotion and facilitation in the 2018 Farm Bill." *Applied Economic Perspectives and Policy* 1-9. <https://doi.org/10.1002/aepp.13255>.

practices and the inclusion of soy as the preferred protein in the feed ration. To round out the value chain, AMPLIFIES developed a consumer education campaign to increase the consumption of eggs. During the life of the project, per capita egg consumption increased from 172 in 2016 to 235 in 2020.

However, because commodity prices dropped after 2015, the project was not able to meet its full approved budget through monetization, reducing the operational budget by approximately \$2.5 million, and therefore was forced to end project activities early. Due to Ghanaian import policies and duties, as well as production and processing capabilities, monetization sales of soybeans and soybean meal only accounted for 11,200 MT of the total 34,700 MT sold for project proceeds.

In 2018, WISHH launched the FFPr-funded Commercialization of Aquaculture for Sustainable Trade (CAST) project in Cambodia at \$17.1 million. The CAST project strengthens the use of high-quality feed in fish production, thereby helping build a profitable market system for Cambodian aquaculture products. Through CAST, Cambodia's private-sector and universities work closely with U.S. soybean growers and businesses, as well as American academic institutions and non-governmental organizations. CAST's activities and project outcomes align with Cambodia's strategy to increase productivity and profitability through Good Aquaculture Practices and maintaining the quality and safety of fish raised in Cambodia. CAST works along the value chain to train fish producers on improved management and production practices, sanitary and phytosanitary standards, and promote the utilization of high-quality feed in the industry. The project was instrumental in creating the Cambodia Aquaculturist Association, a new national industry group whose 600+ members represent fish producers, feed mills, processors, and government and private-sector entities. The U.S. soy meal monetized to fund the project was the first sold bulk in barges in Cambodia, with 41,800 MT of U.S. soybean meal sold to Cambodian companies.

However, there remains an issue with the complexity of monetization requirements in international food aid programs. While monetization can provide new trade opportunities, the monetization process to support large operating budgets is complicated and subjects projects to the whim of world markets and prices that can negatively impact the project's ability to be planned effectively and produce desirable outcomes. ASA recommends the next farm bill look at additional opportunities for flexibility in monetization requirements.

While WISHH has a strong desire to continue to utilize FFPr in its market development and expansion strategy, the program's recent revisions to its strategic plan raise concerns for U.S. soybean growers. Starting in 2019, the FFPr priorities shifted away from projects supporting the export and market development of U.S. commodities and moved to the support and expansion of nuts, spices and coffee grown abroad to be imported to the U.S. This move has left many cooperators unable to engage in FFPr projects and use these projects to build trade demand for U.S. commodities. Furthermore, the 2021 FFPr was awarded to a sole entity, and the sale of wheat to the Government of Sudan was an unprecedented—and concerning—step in this program, which is designed to focus on strengthening agricultural productivity and expanding trade of agricultural products.³

Language in the Fiscal Year 2022 omnibus appropriations report addressed Congress' concern regarding this award and the precedent it could set by allocating an entire year's worth of funding to a single entity. We respectfully request the Committee's attention to this issue in the next farm bill to ensure the approach is not repeated in the future.

McGovern-Dole Food for Education

WISHH has worked in institutional and school feeding throughout Sub-Saharan Africa and Latin America through a variety of USDA funding sources, in addition to leveraging outside funding. McGovern-Dole projects allow WISHH to reach new markets for U.S. soy while helping close the protein gap and addressing nutrition challenges in developing markets. In 2015, WISHH joined Plant Aid in a McGovern-Dole Food for Education project in Mozambique. The project included a comprehensive school feeding project, complemented by a major literacy component, as well as child health, nutrition education, teacher training, water, and sanitation components. The daily school feeding meal included a porridge made from a corn-soy blend to 74,000 students across 270 schools. WISHH led a comprehensive nutrition education campaign in the beneficiary districts that allowed the community to learn about the importance of protein. WISHH also trained 3,228 food preparers from the 264 target schools in hand washing, safe food preparation and storage practices,

³<https://soygrowers.com/wp-content/uploads/2021/02/2-3-2021-Food-for-Progress-letter-FINAL.pdf>.

surpassing its goal of 1,320 food preparers. Of the 3,228 participants, 3,144 were females, a target audience of the program.

Available commodities for FY22 food aid solicitations (*Appendix H* of the Notice of Funding Opportunity) include corn-soy blend, corn-soy blend plus, soybean meal, soybean oil, soyfortified bulgur, and soy-fortified cornmeal, but soy flour and textured soy protein (TSP) are omitted. This is concerning, as soy flour and TSP can easily be added to existing culturally appropriate school meals to provide additional protein. USDA has offered no explanation as to why these two products are excluded from McGovern-Dole. Adding these two additional soy products to the commodities basket would allow for additional protein consumption and help build preference for including soy in school meals. ASA recommends adding soy flour and TSP to the list of eligible commodities available for donation under McGovern-Dole.

Conclusion

Over the past year, ASA has worked intensively with grower leaders and other soybean farmers across the U.S. to deeply analyze the efficacy of 2018 Farm Bill programs, including the Trade Title. While that work is not yet finalized, the recommendations in this written statement are consistent with grower feedback and with ASA's policy resolutions.

As this Committee deliberates the next farm bill, ASA encourages you to remember the importance of international trade to the U.S. agricultural community. U.S. soybean growers are proud to provide a sustainable source of high-quality protein, which is vital to feeding millions around the world, and we thank the Committee for its prior investments in USDA's trade programs and again, for the opportunity to comment on these programs in the upcoming 2023 Farm Bill. ASA looks forward to working with you on these important issues.

SUBMITTED LETTER BY HON. DUSTY JOHNSON, A REPRESENTATIVE IN CONGRESS
FROM SOUTH DAKOTA

April 5, 2022

Hon. KATHERINE TAI,
United States Trade Representative,
Washington, D.C.;

Hon. THOMAS J. VILSACK,
Secretary of Agriculture,
Washington, D.C.

Dear Ambassador Tai and Secretary Vilsack,

Thank you for prioritizing robust implementation and enforcement of the United States-Mexico-Canada Agreement (USMCA), particularly its dairy provisions. Harnessing the full use of USMCA's expanded access for U.S. dairy exports remains a key priority for dairy farmers and manufacturers employing thousands of Americans in our districts and across the country. We appreciate the strong action taken by the Administration in moving forward with USMCA's first dispute settlement case, which found that Canada is improperly limiting access to its dairy market in contravention of USMCA. Translating this win into an outcome that delivers the full benefit of the agreement is vital for America's dairy industry.

We noted with interest Canada's recently proposed allocation and administration policy changes for dairy tariff-rate quotas (TRQs). We believe this proposal would continue to fall short of what USMCA requires. Accordingly, we urge you to insist on much deeper reforms to bring Canada's dairy TRQ allocation system into compliance with its USMCA commitments. For instance, Canada's proposal continues to exclude major swaths of its food and agricultural sector from the TRQ by blocking access of retailers and food service companies. Additionally, its proposed approach to allocating shares of access would continue to deliver the bulk of the TRQ volumes to U.S. dairy manufacturers' Canadian competitors. In short, Canada's proposal amounts to little more than window dressing as it appears designed to effectively preserve the *status quo* of who can bring in the vast majority of U.S. dairy products under USMCA's dairy TRQ.

As the first dispute resolution case under the USMCA, we know you understand well that this dispute will set a powerful precedent. The decisions the United States Government makes next will send a clear signal to our trading partners regarding future dispute panels and the degree of compliance we will require. A deal's a deal; it's not too much to ask that our trading partners live up to their end of the bargain. That is why it is critical that this compliance stage of the USMCA dairy case demonstrate that the USMCA enforcement process works—not just to deliver the right finding, as it did in January—but to ensure faithful implementation of the overall

agreement and drive real, tangible reforms that are seen on store shelves, to the benefit of American dairy producers and manufacturers, as intended.

We appreciate your continued commitment to robust USMCA enforcement, and we look forward to the day where American farmers, manufacturers, workers, and others benefit fully from this trade agreement that our nation has so painstakingly negotiated.

Sincerely,

SUBMITTED QUESTION

Question Submitted by Hon. David Rouzer, a Representative in Congress from North Carolina

Response from Daniel B. Whitley, Administrator, Foreign Agricultural Service, U.S. Department of Agriculture

Question. Food for Progress is an excellent long-term international development and market development program administered by USDA. However, I am concerned with Food for Progress's recent strategic plan, which has emphasized key priority areas around cacao, coffee, spices, Sanitary and Phytosanitary Standards (SPS), Trade Facilitation Agreement (TFA), and Climate Smart Agriculture (CSA).

I am concerned that focusing on commodities such as cacao, coffee, and spices—commodities that we do not produce domestically—will exclude the majority of U.S. cooperators from fully utilizing Food for Progress in their international development projects.

Can you speak to how Food for Progress developed this narrow set of priorities, and how these priorities can be expanded and improved upon in advance of the FY 2024 funding opportunity to allow more U.S. cooperators to participate?

Answer. Using Commodity Credit Corporation (CCC) funds, Food for Progress (FFPr) projects sell donated U.S. agricultural commodities overseas in target markets and use the proceeds of these sales to fund agricultural development projects. It is through these monetization sales that U.S. agricultural commodities are utilized to generate proceeds. USDA communicates with cooperators regularly, while also maintaining a transparent and clear competitive bidding process of the commodities. Soy, rice, and wheat comprise the bulk of FFPr projects' commodity utilization. Cooperators often ask for updates and periodically engage USDA program administration staff to ask questions and provide feedback. In FY21, FFPr utilized 440,890 MT of U.S. grown wheat, 162,050 MT of U.S. grown oilseeds and 78,640 MT

of U.S. grown rice. Over the preceding 5 years, FFPr monetized an average of 242,056 MT in U.S. agricultural commodities annually.

In alignment with the FFPr statute, the two highest level program objectives are increased agricultural productivity and expanded trade of agricultural products in developing countries and emerging democracies. Starting in 2019 FFPr, developed a slate of thematic areas for interventions, which amplified the impact of our investments by focusing more thoroughly and strategically on a select group of project themes rather than implementing a series of one-time projects. The overarching themes included interventions in sanitary and phytosanitary systems (SPS), trade facilitation and in high value crops that are not grown in the United States and don't compete with U.S. agriculture, but are important products for the American consumer. These crops are largely grown and produced in developing countries, but also have reflected a disparity in which local farmers earn an inequitable part of that value chain. Thus, FFPr activities seek to address the value chain limitations and inequities, to increase household income and reduce food insecurity. In FY22, FFPr added climate-smart agriculture as a thematic area.

Each year, with a focus on both strategic decisions (*e.g.*, thematic areas) and that year's project cycle, USDA coordinates with stakeholders, researches and analyzes global development data, conducts Requests for Information (RFIs), and holds public meetings that are open to the private-sector, cooperators, and the private-voluntary organization (PVO) community. It is through these engagements and meetings that cooperators provided feedback or suggestions on the current and future thematic areas. In addition, information is provided regarding the application process for current awardees and new applicants to facilitate and encourage eligible organizations to apply. As USDA seeks to develop its slate of thematic areas for FY23 and beyond, we will continue our outreach to collect input from the stakeholder community. Further, we will continue our current practice of welcoming proposals for projects that are not specifically included in predetermined thematic areas through the Notice of Funding Opportunity to expand upon thematic areas as appropriate.

A 2022 REVIEW OF THE FARM BILL
(THE SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM)

THURSDAY, APRIL 28, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, Costa, McGovern, Spanberger, Hayes, Delgado, Sablan, Kuster, Plaskett, O'Halleran, Carbajal, Lawson, Craig, Harder, Axne, Schrier, Pannetta, Thompson, Austin Scott of Georgia, Crawford, DesJarlais, LaMalfa, Davis, Allen, Kelly, Bacon, Johnson, Baird, Cloud, Mann, Feenstra, Miller, Cammack, and Letlow.

Staff present: Lyron Blum-Evitts, Chu-Yuan Hwang, Ashley Smith, Caleb Crosswhite, Jennifer Tiller, John Konya, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. Welcome. This hearing will now come to order. Welcome, and thank you for joining us at today's hearing entitled, *A 2022 Review of the Farm Bill: The Supplemental Nutrition Assistance Program*. After brief opening remarks, Members will receive testimony from our distinguished witness today, and then the hearing will be open to questions. And I will start first with my opening statement.

Good morning, everyone, and welcome to another important hearing, which is the continuation of our work to review the 2018 Farm Bill and prepare for the 2023 Farm Bill. Today's hearing will review the 2018 Farm Bill provisions related to a very important USDA program, the Supplemental Nutrition Assistance Program, also known as SNAP.

SNAP is one of the most impactful programs that we work on in this Committee. It is the nation's largest anti-hunger program. It addresses the food insecurity of those most in need in our country. In 2020, 10.5 percent of U.S. households or 13.8 million Americans were food-insecure. And the COVID-19 pandemic made it very difficult for many families to even afford the basic necessities, especially including food.

But thankfully, throughout the pandemic, SNAP has worked as it should, serving as an economic stabilizer for our nation. In 2020,

SNAP is estimated to have lifted 2.9 million Americans out of poverty and ensured that millions of our friends, families, and neighbors could put food on their tables for their families, despite the difficult times we were facing. And as we grapple with the ongoing impact of this pandemic and new challenges to our food system, including from the Russian—terrible, criminal—invasion of Ukraine, I know SNAP will continue to be a critical lifeline for low-income Americans, ensuring they are able to purchase a nutritionally adequate diet.

In 2018, our farm bill passed with a strong bipartisan support, including many SNAP-related provisions. One of the most impactful has been the mandate that USDA reevaluate the Thrifty Food Plan. The resulting 2021 Thrifty Food Plan was the first in 5 decades to not be held cost-neutral, allowing it to truly reflect the cost of an adequate diet. And thanks to the 2018 Farm Bill, low-income Americans receiving SNAP benefits on average received \$36.24 more per person per month or about \$1.19 more per person per day. And in my own district, Georgia's 13th District, the latest data shows that more than 35,000 households participated in SNAP, or 13 percent of all households in my district, and each of them are seeing an increase in their SNAP benefits thanks to the Thrifty Food Plan reevaluation.

And it is not just Georgia. The impact these increases in benefits are being felt across every community in our nation, including rural communities, which participate in SNAP at a higher rate and experiences a larger economic impact from SNAP benefits spending than even in our urban areas.

Additionally, the 2018 Farm Bill included important provisions impacting SNAP employment and training, the quality control system, nutrition education, and much more. I look forward to hearing from our distinguished panel today about these provisions, as well as future opportunities to maintain and improve this critical program.

One particular area of interest for me looking forward is veteran hunger. Research has found that veterans have a 7.4 percent greater risk for food insecurity than non-veterans, and rates are even higher among our veterans with disabilities, 33.6 percent of whom face food insecurity. And that is why I am working closely with our Subcommittee Chairwoman on this, the gentlelady from Connecticut, who is spearheading excellent legislation to address this, and we will hear more from her on this later.

Representative Hayes is the Chairwoman of our Subcommittee on Nutrition, Oversight, and Department Operations, and she is doing an excellent job. She has introduced bipartisan legislation to make it easier for veterans with disabilities to access SNAP, the Feed Hungry Veterans Act of 2022 (H.R. 7272), of which I am a proud cosponsor, co-leading with that bill. And, as I said, we will hear more from the Chairwoman on this later.

I look forward to working with all the Members of our Committee on this important legislation, and I hope this hearing will provide us all an excellent opportunity to evaluate ways that we can work together to improve SNAP by making it more accessible for Americans facing food insecurity. Thank you again. We look forward to our panelists.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning and welcome to another important hearing, which is a continuation of our work to review the 2018 Farm Bill and prepare for the 2023 Farm Bill.

Today's hearing will review the 2018 Farm Bill provisions related to a very important USDA program: the Supplemental Nutrition Assistance Program, also known as SNAP.

I believe that SNAP is one of the most impactful programs that we work on in this Committee. I look forward to discussing how SNAP—as the nation's largest anti-hunger program—addresses the food insecurity of those most in need in this country.

In 2020, about 10.5 percent of U.S. households, or 13.8 million Americans, were food-insecure. As we know, the COVID-19 pandemic made it difficult for many families to afford basic necessities, and in many cases, this included food.

Thankfully, throughout the pandemic, SNAP has worked as it should, serving as an economic stabilizer for our nation. In 2020, SNAP is estimated to have lifted 2.9 million Americans out of poverty and ensured that millions of our friends, family, and neighbors could put food on their tables, despite the difficult times we were facing.

As we grapple with the ongoing impact of the pandemic and new challenges to our food system resulting from the Russian invasion of Ukraine, I know SNAP will continue to be a critical lifeline for low-income Americans, ensuring they are able to purchase a nutritionally adequate diet.

The 2018 Farm Bill, which passed with strong bipartisan support, included many important SNAP-related provisions.

One of the most impactful has been the mandate that USDA reevaluate the Thrifty Food Plan. The resulting 2021 Thrifty Food Plan was the first in 5 decades to not be held cost neutral, allowing it to truly reflect the cost of an adequate diet.

Thanks to the 2018 Farm Bill, low-income Americans receiving SNAP benefits, on average, receive \$36.24 more per person per month—or about \$1.19 more per person per day.

In my District—Georgia's 13th—the latest data shows that more than 35,000 households participated in SNAP, or 13 percent of all households in my District, and each of them are seeing an increase in their SNAP benefits thanks to the Thrifty Food Plan reevaluation.

And it's not just in Georgia, the impact of that increase in benefits is being felt across every community in the U.S., including rural communities, which participate in SNAP at higher rates and experience a larger economic impact from SNAP benefit spending than urban areas.

Additionally, the 2018 Farm Bill included important provisions impacting SNAP employment and training, the quality control system, nutrition education, and more.

I look forward to hearing from our distinguished panel today about these provisions, as well as future opportunities to maintain and improve this critical program.

One particular area of interest for me, looking forward, is veteran hunger. Research has found that veterans have a 7.4 percent greater risk for food insecurity than non-veterans. And rates are even higher among veterans with disabilities, 33.6 percent of whom face food insecurity.

Representative Hayes—the Chairwoman of our Subcommittee on Nutrition, Oversight, and Department Operations—has introduced bipartisan legislation to make it easier for veterans with disabilities to access SNAP—the Feed Hungry Veterans Act—and I am proud to be a co-lead of that bill.

I look forward to working with all the Members of our Committee on this important legislation, and I hope this hearing provides us all an opportunity to evaluate ways we can work together to improve SNAP by making it more accessible for Americans facing food insecurity.

Thank you again to the Members and witnesses for being here today.

With that, I'd now like to welcome the distinguished Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for any opening remarks he would like to give.

The CHAIRMAN. And with that, I would like to now welcome my good friend, our distinguished Ranking Member from Pennsylvania, Ranking Member Thompson.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Mr. Chairman, thank you so much. Good morning, everybody. Welcome, Deputy Under Secretary Dean and Administrator Long. Administrator, I hear this is your first appearance at a Congressional hearing, and so we are glad to have you here and welcome to the historic Agriculture Committee hearing room. And I see Associate Administrator Shahin has accompanied you both. Ms. Shahin, please accept my heartfelt gratitude for your work at the Department, and I understand you are going to be retiring. And both your presence and your performance are going to be sadly missed. Thank you for everything you have done, and I wish you a peaceful, easy retirement.

Moving on to say this hearing is long overdue is an understatement, so I am so glad we are all here today. The agency which occupies more than 80 percent of this Committee's spending has gone unchecked for nearly 4 years. Each section of title IV of the 2018 Farm Bill has made nominal changes to a program that has since exploded to serve more than 40 million individuals at a current cost of roughly \$9 billion per month.

And what frustrates me most at this moment—and the Nutrition Title is important to me as a former Chairman of the Nutrition Subcommittee in the 2018 Farm Bill. I am very frustrated at this moment that my Democratic colleagues have already drawn a line in the sand that this program will not be touched in the next reauthorization of the farm bill. That is why we have reauthorizations, to make sure that we are getting it right and that we are making adjustments where needed. How can we be so certain everything in title IV is perfect or untouchable?

Now, I disagree, and I am sure that we will hear today that there are things we can improve and things that we can change. And quite frankly, on the Agriculture Committee being open-minded and preparing for the next farm bill, any farm bill is a really good state of mind. Being shortsighted on policy improvements shortchanges the millions of households who depend on SNAP when their lives take a turn, when they find themselves in financial distress, often for short periods of time.

So, despite my colleagues' narrow outlook, I think we need to contemplate SNAP through four principles, particularly as we shift from emergency spending and administration to more targeted informed programming. First, we need to further explore how do we serve recipients through innovation and flexibility? If the pandemic has taught us one thing, it is there is no one way to serve families in need.

The second principle, we must think about the best ways to guide recipients to independence through employment, education, and training, while providing for their nutritional support. Now, waivers related to work under the former Administration were logical. They are now clearly keeping employable individuals idle and disengaged, and it is time to talk about reemployment with a specific focus on those who have left the labor force.

Third principle, we can't deny program integrity has been compromised. I want to work with the Department to return to and maintain the virtues of SNAP. That includes normal modes of data

collection and normal modes of analysis and dissemination of information to ensure the responsible use of program funds.

And a final principle I would offer up that should guide our work, guides my work, and last and perhaps most importantly, we must come together to improve access and promote healthy foods and improve nutrition. Employment, healthcare costs, and general longevity are highly dependent on the foods that we consume. Together with modernized nutrition education initiatives, the nutrition research funding secured in the Consolidated Appropriations Act of 2021 (Pub. L. 116–260), and the existing library of research on healthy eating, USDA is uniquely positioned to improve the nutrition of millions of households, not just those deemed healthy.

I think my colleagues across the aisle can agree with each of these principles. Where we diverge is how to preserve the program for those in actual need without regulatory loopholes and fuzzy interpretations of the law, both of which exploit the very intent of the program.

Now, where we diverge is the reality that this one title will cost taxpayers nearly \$1 trillion over the next 10 years. With this exorbitant spending increase, namely because of the less than transparent and questionable Thrifty Food Plan update, the Biden Administration and the current Majority consciously put a colossal financial and political target on any future farm bill, compromising not only Nutrition Title but the 11 other titles which support and protect every farmer, rancher, forester, and rural community, the very people that actually provide the food that we try to deliver for nutrition support.

Adding insult to injury, many of us learned of the Thrifty Food Plan scheme through a choreographed effort by pro-poverty advocates and their media allies. Beginning on January 22, 2021, more than three dozen outlets, including the *Washington Post*, *NBC News*, *Bloomberg*, *CNN*, and *CBS News* uniformly touted the Department's work to rapidly proceed with the egregious TFP update.

And while we will continue to debate this attempt at executive overreach, I do want to ask one thing of you, Madam Deputy Under Secretary, just to be more forthcoming. As the Ranking Member of this Committee, I prefer to learn directly from the Administration, not lobbyists or reporters or the internet.

And last, I do hope today allows for some conversation on pandemic-related policies and spending. Mr. Chairman, I ask unanimous consent to submit for the record an April 15th timely article by *The Wall Street Journal* Editorial Board entitled, *The Eternal COVID Emergency*.

[The article referred to is located on p. 817.]

The CHAIRMAN. Without objection.

Mr. THOMPSON. Thank you, Mr. Chairman. I remain concerned pandemic aid is set to become endemic aid and that various issues caused by this Administration's own actions and, at times inaction, have caused my colleagues and their mouthpieces within the media to think emergency allotments or SNAP-related waivers should be carried on in perpetuity, and I beg to differ.

With that in mind, I also look forward to an implementation update on each of the relevant sections of the 2018 Farm Bill and the agency's timeline to implement any outstanding provisions. I hope

we can have an honest conversation about what is working and what is not working and how can we move forward.

Thank you again, Ms. Dean and Ms. Long. And with that, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, Ranking Member. And now, I would like to welcome the distinguished Nutrition, Oversight, and Department Operations Subcommittee Chairwoman, the gentlewoman from Connecticut, Mrs. Hayes, for your opening statement.

**OPENING STATEMENT OF HON. JAHANA HAYES, A
REPRESENTATIVE IN CONGRESS FROM CONNECTICUT**

Mrs. HAYES. Thank you, Mr. Chairman, Ranking Member Thompson, and this Committee, for hosting this very important hearing, and thank you to our guests from the USDA, Deputy Under Secretary Dean and Administrator Long, for joining us today. We really appreciate your time and expertise.

I want to first take the opportunity to frame this conversation. The 2023 Farm Bill will not be like any other farm bill. It will be a seminal historic piece of legislation. Over the past 2 years, we have seen our communities struggle with food insecurity caused by an unprecedented global crisis. We have also seen communities come together to implement creative solutions from expanding the capacity of food banks to partnering with local farms to ensuring that children can access school meals through electronic benefits in non-congregate settings. This farm bill is our first opportunity to recognize the unique challenges that many people face and our commitment to our communities to have permanent solutions. It is our first chance to respond to the glaring gaps in nutrition policy highlighted so clearly through the past 3 years with long-term improvements and solutions. Of course, the Supplemental Nutrition Assistance Program, or SNAP, will be central to that effort.

The vital importance of SNAP is not theoretical. I have experienced firsthand how the program gives people stability when they are facing life's challenges and have brought recipients before my Subcommittee to share their stories before Congress. I believe wholeheartedly in the mission of SNAP, the life-changing impact it has on recipients, and the incredible support it provides our national economy and food systems.

SNAP is a highly responsive program which serves as a stabilizer in times of economic downturn, something we saw clearly during the pandemic. It provides economic stimulus to households in every community. SNAP is a targeted program which serves the lowest-income Americans, incentivizes work, and provides long- and short-term health benefits to those who participate.

As a result of the 2021 Thrifty Food Plan reevaluation, mandated by the last farm bill, the impact of SNAP is growing as recipients receive more adequate benefits. Specifically, an average of \$1.19 more per person per day. This is modest, but the impact increases in our communities and has made tangible improvements to the everyday lives of my neighbors.

However, we know that there are still people who are falling through the cracks. USDA research has found that veterans in particular face a greater risk for food insecurity than non-veterans. On our Subcommittee, Rep. Bacon and I had a hearing last year on the

levels of veteran hunger that permeate our communities. I heard directly from veterans on how the lack of access to the SNAP program negatively impacts their lives, their ability to look for work, their mental health, and their nutrition needs. Their stories echoed the research which shows that an unacceptable 33.6 percent of disabled veterans are food-insecure. That is not a statistic that any of us should be proud of.

After the hearing, I began working on a legislative fix to address the issue, and I introduced the bipartisan Feed Hungry Veterans Act of 2022 with the support of Chairman Scott and Delegate Aumua Amata Coleman Radewagen. My bipartisan bill will address veteran hunger by making it easier for veterans with disabilities to access SNAP benefits.

In addition to exploring this issue further, I look forward to hearing more today from Deputy Under Secretary Dean and Administrator Long about the provisions in the 2018 Farm Bill, the status of implementation, and recommendations for the upcoming farm bill. As the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations, it is critical for me to hear from USDA about how we stabilize and sustain nutrition programs and how we can improve them in the upcoming farm bill.

We spend a lot of money on a lot of programs in Congress. Programs that feed people have to be included in those numbers. I don't know about schemes or media plots, but what I do know is that I have hungry people in my district, and as their Representative, I am going to make sure that I can do everything that I can to close those gaps because most of those people are children.

I thank you again, Mr. Chairman, for holding this Committee hearing today and I look forward to hearing from the panel who has joined us. And with that, I yield back.

The CHAIRMAN. Thank you, Chairwoman Hayes.

And now I would like to welcome the distinguished Nutrition, Oversight, and Department Operations Subcommittee Ranking Member, the gentleman from Nebraska, Mr. Bacon.

Mr. BACON. Thank you.

The CHAIRMAN. Please give your opening statement.

**OPENING STATEMENT OF HON. DON BACON, A
REPRESENTATIVE IN CONGRESS FROM NEBRASKA**

Mr. BACON. Thank you, Mr. Chairman. I appreciate it.

I appreciate the opportunity to share some thoughts today. I also want to thank the Deputy Under Secretary Dean and Administrator Long for being here.

I would like to just start by saying we are so blessed to live in this great country. We are the greatest of nations. Our free market system and our freedoms have produced more prosperity than any nation ever has had. We have elevated more people out of poverty than any other country, and so we should keep that in mind. And we, as a great nation, we want to live up to our values and our morals and provide a good safety net to protect our citizens.

Our SNAP is a part of that safety net, and it is intended to be a supplement, but not 100 percent subsidy to offset costs. I feel like we have to stress that periodically because some folks want to treat it as more than just a personal payment of the costs.

So, as we think of the next farm bill and really the future of SNAP, I echo the Ranking Member's comments in that we need to have real conversations about how to make this program better. We look to our taxpayers, to those who use the program, to make it more efficient, to make it more effective, and we want to ensure that it is providing a hand up, and not just a handout. We want to help people get out of poverty. And as the Ranking Member said, too, we just can't draw a line in the sand to say this program is untouchable. That is not how good policy comes about. So as the agency walks through the implementation updates, I hope my colleagues think through areas for improvement and how to use this magnificent amount of money that we have and to do so more efficiently and better.

The anecdotes I hear about some of these non-government organizations that serve as the intermediary, having outlandish administrative expenses, must be stopped. We should review that. I think our taxpayers expect us to take a look at that and reduce those costs.

And last, for the sake of our country, our military readiness, and the healthcare of our system and for our young adults, we need to do a better job and focus on how to target and make healthy eating habits better. We need to stress the education here. Seventy-two percent of our young adults today do not qualify to join the military, mainly for fitness, and so I bring this up not because of the military point but it is for the health and the future of these young adults and we want them to have a better future. So, this is a problem our country needs to look at and tackle.

So, I hope the conversation today lends to this focus and does better. And I would also like to just echo Chairwoman Hayes, who I work with on the Nutrition Subcommittee about the veterans and SNAP. I am on the Armed Services Committee as well, and we want to look at enlisted pay and adjust it. There is no reason why our junior enlisted should qualify for SNAP. We have to do better there.

So, with that, I yield back, Mr. Chairman, and I appreciate the time.

The CHAIRMAN. Thank you, Congressman Bacon.

And now the chair would request that other Members submit their opening statements for the record so the witness may begin her testimony and to ensure that there is ample time for questions.

[The prepared statement of Ms. Adams follows:]

PREPARED STATEMENT OF HON. ALMA S. ADAMS, A REPRESENTATIVE IN CONGRESS
FROM NORTH CAROLINA

The United States Supplemental Nutrition Assistance Program (SNAP) is the nation's most extensive Federal food aid program. Administered by the Department of Agriculture, SNAP provides food assistance to those who need it most, including working families, veterans, active-duty military members, seniors, college students, and refugees. SNAP's positive impact is felt by recipients and the American economy alike: according to the Center on Budget and Policy Priorities, SNAP assistance immediately benefits families by bridging temporary periods of unemployment, fam-

ily crises or recessions.^{1*} Today, SNAP serves as a cornerstone of our country's social safety net.

The 2023 Farm Bill offers a chance to strengthen the SNAP program and provide the support needed to meet the needs of hard-working Americans. The devastating ramifications of the COVID-19 pandemic have proven that current SNAP allotments do not meet the life-sustaining needs of its recipients.

To meet those needs, I introduced the Closing the Meal Gap Act of 2022, building upon a 5 year process with stakeholders, agencies, and fellow Members of Congress.² I am proud to sponsor this legislation with Nutrition Subcommittee Chair Jahana Hayes.

No one should have to wonder where their next meal will come from. And yet, the latest Census Household Pulse Survey shows that more than 20 million Americans struggle with food insecurity in the richest country in the world.³ Despite the Biden Administration renewing its Federal public health emergency declaration regarding the coronavirus pandemic, emergency allotments for SNAP and other supplemental nutrition programs have expired in nearly a dozen states.⁴

To add insult to injury, high levels of inflation has severely impacted SNAP benefits. Updated yearly, the next adjustment will not take effect until the next fiscal year. As a result, SNAP recipients continue to receive benefits based on the cost of food from June 2021. According to the Food Research and Action Center, SNAP households are under immense pressure to figure out how to cope with what equates to losses amidst current and future food prices this year.⁵

The Closing the Meal Gap Act will help to address these issues by raising the baseline benefit for all SNAP households and allocating more funds to those with large medical and housing expenses. The Closing the Meal Gap Act will increase benefits by incorporating the Low-Cost Food Plan into the SNAP formula instead of the Thrifty Food Plan to better consider how much working Americans spend on food. Furthermore, the Act will eliminate eligibility limits and unrealistic barriers by permanently authorizing the standard medical deduction in every state for seniors and disabled individuals applying for SNAP benefits at a minimum of \$140.⁶ Individuals with high expenses could continue to apply for a higher, itemized medical deduction under the plan.

Other barriers the Closing the Meal Gap Act would eliminate include a cap on the Excess Shelter Deduction in the SNAP formula for all households to consider the cost of living for SNAP recipients in areas with high rent and utilities and the elimination of time-limits on benefits for all Americans.⁷ By passing this Act, Congress can ensure that the USDA works within their own motto: "do right and feed everyone."

Food security and equity are and should not be partisan issues. Leaders across the country are urging Congress to pass the Closing the Meal Gap Act and continue the fight against hunger.

Let me introduce our distinguished panel. Our witnesses today is Ms. Stacy Dean, who is the Deputy Under Secretary for Food, Nutrition, and Consumer Services, at the United States Depart-

ment of Agriculture. She is accompanied today by Ms. Cindy Long, the Administrator of USDA's Food and Nutrition Services.

Deputy Under Secretary Dean, please begin when you are ready.

STATEMENT OF STACY DEAN, DEPUTY UNDER SECRETARY FOR FOOD, NUTRITION, AND CONSUMER SERVICES, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.; ACCOMPANIED BY CINDY LONG, ADMINISTRATOR, FOOD AND NUTRITION SERVICE, USDA

Ms. DEAN. Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee, for inviting me to talk about the Supplemental Nutrition Assistance Program, or SNAP. As you noted, I am Stacy Dean, Deputy Under Secretary for Food, Nutrition, and Consumer Services at USDA, and I am joined by Administrator Cindy Long.

Today, I will talk about the impact and importance of SNAP, its response to the pandemic, and the work underway to build back better to an even stronger program. SNAP is the most far-reaching powerful tool available to ensure that all Americans can afford healthy food. It is a lifeline for tens of millions of Americans. It reduces poverty and food hardship. And SNAP participation during early childhood is linked to better long-term health, education, and employment outcomes. About 70 percent of SNAP participants are children, older Americans, or adults with disabilities. The program supports households from major cities to rural America alike, helping low-income workers, seniors with fixed incomes, and parents struggling to make ends meet to put food on the table. Households use SNAP benefits to purchase food at local businesses, benefiting the store where they shop, the truck driver who delivered it, and the farmers who produced it.

As intended, SNAP expanded early in the pandemic in response to sudden increased need, but SNAP's powerful response to the pandemic has been a team effort. Congress took swift action to strengthen the program in recognition of unprecedented hardship, temporarily increasing SNAP benefit amounts, protecting eligibility for select groups, and providing USDA with special authority to allow states to adopt program operations to serve struggling households safely.

USDA worked with retailers and states to expand an online purchasing option to meet households' needs during the pandemic, and today, more than 97 percent of households can use their benefits to buy groceries online. And states did the extraordinary work to process a dramatic uptick in applications and deliver benefits to struggling households, all while radically shifting their operations to respond to public health considerations.

The bold action that we have taken together to help Americans during a time of crisis and get back on their feet has made a meaningful difference. Looking ahead, I want to touch on a few efforts we are undertaking to strengthen SNAP in the long-term, so let us start with the Thrifty Food Plan evaluation.

As directed by Congress, last year, USDA reevaluated the Thrifty Food Plan, the basis for calculating SNAP benefits, to reflect the cost of a cost-conscious, practical, nutritious diet. The reevaluation concluded that the cost is 21 percent higher than the previous plan,

which translates to about \$1.19 per person per day or 40¢ per person per meal. This resulted in the first increase in real purchasing power of SNAP benefits since the Thrifty Food Plan was introduced some 45 years ago.

We are also working to support opportunities through SNAP's employment and training program, or E&T. In 2018 Congress acted to improve the quality of E&T programs, emphasizing evidence-based practices, ensuring that we match participants with the right services and partner with state workforce systems. The farm bill signaled that E&T programs should not just be bigger, they should be better. We view strengthening E&T as an ongoing effort and welcome your continued partnership.

And finally, we are elevating FNS's long-standing work to improve nutrition security, which means having consistent and equitable access to healthy, safe, affordable food. USDA is prioritizing nutrition security for all Americans by ensuring our programs provide meaningful support, connecting all Americans with healthy, safe, affordable food sources; developing, translating, and enacting nutrition science through partnership; and prioritizing equity every step of the way.

Our goal is to come out of the pandemic in a better place than where we started. We are seeking to build on the effectiveness of SNAP and ensure it works for those it is intended to serve. And let me just tick off a few more areas that we are exploring: parity for the Territories that don't have access to SNAP, food sovereignty and self-governance for Tribal Nations, reducing barriers for vulnerable groups like veterans, bolstering program integrity by strengthening oversight and data collection, minimizing errors and enhancing fraud detection, and modernizing SNAP payment and shopping options, all while ensuring our programs are accessible to those who are eligible.

The farm bill represents an important opportunity to build on the remarkable success of SNAP, and we stand ready to partner with you. And before I finish, let me just thank the Ranking Member for acknowledging Associate Administrator Jessica Shahin and her decades of service to this incredible program. We are going to miss her after she retires, but she leaves an incredible legacy.

Thank you, and we look forward to answering your questions.

[The prepared statement of Ms. Dean follows:]

PREPARED STATEMENT OF STACY DEAN, DEPUTY UNDER SECRETARY FOR FOOD, NUTRITION, AND CONSUMER SERVICES, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee for the invitation to join you today to talk about the Supplemental Nutrition Assistance Program (SNAP) and the farm bill. I am Stacy Dean, the Deputy Under Secretary for Food, Nutrition, and Consumer Services at USDA; and I am joined today by our Food and Nutrition Service Administrator Cindy Long.

As the nation's largest anti-hunger program, SNAP is critical in advancing USDA's goal of providing all Americans safe and nutritious food. It is also foundational in our efforts to tackle food and nutrition insecurity as well as advance equity.

My testimony will touch on where we have been and where we are heading—the impact and importance of SNAP, the pandemic response, the work we have done and have underway to build back better to an even stronger program, including the Thrifty Food Plan update, supporting opportunity through SNAP Employment and Training, and a focus on nutrition security, to name a few.

As you prepare for the next farm bill, it is worth stepping back to reflect on the impact and power of SNAP. SNAP is the most far-reaching, powerful tool available to ensure that all Americans can afford healthy food—it's a lifeline for tens of millions of Americans in every part of the country. It reduces poverty and food hardship, and participation by young children has been linked to better long-term health, education, and employment outcomes.

Unlike most other Federal nutrition and anti-poverty programs, which focus on specific groups like seniors or children, SNAP serves a very diverse range of people. About 70 percent of SNAP participants are children, elderly, or adults with disabilities. The program supports households in major cities and across rural America. While all households must demonstrate that their income is low enough to qualify for a benefit, their circumstances differ. And SNAP is responsive to their differing circumstances, for example by supplementing the wages of low-income workers, supporting seniors struggling to make ends meet on fixed income, and helping parents afford healthy food for their children.

One of SNAP's core strengths is its entitlement structure, which enables it to adapt as economic conditions change. By design, SNAP expands to meet increased need and contracts when the need abates, providing food to people and communities where and when it is needed most. SNAP cushions the blow for families when a parent loses a job, sees their hours cut, or is temporarily unable to work due to illness or natural disaster.

SNAP benefits are used at local grocers, injecting demand into the economy. When a household uses SNAP benefits to put food on the table, it also benefits the store and the employees where they bought the food, the truck driver who delivered the food, the plant that processed it, and the farmers who produced it. A 2019 USDA study found that in a slow economy, every dollar in additional SNAP benefits leads to an increase of \$1.54 in the overall economy.

Pandemic Response

As it's designed to do, SNAP responded to the sudden increased need caused by the economic fallout in the early days of the pandemic, including rising unemployment and increased need for food. SNAP participation increased from 37 million to 43 million people in just 3 months, underscoring the program's power in its ability to expand to meet families' needs during times of great hardship.

Congress recognized that the scope of the hardship caused by the pandemic was unprecedented and took steps to further strengthen SNAP by temporarily increasing SNAP benefits as well as ensure that eligible households could access the program while states were transforming service delivery to respond to public health concerns. In fact, Congress went to great lengths to ensure that SNAP could be as responsive as it has been by adapting and bolstering the program to respond to pandemic conditions at least four times. One of the most significant enhancements that Congress provided was the option for states to provide eligible households with temporary SNAP Emergency Allotments (EAs), which are additional benefits to help households weather the pandemic-related economic shocks. Congress also temporarily increased SNAP benefits by 15 percent for all households and expanded SNAP eligibility for low-income college students. Through your support, USDA has also had authority to adapt programs to serve struggling families safely and additional resources to address unmet needs. Congress also provided other significant aid during the pandemic, include expanded unemployment insurance and housing supports. The official measure of food security, collected through a partnership between the Census Bureau and USDA, showed that the food security rate held steady between 2019 and 2020. While we have not had the chance to study this, many are suggesting that a strong safety net was critical to protecting people from increased hunger and hardship during a time we would have otherwise expected to see a substantial increase.

USDA also worked to expand the SNAP Online Purchasing Pilot, which allows SNAP participants to shop and pay for their food online, expanding the same shopping options available to all consumers to those paying with EBT cards. This enhancement has opened up significant new food shopping opportunities for individuals living in food deserts and had a particularly positive impact on those living in rural areas. Now more than 97 percent of SNAP households have access to online purchasing across 49 states and Washington, D.C.

Together, we have taken bold action to help Americans get back on their feet—these efforts have made a huge difference and underscore how powerful the Federal nutrition programs can be in responding to hunger and hardship. A strong safety-net works and we have a lot to learn from the experience of the past few years.

In addition to ensuring that SNAP is adapting and responding as needed to the pandemic, USDA has been working on many fronts to strengthen SNAP for the fu-

ture. I want to share some of the major efforts we have undertaken to strengthen SNAP in the long-term.

Looking Beyond the Pandemic

Thrifty Food Plan

As directed by Congress in the 2018 Farm Bill, USDA conducted a data-driven re-evaluation of the Thrifty Food Plan which serves as the basis for calculating SNAP benefits. The resulting update is the first time the purchasing power of the plan has changed since it was introduced in 1975, reflecting notable shifts in the food marketplace and consumers' circumstances over the past 45 years. The reevaluation concluded that the cost of a nutritious, practical, cost effective diet is 21 percent higher than the previous Thrifty Food Plan. That translates to a modest increase of \$1.19 per person per day, or 40¢ per person per meal—helping to put healthy food within reach for millions of Americans.

When the Public Health Emergency (PHE) and pandemic-related benefit supplements end, most participants will see their benefits decrease. But the benefit levels participants will return to, will be at a level that affords them access to a healthy diet, thanks to the modernized TFP, which is an investment in our nation's health, economy, and security.

Supporting Opportunity through SNAP Employment & Training

SNAP is an important work support and is designed to provide an incentive for participants to seek employment and increase their earnings. The overwhelming majority of SNAP participants who can work do so, and those who need assistance in entering the workforce can receive training and support services through state SNAP Employment & Training—or E&T—programs.

In the 2018 Farm Bill, Congress took important steps to improve the quality of SNAP E&T programs, emphasizing the use of evidence-based practices, like case management and work-based learning. The farm bill also underscored the importance of matching participants with the right services and partnering with state workforce systems to align programs with the needs of participants and employers. Congress gave us clear direction that E&T programs should not just be bigger; they should be better.

The final rule implementing these bipartisan changes became effective in March 2021. The final rule strengthened E&T by ensuring that states use evidence-based strategies to help participants get the skills employers need, increased the use of case management services for E&T participants, and allowed E&T funds to be used for subsidized employment and apprenticeships. The rule also encourages states to build high quality programs and holds states accountable for participant success in E&T programs.

We are working with states to strengthen E&T through the lens of continuous improvement. By learning what works, we are integrating promising and evidence-based practices that will better the program for all participants. We still have a lot of work to do, and we welcome your continued partnership along the way as we seek to strengthen and improve these opportunities.

Transitioning Out of Pandemic Operations

As I've noted, Congress acted quickly to provide USDA with important temporary authority during the pandemic. This allowed SNAP to adapt to help states respond to the sudden increased need while minimizing public health risks. Those operational flexibilities, along with extra benefits through Emergency Allotments, will end when the Federal Public Health Emergency (PHE) ends. We are working with states now to assess and build their readiness and capacity to return to traditional program rules and we continue to review the full array of existing flexibilities that states may utilize in order to streamline program operations.

We will also work with states to ensure that all households that count on both the core program and temporary benefits understand how their benefits will change as authorities expire, so that they can manage the transitions with knowledge and confidence.

Nutrition Security—Supporting Nutrition for the Nation

At USDA, we are committed to tackling both food and nutrition insecurity. Nutrition security means having consistent and equitable access to healthy, safe, and affordable food. It builds on and complements USDA's long-standing efforts to address food security. However, it is different in two distinct ways. It recognizes that we are not all maintaining an active, healthy life, and it emphasizes taking an equity lens to our efforts. USDA is prioritizing nutrition security in four ways by:

- Providing meaningful nutrition support from pregnancy to birth and beyond;

- Connecting all Americans with healthy, safe, affordable food sources;
- Developing, translating, and enacting nutrition science through partnership; and
- Prioritizing equity every step of the way.

I have already talked about USDA's reevaluation of the Thrifty Food Plan to ensure that it reflects the realistic cost of a basic, healthy diet, which is fundamental to ensuring that SNAP provides meaningful support. This has strengthened SNAP and its role as one of our most powerful tools to promote nutrition security, since families simply cannot achieve a nutritious diet, even a cost-conscious diet, without sufficient resources. In fact, previous research found that nearly nine out of ten SNAP participants struggled to achieve a healthy diet, with the cost of healthy food cited as the most common roadblock.

SNAP Nutrition Education—or SNAP-Ed—also plays a key role in helping people lead healthier lives on a limited budget. SNAP-Ed teaches people how to make their SNAP dollars stretch, shop for, and cook healthy meals, and stay physically active. Evidence shows positive impact of SNAP-Ed nutrition education. For example, according to a 2019 study among 56 land-grant universities implementing SNAP-Ed, results showed that 40 percent of participants ate more fruits and vegetables and drank fewer sugar-sweetened beverages, and 35 percent of participants moved more and sat less.

Building Back Better

The public health crisis has placed unprecedented stress on American households, leaving in its wake millions of families struggling to make ends meet. This has been, and continues to be, an uncertain time, with impacts that will last for years to come.

Still, our goal couldn't be clearer: to come out of the other end of this pandemic in a better place than where we began. SNAP is a powerful and effective tool to address hunger and hardship. Yet, we must continue to look for ways to strengthen the program and ensure it is working for those it is intended to serve. I have already touched on a number of priority areas and want to share a few more that we are already exploring at FNS:

- Working towards parity for the people of the Commonwealth of the Northern Mariana Islands, Puerto Rico, and American Samoa;
- Working to reduce barriers for vulnerable groups including seniors, individuals with disabilities and low-income college students;
- Bolstering program integrity by strengthening USDA oversight and data collection, minimizing improper payments and administrative errors, and enhancing fraud detection;
- Supporting food sovereignty and self-governance for Tribal Nations;
- Modernizing SNAP payment and shopping options, building on the successful expansion of SNAP online purchasing with a focus on smaller, independent grocery stores;
- Exploring avenues to reduce burdens on families, streamline enrollment, and improve the participant experience to ensure our programs are open and accessible to all who are eligible; and
- Assessing how well SNAP addresses equity and disparities in who experience food insecurity and addressing any shortcomings.

The upcoming farm bill will be an important opportunity for Congress to build on the remarkable success of SNAP to date. I know that Members of the Committee are already considering areas for improvement and we look forward to working together with you on this effort.

While nutrition assistance is critical, it is simply not enough to address the needs of struggling individuals, families, and communities. The pandemic has laid bare critical gaps in our safety net, highlighting the opportunity and urgency to lay the foundation for a recovery that is more equitable and just for all Americans. That is why the Biden Administration is calling for a comprehensive approach for investing in the American family to ensure that our recovery is inclusive and expansive by proposing, for example, expanding the Earned Income Tax Credit (EITC) and Child Tax Credit, and expanding access to affordable, high-quality childcare. These investments will strengthen the economy and our society from the bottom up and the middle out by building systems that lift up working families.

Thank you, Chairman Scott, Ranking Member Thompson, and every Member of the Committee for your leadership and commitment to helping Americans put food on the table for their families and for your partnership as we continue this critical

work. This Committee has a long history of bipartisan support for USDA's Federal nutrition programs and I look forward to working with you to advance our shared goals. Thank you again for the opportunity to join you today.

The CHAIRMAN. Deputy Secretary Dean, thank you so much for your very important testimony.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. And you will be recognized for 5 minutes each in order to allow us to get as many questions in as we can. And again, as I always tell you, please keep your microphones muted until you are recognized so that we can minimize background noise.

And I will start the questions. I recognize myself for 5 minutes.

And, Ms. Dean, I have an important question I want to ask you. Several of my labor union friends in Georgia have brought up the issue of SNAP privatization to me. And, as you know, SNAP law requires that states use merit system personnel to conduct SNAP certification, interviews, and eligibility determinations. However, I understand that states do have the flexibility to use non-merit staff, or contractors, for work that does not involve SNAP participant contact. And states are also permitted to use contractors for specific purposes that include SNAP participation contact with FNS approval.

However, there has been talk about expanding the use of non-merit staff during the pandemic to address increased caseload and staffing shortages. However, I am very concerned that expanding the use of contractors could reduce the quality of service that SNAP recipients receive.

So, my question to you is: do you believe that additional non-merit employee flexibilities are needed for states to manage their current SNAP caseloads? And if non-merit staffing flexibility were expanded, what impacts would you anticipate it having, if any, on our beneficiaries?

Ms. DEAN. Thank you, Mr. Chairman, for the question. Let me just start with FNS is absolutely committed to working with states to, basically, continuously improve program operations. We and they are constantly assessing new technology, new ways of organizing the business, new platforms to deliver services, and that can re-frame the question around, "What is the role of state *versus* contract staff." We are constantly answering new questions about that.

I think our general guiding principle through all of this is where the statute lies, which is that the merit system's personnel role—meaning state or local government workers really need to hold the most critical functions, which is that eligibility determination—and for us that includes the interview with clients, and of course access to highly private personal information. So, I don't believe that we would be looking for an expansion in that.

But let me just say that the guidance that the previous Administration put out in 2020 that outlined areas where states could use contract staff I very much support, and we are in constant dialogue with states about where their options are. I think many of them don't appreciate how much flexibility they have in the current system. It may mean that they have to reorganize their business model a little bit, but there are lots of places for them to bring in non-merit staff.

And you asked me what would happen if it were expanded. Look, we had some experience with privatization experiments in the past for those core eligibility functions, and it didn't go well. Now, granted, it was quite a while ago, but it was somewhat disastrous and ended up making service worse and states had to pull back from it. So experience would suggest it is a pretty risky endeavor to shift the roles as we have experienced them for the past 4 decades.

The CHAIRMAN. Ms. Dean, now, I am informed that the latest data available shows that in 2018, my district, Georgia's 13th, had more than 35,000 households participating in SNAP, 60 percent, or nearly $\frac{2}{3}$ of which, had children in their homes. Now, research shows that children receiving SNAP have better health outcomes than their counterparts who are not receiving the benefits, including reduced likelihood of obesity, high blood pressure, heart disease, and diabetes in adulthood—it grows to that extent—and improved economic outcomes. So, tell us, how does the 2021 Thrifty Food Plan reevaluation make it possible for families with children to provide their young ones with adequately nutritious meals that would make it easier for them to succeed in both the long- and the short-term?

Ms. DEAN. Well, thank you, Mr. Chairman, for acknowledging SNAP's strength both in terms of its ability to make sure households can purchase food today but also children who are well-nourished particularly early in life do far better later in life. And we have fairly conclusive evidence on SNAP's role there. I think what we found when we did the reevaluation was that—we have to always separate the Thrifty Food Plan from SNAP—but, we found that the basis for the benefit was not sufficient to purchase an adequate diet, low-cost, practical diet, so basically healthy food wasn't within reach. And with this adjustment, we certainly hope that with healthy food in reach, we will only strengthen SNAP's impressive impacts on families and children.

The CHAIRMAN. Well, thank you very much for your answers. They were thorough, very informative. This issue is important to all of us in this country and certainly important to me and my district, so I look forward to working with you as we make forward progress on this issue.

And now I recognize the gentleman from Pennsylvania, our Ranking Member, Mr. Thompson. You are now recognized for your questions.

Mr. THOMPSON. Well, I thank the gentleman from Georgia for the recognition.

Deputy Under Secretary Dean, once again, welcome. There are coalitions who vehemently support restrictions, particularly of sugar-sweetened beverages because they have been found to lead to an array of diet-related diseases. While I don't want to visit the merits of these proposals, I do want to better understand what the agency and the Department are doing to focus on nutrition. What is over the horizon to ensure better use of nutrition education dollars to support healthy eating initiatives?

Ms. DEAN. Well, thank you, Ranking Member. I think this issue couldn't be of more paramount importance to the Secretary and to myself as well. Americans' overall eating habits and its impact on their diet health is alarming, and we really need a whole-of-govern-

ment response to make sure that all Americans are aware of the need to eat better in order to support better diet health.

With respect to SNAP, and all of our programs honestly, we have a four-pillared approach. First is to ensure that our programs are providing meaningful support so that the benefits are adequate and are informed by nutrition science. You have heard about the Thrifty Food Plan adjustment. We are going to be proposing changes to WIC and the school food program to reflect the *2020 Dietary Guidelines*. We are required to do that by law. Those are forthcoming changes.

We also believe promoting healthy foods is important, so programs like GusNIP (Gus Schumacher Nutrition Incentive Program) or incentives programs that you all included in the 2018 Farm Bill offer a terrific opportunity. And, honestly, the Retail Incentives Program is just underutilized, and I hope that we can work with our grocers to take advantage of that and offer incentives for healthy food for our SNAP participants.

And I would say, speaking to the notion of public-private partnerships and agreeing with Ranking Member Bacon, there is so much more we can do to leverage our tools to promote healthy eating. We have MyPlate at USDA. We need to crank it up on that and just make that a tool that tens of millions of Americans are using and are aware of.

And we work with tens of thousands of nutritionists, healthcare providers, educators across the country. It is important, I think—USDA feels it is very important—that we start singing all from the same song sheet and really leveraging up the importance of diet, healthy food, and its profound consequences on long-term health.

Mr. THOMPSON. Well, I wouldn't be true to form if I didn't say as you are looking at beverages—and you kind of opened it up across outside even the jurisdiction of this Committee with child nutrition stuff, I have always appreciated Secretary Vilsack's support for milk-fat and anything that we can do to move from 1 percent to 3½ percent milk-fat, which would be whole milk, would be best for our kids. Nobody is force-feeding anybody to drink or consume anything, but they should have the healthiest options out there, so I am really looking forward to seeing what you put forward because that fits with trying to maximize nutrition, as you talked about.

A follow-up, or another question, not a follow-up—but what role does the Department's Office of Chief Economist play in helping FNS make decisions related to policy and spending? I was made privy to a USDA Office of Information Affairs response to a FOIA request that states, quote, "The OCE relayed they were not asked to review any information related to the 2021 Thrifty Food Plan," end quote. And I think we can all agree that this update has a major economic impact obviously, and if this response is indeed true, can you tell me why the Office of Chief Economist would not be consulted? I can only wonder if there was concern OCE would disagree with your approach from an unbiased economic standpoint, especially when I perceive OCE as falling victim to calculated attempts at blocking economic analysis across a variety of policy issues. And if this response is not true, can you walk me through those consultations with the Office of Chief Economist?

Ms. DEAN. Sure. Thank you, Ranking Member, for the question. Let me just reassure you there were no shortage of economists involved with the Thrifty Food Plan reevaluation, but let me refer that to Administrator Long in terms of the process.

Ms. LONG. Sure, I would be happy to share a little bit more about the process. So, we essentially—in the reevaluation of the Thrifty Food Plan—we essentially used the same technical approach that has been used in prior years. It is a mathematical optimization model with a number of data inputs and constraints, and I will be happy to speak more about that. But in terms of the other entities that were consulted, as the Deputy Under Secretary mentioned, internal to FNS, we certainly had a team that included economists, data scientists, and nutritionists. We had formal input and review from experts at the Economic Research Service and the Agricultural Research Service throughout the process, both as the work was being done and they also conducted a review of the report itself. So, again, we certainly had an extensive opportunity to bring the expertise of not only the Food and Nutrition Service but USDA-wide to bear on this process.

Mr. THOMPSON. And that is fine, but, I mean, this decision tipped the Nutrition Title over \$1 trillion over 10 years. I would think that would warrant being elevated to consulting with the Office of Chief Economist for USDA. And if so, I mean, why within these internal communications that were discovered under FOIA, I mean, I just question why they were excluded. It seemed that something was missed in the process. I appreciate all the things that were done, but my question is what was not done given the significant impact of the changes to the Thrifty Food Plan.

Ms. LONG. Certainly. And, Congressman, we would be happy to get back to you on a more detailed description of the clearance process, because at this point we would need to double-check to see whether OCE did have the opportunity—

[The information referred to is located on p. 820.]

Mr. THOMPSON. Understood, and I appreciate that. Thank you, Mr. Chairman.

The CHAIRMAN. Sure. And now the gentleman from California, Mr. Costa, who is also the Chairman of the Subcommittee on Livestock and Foreign Agriculture, you are now recognized for 5 minutes.

Mr. COSTA. Thank you very much, Mr. Chairman, for your leadership and the timeliness of the oversight necessary to set the table for literally and figuratively the reauthorization of the farm bill next year.

I want to thank the Department for following through with the bipartisan directive in the 2018 Farm Bill to review and update the Thrifty Food Plan. My gosh, it has been 45 years since it has been updated, long overdue, and I suspect that will be the subject of our Subcommittee chair of jurisdiction on how we update it and review it.

I have always said food is a national security issue, and from the onset of the COVID-19, we certainly learned when we turned our food supply chain upside down how dramatic it was in terms of impacting people's availability for food. It is, after all, America's safety net, right? I mean, you really think about it, it is so critical. And

so SNAP and the access to food is critical for lives in America but also to change lives.

And, we all look at it locally. The Chairman noted in Georgia. Let me tell you from the California 16th Congressional District, we have the irony of having one of the richest, largest agricultural areas in the entire country, but, yet significant hunger from young and old alike to working poor. SNAP in my district contributed to the local economy last year, benefitting 174,000 participants. Twenty-three percent of my Congressional district received SNAP, second highest in California. And its impact for food benefits are significant, \$446 million in food benefits, \$804 million in economic activity, and over 10,000 jobs.

I want to put a question to you, Ms. Long, and again, thank you for your service. You are familiar with the pilot project that I worked on back in the 2014 reauthorization that I think was successful. And Fresno County's Bridge Academy was chosen as one of the SNAP employment and training for a pilot program. By the end of 2017, the program had expanded to 14 academies and counties affecting 3,000 families to get people back on their feet. I want to continue to make this push. When we look at the reauthorization of the farm bill—and the Chairman and I have had three authorizations, this will be our fourth. But, as the Ranking Member noted, the title IV is usually the most contentious issue among the Agriculture Committee. I think there are ways that we can work together on this and should. I think this pilot project is an example, but I think more funding is needed.

Ms. Long, would you agree that such an example of this effort can be accomplished and can be expanded to provide reform and opportunities for public-private partnerships?

Ms. DEAN. Congressman, if I may, I will take that question. I was very fortunate some years ago to be invited by the incomparable Pete Weber to come out and visit the Bridge Academies in Fresno, and it was incredibly impressive.

Mr. COSTA. He is a good man.

Ms. DEAN. And many of its elements I think helped inform the pilots and even some of the directives from the 2018 Farm Bill to us on how to shift and change employment and training, huge emphasis on case management, making sure that families have some of the wraparound supports that they need for training and employment to be successful.

Mr. COSTA. Those are critical.

Ms. DEAN. Yes, and also really making sure that participants are matched to the right program or training program for them, as well as the right employer and high-quality jobs, with a big focus on ensuring that we place participants in high-quality jobs.

Mr. COSTA. Provide a living wage.

Ms. DEAN. Yes, and that lead to opportunity.

Mr. COSTA. Well, and because SNAP is such a significant part of the farm bill in terms of the baseline, 80 percent annually, I think it is critical that we focus.

With my remaining time allowed, and I don't know if you, Madam Secretary, would want to continue, I think the importance of reforming and focusing on nutrition, on WIC and the school lunch and breakfast program is critical. And during the pandemic,

obviously the food box program was critical, but we have with the supply chain also a perverse situation in which we have excess commodities that are depressing prices. I am wondering if you are looking at how we can use those excess commodities either through the Commodity Credit Corporation or others to help deal with the impacts of that production oversupply.

Ms. DEAN. Well, quickly, that is an entire initiative of the Secretary and our friends at the Marketing and Regulatory Programs mission area. One example would be the Local Food Procurement Grant Program that the Secretary has just launched where we are going to be supporting state secretaries of agriculture to build their capacity to procure food locally in order to distribute their emergency food or school food. We think that will help support more resilient local food systems.

Mr. COSTA. Well, thank you. My time has expired, but, Mr. Chairman, we are going to have hunger issues not only in this country but around the world, and there is an opportunity here for us to take good action. Thank you.

The CHAIRMAN. Yes, you are right. The gentleman from Arkansas, Mr. Crawford, is now recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman. I appreciate that.

Since March 2020, consumers have rapidly shifted to online grocery shopping. As you know, FNS was tasked with implementing the SNAP Online Purchasing Pilot at a difficult time during this consumer shift and retailers lined up to accept SNAP benefits online. However, I am hearing from my independent grocers who still want to participate 2 years later that there continue to be significant challenges in getting approved, while the largest national chains have accepted SNAP online from the beginning.

Congress attempted to address the bottlenecks and slow onboarding processes by allocating \$25 million in the American Rescue Plan (Pub. L. 117-2) in part for retail technical assistance. My understanding is that none of this money has been distributed yet. What steps are being taken by FNS to help ensure that all retailers and consumers have access to this program?

Ms. LONG. Well, thank you for that question, Congressman, and we really appreciate the support for online purchasing. We are at a place where over 97 percent of SNAP households currently do have access to online purchasing options. But, as you know, there is certainly more to do, particularly with respect to smaller and specialty retailers, and we are very grateful for the support that came through the American Rescue Plan Act. And I am happy to report that next month, in May, we are going to be putting out our request for a contract to develop a technical assistance center which will be specifically designed to assist particularly, again, those smaller retailers and coming on board to the online platforms. And their goal will be really to provide the support that those retailers need to assess their technology needs and the business case to be able to successfully integrate into online purchasing in SNAP.

Mr. CRAWFORD. And so that money, you are saying, will start to flow next month?

Ms. LONG. We will be soliciting for the support for that technical assistance center, and we would be happy to get you more informa-

tion on the anticipated schedule for the actual award and flowing of support.

[The information referred to is located on p. 821.]

Mr. CRAWFORD. Okay, thank you. And just one other thing that I need to note, and I was actually talking to the Ranking Member and this is an issue we have had conversations about in the past. And I got on your website and I noticed that this is the case, that whole milk is not acceptable for school lunches, school breakfasts, and so, we are concerned about the nutritional choices that our children are making, and yet we don't have that same concern as it applies to, say, for example, candy and energy drinks and things like that. Do you see the disconnect there? Do you see the irony of that is that we are making judgments on nutrition value to our young people as it applies to whole milk but we are saying it is okay to go and buy a candy bar. Can you explain the disconnect there?

Ms. LONG. Well, I would be happy to comment on the importance of milk. As you know, it serves a fundamental role not only in the schools but in all of the child nutrition programs. We certainly support the service of milk through the WIC program. Those programs are fundamentally different than SNAP in that they are designed to put a meal or a package of targeted foods on the table, and so we do believe that a differential approach is warranted.

Mr. CRAWFORD. Okay, but you as FNS are making the decision that in one nutrition program we can make those judgment calls but in another nutrition program we can't make those judgment calls. And also, are energy drinks included in SNAP? Are they acceptable for SNAP expenditures?

Ms. DEAN. They are, Congressman. Let me just jump in and this. I think the statute actually differentiates between the programs in terms of the science-based standards and the provision of food *versus* empowering—

Mr. CRAWFORD. Would you support changing that statute so that you could make a more consistent application across the agency?

Ms. DEAN. Well, I think we are making a consistent application in that we are promoting for SNAP participants to purchase food aligned with the *Dietary Guidelines* and as in WIC and school—

Mr. CRAWFORD. You are promoting it and I get that and I appreciate that, but you are not mandating it because the statute doesn't allow for you to mandate that? Is that correct?

Ms. DEAN. That is correct.

Mr. CRAWFORD. But the statute does allow for you to mandate not allowing whole milk in schools for breakfast or lunch. Is that correct?

Ms. DEAN. That is correct.

Mr. CRAWFORD. Okay. So that is my point, is there is an inconsistency there, statutory, that probably this Committee needs to address so that you are not in this position of saying one thing, doing another. I am not laying this in your lap and saying this is your fault. You already pointed to the fact that this is a statutory issue. But it seems to me, based on the exchange we are having today, that the inconsistency can be addressed here in this Committee, and that is something that you would be okay with?

Ms. DEAN. Sir, we bring the *Dietary Guidelines* to life in different ways for each program. It is certainly an important issue for the Committee to look at, but we believe that SNAP participants ought to have the flexibility to purchase like any other consumer in the store.

Mr. CRAWFORD. So basically then, I am running out of time, but then it is really not a statutory issue. It is more of a judgment call then?

Ms. DEAN. I think it is both. It is both, we follow the statute, and what we do in SNAP is the way we bring the *Dietary Guidelines* to life is different than it flows through the other programs. But, I am sorry, judgment informs statute, so maybe we can follow up on this conversation.

Mr. CRAWFORD. Thank you.

Ms. DEAN. I think we want to promote better health.

Mr. CRAWFORD. Yes, thank you. I yield back.

The CHAIRMAN. Thank you. Just as a reminder, Members should direct questions to our witness, Deputy Under Secretary Dean. Thank you.

Mr. CRAWFORD. Sorry, Mr. Chairman, I thought that is what I was doing.

The CHAIRMAN. No problem. And now I recognize the gentleman from Massachusetts, Mr. McGovern, who is also the Chairman of the House Committee on Rules and is a national leader in our fight against hunger. He is now recognized for 5 minutes.

Mr. MCGOVERN. Well, thank you, Mr. Chairman, and thank you for this hearing.

And, Deputy Under Secretary Dean, thank you for being here today. I want to begin first by saying thank you. Thank you to you, thank you to Secretary Vilsack, thank you to President Biden for stepping up during this pandemic and providing additional assistance so that hunger didn't spike even more than it did during this unprecedented time. I am grateful that you were in the positions that you are in, because I quite frankly can only imagine what might have happened if it was the previous Administration that was in charge, number one.

Number two, I got to be honest with you. I get a little frustrated when I hear things like, "Thrifty Food Plan scheme" or talk about how SNAP encourages idleness and disengagement. I find that, to be honest with you, offensive. In terms of the Thrifty Food Plan, you were asked in the last farm bill, when the Republicans controlled the House, to actually reevaluate the program to see what in fact was necessary to be able to afford a nutritious meal. You did that. And by the way, just to put everything in perspective, the average SNAP benefit before all of these adjustments was about \$1.40 per person per meal. To my colleagues who think that is too much, you try living on that. And yet that is what the benefit was.

And in terms of being idle and disengaged as a result of being on SNAP, the majority of people who are eligible to work who are on SNAP actually do work. They are doing everything we expect them to do, but they still earn so little that they are eligible for the benefit.

I also just want to say when people say, "Oh, that some of us are drawing a line in the sand, do not touch SNAP," look, everybody

is open to constructive ideas on how to make any program better and more responsive. But, the thing that gives people like me pause is, to my friends who are calling for “touching SNAP” or “reforming SNAP,” when you guys were calling the shots, that meant cutting the program by over \$20 billion and actually throwing people off the benefit. Yes, no, I mean, I would fight that tooth and nail. I mean, that is just inappropriate.

And, here we are coming out of this pandemic, there is worldwide inflation, food costs are going up, gas prices are going up, and again, I find it somewhat ironic that my colleagues who were calling for, quote, “touching SNAP” have no problem with oil and gas companies gouging consumers or with the continued subsidization of that industry at a great benefit to oil executives. But anyway, that is another story. We will talk about that at another hearing.

But the bottom line is food prices are going up, and that directly relates to people’s ability to be able to afford nutritious food. And, we are all for encouraging people to make better choices. I don’t think we have to micromanage their shopping. There are programs in SNAP, like the Double Bucks Program, which actually incentivizes people to go to farmers’ markets and buy fresh produce and they get more of a bang for their buck with their SNAP dollars if they do that. I think those are good programs. But, basically saying to somebody that because you are struggling, because you are poor we are going to tell you what you can buy and what you can’t buy. I mean, talk about Washington kind of overstepping its bounds and micromanaging people’s lives. I mean, there are better ways to do this.

And Deputy Secretary, I appreciate the fact that you talked about an all-of-government approach to dealing with some of the challenges in nutrition because, quite frankly, this is not just a USDA issue. It is a Department of Education issue. It is a Health and Human Services issue. It is a Department of the Interior issue. I go right down the list. We need a whole-of-government approach to hunger. We need a whole-of-government approach to nutrition. And I hope the Administration will move in that direction.

But let me just ask you, the USDA’s Economic Research Service put out a report in March predicting an up to five percent increase in food prices this year. And that is astounding. It is simply not affordable for many American families. And while I was pleased to see that SNAP spending rose in 2020 in response to the sharp economic downturn, it has been relatively flat since the summer of 2021 and has started falling as temporary benefit increases that took place during the pandemic are phasing out. So, can you help us understand the important role that SNAP played during the pandemic, and, more importantly, can you give us a reality check about what it will mean for families’ food costs if the benefit decreases again at the end of the public health emergency?

The CHAIRMAN. Would you answer that very quickly?

Ms. DEAN. I will do my best. Thank you, Mr. Chairman. Okay. So, SNAP—during the pandemic—did, first of all, increase when we saw a significant increase in need and newly unemployed folks qualifying for the program, so it was able to flex. Congress increased benefits by providing emergency allotments, which actually allowed benefits to go up by about, monthly, aggregate across the

country about 40 percent, so it really helped to cushion folks through the dramatic difficulty in securing food during a difficult time. And that increase has also helped to cushion relative to the rising food inflation. And I think the President's request of USDA to ensure that we had a minimum emergency allotment, a \$95 per month per household amount helps to deflect the impact of rising food costs on SNAP participants. And of course, food hardship would be much, much higher had the program not been able to grow and expand with Congress' support. And I will stop there, sir.

The CHAIRMAN. Very fine. And you can also provide additional information to Jim in writing. Thank you.*

And now the gentleman from Tennessee, Mr. DesJarlais, is recognized for 5 minutes.

Mr. DESJARLAIS. Thank you, Chairman Scott, and thanks to our witness today. I do have some questions I want to ask before my time expires.

Under Secretary Dean, just for some background, can you tell us currently how many citizens are participating in the SNAP program?

Ms. DEAN. Sir, I think it is approximately 43 million individuals, but I can get you the precise number.

Mr. DESJARLAIS. Okay. And what is our annual cost currently?

Ms. DEAN. I believe we estimate it to be—just give me 1 second. This year, we estimate it to be \$127 billion in benefits.

Mr. DESJARLAIS. Okay.

Ms. DEAN. Including emergency allotments.

Mr. DESJARLAIS. Is that including—I think you indicated—about a 21 percent food inflation in your opening statement?

Ms. DEAN. That includes the increased cost associated with the Thrifty Food Plan reevaluation and emergency allotments.

Mr. DESJARLAIS. Okay, thank you. I guess I want to shift a little bit with concerns of what is happening at the southern border. And do you know offhand what number of non-citizens, asylum-seekers, immigrant non-citizen children are receiving SNAP benefits now?

Ms. DEAN. I do not, although non-citizens face much more restrictive eligibility rules than citizens, sir.

Mr. DESJARLAIS. Well, they do, correct, but if you are a non-citizen child under 18, you receive benefits?

Ms. DEAN. Yes.

Mr. DESJARLAIS. If you are an asylum-seeker under Section 208, you receive benefits?

Ms. DEAN. That sounds correct.

Mr. DESJARLAIS. And, I mean, there is a list. There are about 15 different categories. So, there are quite a fair number of non-citizens, especially asylum-seekers. I think right now we have a 1.1 million backlog of asylum-seekers awaiting adjudication inside the U.S. We are getting 300,000, I think just this last year. With title 42 being lifted by the Administration, which temporarily had been blocked, if this abandonment does come to fruition, I was wondering what your concerns would be to the strain on the program moving forward. And have you discussed lifting title 42 with the White House? If so, what is the plan to ensure that SNAP benefits

* **Editor's note:** The information referred to is located on p. 819.

will be preserved for the Americans that truly need it? And if not, why?

Ms. DEAN. Sir, just to—I guess one thing I want to make sure you are aware of is that the program, as an entitlement program, can flex to need, so we would not displace one eligible individual for another.

But in terms of your specific question, no, I haven't been involved with conversations with the White House on that issue.

Mr. DESJARLAIS. Okay. Well, we talked about veteran hunger and hunger in the United States, and it seems that American citizens should be a priority, not that we want anyone to go hungry, but there are other costs associated beside SNAP with asylum-seekers and people who come in, in the form of TANF, heating, education, and whatnot. And according to the Center for Immigration Studies, 45 percent of non-citizen households rely on SNAP as opposed to 21 percent of citizens' households. Can you walk me through this and why this is and what the Department and FNS is specifically doing to help lift these families from poverty and independence? And first of all comment on those numbers and percentages.

Ms. DEAN. Sure. First of all, I am not familiar with that study so I can't speak to its particulars, but we are happy to follow up. I want to just restate again that non-citizens face much more restrictive eligibility rules than citizens. There is, for most adults, a 5 year waiting bar and then other restrictions. And you are right that refugees and other immigrants admitted on a humanitarian basis do have more immediate access to help—

Mr. DESJARLAIS. Right. And I would argue right now that most people crossing the southern border have learned that. They don't come here and say—they don't cross into the United States and say, "We are just coming here because we felt like it." They are saying we are seeking asylum. They are taught what to say. They are charged up to \$4,000 per person to be brought by drug smugglers and cartels and people to get into the United States, and so they know what to say.

So, I guess what I would like to get from you is an actual number. We know what it costs for SNAP per year. We know how many Americans—well, I think we know how many Americans—you said 41 million, but we don't know how many of those are actual Americans. Does that number include the asylum-seekers and children of non-citizens?

Ms. DEAN. It would include eligible non-citizens, yes.

Mr. DESJARLAIS. Okay. So, I guess what we need to know is that, first of all, we are taking care of Americans first. We have programs to assist people whether they are in other countries in terms of hunger, and I think that is important. The U.S. should lead on that, and I am really proud of the SNAP program that we have in order to take care of the people who are hungry in the U.S. I just want to prepare—this line of questioning is to prepare the farm bill so we know what to expect and how to best take care of those in need. So, I thank you for your testimony, and any information you can get to me in writing on those numbers would be greatly appreciated, and I yield back.

Ms. DEAN. Happy to do that, sir.

[The information referred to is located on p. 821.]

The CHAIRMAN. Thank you. And now the gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations, is recognized for 5 minutes.

Mrs. HAYES. Thank you, Mr. Chairman. I am really excited that we are having this hearing because, again, this program is incredibly important. I also hope, Deputy Under Secretary and Administrator Long, that you appreciate the fullness of the immigrant experience, and it is not a single issue. It is much more complex, and it is something that we have a responsibility to look at completely and thoroughly.

SNAP is one of the most effective Federal programs also for bolstering local economies. Every \$1 in SNAP generates \$1.50 to economic activity, and studies have shown that SNAP was responsible for nearly 200,000 U.S. industry jobs and 45,000 jobs in supporting industries like agriculture, manufacturing, and transportation. In my State of Connecticut 77,000 people are lifted out of poverty every year by SNAP. That number includes 31,000 people. It is not a “poverty-inducing endemic program.” It is something that I have seen families use to stabilize themselves until they can enter the fullness of society. And I have a lot to say on that.

However, the program is still not as accessible as it should be, especially for veterans, as I mentioned before. I appreciate the gentleman from Nebraska’s comments about raising the pay of our servicemembers, but we have not done that yet. And in my area of jurisdiction, which is the programs like this, there is more that we can do. And I am hearing from veterans just about the impact when they return, when their disability rating is not enough to qualify for benefits, and we are falling well short of what we can do.

My question is would you have any recommendations as we go into the next farm bill on how we can make sure, especially for this targeted group, that we are doing a better job?

Ms. DEAN. Well, thank you for the question. And I agree. The rates of food insecurity amongst our veterans is incredibly troubling and merits bold action. And just to speak to that, the way we have approached it is first trying to get information to veterans themselves through the Department of Veterans Affairs welcome-home kits. We also work with those who work with veterans, so training nurses and other professionals at the VA to make them aware of our programs and how to screen for whether someone is eligible, and then of course we have been encouraging our states to do direct outreach to veterans. So those are things within our toolkit today.

I am always a little—I do want to be mindful of making policy at the table in a markup, but I think the kinds of things that you have in your bill are certainly worthy of exploration. Is the disability rating in the statute too high and does it close out those who are disabled, severely disabled but not yet at that 100 percent rating?

I think we also have a relationship with Social Security Administration that might be one we could explore with VA where Social Security makes SNAP—actually takes the responsibility of taking

SNAP applications for low-income seniors and individuals with disabilities, and we reimburse them for that activity. That might be something we could look at. And, of course, we would certainly love to explore the idea of targeted outreach programs to veterans, which would require funding, but we would love to talk to you about that.

Mrs. HAYES. Well, thank you. I just appreciate your understanding of the magnitude of this problem and that we really have to make some intentional changes. And I don't want you to make policy at the table because your work is way too important and requires a lot more thought.

I am going to ask a question and then just make an observation and then let you run out the time because 5 minutes is not enough time to have this kind of a conversation. I know that in 2004 we switched from food coupons to the Electronic Benefits Transfer program. I know that—can you just please provide us with any updates on the status of implementation of the mobile technology demonstration projects?

And just one thing—you probably won't even have time to answer this, but I also wanted to share something that I am hearing from grocers in my district that I just think that we should take a better look at is rolling benefits. I have heard from many grocers that at the beginning of the month there is this surge of people who all get their benefits at the same time, and I just think that to preserve the dignity of people, the first 5 days of the month, everybody is shopping, they are running out of the—the stores can't keep the shelves stocked enough because of the surge, and then the rest of the month as benefits begin to dwindle, I just feel like there shouldn't be this idea that on the first of the month everyone who is receiving benefits is shopping because many of these people are also working or are a very different narrative than people associate with benefit participants.

My time has expired, but if you could just share with me just the updates on the mobile demonstration programs and just think of that for your consideration as we move forward because it is something that I am hearing over and over about the way benefits are distributed.

Mr. Chairman, I apologize for going over. I yield back.

The CHAIRMAN. Thank you. And please follow up with the Chairwoman in writing so she can get some specific responses from you, Under Secretary. Thank you.

And now the gentleman from Illinois, Mr. Davis, is recognized for 5 minutes.

Mr. DAVIS. Well, thank you, Mr. Chairman and Ranking Member Thompson. We have had a busy week in this Committee, and I appreciate that. I am looking forward to discussing the SNAP issues today.

Deputy Under Secretary Dean, in your testimony you talk about how SNAP is a powerful tool to address hunger and hardship, and yet the Biden Administration is pushing an agenda of poverty by continuing to incentivize people to stay home, not seek employment, not utilize the employment and training programs that exist through the USDA at a time when there is a business on every corner that really needs employees.

I mentioned this in the Committee's cattle hearing yesterday but it is worth repeating, we are currently seeing the largest increase in food prices in 40 years. I keep bringing up inflation in this Committee because it is warranted. These benefits have always been intended to be a tool to get people back on their feet from a hard time, not an economic incentive to stay on the sidelines.

To that end, the Department conducted its annual cost-of-living adjustment just last year and then increased benefits by way of an accelerated, debatable Thrifty Food Plan update. I believe there is still a focus from this Administration and FNS to increase SNAP benefit allotments and expand eligibility even further. Just yesterday, Democrats blamed meatpackers for high prices even when producers said inflation related to wasteful pandemic spending, supply-chain issues, and a lack of workers was the cause for these increased input costs in subsequent food prices. It seems obvious that the Department wouldn't be able to quantify mere rumors of price gouging when adjusting these prices, so why does the Administration insist on finger-pointing when it comes to the root cause of high food prices?

It is worth repeating that there are currently 11 million work-ready adults certified by their state workforce agencies who are receiving SNAP benefits but could start working immediately to fill the over 11 million open jobs in the United States. Getting these individuals to work could ease supply-chain issues immediately, and that would be done by increasing domestic production and productivity. Until this Administration pushes to do a better job of matching people with these jobs and disincentivizing the COVID culture of not working, these problems that we are talking about today are only going to persist.

So, Mr. Chairman, I want to say thank you for allowing me the time to make these remarks today. I don't have any further questions of the witness, and I yield back the balance of my time.

The CHAIRMAN. Thank you. And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is now recognized for 5 minutes.

Ms. SPANBERGER. Thank you very much, Chairman Scott, and thank you, Ms. Dean and Ms. Long, for taking the time to be with us here today. I really appreciate the opportunity to discuss SNAP and to reflect on the program's efficacy since the farm bill was last enacted in 2018. And at that point in time no one could have predicted the pandemic and just how vital these programs would be to provide food for families, children, veterans, and those with disabilities across our country. In fact, Congress demonstrated the importance of the SNAP program when, under the Trump Administration, we increased the maximum monthly SNAP benefit by 15 percent. That is because we know that SNAP helps families afford food while also boosting economic recovery.

For example, in spite of the pandemic, a USDA report found that U.S. household food insecurity remained unchanged in 2020. Another report from the last economic recession found that SNAP benefits generated an annual increase in rural output of \$46.8 billion while sustaining the employment of $\frac{1}{4}$ million rural workers. As the data suggests, SNAP and Congressional actions to enhance

SNAP both prevented hunger and strengthened local economies in the communities we represent across this country.

And so, as such, I am really appreciative of USDA's work over the past several years to implement the 2018 Farm Bill and contend with the challenges caused by the pandemic. And, certainly, in your testimony you mentioned a few areas the USDA is exploring to reduce the burden on families trying to access SNAP benefits. And as we turn towards the 2023 Farm Bill, I am especially interested in examining the ways that we can improve flexibilities for those who rely on SNAP to put food on the table, and I am particularly interested in discussion related to the exclusion of hot foods from SNAP.

And so, under current policy, a parent on their way home currently cannot pick up from the local grocery store with their SNAP benefits a hot rotisserie chicken for their children's dinner. And just to speak to that, rotisserie chickens are such an important sort of staple in my family because you pick up the chicken, you eat it hot, you have the leftovers, you make chicken salad, you boil the bones and make bone broth that you then use for soup a couple weeks later, a couple days later, stick it in the freezer. It is an economical way to not only feed your family that night with hot food, but it is an important way for people to make those dollars—certainly, we do it in my home—but to make those dollars work harder and feed better.

So, I want to speak a little bit. Congressman Rush has a bipartisan bill, H.R. 6338 that I am a sponsor of, that would repeal this exclusion. And so, I am curious if you could provide your thoughts on this current policy and discuss the potential impact it could have if we were to repeal this exclusion, because I think certainly all of us want to make sure that these SNAP dollars are going towards nutritious, good food that keeps people healthy, keeps people fed. So, could you please speak to that question and that legislation?

Ms. DEAN. Thanks so much, Congresswoman. I am a mom of three, so I totally appreciate the value of being able to pick up a rotisserie chicken as you are preparing a nutritious meal on the fly for your kids. The hot foods prohibition is in the statute, and so that is something that Congress would have to take a look at and so I am glad that you have a bill on it.

I think the issue is grocery stores look quite a bit different today than they did decades ago when those rules were written, and so one question I think we will have—because we have another part of the law that allows restaurants to take benefits for some specific households, senior disabled homeless—is what does this mean—if we allow hot foods—how does that translate over into restaurant involvement in the program? And I think that is going to be critical for the Committee to consider, and I am really not prejudging the issue, but there are over a million restaurants. What will be their role, and how will shifting that policy potentially shift the contours of who is a retailer and how they participate? So, I think that is the issue, that complex operational issue we want to work through with you. But I think we are all fans of rotisserie chicken as a good solution for dinner at home.

Ms. SPANBERGER. Well, and thank you, Ms. Dean. I really appreciate that response. And certainly, I appreciate the leadership of Congressman Rush on this issue. And I thank you for some input on that in terms of how we can make sure that the bill is the strongest possible bill that it can be in that it is focused on kind of efficient, nutritious, good food for our families and particularly with the hot food that makes for great leftovers such as rotisserie chicken. I will be following up on that. But thank you for your guidance and your feedback. And, Mr. Chairman, I yield back.

The CHAIRMAN. Yes. And now the gentleman from Georgia, Mr. Austin Scott, is now recognized for 5 minutes.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. And many of the questions that I have, have been answered, but I again want to reiterate what Ranking Member Thompson said about the need to have an honest discussion about this title instead of having Democrats simply say we are not doing anything with the title, it is untouchable. I don't have a problem—as my colleague from the other side of the aisle was just discussing—I don't have a problem with a rotisserie chicken being available as part of the program. I do have a problem with a Happy Meal or a drive-through being part of it. And I don't understand why we can't have an honest discussion about obesity with our youth and what is available to be purchased with SNAP products.

And so, I guess my question to the Under Secretary is why can't we move, and wouldn't it be better for people's health if we move to a system similar to WIC where you had to buy products that actually had a nutritional value to them instead of soda pop and potato chips? So, Secretary Dean, can you tell me why the Biden Administration would oppose this?

Ms. DEAN. Well, Congressman, thank you for the question. I think what I am hearing from you and so many Members of the Committee is a deep concern about improving overall diet health, improving our risk of diet-related disease, and in particular the risk to children. So, we share that concern. And that is why the Secretary has launched his Nutrition Security Initiative, which is about improving access to healthy, affordable food for all Americans, right, with the goal of improving diet health and their long-term health.

And I think we have to begin with making sure that Americans are aware of what a healthy diet is, that they know how to purchase it, they know how to prepare it, and then we are sure that they are eating it. And, I guess I would say we want to start from an affirming place. We want to start from believing that everybody wants the best for their kids because they do. But that just isn't within reach for a lot of families, and I think that is just going to be a much stronger place to go. And so, we would really love to see a plan to increase our work around MyPlate. We want to seek more public-private partnerships to promote healthy food and healthy eating. We want to partner with our grocers, with our healthcare professionals, with nutritionists around the country. There is just a lot more we can do, and our efforts shouldn't just be limited to our program participants. This is a whole-of-country problem, and it needs a whole-of-government, whole-of-country solution.

Mr. AUSTIN SCOTT of Georgia. Well, ma'am, just giving more money to people and allowing them to buy 200 calorie sodas in a 12 ounce can and potato chips is simply making the problem worse. And we have a system out there, in the WIC program where people are limited to products that are actually nutritious. Now, maybe that program—maybe the SNAP program doesn't need to be identical to the WIC program. Maybe it needs to include things like a rotisserie chicken, for example, that my predecessor just mentioned. But with barcodes and other things today, it would be pretty easy if the Administration was willing to actually make it a nutrition program instead of something that people can buy, again, soda pop and potato chips with.

So one other question that I have, Secretary, is the average balances that are showing up on the SNAP cards right now, I have had people at grocery stores tell me that people line up and offer to purchase other people's groceries for cash for a certain percentage of it, so you buy \$100 worth of groceries, I will put it on my SNAP card, and you give me \$50 for it outside. What is the Administration doing about that type of fraud?

Ms. DEAN. Congressman, thanks for the question. First of all, that kind of trafficking violates Federal law, and it is really critical that when folks see it, that they report it. We want to make sure that we and our state fraud investigators are following up and taking action—

Mr. AUSTIN SCOTT of Georgia. Has the Biden Administration prosecuted a single case of that fraud? Have they prosecuted a single case of SNAP fraud?

Ms. DEAN. You mean in terms of the judiciary or through administrative—we can absolutely follow up with you but, yes, we have a rigorous approach to addressing fraud.

Mr. AUSTIN SCOTT of Georgia. I would appreciate information on how many cases have been brought for fraud.

Ms. DEAN. Okay.

Mr. AUSTIN SCOTT of Georgia. Thank you, ma'am.

The CHAIRMAN. And, Deputy Secretary, please follow up with Congressman Scott's inquiry in writing.

Ms. DEAN. Absolutely.

[The information referred to is located on p. 822.]

The CHAIRMAN. Thank you.

And now the gentlewoman from New Hampshire, Ms. Kuster, is recognized for 5 minutes.

Ms. KUSTER. Thank you, Mr. Chairman, and thank you to the Under Secretary Dean and Administrator Long for being with us for this important hearing today.

SNAP has a proven track record of helping to mitigate hunger in New Hampshire and save thousands of families from slipping into the depths of poverty. Never was the safety net more necessary than during the COVID-19 pandemic. Not only was access to SNAP critical for so many Granite Staters and their families during the heights of the pandemic but the waivers and flexibilities granted to the SNAP program by Congress and implemented by the USDA made a tremendous difference as well.

A perfect example is flexibility around how to apply for SNAP. As you may know, I have introduced the Streamlining Assistance

Paperwork Act that would make permanent SNAP application flexibility granted by USDA in 2022 under the parameters of the Families First COVID package (Pub. L. 116–127). This flexibility allows states to process SNAP applications without expensive telephonic signature technology and saves applicants from having to make the trip to a state office to fill out the paperwork. That is critical for a rural state like mine, especially for people who can't easily travel or get time off from work. Not only does this flexibility cut a lot of unnecessary red tape, it still holds applicants to the same standards as if they had come into the office to sign the paperwork, thereby maintaining the SNAP program's integrity.

Administrator Long, do you believe the flexibilities extended to SNAP during the pandemic have been valuable and should be made permanent in the farm bill?

Ms. LONG. Well, thank you for the question, Congresswoman. We certainly believe that we had the opportunity to learn a lot about how the program can operate better through the kind of natural experiment of the pandemic. We are currently in the process actually of doing some fairly intensive conversations with our state agencies that administer the program to help them prepare for the return to normal operations, but that also provides us the opportunity to receive feedback about how they have experienced some of those flexibilities and have a conversation about what could be useful, going forward.

Certainly, the flexibility around the telephonic signature is something that we have heard from quite a few states they have found extremely useful and valuable, and we are taking a look internally at putting together our thoughts on how we might work with Congress to move forward to make that particular flexibility available, and we are happy to continue the conversation with you about other ways in which we might take the learnings of the last several years as Congress begins its work on the farm bill.

Ms. KUSTER. Excellent. Thank you. I also wanted to ask about the Federal SNAP emergency allotment, a modest but valuable boost in funds for SNAP participants that was also implemented under the auspices of the Families First bill. We know this allotment will expire in states still utilizing it as soon as the Federal public health emergency ends. And even though much work is being done to make sure families are made aware of this, I fear it will have a jarring effect, particularly as food prices remain high. Has there been consultation within USDA or the Administration more broadly about how we could gradually reduce this allotment instead of having a hard stop? And would you recommend that Congress take action to reduce the allotment along those lines once the health emergency has been lifted?

Ms. DEAN. Thank you, Congresswoman. We share your concern about basically when the allotments end, that it will be disruptive and confusing for a lot of families and will require many to rejigger and think through their monthly budgets. Of course, they were intended to be temporary, and so you are asking a really good question about is there a better way to taper them off that would be perhaps less jarring for households. We don't have the authority to do that within the Administration. Certainly, we would be happy to talk with you and others in Congress about whether you have

thoughts about ways to staircase it down so that families don't experience such an abrupt change.

Ms. KUSTER. Great, thank you, and we will follow up on that as well.

And thank you, Mr. Chairman, and I yield back.

The CHAIRMAN. Thank you. The gentleman from California, Mr. LaMalfa, is now recognized for 5 minutes.

Mr. LAMALFA. Thank you again, Mr. Chairman.

I want to follow up on something that Mr. Crawford was speaking about, Under Secretary, and I wanted to ascertain the jurisdiction standpoint here within the agencies here on interpreting the statutes as far as going back down to this healthy foods issues *versus* things that I think almost everybody unanimously would agree is that should we be looking at milk *versus* energy drink or soda pop and things like that? And so, it sounded like there was inconsistency in the thought or even the response on the ability to interpret the statute is available in the different branches of the agencies involved.

Ms. DEAN. I am very sorry, Congressman, if I left that impression. The definition of *food* is in the statute—the definition of what is an *allowable food* for SNAP—so we don't have the opportunity to shift that, I guess I would say, outside of I suppose a robust research demonstration project. But as a general matter, the statute sets the definition.

Mr. LAMALFA. Applies to SNAP but not to WIC, not to Thrifty foods, or the other—

Ms. DEAN. The other programs—

Mr. LAMALFA. They seem to have—it sounded like you have the ability to decide that within those others the same as you would within SNAP.

Ms. DEAN. Thank you. No, the other programs—and you should jump in here, Cindy, as a real expert in school meals and WIC, the other programs set a prescription package that needs to be informed by the *Dietary Guidelines*. So, in WIC it is a supplemental package that is informed by where participants in that program, say, have overall nutrient deficits where we need to supplement, and then in school meals, it is about putting a meal on a plate that aligns with the *Dietary Guidelines*. So, we update them in the case of those particular food packages based on the *Dietary Guidelines*. So, I am sorry if I am not being clear.

Mr. LAMALFA. Okay. Maybe it is pretty muddled, but everybody understands what the intent is here, right, is we want American-grown food that is nutritious from our ag sector or the processing that comes from that to be on the plates of people that are receiving taxpayer-driven assistance, not things that are not common sensibly as healthy, right, healthy foods, not that they are bad foods or just not targeted towards driving health because we get it on the other end, too. If people are purchasing things that are not positive for their health, then we are going to pick it up on the healthcare system on the other end if they are eating other things that cause obesity, *et cetera*, diabetes, what have you.

So, what is so difficult about the jump here within the agency here to say we don't want to have eligibility for soda pop and candy bars and all that sort of thing, potato chips and fast food to be part

of the program? Why can't we define it more straight up? And you have that ability to do so from what we are looking at within your jurisdiction.

Ms. DEAN. We have the ability in WIC and school meals to ensure that those programs align with the *Dietary Guidelines*. In SNAP, Congress sets the definition of *food*, sir, so it is Congress who decides what benefits can be used for in the stores.

But I guess the one re-frame I would put on your—I completely agree with you that we are all—it sounds as if we are all here with the goal of improving what Americans are eating, for the goal of improved health outcomes. But for us this problem is not limited to those who participate in Federal nutrition programs. This is a universal problem for most of the country. Almost no American eats according to the—

Mr. LAMALFA. But those are private decisions. Where the rubber meets the road is that we are expending tax dollars and would have a say in a lot of other things. There are strings attached to tax dollars on building roads and everything else, and so why would we be going down a path that is not helpful to the health of those folks? And, normal people are still wondering why are you guys doing that? Every farm bill, you have the discussion that runs into a big political problem. It was on a national broadcast this morning. A lady from Ohio was wondering why do you guys still have this stuff in these programs? And so, you are saying you do not have the jurisdiction to interpret that as far as SNAP goes, that Congress has to change the law itself?

Ms. DEAN. That is correct.

Mr. LAMALFA. Okay. All right. Thank you. I yield back, Mr. Chairman.

The CHAIRMAN. Thank you. And now the gentleman from Arizona, Mr. O'Halleran, is recognized for 5 minutes.

Mr. O'HALLERAN. Thank you, Mr. Chairman and Ranking Member, for organizing this important hearing. I also want to thank the witnesses for their participation today.

Food insecurity is a devastating issue for our Tribal communities. Roughly one in four Tribal families experience food insecurity in comparison to one in eight Americans overall. Before the pandemic, Apache County, a rural county in my district, had a food insecurity rate of 20 percent. This county is home to several Native American Tribes, including some of the Navajo Nation. During the pandemic, nearly half of Native Americans nationwide reported experiencing food insecurity.

The questions I have are these: The 2018 Farm Bill authorized USDA to conduct demonstration projects to enter into self-determination contracts with Tribal organizations to purchase agricultural commodities under the Food Distribution Program on Indian Reservations. Ms. Dean, are there lessons USDA has learned from the new demonstration projects in Indian Country that might be applicable to nutritional programs like SNAP so that we can better understand and address the food insecurity on Tribal lands?

Ms. DEAN. Thank you, Congressman. We are really delighted and thrilled with the self-determination projects and thank Congress. We are going to be able to extend them for the current grantees and offer new Tribes the ability to come into the program.

I think part of the lessons that we have learned is a new effort and a new conversation with Tribes about self-governance and self-determination, and so we are seeking to do that with respect to SNAP and also the components of SNAP, employment and training, nutrition education, so that we can make sure that we are in a better place for a conversation with you all about how to incorporate self-governance and self-determination into those aspects of the Act if that is of interest to Congress.

Mr. O'HALLERAN. Thank you. Additionally, SNAP is also essential to our rural communities. Following the Great Recession, SNAP benefits increased rural employment by 279,000 jobs and increased rural economic output by \$48.8 billion. However, accessing these benefits often presents major issues for those in rural communities. How can we strengthen and improve rural grocery stores and retailers to ensure access to healthy food in rural and Tribal communities?

Ms. DEAN. Well, our Rural Development mission area is definitely taking a look at the Healthy Food Financing Initiative and how it can help support and attract grocers to rural areas. We have the online shopping option that is now available, and as Administrator Long pointed out, we are seeking to dramatically increase the number of stores, particularly small individually owned grocers, who probably are very frequently in rural areas, seeing if we can bring them onto the program. So those would be two examples.

But we have to expand our reach into rural America. And as I am sure you know, this is a critical priority of the Secretary's—to make sure that USDA and across the whole-of-government are fundamentally serving those communities and thinking creatively and across mission areas so that we can fully leverage the support in those communities to see them revitalize and thrive.

Mr. O'HALLERAN. And the quality of food in my district, which is the size of Illinois, it just is not the quality that you can get in other places within urban areas throughout the state. And the distance between stores is terrible. Each Tribal government is different, though, just like each state. What is the USDA Food and Nutrition Service doing to work closely with each Tribe to help them tailor programs like the Food Distribution Program on Indian Reservations and SNAP to the needs of those Tribes?

Ms. DEAN. I would say two things quickly. One is regular consultation. We do about four consultations a year focused on FDPIR, but open to other topics, and we do also do collaboration on our other programs where we make a rule change there, we want to make sure we confer and consult with Tribes.

But, in addition, we need to strengthen our own capacity to work with Tribes, so our budget that the Secretary is testifying on I think just down the Hill today would include several additional positions to bolster our ability to support Tribes and their needs as they seek to leverage our Federal food programs.

Mr. O'HALLERAN. Thank you very much. I would like to sit in on one of those programs sometime. And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, and thank you, Congressman O'Halleran, for bringing up the rural and Tribal communities. They are facing some tremendous challenges. Thank you, Congressman O'Halleran.

And now the gentleman from Georgia, Mr. Allen, is recognized for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman. Can you hear me okay?

The CHAIRMAN. Yes, we can, Mr. Allen.

Mr. ALLEN. Very good. Thank you.

Deputy Under Secretary, thank you for joining us today for this important hearing as we review the Supplemental Nutrition Assistance Program. Obviously, we have a health crisis in our country, along with the food supply issues and obviously the cost of meat and other things. And I hear about this daily. In fact, as my doctor tells me, you are what you eat. And what you eat has, and your habits and that sort of thing has, tremendous implications on your health. And obviously, we want to promote good health in this country.

Currently, our country continues to have a sluggish rebound from the unprecedented stay-at-home policy measures enacted over the past 2 years. We have nearly five million childless nonworking adults that are not employed currently. These are folks that have no children, and they are 18 to 49 years old. At the same time, we have over 11 million job openings drop the country, and of course we have runaway inflation because of supply-demand issues caused by a workforce shortage.

The SNAP program was designed to work as a primer to get people through difficult times, and it has been successful doing that, but it was meant primarily for our children and certainly our elderly folks. But now it has become a generational program. In other words, we have generations that continue to be on welfare. We need to reform this program so that it serves its original intended purposes.

Under Secretary Dean, from your standpoint, I mean, do you look at—I mean, is USDA concerned about the health of the American people?

Ms. DEAN. Yes, sir, absolutely.

Mr. ALLEN. So, what measures has USDA taken as far as the food security issues to promote good health to the American people?

Ms. DEAN. So, well, sir, thank you for the question. Secretary Vilsack recently at Columbia University just launched what we are calling our Nutrition Security Initiative, and it has four core pillars. One is ensuring that all of our nutrition programs offer meaningful support, meaning sufficient support to secure a healthy diet, as well as that they are nutrition science-informed. Second is that we want to be promoting access to healthy foods and healthy foods overall. Third is collaborative action, work that we can do with nutritionists, educators, health professionals across the country. And then fourth, making sure that all of our work in this space is driven from an equity lens given that food insecurity and health disparities are not problems that are equally borne and that people of color in particular experience those problems at much higher rates. And so, we want to be mindful of what caused those disparities.

Mr. ALLEN. Well, so we are saying that the current farm bill is untouchable? So, I mean, and this has to be done legislatively as I understand, so how are we going to fix the problem if we don't do it legislatively?

Ms. DEAN. Sir, I am not saying the current farm bill is untouchable. Obviously, that is Congress' purview. But I think what we want to do is a stronger nutrition education—

Mr. ALLEN. Okay. Well, our Democratic colleagues are saying that this program is untouchable, but at any rate, I am just about out of time. One other thing that we need to get to the root of the problem on, and I don't understand this, but, we hear time and time again that one out of five children go to bed hungry in this country every night, and I don't know about the rest of the country, but in the 12th District of Georgia, during the pandemic, our children got breakfast, lunch, and a snack each day through our school nutrition programs. We made that happen. How is it possible that one in five children go to bed hungry at night, and why? Have you all investigated this problem?

Ms. DEAN. I don't have enough time to get back to given the time, but I am happy to follow up with you, sir.

[The information referred to is located on p. 823.]

Mr. ALLEN. Yes, we are out of time. Yes, that would be great. And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentleman from California, Mr. Carbajal, is recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman, and thank you, Under Secretary Dean, for your testimony. And thank you, Ms. Long, for being here today.

I must say, as somebody who when I was young my family had to be on SNAP, it is sometimes disconcerting to hear some of the over-obsession with real specifics, how we want to monitor and the guidelines and the specific nutrition of the subsidies provided to families that are food-insecure. Certainly, I think we all have the goal to promote good nutrition—make sure that the dollars are spent as such—and education, to educate more families as to what is more nutritious *versus* not nutritious. And I know we do that with a lot of the subsidies and support we give our food banks. They go a long way to now really focus on nutrition. I just wish some of my colleagues and good friends on the other side of the aisle were as dogged about the subsidies we give certain industries, oil companies and what have you, about how those dollars are being spent. But usually, it is those that have the least among us who don't have a voice that oftentimes we are over-obsessed with how they spend every dollar. We want government intrusion in that candy bar that they buy that maybe the rest of America buys as well.

Nutrition and healthy eating is a challenge that we all have throughout the country, irrespective of class. Certainly, it is sometimes more pervasive with those who have less means, but certainly, I do hope that we don't get over-obsessed with how we are helping the poor and then being very direct of how they should spend every single dollar.

I believe it is the basic function of government to ensure people in this country are not going hungry. SNAP is essential to ensuring that individuals are able to have access to food. Congress acted multiple times to provide flexibility to SNAP and bolster the benefits during the course of the pandemic. However, at the end of the

public health emergency, people receiving SNAP will see substantial decreases to their benefits.

Under Secretary Dean, is the USDA putting in place any plans to be ready for this decrease in benefits and the hunger cliff following this decrease?

Ms. DEAN. Thank you, Congressman, for your question and your comments. We are concerned that when the emergency allotments end, it will be an abrupt change for millions of households. At this point we are issuing about \$3 billion a month in emergency allotments, so it will be a dramatic shift if the public health emergency were to end in terms of—and to be clear, the public health emergency ending is a signal of a good thing in our country, but just thinking about the impact on households and monthly budgets could be very difficult.

So, we are working with states to make sure that they have good communications available for households. We want to make sure also that when households see their benefits change, probably many of them are going to be calling states, right, which will clog up phone lines and could lead to disruption and cause folks who are eligible to lose benefits, so planning for this pivot is critically important.

And the Secretary also has made investments in the emergency food system by ensuring that we had significant additional resources available through TEFAP and complementary programs to shore up emergency food.

I will say one of the worries we have looking ahead is what the impact will be for school food. That is an area where we know we will lose our expanded waiver authority on June 30th. We have called upon Congress to see if there is a way to extend it because that is a system we are not as confident can make the pivot to ensuring that they are continuing to provide meals to children during a period of higher food prices and labor difficulties. So, we really hope that we can work with you all on giving us some additional flexibility to help there.

Mr. CARBAJAL. Thank you. We have seen benefits associated with the expansion of online services across several sectors, including the online acceptance of SNAP benefits. This flexibility can be particularly useful if an individual does not have access to transportation or is caring for children at home. Under Secretary Dean, what are some of the successes of online services you have seen, and what are some of the challenges people have run into, and how can we improve these services so that they benefit more individuals, especially in rural areas?

Ms. DEAN. Well, how to capture all of the benefits of online, I think a great example is just managing your benefits. Many states offer an account management tool similar to what you might have with banking or your credit card management and you can go in and see when you have applied, what follow-up data or pieces of paper are necessary, what is your balance, so just giving households more transparency and agency over the process as opposed to it being some sort of bureaucratic black box where they feel powerless, right, for understanding what is happening with these processes. So that is a wonderful thing. Also, the ability to more quickly

adapt the forms and the questions to be responsive to what households may or may not understand.

The challenge is of course that so many struggling Americans don't have access to broadband at home, they may not have a mobile phone, and so if we shift all service to online, we would of course exclude many, many vulnerable individuals. So online services, it has to be at both ends to also in-person service, and we have to meet people where they are at. And we are certainly working to expand broadband to the whole of the country, but until we do—and to equip everyone with devices. But until we do, it has to be at both ends.

The CHAIRMAN. The gentleman from Nebraska, Mr. Bacon, is recognized now for 5 minutes.

Mr. BACON. Thank you, Mr. Chairman. I appreciate your testimony today. Deputy Under Secretary Dean, what is the agency doing to emphasize employment and training, especially when businesses are clamoring for employees? In Nebraska we have record low unemployment, but half the businesses are looking for employees, so we have a challenge there. Do you have staff on the ground guiding states in their quests to build for higher-quality programs? Thank you.

Ms. DEAN. Well, thank you. And the 2018 Farm Bill made quite a number of changes in direction in employment and training, in particular emphasizing better, higher-quality employment and training over sort of larger-scale, lower-quality services. So, a big part of what we have been doing has been implementing those changes. New regulations, lots of training on the ground for states to make sure that they are aware of the changes there, and then of course working with them on their plans.

Our goal is very much to make sure that E&T reflects what our local workforce needs are, and to make sure that we are matching individual participants to either training or jobs that makes sense for them.

I saw a terrific program in Nevada that actually really—sorry, it was quite impressive, and that was one that was set up by the casinos and local labor to train individuals for exactly what the Las Vegas hospitality industry needed in terms of folks, highly skilled staff prepared to work in restaurants or in hotels but then also credentialing them so that they can move up the system from a barback to a bartender, from a custodian to hospitality services. So, I think that is the kind of collaboration that we really want to see and support.

Mr. BACON. I echo that. And I know not all states are the same, but in many states with half the companies trying to hire and I have talked to some businesses that have the trades that will actually help people go through 2 years of school, get them licensed or certified. I mean, if you are looking for a job in many states, they are there and people will train you to do it, so that is something we can keep stressing.

I would like to switch directions a little bit and talk about the National Association of States Workforce Agencies or NASWA. Forty-one states and the District of Columbia took the pandemic legislation authorized option to use private contractors to help shore up their unemployment insurance programs during the pan-

demic. The states that took this option are both Republican and Democratic, governor-led, with more Democratic states actually taking advantage of this option. Further, NASWA has unanimously asked for an extension of this flexibility, and some SNAP directors have recently asked for 12 months of similar flexibility. So, you touched on this early on. Can you provide your position on this?

Ms. DEAN. Well, the statute requires that we use merit system personnel for certain aspects of state operations, so I think we have been focusing on making sure states understand where they can and can't use private contract workers if that is a flexibility they choose to avail themselves of in terms of expanding their capacity.

I do want to say that when SNAP—before this issue came up, it was merit systems work or whatever the states construct was in terms of a balance of private and public workers that allowed the program to grow dramatically in the early days of the pandemic under extraordinary circumstances, right? Many workers had shifted to home. They hadn't been working from home before. It was an incredibly impressive.

So, I think the current problem that we are looking at is states are, like many employers, having difficulty bringing on labor and being able to predict what the future will hold. So, we want to work with them on that and make sure they understand what their options are. But the system we have now has worked well for 40 years, 4 decades, and I would be very careful before making any significant changes to it.

Mr. BACON. But are we having backlogs with the SNAP processing? Because I hear we are, so there may be need in some states to have this flexibility for SNAP like it is with unemployment insurance.

Ms. DEAN. Yes, certainly some states are experiencing backlogs, and we would imagine when the public health emergency ends and their current flexibilities both in SNAP and the other programs that they operate, there is going to be a disruption and a shift. So, we are working very hard to make sure—they are trying to get ahead of that problem and prepare for it. And thinking through their business model and who does what is certainly a relevant question on their part. We think they have more flexibility than many of them are availing themselves of now, though.

Mr. BACON. I would just close. We don't want to see with SNAP what we are seeing with IRS. We have a year backlog of paper-work.

So, with that, thank you, Mr. Chairman.

The CHAIRMAN. The gentlewoman from Washington, Mrs. Schrier, is recognized for 5 minutes.

Ms. SCHRIER. Well, thank you, Mr. Chairman, and welcome to our witness.

I first just want to take a moment to recognize how vital this conversation and SNAP are right now. This week, new data from the U.S. Census Bureau shows 11.2 percent of households reporting food insecurity. The number is even higher for families with children, 14.5 percent. And the statistics for children—and I am a pediatrician—are that one in six children do not reliably have enough to eat, one in six.

I also want to just take a minute to point out that my colleagues and I have had many discussions about the issues at food banks, the long lines over the past year or 2, the way that they have stepped up during the pandemic, distribution, donations more than ever, but I also want to remind those listening that the primary program to help individuals facing food insecurity in this country is SNAP. It is not food banks. They are supposed to be the last resort. And if SNAP better supported the dietary and nutritional needs of food-insecure Americans, it would really reduce the burdens on food banks, the rest of the hunger relief system, which has faced so many challenges these past couple years. And then I would add that SNAP also supports local economies because those purchases are made at local stores.

I also want to just say that one crucial component of making sure people have enough to eat is addressing barriers for college and other post-high school students to access SNAP because those one in six children don't suddenly have enough resources when they go past high school. The farm bill allows an exemption to the 20 hours per week work requirement for students awarded work-study, but for a huge percentage of students eligible for work-study, there are simply no jobs available. And in Washington in recent years only 2.8 percent of students eligible actually got that work. I will add the full-time education that I have, whether it is grad school, college, or apprenticeship enrollment, that is comparable to at least 20 hours of work, and we should frankly just allow full-time students access to the SNAP programs. All of that is why I am a co-sponsor of Representative Gomez's EATS Act (H.R. 1919, Enhance Access To SNAP Act of 2021), which permanently expands eligibility for SNAP to students attending institutes of higher education.

I want to ask you, Under Secretary Dean, about whether we can find some practical, pragmatic solutions here. Green River College in my district, the average student is 28 years old, many have children. SNAP is a vital resource for these families and millions of others across this country, and we just need to make it simpler for these students when they are strained to access benefits. Can we recognize that the current regulations just don't account for the situation on the ground? And what flexibility might you be able to find like circumstances out of their control like not being able to get a job, for example?

Ms. DEAN. Well, Congresswoman, thanks for the question. And you are right, it is a really important and timely issue. The SNAP eligibility rules for college students were written with what we call a traditional college student, so my kid who actually goes to the University of Washington in Seattle, right, who temporarily appears lower income but actually has the support of their family. And there was concern in the early 1980s that those folks were getting eligibility to SNAP and they needed to be precluded.

But, as it turns out, the traditional student isn't in fact who are predominantly going to college or pursuing higher ed these days. I believe it is $\frac{3}{4}$ of students are actually nontraditional, meaning independent from their parents or have a child of their own. And so, you are right that we have to figure out how to refresh these rules that are just wildly out of sync with what the reality is and

probably are very much inadvertently keeping out needy individuals from participating in the program.

So, Washington is very much a leader here. I just recently met with Claire Lane and other advocates from across the country who are deeply concerned, and we are going to see what we can do there. And we would really welcome working with you on making improvements in the farm bill.

Ms. SCHRIER. Thank you. And yes, there are food banks on college campuses in my district.

In my little bit of time remaining, I just want to touch on a program that is really near and dear to my heart where we are also leading the way in Washington State, which is the GusNIP program. And it provides incentives for SNAP participants to increase their purchase of fruits and vegetables. And we need more funding for programs like this. Again, as a pediatrician, I can tell you food is preventative medicine if you choose the right foods, incentivize that, and train kids up on eating the right foods. So, I want to address this as an urgent health issue and I want to yield back. Thank you very much.

The CHAIRMAN. The gentleman from Indiana, Mr. Baird, is now recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman, and I appreciate you and the Ranking Member holding this important hearing. I always appreciate the witness being with us and having the opportunity to discuss the SNAP program.

So I am going to start out with we know that consumers really need to increase their fruit and vegetable consumption, and having the availability of all forms of produce, whether it be fresh or frozen, canned, or dried, can be one beneficial tool to do so, especially when fresh-only options are not available in parts of the country all year round.

So, Deputy Under Secretary, what is FNS doing to ensure SNAP participants feel empowered to choose other forms of fruits and vegetables like frozen options in alignment with the *Dietary Guidelines* recommendations while also addressing this nutrition security. Madam Under Secretary?

Ms. DEAN. Thank you, Congressman. And you are absolutely right that frozen and other forms of fruits and vegetables are healthy and nutritious. They are also really low-cost quality options. So a big part of the way that we introduce them as a practical, low-cost, quality choice is through our SNAP nutrition education programs, as well as through USDA's MyPlate where we translate the *Dietary Guidelines* into menus. And that is how we fundamentally seek to inspire households to select the array of fruit and vegetable choices that they have.

Mr. BAIRD. Super. Can you also—what is the agency doing to tangibly ensure that rural communities like my district have access to healthy foods? And if so, is there more to be done to ensure parity with their urban counterparts?

Ms. DEAN. I feel like you teed me up for that question. The Secretary is going to be so pleased. Absolutely there is more that we can do for rural America, and that is why for the past month the Secretary and Cabinet Secretaries across the Administration have been on a rural tour to show how we can leverage all of govern-

ment to ensure that we are supporting and working to revitalize rural communities. So, I mentioned earlier that the Rural Development mission area at USDA has a program called the Healthy Food Financing Initiative, which provides resources to support grocers to come in to rural areas. And the Secretary is a champion of finding ways to see if we can expand that program.

Mr. BAIRD. It is interesting, *food deserts*, when I first heard that term, it didn't seem possible in a rural community like ours, but I am coming to find out that there are those situations in many communities.

But my last question deals with work. So, could you tell us what the agency is doing to emphasize employment and training, especially when the businesses are clamoring, trying to get employees? So, do you have staff on the ground that are guiding states to help their guests to build higher-quality programs?

Ms. DEAN. Yes, sir. And let me just add in response to your last question, too, of course offering SNAP participants an online shopping option is a real way to address some of the food desert issues that we know rural Americans face, so I just wanted to flag that from before.

In terms of employment and training, that is a program that states run with our Federal support, but the 2018 Farm Bill really did a terrific job at helping us to work to reshape the program to make sure that states are designing programs that are much more responsive to local employers' needs, incorporate local workforce programs and orientation to how to connect eligible workers to the available jobs in the community, and to make sure that the individuals that we are matching to training or employment are well-suited for those things. So, we provide support to the states in that and will be very soon on the ground in terms of assessing and reviewing what they are doing this fiscal year and the next fiscal year.

Mr. BAIRD. Well, thank you, Madam Under Secretary. We appreciate the opportunity to be with you. I appreciate you being with us. I yield back.

The CHAIRMAN. The gentleman from California, Mr. Panetta, is now recognized for 5 minutes.

Mr. PANETTA. Thank you, Mr. Chairman. I really appreciate this hearing, which I am sure there will be many hearings in which we are going to talk about this very, very important subject of the Supplemental Nutrition Assistance Program, especially as we approach the 2023 Farm Bill. And that is why it is so important to have Deputy Under Secretary Dean here, as well as Administrator Long. Thank you for your participation.

I hail from the Central Coast of California. We have a lot of beauty, but we also have a lot of bounty, and that is with our fresh fruits and vegetables especially. As you know, in order to harvest those fresh fruits and vegetables, we can't just send a machine through the field. It is all about farmworkers. It is all about people who are actually in the fields bending down, discerning what is a fresh, ripe, aesthetically pleasing product to then package into a clamshell or package appropriately and get it to the store shelves.

Those farmworkers are surrounded by fresh fruits and vegetables all day long. Unfortunately, what we have seen is that their access

at home is not as plentiful as it is when they are at work, and it has been unfortunate that this has been a problem.

However, let me just also give a shout-out to some programs that we have there locally and from our schools, which are starting to give their children exposure to our fresh fruits and vegetables. Starlight Elementary is developing a kitchen and a garden of course there. Our farmers are very generous. Some have pantries. Lakeside Organics in Watsonville has its own pantry for its farmworkers to choose from after work. And then our food banks are absolutely awesome and they have been awesome during the pandemic.

However, as you know, many families, many farmworkers still greatly rely on SNAP, especially over the last few years with the pandemic, which has definitely led to higher food insecurity in many parts of my district. Salinas Valley, one in four children were still food-insecure in 2021, and then Santa Cruz and San Benito Counties, household food insecurity was over 30 percent unfortunately.

So, I am obviously proud of what we did at the Federal level to increase SNAP assistance, but as you know and as you said today, that is temporary. There is more we have to do, and especially with the upcoming farm bill. We are going to have to prepare for the fights of increasing and keeping SNAP as to what we got.

There are many programs in which we can make SNAP more convenient as well. The SNAP CARRY Act (H.R. 6688, SNAP COVID-19 Anti-Hunger Restaurant Relief for You Act of 2020),* a bill that I authored, would open up the Restaurant Meals Program for all SNAP households and support our restaurants that have been rocked over the past few years that need to continue to recover.

My question to you is about the USDA and how is it supporting states and restaurants to become part of the Restaurant Meals Program? And is there anything else that can be done to support this important aspect, a food aspect to make the SNAP benefit more convenient and meaningful to all participants?

Ms. DEAN. Thank you, Congressman. California has been a real leader on the Restaurant Meals Program. California and just a few other states have taken advantage of it, and so I think during the pandemic we saw an uptick in the number of states interested because of the very issues that you raise.

Often when we see states holding back on an option, it is just simply that they don't have the experience. They don't necessarily have the models to look to. So, I think with the few more in the program and there are several more queued behind, that will just create a more robust conversation amongst peers about the value and interest and we are likely to see it grow. And we will of course support that as states show more interest in taking on the program.

Mr. PANETTA. Outstanding. I have a minute left. I just want to go on to another topic. I am also a Member of the House Armed Services Committee, and I have been working to get military hunger prevention legislation across the goal line. Currently, you have

* **Editor's note:** the legislation was introduced May 1, 2020 in the 116th Congress.

tens of thousands of servicemembers who struggle to feed and support their families, around 20 percent of active servicemembers actually. I am ashamed to say it. Current SNAP guidelines often disqualify them from accessing this Federal lifeline, as you know.

Senator Duckworth in the Senate and myself have introduced the Military Hunger Prevention Act (S. 1488/H.R. 2339), which would expand eligibility and modify income calculations to exclude the BAH, which is used to determine SNAP eligibility where we are working right now in the House on a version. Can you commit to working with us to find a suitable solution to address the issue of military hunger and provide our servicemembers access that they deserve at a minimum to the established nutrition programs like SNAP?

Ms. DEAN. Of course, sir. And let me just say we are so appreciative of the basic needs allowance that Congress just passed. We think by raising pay of military members, actually making it so that their pay is that they don't qualify for food assistance because they are getting sufficient income is really going to be a powerful way forward. But absolutely, we are happy to work with you.

Mr. PANETTA. Thank you. Thank you for your service. Thank you for your testimony today. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. The gentleman from Iowa, Mr. Feenstra, is recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Scott and Ranking Member Thompson. And I also want to say thank you to the Deputy Under Secretary for testifying today, I am very grateful.

Making sure Americans are fed remains a shared and critical goal for this Committee, I think for most people in Congress. My state was home to Norman Borlaug, who was very instrumental in saving billions of people from starvation over the generations. His statue is honored in Statuary Hall, and he also received the Nobel Peace Prize for his work.

Those who are vulnerable and need food should have access to it. Obviously, title IV, the Nutrition Title of the farm bill, makes up to 80 percent of the authorized funding, so it is important that we get it right as we move forward. We are trusted by constituents to be good stewards of the taxpayer dollars, and my district in northwest Iowa is almost entirely made up of rural communities. Seventeen percent of my district are seniors with seven percent being veterans.

So, this is my question. This past Monday the Government Accountability Office released a report regarding the oversight and collaboration efforts to support veterans with food insecurity, and we just talked about this with Congressman Panetta. Broadly speaking, the GAO's recommendations include the VA fully monitoring and evaluating the effectiveness of these efforts and that the USDA improve its collaboration with the VA. So, Deputy Under Secretary Dean, can you talk to me or talk through the collaborative efforts as you see them today and what the agency plans to do to further ensure that veterans understand the nutrition supports available to them?

Ms. DEAN. Absolutely, Congressman. The food insecurity rates amongst veterans are disturbing, and it is really critical that we take action to address it. So, my team meets very regularly with

the Department of Veterans Affairs, but, after looking at the GAO recommendation I am going to ask them whether it would benefit the partnership to formalize that, as the recommendation suggests.

But the framework about how we have gone about this is we work to create material that can go directly to veterans to make them aware of their potential eligibility that goes into their welcome home kit that VA passes out. We do training when VA asks for it of their nurses and social workers and others who are directly supporting veterans to make sure they are aware of our programs so that when they are in a conversation with veterans or aware of a vulnerability that they can help connect. And then we are encouraging states to use their SNAP outreach dollars to do direct outreach to veterans. But we talked with other Members on the Committee earlier about the opportunity to do more and whether the farm bill offers the right time for our conversation about that.

Mr. FEENSTRA. Yes. Well, I thank you for those comments. I think it is really good to formalize, as the GAO noted, I think it is very important. And I often think that veterans have done so much for us and they are very proud people, that sometimes they don't ask. And sometimes we have to look out and say how can we help, and I hear you saying that.

Deputy Under Secretary, another question. Your testimony closes with a call to further strengthen SNAP. As I mentioned, we need to be deliberate when we are making changes to this program. We have to be very focused. Seeing title IV, it will cost roughly about \$1 trillion over the next 10 years, which is very significant. So how do you reconcile the dollars with your programmatic goals? I mean, I look at results-based government. And results-based government is saying, "Okay, here is the objective, here are the goals, here are the outcomes." Do you see anything like this going into these types of programs?

Ms. DEAN. Well, I think there is extraordinary evidence to support SNAP in terms of the outcomes that it achieves both in terms of alleviating immediate hardship and then over the longer-term poverty reduction, food insecurity, and then there is powerful evidence to show that children who received *in utero* or while as very small children have better health, employment, and education outcomes.

But because that evidence base is so powerful, and honestly, evidence underlies all of our programs at FNS, we want to continue to make investments to assess how the programs are performing relative to expectations, so we will continue to do that.

Mr. FEENSTRA. Well, and I appreciate that. I just think we are a government together. It is not government in D.C. It is we the people, and we the people are paying these dollars through our taxes. And I think we have to make sure we get it right always. And that is always a challenge, but we get it right through facts and figures and making sure that we look at the analysis and say, okay, this works or this doesn't. And sometimes we keep programs going on and on forever and sometimes there are new ones that we could put on and stop other ones. So, thank you for those comments. And Mr. Chairman, I yield back.

The CHAIRMAN. Sure. And now the gentlewoman from Iowa, Mrs. Axne, is recognized for 5 minutes.

Mrs. AXNE. Thank you, Chairman Scott, and thank you, Under Secretary Dean, for joining us today. We are just going to keep the Iowa theme going here.

I am looking very much forward to working on the 2023 Farm Bill, and on behalf of Iowa farmers and producers in particular, but also so that we can support strong nutrition policy that reduces food insecurity and improves access to healthy, sustainable foods for all Americans. And that means local.

In my home state there are over 400,000 food-insecure Iowans. That is roughly one in seven adults and one in five children in Iowa not having reliable access to food. These aren't just numbers. As we all know, these are our friends. They are our neighbors. They are our community members. They are the kids in our schools that are struggling to get by.

And thankfully, though, we have many dedicated Iowans doing a lot of great work to address food insecurity, but unless Congress continues to support and improve critical programs like SNAP, we are unlikely to make any meaningful progress towards food security.

And so, I first want to applaud you and the USDA's actions to expand the Thrifty Food Plan, as directed by the 2018 Farm Bill. The USDA recently re-evaluated the Thrifty Food Plan calculation, and that resulted in higher SNAP benefits for families. So, the updated Thrifty Food Plan, while modest, is estimated to lift about 2.4 million Americans, including more than a million children, out of poverty this year. And this also has tremendous impact for Iowa families. Just last year, SNAP benefits helped over 285,000 Iowans with nearly 70 percent of those participants being families with children and a majority of them in working families.

So, Deputy Under Secretary Dean, I want to thank you and others again for your hard work on expansion of the Thrifty Food Plan. But I am concerned, however, with how food-insecure families will manage as these pandemic-related emergency allotments for SNAP expire. And as you are probably aware, Iowa has chosen to end those emergency allotments starting this month, which means many Iowans have seen their monthly SNAP benefits reduced. So, I would like to look at that. In your opinion, what has the impact of those emergency allotments been, particularly in rural areas over the past 2 years? And what does the end of these emergency allotments mean to families in Iowa?

Ms. DEAN. Well, thank you, Congresswoman. As you can imagine, given who we work for, we are on a very vigilant Iowa watch. So, I am actually going to turn it over to Administrator Long to respond.

Ms. LONG. Thank you for your question, Congresswoman. We do have some data available for the State of Iowa with respect to the impact of emergency allotments and the impact of the ending of those with the end of the public health emergency. So, as you know, the last month of emergency allotments were paid out in March, and our data indicates that about just under \$30 million was provided to SNAP recipients in that month. And that was to support about 142,000 households who participated in Iowan SNAP, so that gives a sense of the importance that the emergency allotment has provided and the impact of the transition.

Mrs. AXNE. Well, thank you so much, Ms. Long, for bringing that up. When you talk about this \$30 million, 142,000 households, what do you think the end of this emergency allotment will mean to those families?

Ms. DEAN. We can both jump in. I mean, it is going to be very disruptive as they sort out how to re-budget.

Ms. LONG. Yes.

Ms. DEAN. One of the groups that will have the biggest impact are seniors. Many of them would typically receive a much smaller benefit, \$40 or \$50 a month, but they have been receiving the maximum allotment, and they will see quite a big drop-off. That is very disruptive. I also think it will have a big impact on community agencies who help support families, and so we may see many families turning to emergency food. And so, we are looking for ways to make sure that we are continuing to support that community as well.

Ms. LONG. Yes, and I would simply add with respect to the impact, it will also impact your state administration of the program. I think Deputy Under Secretary Dean mentioned earlier that we recognize when these changes occur and the pandemic benefits are transitioned out, there are likely to be a lot of questions and issues that come up for recipients, which is going to translate into sort of more telephone calls and expanded workload that the state agency will be managing.

Mrs. AXNE. Well, I appreciate you letting me know about that. Those are not good things. And the last question I want to ask you then—and I think we also have another impact because studies have shown that for every \$1 additional in SNAP benefits, it equates to \$1.50 or more returning into the economy. What impact will the revised Thrifty Food Plan have on Iowa's economy, and what will be the impact of the grocers, grocery retailers in our state?

Ms. LONG. Yes, well, I think it was mentioned earlier the re-evaluation of the Thrifty Food Plan resulted in a 21 percent increase in the value of the Thrifty Food Plan. And just looking roughly at data from Iowa, the last year we have was a couple years back, but it looks like \$134 million worth of benefits were redeemed at Iowa retailers, so if you just kind of apply that 21 percent difference to that figure, that would suggest that that change means about another \$90 million available to the Iowa economy to support families and then \$90 million in revenue. That same \$90 million will certainly flow through retailers in those communities.

The CHAIRMAN. Thank you for that. The lady's time has expired.

And now the gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. Well, thank you, Mr. Chairman and our Ranking Member.

Deputy Under Secretary Dean, can you walk me through why the update to the Thrifty Food Plan, as required by the 2018 Farm Bill, was accelerated and finalized without regular updates to Congress? Was it simply coincidental or was it accelerated purposefully?

Ms. DEAN. I think the quick answer to that is that on the second or third day of his Presidency, the President directed USDA to see

if we were able to undertake the reevaluation more quickly, and we assessed that we were able to do so.

Mrs. CAMMACK. Okay. So, we only got these updates through *Bloomberg*, *The New York Times* and *The Washington Post*, so it would be nice if the Administration would acknowledge that, as required by the GAO report, that Congress should have been notified. But to me it looks a lot like your agency and this Administration wanted to avoid the criticism more than anything for what has been done here and push through the historic increase in SNAP by adding calories to the diets of Americans, which if you look at the research, it is actually contrary.

So, I say that to say, to the consternation of my colleagues across the aisle, I put forward an amendment last year in the budget reconciliation to delay the update until a full GAO investigation could be completed. I think that is critical, and I think the American people deserve transparency and accountability. And I am sure you would agree with that.

But I want to move on to program integrity moving forward because it appears that FNS opposes using a blended workforce to supplement merit staff in determining household eligibility. Now, at times of rapid caseload increases, it seems like FNS would leap at the chance to ensure efficient eligibility determinations, especially when other safety net programs do just that regularly. So, if this is true, can you tell me the rationale? And will FNS make a commitment to work with Congress to pass legislation allowing eligibility determinations to be made by contracted personnel?

Ms. DEAN. Congresswoman, we don't oppose a blended workforce. In fact, most states have them. The question is about where to draw the line with which functions need to stay with state or local government workers. So, we are focused on, and we believe this is where the statute is, eligibility determinations, the interview, and areas where we are maintaining privacy of very private personal information from households. So that is sort of the core nexus that we think needs to stay with state personnel.

But the prior Administration put out guidance in 2020 that outlined some of the functions, given technology and the way—what is the right way to say—the business flow has changed, identifying new opportunities to consider, as you pointed out, bringing in a blended workforce. And I think that was very sensible, and we have been talking with states about it when they raise their labor force challenges.

Mrs. CAMMACK. I appreciate that feedback. It is not every day that you hear this Administration compliment the previous Administration's work, so I do appreciate that.

And I do want to end on this because I do think that we can all kind of come together on this. And as someone who about 11 years ago found myself homeless, I am not sure if you are familiar with my journey to Congress, but a little over a decade ago I was homeless, and now I serve in the House of Representatives along colleagues who, while I was homeless, talking about these same programs, were here.

So, I think by the very definition of *insanity*, right, doing the same thing over and over and over again and expecting a different result, I think it is time that we start looking at new approaches.

And we talk about SNAP as a safety net, and we talk about it in terms of bringing integrity and a hand up rather than a handout. And I think every Member on this Committee, every Member in the House of Representatives serves constituents that are in need of this program. So we want it to be useful, but we don't want it to be a lifestyle. And we want to talk about self-sufficiency and integrity without making people dependent. And it seems like today we deal with a lot of programs that are really designed by their very nature to create dependence rather than self-sufficiency.

So, I hope this Administration will work with us on that and will not see COVID as an excuse moving forward. I look forward, truly, to working with my colleagues and the Administration to shore up any future updates. Hopefully, we can work closely on those updates to ensure that it cannot be used in a blatantly partisan manner, as we have seen in the past.

And with that, I yield back. And thank you for being here today.
Ms. DEAN. Thank you.

The CHAIRMAN. The gentlewoman from the U.S. Virgin Islands, Ms. Plaskett, who is also the Chair of the Subcommittee on Biotechnology, Horticulture, and Research, is now recognized for 5 minutes.

Ms. PLASKETT. Thank you so much, Mr. Chairman. And I also want to thank the Subcommittee Chairwoman, our good colleague, Congresswoman Jahana Hayes, for working with you, Mr. Chairman, on having this hearing, which is so vitally important to the farm bill.

I have several questions that I would like to ask the witness. And I want to thank you as well for your honesty and for your openness and hearing our suggestions and having a discussion with us.

Now, I understand that the USDA ERS study showed that food insecurity in the U.S. has remained steady in 2020 when compared to 2019, despite the pandemic. However, in the Census Household Pulse Survey Data for early April of this year, 11.2 percent of adults, or nearly 24 million adults, reported that they do not have enough to eat in the previous week. It is clear that quick Congressional action during the early portion of the pandemic was successful in staving off the worst potential hunger crisis. The increasing hunger we are now seeing is due to a number of factors. But how can USDA and Congress, if necessary, act to ensure that our safety net programs like SNAP are providing sufficient support for Americans in need?

Ms. DEAN. Thank you, Congresswoman, for your question. What is the right way to say it? We were very pleased that the response that wasn't just through food assistance but through a really robust set of expansions of support to households during a period of incredible crisis. It worked, and I think that is an important lesson for the future.

Ms. PLASKETT. Right. Whatever anybody says, the child tax credit worked for American families.

Ms. DEAN. That is right where I was going, ma'am, and that is that—you asked me what we could do—I think the President's agenda on making sure that, as we recover, we are recovering in a way that works for all and that lifts folks up, investments in

childcare, continuing the expansions of the CTC and the EITC, supporting housing, as well as the investments in summer feeding that the USDA sought for building off of pandemic EBT, those would be critical investments to addressing the hardships that you described.

Ms. PLASKETT. Thank you. My second question is related to the Farm to School Grant Program. Now, the Department of Agriculture's Farm to School Grant Program includes \$5 million in annual mandatory funding. And since its inception in 2013, USDA has awarded over \$52 million through Farm to School grants, funding a total of 719 projects, reaching almost 21 million students and 47,000 schools. We have seen increased demand for Farm to School programming, and as we emerge from the pandemic, we must ensure that this program has the necessary resources. Do you support proposals like the Farm to School Act of 2021, H.R. 1768, to allow more of these impacted projects to be realized by increasing the annual mandatory funding to \$15 million and the maximum grant award amount of \$250,000, expanding markets to local farms and targeting increased participation? So targeted participation, expanding markets to local farms, and increasing the mandatory funding, amongst other provisions?

Ms. LONG. Well, thank you for that question, Congresswoman. We certainly share your view on the incredible value of the Farm to School Program. You are obviously very well-versed in its impact. I can share from personal experience that nothing is more motivating for schools and students and the entire community than really engaging around where the food comes from and integrating what is happening at schools and what is happening in the broader community, including local producers. So, we would be absolutely delighted to work with you moving forward to look at how we can strengthen that program and some of the ways you have described, we would also be happy to offer other observations and experiences.

Ms. PLASKETT. Well, our office is excited about the work that we have coming up and how we can all be supportive of one another. In the Virgin Islands, with the amount of students that we have living in poverty, we know how critical the Farm to School Program is to not only support our small farming community—micro-farmers that are one of their primary markets is this—as well as to our seniors, but also to ensure that our students have nutritious food so that they can think and they can learn and they can be productive members of our society.

So, again, thank you, Mr. Chairman, for the opportunity to speak and to ask questions of these witnesses, and I yield back.

The CHAIRMAN. And thank you, Ms. Plaskett.

And now the gentlelady from Louisiana, Ms. Letlow, is recognized for 5 minutes.

Ms. LETLOW. Thank you, Chairman Scott.

I represent the 5th District of Louisiana, which is home to many rural communities, and agriculture and small businesses are the backbone of our local economies. When reviewing the USDA nutrition programs, I believe it is essential to ensure they are adequately meeting the needs of families, especially in rural America where many lack access to fresh foods like fruits and vegetables.

In the 2018 Farm Bill, Congress authorized more than \$½ billion in mandatory funding over 10 years for the Gus Schumacher Nutrition Incentive Program to incentivize SNAP recipients to eat fruit and vegetables. In addition, Congress spent another \$75 million in the American Rescue Plan Act with no strings attached.

Fast-forward 4 years. Louisiana hasn't seen a dime of this funding expended in retail grocery stores where most SNAP recipients do their shopping. Even if there were grocery stores offering these incentives, we wouldn't be able to find those statistics because the USDA hasn't updated the GusNIP retailer store locator data in years.

Deputy Under Secretary Dean, the 2018 Farm Bill prioritized allocating GusNIP funding to retail locations. How has the USDA adequately provided retailers an opportunity to participate in this program?

Ms. DEAN. Congresswoman, I guess I will need to get back to you on that. GusNIP is operated through another arm of USDA, but I take your—I am concerned about your concerns, and so I want to make sure that we are responsive to—I would flag that the farm bill also included another provision which allows retailers themselves to offer incentives to SNAP participants, and that, too, we haven't seen a robust take-up of. And it is an area that I want to explore with my team. I feel that retailers across the country are participating with the program, they are supporting participants through their grocery stores, and we would love to see them be offering more incentives at their own direction.

Ms. LETLOW. Thank you. I would appreciate that information. And it is also my understanding that these incentives are only available at farmers' markets in Louisiana, yet farmers' markets represent less than one percent of all SNAP redemptions. My grocery retailers who serve SNAP populations are very eager to participate, but they don't even have that opportunity. Why is this, and what can we do to change it?

Ms. DEAN. Well, I can't speak to that particular issue, but funding for GusNIP is limited, so wherever it operates, it is smaller than we would like it to be, so that is of course something we are happy to talk with you further about.

[The information referred to is located on p. 823.]

Ms. LETLOW. Okay. As our Committee considers the farm bill reauthorization, it is essential to ensure these funds are getting to the individuals they are intended for and need them the most. One reform could be providing these incentives directly on the SNAP EBT card to help at-risk populations. Do you have any feedback on this kind of proposal?

Ms. DEAN. We couldn't agree with you more, and that is something that we are looking at is how to streamline and coordinate all of our incentive programs, farmers' market programs, and make sure that we have simpler, easier solutions that would leverage off of the EBT benefit.

Ms. LETLOW. Okay. Thank you. I look forward to working with you on that and my colleagues to improve this program and provide greater transparency. Thank you, Mr. Chairman. I yield back the remainder of my time.

The CHAIRMAN. Thank you. And now the gentleman from Florida, Mr. Lawson, is now recognized for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman and Ranking Member, for this hearing today. And, Madam Under Secretary, you have heard earlier from some of my colleagues about student hunger. The reason why I make this statement is I have here maybe as many as almost 60,000 students. And I know while the Biden Administration acted to support college students during the pandemic, COVID-19 has only worsened food insecurity and intensified racial disparities and hunger among students. Once the public health emergency ends, the waiver in place to expand SNAP eligibility for college students will expire, and many will lose access to this very important vital lifeline that they have.

My question is, the bill that I sponsored, H.R. 6272, the College Student Hunger Act, would make permanent the temporary eligibility waiver passed in the Consolidated Appropriation Act of 2021 and includes additional waivers for college students who are eligible for Pell Grants and reduce the work requirement to 10 hours a week, among a number of other things. What else do you believe can be done by Congress to better address college students' specific needs?

Ms. DEAN. Well, thank you, sir, for the question. I think we have been talking about the struggles of college students and college student hunger, which is of course a serious concern, but I think the broader question is affordability of college and the affordability of pursuing any kind of credential or degree through higher ed. That is fundamentally a pathway to more opportunity in the workplace, and that is what—the President put forward some fairly bold initiatives, for example, to make a community college free of charge to all students.

Now, we may not be pursuing that path, but I think the broader question is higher ed and college affordable is really the core one. And then when folks are pursuing a credential, a degree, additional higher ed training, how do we make sure that we are adequately supporting them?

So, I think all of the ideas that you put forward are terrific, and I think we also want to make sure we do more, and perhaps that is with Congressional direction or support, but that we are doing more with the Department of Education to make sure that education institutions are aware of all of the supports such as SNAP or health coverage and that they are informing students of that. I think that that will probably be a much more powerful intermediary to students than assuming that we can reach them through the SNAP agencies. But we will do both.

Mr. LAWSON. Okay, thank you very much. And one other thing, you stated that the economic fallout in the early days of the pandemic, I have inflation and housing costs—as it was stated earlier—continuing to rise and many Americans are still struggling to afford a nutritious meal for themselves and their families. So, my question would be, before the public health emergency ends, what can be done by Congress to help prepare states and better expand their capacity to meet the needs of their residents?

Ms. DEAN. Well, to be fair, I think states are very much focused on this. They are also concerned about the end of the public health

emergency and losing flexibilities, not just in SNAP but in other programs, as well as losing the additional eligibility rules and augmented benefits. They care about their residents just as much as we do. We have engaged in a very aggressive outreach and engagement effort, as have our colleagues at HHS through Medicaid, talking with state agency leaders about where are you today, where do you want to be, what disruption does the public health emergency end cause for you, and what do we do to work together, what flexibilities do you need from us, what peers do you need to talk to, to learn from their experience, and which of you are, for example, asking your legislatures for additional resources or supports. So, it is a very active conversation.

I actually just spoke with Secretary Harris to think about other states in other parts of the country that were good models for Florida as she was thinking about how best to set up operations to deal with these changes.

Mr. LAWSON. Okay. My time has about expired, but I would like to comment later on, if you get a chance if someone asks the question—how can we do something about the cost of the meals? I think it was discussed earlier in the conversation, and I don't know exactly what was really stated that we need to do, but with that, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you very much, Mr. Lawson.

And now the gentleman from the Northern Mariana Islands, Mr. Sablan, is recognized for 5 minutes.

Mr. SABLAN. Well, thank you. Thank you very much, Chairman Scott and Ranking Member Thompson, for holding this hearing. Good morning, Secretary Dean. Good morning, Ms. Long.

Madam Secretary, you mentioned in your testimony that FNS is, and I quote, "working towards parity for the people of the Commonwealth of the Northern Mariana Islands, Puerto Rico, and American Samoa." Could you expand on what you mean by *parity* and the steps the Department has taken and will take to ensure that it continues to work towards parity for the Northern Mariana Islands, Puerto Rico, and American Samoa? And I like the word *parity*.

Ms. DEAN. Good to see you, Congressman. I would be happy to do that. As you well know, I am probably one of the foremost champions on this issue. Those three Territories don't have access to household food assistance in SNAP. Instead, they are offered block grants. And so, although each one has a different potential pathway to having a more robust household food assistance program, in the case of the Northern Mariana Islands, the Secretary has an authority to expand household food assistance, and we have been able to work with the governor through your leadership to do just that, where it is the Northern Mariana Islands who was able to put forward a plan or proposal for household food assistance program that was more aligned with the level of support that is offered through SNAP, although not exactly the same, because that wasn't perfectly well-suited for them.

With American Samoa, we have been in similar conversations, although I would say unfortunately their block grant sets a statutory cap on the amount of assistance that we can provide that way.

And then, in Puerto Rico, where it would be a much bigger undertaking to shift to SNAP just because of the size and scale of the program, we are engaged in monthly conversations, ongoing workgroups to talk through the particulars of a shift so that if the Committee is prepared to consider that, that each of the Territories can come and talk about what SNAP would mean for them and their readiness to take it on.

Mr. SABLAN. Yes, thank you very much. Again, I know so many in my community have access to nutritious food because of the generosity of the American people, and I can never forget that. I am very grateful for that.

Now, Ms. Long, if I may, two farm bills ago Congress authorized funds for the development and installation of the EBT system for FNS, for SNAP here in the Northern Mariana Islands. That continues to be unavailable, and I am sometimes made to understand from the local—from the ground here, that the obstacle may be coming from region 9, from USDA, from FNS. Can you tell me why we still don't have EBT card in place in the Northern Mariana Islands? Including, one of my colleagues earlier said there was fraud, waste that people can fraud the system. I just can't imagine how you can fraud a system with paper coupons. So, any plans on getting EBT implemented in the Northern Mariana Islands, especially since it has been authorized and especially since funds have been available all these years?

Ms. DEAN. Well, Congressman, if I may, I will take the question.

Mr. SABLAN. Okay, all right, thank you. Thank you.

Ms. DEAN. We understand that this is something that the Northern Mariana Islands want to pursue. My understanding is that there has been difficulty in securing a vendor to provide a system, but we are happy to dig more into that and follow up with that.

[The information referred to is located on p. 819.]

Mr. SABLAN. Okay. Okay. Because, WIC was able to do this and get this program running, running very well. In fact, I know of one department store here that sells groceries, and I encourage them to get up and prepare for EBT someday, and they did, and it is working well to their delight.

But anyway, Ms. Dean, thank you. Madam Secretary, thank you for you, your staff, your colleagues, and your Department for everything you continue to do for us. It is not always very smooth and not always easy, but please know that it is always very much appreciated.

Mr. Chairman, thank you for the hearing, and I yield my time back.

The CHAIRMAN. Well, thank you, Mr. Sablan.

And we have reached the end of our hearing today. But before we adjourn, I certainly want to recognize the Ranking Member for his closing remarks, my closing remarks, and also we have a special guest with us. So, please, Ranking Member, you are recognized for your closing remarks.

Mr. THOMPSON. Thank you very much, Mr. Chairman. First of all, thank you to our USDA leaders out here for testifying, your leadership. I look forward to continuing to work with you. And I will make a few more comments on this section. I want to take the liberty of recognizing some folks here. First of all, I want to thank

the staff, both of our staffs for their work and due diligence as we prepare for the 2023 Farm Bill. I thought this was—these are the kind of hearings I look forward to. I think they are instructive, having folks from USDA that are responsible for implementing these various titles, so thank you, ladies, for your leadership and being here.

I want to recognize—I have got a—we have had the pleasure of working with a very special student intern that has been with us, and this is her final week and she is from Texas A&M, Tatum Hausman, and so thank you to her for her work. Best wishes to her and her continued education.

And then I brought another friend of mine with me, Seth Parish. And Seth is—stand up there, Seth.

The CHAIRMAN. Hey, there he is.

Mr. THOMPSON. Seth is a—

The CHAIRMAN. Why don't we give a hand for both of the—

Mr. THOMPSON. Seth is a—

Mrs. HAYES. I would have brought friends.

Mr. THOMPSON. Seth is a sixth grader from Maryland. He has been a friend of mine for many years. This is the fourth year he has shadowed me. He is part of an organization called Tuesday's Children where his dad served and sacrificed in the Army and sadly died about a month before Seth was born. But Seth has become a really close friend and I am really happy to have him here today. I just had him on the House floor where I bragged on him a little bit.

The CHAIRMAN. Way to go.

Mr. THOMPSON. Yes. So, in terms of this hearing, my thanks to the witness. Obviously, I laid out my initial principles in looking at the Nutrition Title. I really believe like true north on a compass where you lay your principles out first, and it helps you cut through sometimes some of the minutiae and also some of the controversy if we stay focused based on principles. And I have laid those out in my opening comments.

We obviously need to make certain that our intentions create good outcomes. We need to have executive action that is transparent. We need to work together to promote work, integrity, and great nutritional outcomes that I think we are all dedicated to, that I know we are all dedicated to. And I will follow up with some additional questions for the record.

So with that, thank you so much for your testimony today. And, Mr. Chairman, I yield back.

The CHAIRMAN. And thank you, Ranking Member, for your expert participation, as always. It is a pleasure working with you. And I want to thank the Members of the Committee. I certainly want to thank our distinguished Chairwoman of our Subcommittee for the great work that she is doing. Please give her a hand. Thank you.

And of course, I want to thank the Deputy Under Secretary, Ms. Dean, and our Administrator, Ms. Long, for taking the time to join us and presenting this extraordinary hearing. This is an important hearing to us.

And now, I would also like to recognize Ms. Jessica Shahin. Now, let me tell you about her, Ms. Shahin. She is here today, and I am

so delighted for your long service that you have given to us in this area. And as I look at you, I just want you to know there is no greater thing you could be doing than making sure that people receive food. We can do without a lot of things, but the one thing we cannot do without is food. And you have put in 18 years of incredible service. You started at the USDA in 2001 as the Associate Administrator for SNAP and have become an institution in the SNAP world. And we thank you for that. You are a blessing and have been a blessing to our nation. And please, won't you join me, everyone, in giving her a most deserving round of applause. Thank you so much for your service, we really appreciate it.

And now, as we continue to review the previous farm bill and look forward to the upcoming 2023 Farm Bill, I hope we will all keep in mind what we heard from USDA today. The farm bill is one of the most unique legislative packages in Congress. As was referenced, SNAP is close to 80 percent of our spending package with our farm bill. That shows you the importance of what we are doing with this Committee, and particularly with SNAP, with a long history of passing a bipartisan coalition of urban, suburban, and rural Members of Congress joining together for the collective purpose of supporting our nation's food system all the way from the farmer to the consumer.

SNAP is a vital piece of that puzzle, providing Americans in need with a hand up, not a handout. And there is no greater hand up we need than to make sure we are healthy, and you cannot be healthy without the proper food being put on the food tables of our families, regardless of their circumstance, but particularly for the lower-income and people who are struggling and, as we pointed out earlier, special groups like our veterans who are suffering today from hunger. And I just look forward to working as we have been with our Subcommittee Chairwoman on this bill to help our veterans.

And this is why, in the next farm bill, I will continue to be committed to protecting and preserving SNAP, to ensure that it will continue to serve as our nation's frontline anti-hunger program for many decades to come.

Again, thank you all for joining us today. And now we reach adjournment, and I must read these words. Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witness to any question posed by our Members.

And with that, this hearing is adjourned.

[Whereupon, at 1:08 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM GEORGIA; ON BEHALF OF BILL SWEENEY, SENIOR VICE PRESIDENT, GOVERNMENT AFFAIRS, AARP

May 3, 2022

Hon. DAVID SCOTT,
Chairman,
House Committee on Agriculture,
Washington, D.C.;

Hon. GLENN THOMPSON,
Ranking Minority Member,
House Committee on Agriculture,
Washington, D.C.

Dear Chairman Scott and Ranking Member Thompson:

AARP, on behalf of our 38 million members and all older Americans nationwide, appreciates the opportunity to submit a written statement for the hearing record of the April 28 House Committee on Agriculture hearing, “A 2022 Review of the Farm Bill: The Supplemental Nutrition Assistance Program”. SNAP serves as a lifeline for millions of people who are struggling to put food on the table, and nearly half of all SNAP households include at least one adult age 50 or older.^{1*}

SNAP is critical to the food security and health of millions of older Americans

SNAP is the nation’s largest nutrition assistance program. There are 8.7 million households with at least one adult age 50 or older participating in the program,² though many more are eligible. While the program provides a modest benefit—\$142 a month on average, or \$1.56 per meal—it helps older adults meet their basic food needs.³ The program reduces food insecurity⁴ and poverty and is linked to improved health outcomes. Growing evidence suggests SNAP is associated with fewer inpatient hospitalizations, emergency department visits, and long-term care admissions among older adults.^{5–7} This translates into substantial health care savings. A recent study found that SNAP enrollment was associated with lower Medicaid spending among older adults dually eligible for Medicare and Medicaid.⁸ Additionally, qualitative interviews found that increased SNAP benefits during the pandemic helped participants purchase healthier food and had a positive impact on their health.⁹ Access to an adequate and nutritious diet is foundational to maintaining health, quality of life, and independence as people age.

Older adult SNAP participation: Millions are eligible but not enrolled

Despite SNAP’s importance, seniors have historically had much lower participation rates in the program than other age groups. The U.S. Department of Agriculture reports that in fiscal year 2018, only 48 percent of adults ages 60 and older

participated in the program under Federal income and resource rules.¹⁰ While using Federal rules is useful for state comparisons, forthcoming AARP/Mathematica research estimates an even lower FY 2018 participation rate of 29 percent among this age group using state-specific broad-based categorical eligibility rules, which better reflect the actual percentage of those eligible for the program. Under state SNAP rules, we estimated that 16 million—or over 60 percent—of eligible adults ages 50 and older were not enrolled in the program in FY 2018. While many would have been eligible for the minimum benefit, over three million lived in households that could have been eligible for over \$200 a month.¹¹

Qualitative research has identified common reasons for nonparticipation, including the belief that the benefit would not be worth the effort, social isolation, a confusing application process, and barriers such as discomfort with technology.^{12–13} Administrative inefficiencies such as outdated enrollment systems, processing delays, and complicated recertification processes may also contribute to the under-enrollment of eligible seniors in SNAP.¹⁴ We look forward to working with Congress to address this challenge to make sure that older Americans can access the SNAP benefits for which they are eligible.

Food insecurity among older adults

Nearly 9.5 million Americans ages 50 and older experience food insecurity, meaning they have limited or uncertain access to adequate, nutritious food.¹⁵ Older adults may face life challenges as they age—such as experiencing a medical crisis, job loss, or the death of a spouse or other loved one—that may result in financial instability and make it difficult to afford food. SNAP is critical for older workers who lose their job. In economic downturns especially, older workers face longer durations of unemployment compared with younger job seekers. Rising food prices can mean the difference between putting a meal on the table and going without for someone living on a tight budget. When financially strained, seniors may be forced to choose between paying for food and paying for other necessities like rent, transportation, medication, and medical bills. Between an aging population and rising food prices, it is increasingly important to find ways to connect eligible older adults to SNAP.

Impact of COVID–19 on food insecurity among older Americans

In 2020, the COVID–19 pandemic led to widespread job loss that hit older workers particularly hard.¹⁶ Yet, food insecurity did not impact everyone equally. According to annual data from USDA, the overall share of older Americans experiencing food insecurity did not change significantly from 2019 to 2020,¹⁷ in part, likely due to short-term pandemic-related relief policies. However, between 2019 and 2020, food insecurity increased among older Black, American Indian/Alaska Native, Hispanic, and Asian adults, while it decreased slightly among older White adults.¹⁸ In 2020, nearly one in five Black and American Indian/Alaska Native adults ages 50 and older experienced food insecurity. Among this age group, 14.6 percent of His-

panic adults were food-insecure, compared with 5.6 and 5.2 percent of Asian and White adults ages 50 and older, respectively.¹⁹

Impact of food insecurity on health

Older adults who are food-insecure are at increased risk for many negative health outcomes. They are over twice as likely to report being in fair or poor health relative to their peers who are food-secure.²⁰ Compared to food-secure older adults, they are 78 percent more likely to have asthma, 74 percent more likely to be diabetic, 71 percent more likely to have congestive heart failure, 64 percent more likely to have experienced a heart attack, 20 percent more likely to report at least one Activities of Daily Living limitation, and almost three times more likely to experience depression.²¹ Food insecurity among this population also results in significant costs to the American public, particularly through increased expenditures on health care. Experts widely agree that nutrition is one of the most important factors influencing our health.²² Enrolling the millions of older Americans eligible but not enrolled in SNAP could result in billions of dollars in health care savings.²³

SNAP plays a critical role in reducing the likelihood of food insecurity and we must make sure that eligible older adults can get the food they need to nourish themselves when they fall on hard times. The reauthorization of the farm bill presents an opportunity to solve for the persistent participation challenges in SNAP. We appreciate the opportunity to provide our perspective and look forward to working with you throughout the reauthorization process. If you have any questions or need more information, please feel free to contact me or Nicole Burda on our Government Affairs team at [Redacted] or [Redacted].

Sincerely,

BILL SWEENEY,
Senior Vice President Government Affairs.

Secretary of Health and Human Services Xavier Becerra.
Photo: Ron Sachs—Pool Via CNP/Zuma Press.

The [COVID] emergency is over thanks mainly to vaccines and therapies. Yet Health and Human Services Secretary Xavier Becerra on Wednesday extended the national public-health emergency for another 90 days. Why? Because permanent crisis means more dependence on government.

The Trump Administration invoked the emergency under the Public Health Service Act on Jan. 31, 2020 to reduce red tape for healthcare providers. But then Congress linked an expansion of Medicaid and food stamps to the declaration. Now progressives don't want the emergency to end.

The Families First Coronavirus Response Act of March 2020 suspended food stamp work requirements for able-bodied adults without dependents during the emergency. These individuals normally can't receive benefits for more than 3 months over a 3 year period unless they work or participate in a work-training program. Congress also boosted benefits, so the average monthly payment is now double (\$240 per person) what it was in 2019.

Suspending work requirements was intended to help workers laid off during lockdowns when few jobs were available. But once lockdowns eased, businesses were desperate to hire. The sweetened food stamps and suspended work-requirement—on top of enhanced unemployment benefits and other transfer payments—reduced the incentive to return to work.

Now there are 1.8 job openings for every unemployed worker, and the unemployment rate has fallen to near pre-pandemic levels. Yet as of January there were nearly 2.5 million more households receiving food stamps than in 2019 and 500,000 more than in April 2020. What's wrong with this picture?

States may end the supplemental food stamps before the public-health emergency is lifted, but only a dozen or so have. Even GOP governors struggle to resist free Federal money, and they fret about being attacked for refusing extra benefits amid rising food costs, even if beneficiaries aren't poor.

Congress also increased Medicaid funding for states during the emergency on the condition they don't remove beneficiaries from their rolls, even if they earn too much to qualify. Medicaid enrollment has swelled by more than 14.6 million (20%) since February 2020—more than gained coverage from *ObamaCare*.⁴

A recent *Journal of the American Medical Association* study found that Wisconsin Medicaid enrollment increased 11.1% more than would be expected based on economic factors during the first 7 months of the emergency, mostly because ineligible beneficiaries weren't kicked off. Some states now want to prune their rolls but can't

⁴<https://www.macpac.gov/subtopic/medicaid-enrollment-changes-following-the-aca/>.

without losing Federal funds. Congress has hooked states on Federal transfer payments, and Democrats want them to stay hooked.

The emergency rules have served some useful purposes, such as letting Medicare cover telehealth services and waiving a Medicare requirement that beneficiaries be hospitalized for 3 days before the cost of nursing-home care is covered. But the Administration can make some of those useful changes permanent by regulation and ask Congress to include those it can't in the mooted [COVID] spending bill.

The same bill is also a chance to override Mr. Becerra's declaration of what is becoming an eternal [COVID] emergency. Pandemic welfare shouldn't become endemic.

Appeared in the April 16, 2022, print edition.

SUPPLEMENTARY MATERIAL SUBMITTED BY STACY DEAN, DEPUTY UNDER SECRETARY FOR FOOD, NUTRITION, AND CONSUMER SERVICES, U.S. DEPARTMENT OF AGRICULTURE

Insert 1

Mr. MCGOVERN. . . .

. . . the USDA's Economic Research Service put out a report in March predicting an up to five percent increase in food prices this year. And that is astounding. It is simply not affordable for many American families. And while I was pleased to see that SNAP spending rose in 2020 in response to the sharp economic downturn, it has been relatively flat since the summer of 2021 and has started falling as temporary benefit increases that took place during the pandemic are phasing out. So, can you help us understand the important role that SNAP played during the pandemic, and, more importantly, can you give us a reality check about what it will mean for families' food costs if the benefit decreases again at the end of the public health emergency?

The CHAIRMAN. Would you answer that very quickly?

Ms. DEAN. I will do my best. Thank you, Mr. Chairman. Okay. So, SNAP—during the pandemic—did, first of all, increase when we saw a significant increase in need and newly unemployed folks qualifying for the program, so it was able to flex. Congress increased benefits by providing emergency allotments, which actually allowed benefits to go up by about, monthly, aggregate across the country about 40 percent, so it really helped to cushion folks through the dramatic difficulty in securing food during a difficult time. And that increase has also helped to cushion relative to the rising food inflation. And I think the President's request of USDA to ensure that we had a minimum emergency allotment, a \$95 per month per household amount helps to deflect the impact of rising food costs on SNAP participants. And of course, food hardship would be much, much higher had the program not been able to grow and expand with Congress' support. And I will stop there, sir.

The CHAIRMAN. Very fine. And you can also provide additional information to Jim in writing. Thank you.

USDA remains committed to ensuring SNAP households' access to a healthful, nutritious diet. Some states have already begun to transition away from issuance of Emergency Allotments (EA) as their state emergency declarations end. As of August 2022, 17 states have ended EA issuance. When the COVID-19 public health emergency ends, SNAP participants will see decreases in their benefits as a result of losing EA.

To mitigate any potential negative impacts from losing EA, USDA is providing enhanced technical support to state agencies to ensure that SNAP households receive all the benefits to which they are entitled. USDA is providing this support through a variety of means, including training webinars, policy clarifications and additional waiver opportunities. USDA welcomes any opportunity to work with Congress to support SNAP households during this transition.

Insert 2

Mr. SABLAN. . . .

. . . Can you tell me why we still don't have EBT card in place in the Northern Mariana Islands? Including, one of my colleagues earlier said there was fraud, waste that people can fraud the system. I just can't imagine how you can fraud a system with paper coupons. So, any plans on getting EBT implemented in the Northern Mariana Islands, especially since it has been authorized and especially since funds have been available all these years?

Ms. DEAN. Well, Congressman, if I may, I will take the question.

Mr. SABLAN. Okay, all right, thank you. Thank you.

Ms. DEAN. We understand that this is something that the Northern Mariana Islands want to pursue. My understanding is that there has been difficulty in securing a vendor to provide a system, but we are happy to dig more into that and follow up with that.

USDA recognizes the importance of implementing an Electronic Benefit Transfer (EBT) system for the Commonwealth of the Northern Mariana Islands' (CNMI) Nutrition Assistance Program (NAP). Implementing EBT in the CNMI only became more critical as participation increased, which required issuing coupon benefits in significant volumes. The implementation has presented some challenges, but the CNMI and USDA are committed to ensuring its completion.

Starting in March 2021 the CNMI worked to secure a project management contract to assist in developing a scope of work and procuring an EBT Processor to implement the EBT system. At present, the CNMI is close to concluding the contract for the EBT system. The total cost of the 7 year contract amounts to \$3,088,225, which has been approved to be covered by *American Rescue Plan Act* and block grant funds. The CNMI's EBT system is tentatively scheduled to roll out in June 2023.

Insert 3

Mr. THOMPSON. . . .

A follow-up, or another question, not a follow-up—but what role does the Department's Office of Chief Economist play in helping FNS make decisions related to policy and spending? I was made privy to a USDA Office of Information Affairs response to a FOIA request that states, quote, "The OCE relayed they were not asked to review any information related to the 2021 Thrifty Food Plan," end quote. And I think we can all agree that this update has a major economic impact obviously, and if this response is indeed true, can you tell me why the Office of Chief Economist would not be consulted? I can only wonder if there was concern OCE would disagree with your approach from an unbiased economic standpoint, especially when I perceive OCE as falling victim to calculated attempts at blocking economic analysis across a variety of policy issues. And if this response is not true, can you walk me through those consultations with the Office of Chief Economist?

* * * * *

Mr. THOMPSON. And that is fine, but, I mean, this decision tipped the Nutrition Title over \$1 trillion over 10 years. I would think that would warrant being elevated to consulting with the Office of Chief Economist for USDA. And if so, I mean, why within these internal communications that were discovered under FOIA, I mean, I just question why they were excluded. It seemed that something was missed in the process. I appreciate all the things that were done, but my question is what was not done given the significant impact of the changes to the Thrifty Food Plan.

Ms. LONG. Certainly. And, Congressman, we would be happy to get back to you on a more detailed description of the clearance process, because at this point we would need to double-check to see whether OCE did have the opportunity—

The clearance process undertaken for the *Thrifty Food Plan, 2021*,^{1*} published by USDA in August 2021 (FNS-916) followed the standard process set forth in the USDA Departmental Regulation on "Publication Review and Clearance Policy" (DR1410-001).² Specifically, in accordance with Section 5a(4)(e) of that Departmental Regulation, the FNS consultation process included economists from the Economic Research Service (ERS) and nutrition scientists from the Agricultural Research Service (ARS). The publication itself lays out the approach and methodology that was used to fulfill this Congressional mandate, mentions numerous internal and external stakeholders were consulted by FNS throughout the process, and describes ways in which FNS—specifically the Center for Nutrition Policy and Promotion (CNPP)—leveraged expertise and equities of other USDA agencies like ERS and ARS for this effort. The Office of the Chief Economist (OCE) did not provide specific input for this publication, in part because the support FNS received from economists at ERS was sufficient to fulfill the mandate from Congress. The partnership between FNS and ERS for this effort began several years ago, resulted in a

¹ <https://doi.org/10.52570/TFP2021>.†

Editor's note: footnotes annotated with † are retained in Committee file.

² <https://www.usda.gov/directives/dr-1410-001>.†

new method to determine food prices for updating the Thrifty Food Plan, and is documented in an ERS Technical Bulletin published in September 2020 and titled, *Estimating Prices for Foods in the National Health and Nutrition Examination Survey: The Purchase to Plate Price Tool*³ (TB-1955). Historically, OCE has not played a role in calculating or reviewing the Thrifty Food Plan during its development; however OCE was briefed on the 1999, 2006, and 2021 reports prior to their respective releases. As such, their engagement did not change relative to past updates. FNS is confident in the soundness of the approach and methodology—informed by USDA economists—that was used for this most recent reevaluation. The reevaluation was strengthened by interagency input and external partnership and followed all applicable Departmental regulations and guidelines.

Insert 4

Mr. CRAWFORD. . . .

Congress attempted to address the bottlenecks and slow onboarding processes by allocating \$25 million in the American Rescue Plan (Pub. L. 117-2) in part for retail technical assistance. My understanding is that none of this money has been distributed yet. What steps are being taken by FNS to help ensure that all retailers and consumers have access to this program?

Ms. LONG. Well, thank you for that question, Congressman, and we really appreciate the support for online purchasing. We are at a place where over 97 percent of SNAP households currently do have access to online purchasing options. But, as you know, there is certainly more to do, particularly with respect to smaller and specialty retailers, and we are very grateful for the support that came through the American Rescue Plan Act. And I am happy to report that next month, in May, we are going to be putting out our request for a contract to develop a technical assistance center which will be specifically designed to assist particularly, again, those smaller retailers and coming on board to the online platforms. And their goal will be really to provide the support that those retailers need to assess their technology needs and the business case to be able to successfully integrate into online purchasing in SNAP.

Mr. CRAWFORD. And so that money, you are saying, will start to flow next month?

Ms. LONG. We will be soliciting for the support for that technical assistance center, and we would be happy to get you more information on the anticipated schedule for the actual award and flowing of support.

On July 7, 2022, USDA issued a Request for Applications to solicit a nonprofit grantee to provide technical assistance to retailers interested in pursuing online SNAP. Award is expected in the early fall.

This grant will use \$5 million of the \$25 million from the *American Rescue Plan Act* and the period of performance will be four years.

The grantee will assist retailers in understanding the various paths to online SNAP, including determining costs and return-on-investment. The grantee will simplify, streamline, and translate existing guidance, and guide interested retailers through online implementation.

Eventually, the grantee will provide the same services to retailers operating in States selected to pilot mobile payments.

Insert 5

Mr. DESJARLAIS. Right. And I would argue right now that most people crossing the southern border have learned that. They don't come here and say—they don't cross into the United States and say, "We are just coming here because we felt like it." They are saying we are seeking asylum. They are taught what to say. They are charged up to \$4,000 per person to be brought by drug smugglers and cartels and people to get into the United States, and so they know what to say.

So, I guess what I would like to get from you is an actual number. We know what it costs for SNAP per year. We know how many Americans—well, I think we know how many Americans—you said 41 million, but we don't know how many of those are actual Americans. Does that number include the asylum-seekers and children of non-citizens?

Ms. DEAN. It would include eligible non-citizens, yes.

Mr. DESJARLAIS. Okay. So, I guess what we need to know is that, first of all, we are taking care of Americans first. We have programs to assist people whether they are in other countries in terms of hunger, and I think that is im-

³<https://www.ers.usda.gov/publications/pub-details/?pubid=99294>.†

portant. The U.S. should lead on that, and I am really proud of the SNAP program that we have in order to take care of the people who are hungry in the U.S. I just want to prepare—this line of questioning is to prepare the farm bill so we know what to expect and how to best take care of those in need. So, I thank you for your testimony, and any information you can get to me in writing on those numbers would be greatly appreciated, and I yield back.

Ms. DEAN. Happy to do that, sir.

The latest data available are from FY 2019. A total of 37.2 million individuals received SNAP on average each month in FY19.

The citizenship breakdown of these individuals is as follows:

- 33.9 million (91.1%) are U.S.-born citizens;
- 1.9 million (5.0%) are naturalized citizens;
- 295,000 (0.8%) are refugees, asylees, or individuals given a stay of deportation; and
- 1.1 million (3.1%) are other noncitizens—*e.g.*, a legal permanent resident with 40 quarters of work (which is typically 10 years of work history), military service, 5 years legal U.S. residency, disability, or under age 18.

Included in the above groups are 2.5 million citizen children that are living with noncitizen adults (adults may or may not be SNAP participants).

Insert 6

Mr. AUSTIN SCOTT of Georgia. Has the Biden Administration prosecuted a single case of that fraud? Have they prosecuted a single case of SNAP fraud?

Ms. DEAN. You mean in terms of the judiciary or through administrative—we can absolutely follow up with you but, yes, we have a rigorous approach to addressing fraud.

Mr. AUSTIN SCOTT of Georgia. I would appreciate information on how many cases have been brought for fraud.

Ms. DEAN. Okay.

Mr. AUSTIN SCOTT of Georgia. Thank you, ma'am.

The CHAIRMAN. And, Deputy Secretary, please follow up with Congressman Scott's inquiry in writing.

Ms. DEAN. Absolutely.

In Fiscal Year (FY) 2021, USDA identified 27,862 firms as potential compliance violators and conducted 11,273 investigations of authorized retail firms to determine compliance with program regulations. USDA may sanction or warn retailers found violating Program rules. Sanctions include permanent or time-limited term disqualifications and civil money penalties. Retailers who commit minor violations are issued official warning letters. Retailers who are disqualified permanently and later sell their stores are also subject to a transfer of ownership civil money penalty.

Sanctions	Total
Time-Limited Term Disqualification	1,155
Permanent Disqualifications	1,595
Hardship Civil Money Penalty (CMP)	345
Trafficking CMP	4
Total Sanction Actions	3,099
Other Compliance Actions	Total
Transfer of Ownership CMP	102
Official Warning	784
Involuntary Withdrawal (for other than non-redemption)	299
Permanent Involuntary Withdrawal	12
Fiscal Claim	162
Unauthorized Acceptance Fine	15
Total Compliance Actions	1,374
Total Sanctions + Compliance Actions	4,473

In the first half of FY 2022, more than 1,000 stores were sanctioned and over 700 were subject to compliance actions.

Insert 7

Mr. ALLEN. Okay. Well, our Democratic colleagues are saying that this program is untouchable, but at any rate, I am just about out of time. One other thing that we need to get to the root of the problem on, and I don't understand this, but, we hear time and time again that one out of five children go to bed hungry in this country every night, and I don't know about the rest of the country, but in the 12th District of Georgia, during the pandemic, our children got breakfast, lunch, and a snack each day through our school nutrition programs. We made that happen. How is it possible that one in five children go to bed hungry at night, and why? Have you all investigated this problem?

Ms. DEAN. I don't have enough time to get back to given the time, but I am happy to follow up with you, sir.

Although, most households in the US are food secure (89.8 percent in 2021), some households experience food insecurity in that their access to adequate food is limited due to lack of money and other resources. USDA's nutrition assistance programs improve household food security by providing low-income households access to food for a healthful diet. USDA also monitors food insecurity among U.S. households annually through a nationally representative survey and publishes annual statistics on prevalence of food insecurity. The annual report presents prevalence and trends but does not examine causation.

Food security statistics for 2021 were published by USDA's Economic Research Service on September 7, 2022 (USDA ERS—*Household Food Security in the United States in 2021*⁴) and key findings for households with children are as follows:

- In 2021 the prevalence of food insecurity among all households with children decreased from 14.8 percent in 2020 to 12.5 percent.
- Children were food-insecure at times in 6.2 percent of households with children (2.3 million households). These households were unable at times to provide, adequate, nutritious food for their children. The prevalence decreased from 7.6 percent in 2020.
- Children and adults experienced very-low food security (severe form of food insecurity) in 0.7 percent of household with children (274,000 households). The rate in 2020 was 0.8 percent (322,000 households).

In 2020, the onset of the COVID-19 pandemic resulted in school and business closures and job losses which could have increased food insecurity considerably among resource constrained households. However, in response, USDA implemented additional nutrition assistance programs such as the Pandemic EBT program (P-EBT) as well as flexibilities within existing programs, some of these continued in 2021 (FNS Responds to COVID-19 *Food and Nutrition Service (usda.gov)*).⁵ Previous research has shown that participation in nutrition assistance programs can improve food security among children living in food insecure households. Summer Electronic Benefit Transfer for Children (Summer EBT) was found to reduce the prevalence of food insecurity among children by nearly 1/5. Participation in SNAP for around six months was associated with a 9 to 10 percentage point decrease in the prevalence of households with food insecure children.

Insert 8

Mrs. LETLOW. . . .

Deputy Under Secretary Dean, the 2018 Farm Bill prioritized allocating GusNIP funding to retail locations. How has the USDA adequately provided retailers an opportunity to participate in this program?

Ms. DEAN. Congresswoman, I guess I will need to get back to you on that. GusNIP is operated through another arm of USDA, but I take your—I am concerned about your concerns, and so I want to make sure that we are responsive to—I would flag that the farm bill also included another provision which allows retailers themselves to offer incentives to SNAP participants, and that, too, we haven't seen a robust take-up of. And it is an area that I want to explore with my team. I feel that retailers across the country are participating with the pro-

⁴<https://www.ers.usda.gov/publications/pub-details/?pubid=104655>.†

⁵<https://www.fns.usda.gov/coronavirus>.

gram, they are supporting participants through their grocery stores, and we would love to see them be offering more incentives at their own direction.

* * * * *

Ms. LETLOW. Thank you. I would appreciate that information. And it is also my understanding that these incentives are only available at farmers' markets in Louisiana, yet farmers' markets represent less than one percent of all SNAP redemptions. My grocery retailers who serve SNAP populations are very eager to participate, but they don't even have that opportunity. Why is this, and what can we do to change it?

Ms. DEAN. Well, I can't speak to that particular issue, but funding for GusNIP is limited, so wherever it operates, it is smaller than we would like it to be, so that is of course something we are happy to talk with you further about.

USDA has diligently worked to provide retailers an opportunity to participate in the program. The *GusNIP Request for Applications (RFA)*⁶ is available through the USDA–NIFA Grants Funding Opportunity Page and through *Grants.gov*. Other outreach components for this grant include but are not limited to: GusNIP Webinars and GusNIP Listening Sessions.

All GusNIP Nutrition Incentive Program priorities are given equal consideration and include:

1. Maximize the share of funds used for direct incentives to participants;
2. Use direct-to-consumer sales marketing;
3. Demonstrate a track record of designing and implementing successful nutrition incentive programs that connect SNAP/NAP participants and agricultural producers;
4. Provide locally or regionally produced and fresh fruits and vegetables, especially those culturally appropriate for the target audience;
5. Include a project design that provides incentives when fruits or vegetables are purchased using SNAP/NAP benefits and in which the incentives earned may be used only to purchase fruits or vegetables;
6. Have demonstrated the ability to provide services to underserved communities; and/or communities where the majority of residents are racial/ethnic minorities, living below the Federal poverty line, and/or rural or remote communities;
7. *Include coordination with multiple stakeholders, such as general farm organizations, nutrition education programs, cooperative extension services, public health departments, health providers, private and public health insurance agencies, cooperative grocers, grocery associations, and community-based and non-governmental organizations;*
8. Offer supplemental services in high-need communities, including online ordering, transportation between home and store, and delivery services;
9. *Include food retailers (firms) that are open (1) for extended hours and (2) most or all days of the year;*
10. Test innovative or promising strategies within the limits of SNAP/NAP policy that would contribute to our understanding of how best to increase the purchase of fruits and vegetables by SNAP/NAP participants, to inform future efforts; and
11. *Involve a diversity of types of firms (e.g., convenience stores, supermarkets, farmers' markets).*

As part of our nutrition security work, the Department is making a concerted effort to inform retailers of the opportunity and process for providing incentives to SNAP participants. Such efforts go a long way to assist in making healthy foods, those that are aligned with the dietary guidelines for all Americans, more readily available and affordable for SNAP participants.

SUBMITTED QUESTIONS

Response from Stacy Dean, Deputy Under Secretary for Food, Nutrition, and Consumer Services, U.S. Department of Agriculture

Questions Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question 1. Under Secretary Dean: Can you please provide an update on the status of the implementation of the mobile technology demonstration project, including what USDA is doing to ensure that any approved demonstration projects are technologically secure and protect the privacy of SNAP recipients?

Answer. The *Agricultural Improvement Act of 2018* authorizes the use of mobile technologies for the purpose of accessing SNAP benefits for payment at the point-of-sale. This will allow SNAP participants to input their Electronic Benefit Transfer (EBT) card into a mobile device and make SNAP purchases at the point-of-sale without the presence of the physical EBT card. The Act requires that USDA approve not more than five projects to pilot the use of this technology and then determine if mobile technology should be authorized nationwide.

The Mobile Payment Pilot Request for Volunteers (RFV) was released on July 12, 2022. The deadline for submission of proposals to the RFV is October 4, 2022. State SNAP agencies are eligible entities.

The RFV requires respondents to address fraud concerns specific to mobile payment methods, and clearly explain how the pilot project plans to deter potentially fraudulent activity. Respondents must ensure that state participants have adequate methods in place to ensure system and data security, as well as customer privacy, to prevent compromise of SNAP household information, identity theft, and other fraud. Proposals will be carefully evaluated for strong data security systems and policies, and the use of industry-recommended practices.

Question 2. Under Secretary Dean: I have heard concerns from grocers in my district that releasing SNAP benefits on the first of the month, every month, not only causes problems for stocking common items but also contributes to stigma of SNAP participants who are often working, caring for family, and generally living lives wholly inconsistent with stereotypes associated with their benefit. Do you believe it would be feasible to distribute benefits in a different way—throughout the month, or on a rolling basis in some other sense? Has the Department deliberated this possibility at any time?

Answer. SNAP state agencies are responsible for general SNAP program administration at the local level, including the issuance of SNAP benefits to eligible households. USDA encourages SNAP state agencies to stagger their benefit issuance over multiple days throughout the month, as a staggered issuance schedule more evenly distributes demand on SNAP authorized retailers and may reduce stigma clients face. Most states issue benefits on a staggered schedule that can, for example, range from 10 business days to as many as 28 calendar days over the issuance month.

Six states and one U.S. Territory issue all benefits on one day of the month. Within that subset, only four states and one U.S. Territory issue benefits on the first day of the month.

Question Submitted by Hon. Al Lawson, Jr., a Representative in Congress from Florida

Question. The recent SNAP increase drastically helped to close the gap between SNAP benefits and meal costs, however, for four of my eight counties these benefits are still below the average cost of a meal in that county.

Since a review of the Thrifty Food Plan is not expected for another 5 years, what else could be done by Congress to address this gap and ensure that all Americans have access to healthy and delicious food?

Answer. The most recent reevaluation of the Thrifty Food Plan (TFP) increased the purchasing power of SNAP households by utilizing a modernized, data driven approach, reflecting notable shifts in the food marketplace and consumers' circumstances. This reevaluation included current food prices, foods Americans typically eat, nutritional values and the latest dietary guidance.

In addition to reevaluating the TFP every five years, USDA issues annual SNAP Cost-of-Living-Adjustments (COLA) to address increased consumer costs. COLA adjusts the SNAP maximum allotments, minimum allotment, income eligibility standards, and deductions. Beginning October 1, 2022, maximum allotments will increase for the 48 states and the District of Columbia, Hawaii, Guam, the U.S. Virgin Islands, and Alaska. For a family of four receiving a maximum allotment in the 48 states and the District of Columbia, benefits will be \$939. Maximum allotments for a family of four will increase to \$1,794 in Hawaii, \$1,385 in Guam, \$1,208 in the

U.S. Virgin Islands, and to a range of \$1,172 to \$1,819 in Alaska. The minimum benefit for the 48 states and the District of Columbia will increase to \$23 and will also increase in Alaska, Guam, Hawaii, and the U.S. Virgin Islands.

In addition to the annual COLA adjustment, during the pandemic Congress passed legislation which temporarily increased SNAP benefits for households. Many of the flexibilities, such as emergency allotments which provided SNAP households with the maximum allotment, were instrumental in ensuring SNAP households had access to healthy and delicious food. USDA stands ready to work with our partners in Congress to help all Americans have access to healthy and affordable food.

Question Submitted by Hon. Jimmy Panetta, a Representative in Congress from California

Question. Deputy Undersecretary Dean and Administrator Long, thank you so much for your recent testimony to the House Agriculture Committee about the importance of the Supplemental Nutrition Assistance Program (SNAP) in the 2023 Farm Bill.

I appreciate your comments regarding building on the proven success of flexibilities during COVID-19, including to streamline methods for accommodating telephonic signatures—this has provided critical program access here in California. I look forward to seeing the guidance and other assistance you provide states on the overall approach to continue proven practices to improve operations and streamline access for families in need as permanent solutions to strengthen SNAP.

I would like to expand that topic to the importance of telephonic and online remote options to for applications and interviews during Disaster SNAP operations.

I appreciate that FNS has temporarily allowed remote interview options during pandemic given the larger flexibility, providing crucial program access in Santa Cruz County¹ in the summer of 2020 during the height of COVID & following the CZU Complex Fires.²

Prior to the pandemic, however, FNS has required the interview to be in person. This has been problematic for several reasons, including: retraumatizing applicants who have been through a major crisis to have to present in person while they are managing multiple other disaster benefits during the limited D-SNAP application window; the significant transportation, distance, fuel expenses, and other barriers applicants who have had to relocate but are eligible for aid; the inequitable impact all of this has for the civil rights of people with disabilities and other outstanding barriers to accessing D-SNAP.

The California Association of Food Banks that represents the three food banks serving my District, along with the Western Center on Law & Poverty, have documented the impact that the lack of remote interview options has had, and called for permanent remote access to D-SNAP,³ since 2015.

How can FNS support states to permanently provide remote (telephone and online) options for the application and interview during Disaster SNAP to ensure equitable access to food assistance when communities need it most?

Answer. Traditionally, state agencies operate Disaster Supplemental Nutrition Assistance Programs (D-SNAPs) via an in-person application and interview process. Since the onset of the COVID-19 pandemic, USDA has approved D-SNAPs with virtual components to support states in protecting the health and safety of households and staff while responding to disasters.

Since March 2020, USDA has approved 23 D-SNAP operations with novel virtual components. Virtual operations were critical to states as they dealt with challenges due to the COVID-19 pandemic and USDA is committed to continuing to approve virtual D-SNAPs through the end of COVID-19 Public Health Emergency.

In many states, the use of virtual components in D-SNAP has improved efficiency and program access but has not been without its challenges. USDA believes that states may mitigate these access challenges by utilizing technology for pre-registration systems, call centers, and ensuring they have the capacity to mail the electronic benefit transfer (EBT) cards overnight.

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. Based on recent Department data, it appears some states are seeing declines in program enrollment while others see growth. Deputy Under Secretary

¹ <https://www.fns.usda.gov/disaster/california-disaster-nutrition-assistance>. [Attachment 1].

² <https://www.fema.gov/disaster/5336>. [Attachment 2].

³ https://wclp.org/wp-content/uploads/2016/07/071116_WCLP_CAFB_DisasterSNAPComments_Final.pdf, https://wclp.org/wp-content/uploads/2020/09/WCLP_DSNAPE_Comments_Sept14_2020.pdf. [Attachments 3a & 3b].

Dean, what do you attribute these variations in enrollment trends to? Do you think it's a matter of policy choices? Operations? Something else?

Answer. As a result of the COVID-19 Public Health Emergency, SNAP saw a rapid growth in participation across the country. As the nation continues to recover from the pandemic, shifts in participation trends are expected as state economic conditions vary.

A growing number of states have begun to end state emergency declarations and transition off program flexibilities available under such declarations.

USDA remains committed to assisting states with administering SNAP and ensuring program integrity throughout the pandemic and as we continue to transition through recovery to ensure access among eligible populations.

Question 2. Deputy Under Secretary Dean, I am increasingly concerned SNAP promotes a perverse business of poverty. Organizations across the country have come to expect ongoing, or even increased reliance on safety net programs to remain solvent, particularly through the receipt of Federal dollars. How do we engage non-traditional partners in the delivery of services? How can we weed out those who are not conducting the work in the vein of what the American taxpayer expects?

Answer. SNAP is the most far-reaching, powerful tool available to ensure that all Americans can afford healthy food—it is a lifeline for tens of millions of Americans in every part of the country. It reduces poverty and food hardship, and participation by young children has been linked to better long-term health, education, and employment outcomes. SNAP also helps to stabilize the economy and respond to increased need during downturns. Every additional \$1 in SNAP benefits can create at least \$1.50 in economic activity. USDA is continuously working to improve the effectiveness and efficiency of nutrition assistance programs.

As part of this ongoing work, the Administration is strengthening communication with longstanding partners and engaging new partners, including non-traditional partners, for ideas on how to better implement the Federal nutrition programs and deliver services. In this regard, we continue formal consultations with Tribes and our regular dialogue with state agencies that administer our programs.

The Secretary has also engaged directly with local school officials, including school food service personnel, to ensure we have robust dialogue and direct stakeholder input as we work together to enhance policy around and support for school meals.

We are expanding our lines of communication with non-profits, academic leaders, faith-based organizations, and industry and private-sector partners across multiple fronts. As an example, we are launching a series of summits on nutrition security and the connection to both individual and public health with stakeholders in the healthcare sector. After a recent national kickoff summit, FNS is partnering with the private-sector for a series of regional summits across the nation on this important topic in 2023. We have also engaged partners in the efforts to innovate and modernize the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC).

WIC is one of the nation's most successful and cost-effective nutrition intervention programs, as proven by the results of studies conducted by USDA and other non-government entities. Since its beginning in 1974, the WIC Program has earned the reputation of being one of the most successful federally funded nutrition programs in the United States. Collective findings of studies, reviews, and reports demonstrate that the WIC Program is cost effective in protecting or improving the health and nutritional status of low-income women, infants, and children.

Additionally, USDA's school meals programs provide critical nutrition to tens of millions of children every school day. For many children, the food they receive from school breakfast and lunch makes up about half their dietary intake each school day. Students' success in the classroom is connected to their ability to access healthy and nutritious meals, and a 2021 study published in the *Journal of the American Medical Association* found that school meals are the healthiest meal kids receive each day. Research also shows children who ate lunches from school were more likely to consume milk, fruits, and vegetables and less likely to consume desserts, snack items, and non-milk beverages than children who brought food from home. Strong school nutrition programs are proven to work for schools and families.

We strive to seek out and leverage opportunities to enhance input and dialog, especially with non-traditional partners. We welcome input from you, Ranking Member Thompson, and other members of the Committee as we strive to make connections with stakeholders, engage those with "lived experiences" for their rich perspectives, and advance USDA's diversity, equity, inclusion, and accessibility goals with respect to the Federal nutrition programs.

Question 3. On April 21, the Supreme Court turned down a bid to allow Puerto Rico residents to claim benefits under the Federal Government's main disability in-

insurance program, ruling the Constitution does not require Congress to offer such payments to residents of the island, largely because residents are exempt from most U.S. taxes. The Biden Administration defended the law excluding Puerto Rico, but acknowledged it favors legislation to address the issue. Deputy Under Secretary Dean, your testimony stated the agency is exploring parity for residents of Puerto Rico; is this something the agency thinks you have authority to do? Or will legislation be required? Are their proposals out there that FNS supports?

Answer. Legislation is required to move from the Puerto Rico Nutrition Assistance Program (NAP) block grant to the Supplemental Nutrition Assistance Program (SNAP). USDA supports giving the Government of Puerto Rico the choice to pursue transitioning from NAP to SNAP.

USDA is providing ongoing, robust technical assistance to the Government of Puerto Rico as they consider this possibility and what it means for their current program and residents. This assistance includes facilitating visits to SNAP state agencies, creating working groups, and providing technical assistance on their annual plan of operation to better align the program with SNAP within the authority of the block grant.

USDA is committed to continuing to work with our partners in Puerto Rico and in Congress on a path forward that best meets the nutrition needs of the residents of Puerto Rico. Specifically, our ongoing work with the Government of Puerto Rico is helping ensure they have a robust and accurate understanding of SNAP, including all program requirements. This partnership is also equipping them with information they need to engage with the Committee in discussions about legislation related to the future of nutrition assistance in Puerto Rico.

Question 4. In March 2022, FNS rescinded charge letters and Final Agency Decisions related to indirect trafficking. Deputy Under Secretary Dean, can you walk the Committee through the following: What led to FNS charging these (potentially hundreds) of retailers with indirect trafficking?

Answer. Starting in 2018, the Department expanded its efforts to investigate SNAP trafficking to provide stronger monitoring and enforcement against those seeking to undermine the program. This included pursuing more cases of indirect trafficking, or the illegal act of a retailer intentionally purchasing products that were originally bought with SNAP benefits.

Question 4a. If the investigators were contractors, what is the process by which these contractors are retained?

Answer. The investigators are on contract with the Department. The contract is solicited using standard contracting practices.

Question 4b. How many total retailers had their permanent disqualification reversed by the March 2022 decision?

Answer. Out of an abundance of caution, USDA rescinded all actions taken against retailers whose indirect trafficking investigations may have been adversely impacted by process weaknesses, including reinstating those that were disqualified. USDA did this because of a deep commitment to maintaining fairness and program integrity in SNAP and will continue to pursue ways to leverage the best tools available to safeguard all our programs. There are nearly 250,000 SNAP-authorized retailers. In total, less than 1,000 retailers had permanent disqualification actions rescinded.

Question 4c. Is the notification process complete? If not, how many notifications remain and when do you expect the process to be finalized?

Answer. Yes, the notification process was completed in April 2022.

Question 4d. Has the agency found wrongdoing by the investigators? If so, has disciplinary action occurred? If so, in what form and how many investigators have been impacted by such?

Answer. When concerns were brought to the Department's attention about specific aspects of how those indirect trafficking investigations were executed, a sample of the administrative (not criminal) indirect trafficking cases conducted between 2018 and 2021 were reviewed. Some weaknesses in the process were identified.

While we cannot discuss investigative techniques in detail, we take very seriously the enforcement power that we wield. USDA has taken immediate actions to address those weaknesses, including providing extensive training to investigative and compliance staff.

Question 4e. I have heard many of these retailers have lost thousands of dollars in revenues as a result of these original agency decisions, and some have had to close their doors entirely. What, if anything, is the agency doing to rectify that? Will the agency commence some type of claims process?

Answer. Impacted retailers that were still under investigation or awaiting appeal had the administrative cases against them rescinded. Those who were disqualified while awaiting administrative appeal were automatically reinstated. Retailers who were already disqualified for indirect trafficking had their Final Agency Decisions (FADs) rescinded and were reinstated. The administrative decision that was rescinded for these retailers will not be held against them for purposes of future authorization decisions. Monetary penalties paid by sanctioned retailers were refunded.

Retailers who are no longer in business will be able to return to SNAP as authorized retailers should they so choose. Their application will be accepted without prejudice, meaning USDA will not hold the rescinded actions against them. They will be subject to the same monitoring and oversight as all SNAP authorized retailers.

Question 4f. The Department makes equity in services a priority; how many of these retailers are minority-owned? Additionally, please provide the full demographic (*i.e.*, race, age, gender) breakdown of these retailers.

Answer. USDA does not collect the racial or ethnic make-up of retailers who participate in SNAP.

Question 5. Deputy Under Secretary Dean, as you know, many businesses and schools were shuttered during 2020 and 2021. Please explain how Federal E&T disbursements were used by states during that time.

Answer. USDA responded immediately to the COVID-19 public health emergency (PHE) by issuing an April 2020 memorandum clarifying that SNAP E&T service providers could offer virtual services to better meet SNAP E&T participant's needs during this unprecedented time.

Although many of the organizations that normally offer E&T services were forced to close their doors to in-person activities, many states and E&T providers quickly shifted to offering virtual services.

As a result, Federal E&T funds continued to be used during the pandemic for regular administrative costs of operating an E&T program, offering SNAP E&T components and case management, and providing participant reimbursements.

As always, states were required to submit amendments to their state SNAP E&T plans if they anticipated any major changes to their SNAP E&T program or operating budget.

Question 6. The 2018 Farm Bill asked FNS to implement the successful Obama-era National Accuracy Clearinghouse (NAC) demonstration pilot nationwide. Subsequent appropriations bills directed the agency to ensure the NAC provides for a robust appeals process for SNAP recipients identified as receiving SNAP benefits in more than one state before removing them from the program in either state. Deputy Under Secretary Dean, what has FNS done to ensure there are new minimum appeals processes in light of the Department's reports to Congress that nationwide implementation of the NAC is imminent? Can you point me to the regulation or guidance?

Answer. The National Accuracy Clearinghouse (NAC) interim final rule—which was published in the *Federal Register* on October 3, 2022, with a corrected effective date of December 6, 2022 (87 *FR* 59633)⁴—as well as the SNAP regulations, seek to improve the customer service experience for SNAP applicants and participants by ensuring that they receive the benefits they are entitled to, while maintaining program integrity through the prevention of duplicate participation.

USDA's development of the NAC interim final rule and the NAC system have been informed by recommendations from the independent evaluation of the NAC pilot. This evaluation found that more successful states integrated the NAC with their SNAP eligibility systems and into existing workflows. As a result, the NAC interim final rule inserts the NAC requirements into current regulations to prevent the disruption of existing workflows while still enhancing customer service and program integrity by preventing duplicate participation.

State agencies that use match information from the NAC must comply with the requirements set forth in 5 U.S.C. § 552a(p) and 7 CFR § 272.12(c). According to these requirements, state agencies may not take any adverse action to terminate, deny, suspend, or reduce benefits to an applicant or SNAP participant based on information produced by the NAC until the state agency has independently verified the information and informed the applicant or SNAP participant of agency findings, the opportunity to contest findings, and the allowable timeframe to do so. In addition, under requirements in 7 CFR § 273.15, SNAP households or individuals may request a fair hearing to contest any action of the state agency which affects their

⁴<https://www.federalregister.gov/documents/2022/10/03/2022-21011/supplemental-nutrition-assistance-program-requirement-for-interstate-data-matching-to-prevent>.[†]

participation in the program. If a household wishes to appeal a local fair hearing decision, they can request an appeal within 15 days of the mailing date of the hearing decision notice.

If the state agency suspects that a household or individual is intentionally participating in SNAP in more than one state, based on data obtained through a NAC match or other means, the state agency investigates the alleged intentional program violation. The state agency is required to act on households or individuals with intentional program violations through administrative disqualification hearings or court referrals. However, while these actions are pending, affected households or individuals are allowed to participate in the program, per regulations at 7 CFR § 273.16.

Question 7. The Department had announced a suite of investments in program administration and integrity, which amounted to less than $\frac{1}{10}$ of 1 percent of the annual SNAP appropriation. Upon adding roughly \$20 billion more in payments per year by way of the Thrifty Food Plan update, this investment appears to have dropped to less than $\frac{1}{20}$ of 1 percent. Deputy Under Secretary Dean, beyond the announcements, what is the agency doing to ensure those investments are worthwhile? Do you anticipate further investments in the integrity and administration space?

Answer. Integrity and payment accuracy are ongoing priorities for the USDA. SNAP state agencies are responsible for identifying and holding SNAP recipients who break the rules accountable. USDA has numerous initiatives and resources focused on strengthening the integrity of SNAP and improving payment accuracy. To support states in these efforts, USDA provides policy guidance, regulations, and technical assistance to enhance states' ability to prevent, detect, and investigate recipient fraud. Accurate payments mean better customer service for SNAP clients, and USDA is committed to maintaining program integrity as stewards of taxpayer dollars. Following are a few specific examples of the projects USDA is working on in this area, and the standard statutory and regulatory tools that USDA regularly employs.

Income Verification Pilot Program—In Fiscal Year 2022, USDA awarded grants to 16 states to evaluate their use of third-party databases to verify earned income. Preliminary results suggest this project may have a positive impact on payment accuracy. USDA is using the information from grantees to pursue a national-level contract for all states for earned income verification.

Understanding Risk Assessment in SNAP Payment Accuracy and Employing Model Programs to States—USDA is studying how state SNAP agencies use analytic risk assessment tools and what makes these tools effective. At the same time, USDA is developing its own risk assessment model that can easily be deployed to any state and aims to identify characteristics of cases that are prone to payment errors so that state SNAP eligibility staff can provide extra layers of review during the certification process to ensure households receive only the benefits to which they are entitled. This model contains safeguards to ensure the protection of protected classes.

SNAP Fraud Framework—The SNAP Fraud Framework (SFF) serves as a cornerstone of recipient integrity efforts, and USDA seeks to enhance the SFF as new technology and best practices emerge. USDA designed the SFF and its supporting documents to support states as they develop new efforts or improve existing ones to prevent, detect, and investigate fraud. In 2019, USDA established the SNAP Fraud Framework Implementation Grant program. These grants aim to improve state agencies' recipient fraud prevention, detection, and investigation efforts, using principles from the SFF. Since 2019, USDA has funded 29 awards totaling over \$15 million under this grant program.

Proposed Rulemaking for Strengthening Integrity and Reducing Retailer Fraud in the Supplemental Nutrition Assistance Program—USDA is working to issue a proposed rulemaking to strengthen the integrity of SNAP's payment accuracy measurement system. These proposed changes address longstanding concerns by USDA, OIG, and state partners and is planned for publication in July 2024 for notice and comment.

Investments in IT Resources to Improve Improper Payment Measurement and Analysis—USDA is developing a new information technology system that will provide a suite of tools and process efficiencies for state and Federal reviewers conducting improper payment reviews. This system will also provide better data analysis tools, allowing administrators at all levels of the Program to make more informed decisions about how to ensure the integrity of SNAP. Additionally, USDA is adding additional data analytic tools that will go beyond the improper payment data to integrate multiple data sources, allowing for a more nuanced examination of what is causing payment errors and how they may be fixed.

Statutory and Regulatory Ongoing Compliance Activities—USDA continues to conduct management evaluations on state recipient integrity and payment accuracy activities to ensure states are following the law and regulations, and implementing the most effective strategies to administer and oversee integrity responsibilities. For states that are found to have deficiencies, USDA works to establish corrective actions with the state to improve program performance and payment accuracy.

Question 8. States are exploring innovative ways to streamline eligibility determinations. Mobile sites and mobile applications offer the ability to upload verification documents, greatly reducing a common source of churn—where households apply but do not complete their applications, and subsequently reapply, creating administrative burden and higher costs—by capturing verification quickly and easily. These and other technology initiatives, combined with data-driven business process improvements, can enhance administrative efficiency, and reduce both state and Federal expenditures. There are companies currently providing asset verification to a host of other safety net programs, yet they have struggled to enter the SNAP space. Deputy Under Secretary Dean, I welcome your thoughts on exploring verification services that provide responses in minutes. Are state budgets and policies the burden here? Is it an agency decision? Or, can it be surmised there is just no interest in any asset tests?

Answer. USDA supports states' efforts to modernize their applications, eligibility systems, usage of data matching and processes, and other program operations in various ways, for example by providing ongoing technical assistance and through annual Process and Technology Improvement Grants.

USDA is also focused on the potential advantages to using third-party, commercial payroll databases to meet the statutory requirement to verify applicants' earned income. This form of data matching has the potential to help states verify earned income amounts and/or confirm the lack of earned income faster and more effectively than traditional methods, which entail relying on households to provide documentation (*e.g.*, paystubs) or in some cases require state eligibility workers to contact employers directly (*e.g.*, by calling the employer).

Approximately 75 percent of states have entered contracts with commercial vendors to obtain data matching services that allow them to verify a significant portion of SNAP applicants earned income upon a single query, in real-time. The cost of these contracts varies widely, and the majority of states are forced to ration usage due to cost concerns. Other states have discontinued their contracts due to cost concerns and negotiation challenges.

In FY22, USDA awarded grants to 16 states to evaluate their use of third-party databases to verify earned income. Preliminary results suggest this project may have a positive impact on payment accuracy. USDA is using the information from grantees to pursue a national-level contract for all states for earned income verification.

Question 9. As mandated in the Consolidated Appropriations Act, 2021 (CAA, 2021), the National Academy of Sciences, Engineering, and Medicine (NASEM) was to complete a review of the 2020 edition of the *Dietary Guidelines for Americans* that among other things, would conduct comparative analyses of methodologies, protocols, and evaluation processes. This report is long overdue, however the Department of Health and Human Services and the Department of Agriculture have seemingly ignored this mandate, instead moving ahead with the proposal of scientific questions and a call for public comment on them. Deputy Under Secretary Dean, when can we expect the release of the NASEM report, and will you commit to ample notice and briefings on it? Additionally, is it not premature to move forward with the 2025–2030 iteration, knowing the relevant Congressional committees, the scientific community, and the general public have not been privy to the comprehensive analyses as required in CAA, 2021? Do you think the public, including the scientific community, should have the opportunity to comment on the NASEM report once released? Especially before an expectation to engage on the 2025–2030 edition?

Answer. It is our understanding that NASEM provided Congress with the study's midcourse report on May 18. NASEM requested an extension to complete the study, and the committee now expects to submit its final report by the end of this calendar year. NASEM has told us it is their standard practice to offer Congress a briefing on its study committee's work. USDA and HHS are also happy to brief Congress on the midcourse report released publicly on May 19, and on the final report once we receive it ourselves.

While the *DGA* is published every 5 years, the work to develop each new edition is a multiyear process. In order to ensure we release the next edition of the *DGA* on time, as mandated by Congress, we had to begin work when we did, particularly

to ensure we have enough time to give the public ample opportunities to weigh in and participate throughout.

The purpose of the NASEM study currently underway is to assess the process for developing the *2020–2025 Guidelines* in light of the 2017 NASEM study recommendations. While the current NASEM study will not include recommendations on the process to develop the *Dietary Guidelines for Americans*, continuous quality advancement is critical to our work, and we'll continue to work towards integrating the recommendations from the 2017 NASEM study into our process as we move forward.

We appreciate their ongoing work on this analysis, described in the midcourse report, and look forward to the final report once published. This is one of many tools we will use to help support our continuous process improvement and promote science-based decision making across all that we do. USDA and HHS are fully committed to a scientific and transparent process for developing the *Dietary Guidelines for Americans*. As we look ahead to the next edition, we have already taken steps to implement the NASEM recommendations, including enhancing transparency and supporting state-of-the-art processes and methods.

Question 10. On May 05, 2022, the Department announced it will interpret the prohibition on discrimination based on sex found in Title IX of the Education Amendments of 1972, and in the Food and Nutrition Act of 2008, as amended, Supplemental Nutrition Assistance Program (SNAP), (7 U.S.C. § 2011 *et seq.*), to include discrimination based on sexual orientation and gender identity. As a result, state and local agencies, program operators and sponsors that receive funds from FNS must investigate allegations of discrimination based on gender identity or sexual orientation. Those organizations must also update their non-discrimination policies and signage to include prohibitions against discrimination based on gender identity and sexual orientation. Deputy Under Secretary Dean, this is concerning because like you, I feel that access to programs should come without fear of discrimination. Looking at the last 10 years, how many complaints have been filed regarding SNAP discrimination based on sexual orientation or gender identity? Please walk me through each, as well as the process by which the Department addressed and/or resolved the complaint(s). Is the Department providing additional training to ensure partners understand their responsibilities?

Answer. Each of the FNS programs also has enabling regulations that include certain civil rights components. The SNAP regulations at 7 CFR 272.6 describe procedures for SNAP complaint handling, and specifically authorize state SNAP agencies with an approved complaint processing procedure to opt to directly process program civil rights complaints. States must process discrimination complaints based on sexual orientation and gender identity just as they would process discrimination complaints based on sex.

Generally, state agencies must “timely” forward all complaints of prohibited discrimination to FNS, unless they have an approved complaint processing procedure in place. In addition, state agencies must maintain records of complaints and submit records to FNS. State agencies with approved complaint processing plans must follow those plans in handling complaints, including submitting decisions to FNS for review before they are issued, and ensuring decisions include appeal rights to USDA’s Office of the Assistant Secretary for Civil Rights.

Prior to 2016, FNS complaint databases were unable to track complaints of discrimination in SNAP programs that raised issues based on gender identity or sexual orientation separately from other sex discrimination complaints. Beginning in 2016, FNS Civil Rights tracked complaints based on gender identity or sexual orientation manually. Between February 2016, and August 2022, FNS received 36 complaints of discrimination in the SNAP program based on sexual orientation or gender identity.

FNS contacted all 36 complainants. In 33 of those cases, FNS received no response from the complainant. In the remaining three cases, FNS closed one case because the complainant filed in court on substantially the same issues, received one request to withdraw the complaint, and issued one final agency decision finding no discrimination.

Question 11. Deputy Under Secretary Dean, for any states approved for Pandemic EBT benefits in February, March and/or April 2022, can you please outline the average amount provided to families via P–EBT benefits? Also, given that most schools have reopened, what is the purpose of continued issuances?

Answer. USDA approved 14 state P–EBT plans for school children in the months of February, March, and April 2022. These states estimated that 4.5 million children would receive P–EBT benefits totaling \$1.94 billion under their plans over the course of School Year 2021–2022. On average, beneficiaries under these plans would

receive a state-estimated \$430 for the school year. Note, though, that many children would receive no benefits under these plans since they did not miss school days due to the pandemic. Averaged across the total number of children eligible for free or reduced-price school meals, children in these states would receive an average of \$190 over the course of the school year.

USDA approved five P-EBT child care plans in the months of February, March, and April 2022. These states estimated that they would issue a total of \$196.5 million to 532,000 SNAP-enrolled children in child care over the course of the school year. On average, this is \$370 per child.

Although most schools have reopened, many children continued to miss school days during School Year 2021–2022 for COVID-related reasons. These reasons include mandatory isolation periods due to positive test cases or exposure to someone else who tested positive. Children also missed school days because their health-compromised status or the health-compromised status of their family members prevented them from safely attending school in-person. All these children lacked access to meals at school for some or all of the school year and qualified for P-EBT benefits under the terms of the Families First Coronavirus Response Act (FFCRA).

Question 12. The agency shares a daily file of all SNAP-authorized retailers with state vendors for purposes related to their contracts with state agencies. I am hearing multiple retailers have been contacted by third-party processors (TPP) shortly after being authorized (in some cases, less than 24 hours post-authorization). I have also heard of cases where the retailer was contacted before they themselves were made aware of authorization. I have been told several complaints have been filed with FNS in recent months. Deputy Under Secretary Dean, if true, how are these third-party processors obtaining this information, in what appears to be real time? What has or is FNS planning to do to address what appears to be an improper use of personally identifiable information? If nothing, does the agency not see this as an issue? Does the agency have any plans to contact state vendors and third-party processors and advise them to not share or use this confidential information?

Answer. The Department has conducted extensive outreach to all internal and external stakeholders who have a need for the daily file of SNAP authorized retailers to remind them of their responsibilities to safeguard the information, and of the penalties associated with information release.

All stakeholders were required to acknowledge and re-sign attestations regarding information use and disclosure. USDA will ensure that all authorized users are periodically reminded of these responsibilities.

USDA also reached out to certain third parties directly to inform them of information use and disclosure penalties and provided them links to readily available public information. USDA has seen a notable downtick in complaints regarding early contacts.

Question Submitted by Hon. James R. Baird, a Representative in Congress from Indiana

Question. Deputy Under Secretary Dean, the Committee appreciates your response regarding the use of MyPlate and SNAP-Ed as educational opportunities which empower customers to purchase all forms of produce, specifically frozen. Please provide descriptive, tangible proof of Federal and state programming where the purchase of frozen foods has been encouraged.

Answer. In SNAP-Ed, messages of nutrition education and obesity prevention are to be consistent with the *Dietary Guidelines for Americans (DGAs)*. The DGAs state that all forms of fruits and vegetables, including fresh, canned, dried, frozen, and 100 percent juices, in nutrient-dense forms, can be included in healthy dietary patterns. Some examples of SNAP-Ed programming that encourages the consumption of frozen foods include:

- Webpage messaging: “Remember, fresh, frozen, canned, and dried: fruits and vegetables are a delicious way to make every bite count!” <https://snaped.fns.usda.gov/seasonal-produce-guide>
- Educational discussion guides, recipes and handouts available on this page reference the use of frozen foods <https://snaped.fns.usda.gov/nutrition-education/fns-curricula/myplate-my-family>, such as:
 - MyPlate Family Meals discussion guide https://snaped.fns.usda.gov/sites/default/files/documents/Discussion_MyPlateFamilyMeals.pdf* †
 - MyPlate Family Meals handouts complete set <https://snaped.fns.usda.gov/sites/default/files/documents/MyPlateFamilyMealsHandouts.pdf> †

* **Editor’s note:** items annotated with † are retained in Committee file.

- The Shop Simple with MyPlate app includes using frozen vegetables as well as fresh and canned. *Start Simple with MyPlate* ⁵
- “New Mainers Learn Strategies to Shop, Cook, and Eat Healthy”—A state success story about teaching participants how to use low-cost frozen and canned food items to make meals that are healthy and familiar <https://snaped.fns.usda.gov/success-stories/new-mainers-learn-strategies-shop-cook-and-eat-healthy> †
- Additional examples containing reference to frozen foods are in the links below:

 - *Search* ⁷

Question Submitted by Hon. Chris Jacobs, a Representative in Congress from New York

Question. According to USDA’s FY 2023 budget materials, “[e]ncouraging SNAP families to purchase more healthy foods remains an important priority for FNS.” And one of the ways that Congress has been doing this is through incentive programs such as the Healthy Fluid Milk Incentives Projects program, which was established in the 2018 Farm Bill to help improve nutrition security for SNAP families through healthy and nutritious dairy products. Under this program, shoppers that use SNAP benefits to purchase a qualifying fluid milk product receive a matching dollar for dollar coupon to use for additional free milk. Deputy Under Secretary Dean, can you please explain why incentive programs, such as the Healthy Fluid Milk Incentives Projects, are so important to families that benefit from SNAP?

Answer. Incentives programs are intended to increase the consumption of healthy foods by SNAP participants while making these foods more affordable. Current programs include:

- The Healthy Fluid Milk Incentives Project, which encourages the purchase and consumption of low-fat dairy;
- The Gus Schumacher Nutrition Incentive Program, which encourages the purchase and consumption of fruits and vegetables; and
- Incentives initiated by SNAP-authorized retailers for the purchase of products that meet the dietary guidelines.

In Fiscal Year 2014, USDA completed an evaluation of the Healthy Incentives Pilot (HIP). HIP made fruits and vegetables more affordable to SNAP participants. SNAP households received 30¢ on every SNAP dollar they spent on targeted fruits and vegetables at participating SNAP authorized firms including large supermarkets, grocery stores and farmers markets. This pilot operated in one Massachusetts county between November 2011 and December 2012. A rigorous evaluation showed that HIP increased the consumption of targeted fruits and vegetables by about ¼ of a cup per day.

Questions Submitted by Hon. Michael Cloud, a Representative in Congress from Texas

Question 1. Deputy Under Secretary Dean, it is my understanding that states had regulatory flexibility during the pandemic when it came to quality control reviews. In a release dated February 19, 2021, FNS specifically encouraged states to still collect this data. Do you know how many states continued collecting quality control data during the pandemic and were there any who chose not to collect this data? For those that chose not to, why?

Answer. While quality control (QC) flexibilities provided to states by Section 4603(a)(2) of the *Continuing Appropriations Act, 2021 and Other Extensions Act* ⁸ allowed states to suspend QC reviews, most states continued to conduct some reviews during the course of the suspension.

See the table below showing the number of states that continued to conduct reviews and the proportion of QC reviews states completed. Although most states completed at least some reviews, many opted to modify their sampling or review procedures in ways that make it problematic to compare data from these reviews to official, validated QC data.

⁸ <https://www.congress.gov/116/plaws/publ159/PLAW-116publ159.pdf> †

Number of States that Completed SNAP Quality Control (QC) Reviews

Fiscal Year (QC Sample Months)	0% of QC Reviews	1-25% of QC Reviews	26-50% of QC Reviews	51-75% of QC Reviews	76-100% of QC Reviews
2020 (03/2020–09/2020)	4	17	16	14	2
2021 (10/2020–06/2021)	21	8	12	6	6

Question 2. Deputy Under Secretary Dean, regulatory requirements concerning quality control were supposed to return July 2021. Does FNS have any intention of going back and retroactively developing error rates for FY 2020 and FY 2021?

Answer. Using the QC flexibilities provided to states by Section 4603(a)(2) of the *Continuing Appropriations Act, 2021 and Other Extensions Act*,⁹ many states modified their sampling or review procedures in ways that make it problematic to compare data from these reviews to official, validated QC data. These modifications impacted the quality and completeness of the data gathered and, consequently, USDA's ability to calculate statistically valid payment error rates using these data. For example, some states focused on conducting QC reviews of error-prone SNAP households, rather than reviews of a random sample of all SNAP households.

As a result, USDA is unable to use the QC data gathered for FY 2020 and FY 2021 to establish official payment error rates that comply with requirements in the Food and Nutrition Act of 2008, as amended. However, USDA has used, and will continue to use, these data to provide technical assistance to states.

Question 3. Deputy Under Secretary Dean, from the audits that FNS has conducted so far this year, what are the trends you are seeing for over and under payments?

Answer. At this time, USDA has received state-reported QC data for the first half of FY 2022. Those data are unweighted, un-regressed, and do not incorporate any adjustments that result from the Federal re-review.

The QC data currently available to USDA are considered preliminary, as they change daily with each submission of a state's QC findings. FY 2022 QC data will be final when the FY 2022 payment error rates are officially announced on June 30, 2023.

The preliminary data show that agency-caused payment errors are more than half of all payment errors, and the majority of all payment errors resulted in overpayments. The most frequent causes of payment errors are inaccurate wages and salaries, inaccurate household composition, and incorrect application of policy related to a household's reporting system. USDA continues to monitor these and other trends and to provide technical assistance to states to help improve payment accuracy.

Question Submitted by Hon. Michelle Fischbach, a Representative in Congress from Minnesota

Question. Deputy Under Secretary Dean, a nonprofit based in Minnesota is under Federal investigation over allegedly defrauding the Federal Government of tens, even hundreds of millions of dollars. Two programs, the Child and Adult Care Food Program and the Summer Food Service Program, are administered by the Food and Nutrition Service, and further managed by state agencies. This nonprofit, contracted by the state agency, has claimed feeding more children—on a daily basis—than there even exists in Minnesota's largest school district. Allegations include Federal funds meant to provide free meals to underprivileged children and adults instead went to extravagant expenses, such as property purchases in Kenya and trips to Las Vegas. State officials claimed they brought their concerns to USDA when irregularities were found, even sharing them with the Office of Inspector General. Ensuring adequate oversight and safeguards over Federal meal programs is critical to tamping down fraud and good stewardship over the taxpayer dollars. When my office requested more information surrounding this situation, it took nearly 2 months to hear that your staff cannot discuss details. That is a disappointment, and I am asking you on the record to commit to working with my staff and me to address the underlying gaps in safeguards so that this situation does not occur again in the future.

Answer. Ensuring the integrity of Federal funds granted to institutions administering and operating all of our programs, including child nutrition programs, is of the utmost importance to us at USDA and FNS welcomes working with Congress on these important matters. FNS understands that at this time, the Federal Bureau of Investigation continues its active, ongoing investigation into the administration of the Child and Adult Care Food Program (CACFP) and the Summer Food Service

⁹ <https://www.congress.gov/116/plaws/publ159/PLAW-116publ159.pdf>.

Program (SFSP) by Feeding Our Future and other sponsoring organizations in Minnesota and is thus limited in the statements we may make relative to this matter.

USDA has measures in place at both the state and Federal levels to safeguard against fraud and minimize misuse of program funds. FNS and state agencies regularly conduct oversight of FNS local program partners during local level reviews and Management Evaluations. In instances where fraud and program abuse are suspected, USDA has regulatory provisions and processes which state agencies follow. In addition, mechanisms are in place to engage other Federal entities that have specific legal authority and ability to conduct investigations on fraud or criminal wrongdoing.

FNS Disaster Assistance

California Disaster Nutrition Assistance

Incident: Severe Snow Storms and Power Outages

Began on Dec. 26, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On Jan. 13, 2022, FNS approved California's request to waive timely reporting of food loss for households in Trinity County due to power outages caused by severe winter storms that began on Dec. 26, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and includes November 2021 Emergency Allotments issued on Dec. 4 and 11, 2021. The waiver will be in effect through Jan. 25, 2022.
- On Jan. 7, 2022, FNS approved California Department of Social Services (DSS) request to issue mass replacements to impacted households. This waiver approval allows households to receive replacement of benefits in certain [ZIP C]odes of 17 counties (Amador, Butte, Calaveras, El Dorado, Humboldt, Mariposa, Mendocino, Nevada, Placer, Plumas, Sierra, Siskiyou, Sonoma, Trinity, Tulare, Tuolumne and Yuba) due to power outages caused by record breaking snowfall and heavy winds that began on Dec. 26, 2021.
- On Jan. 7, 2022, FNS also approved DSS request to waive timely reporting of food loss for households in 20 counties (Alameda, Amador, Calaveras, El Dorado, Humboldt, Lake, Los Angeles, Marin, Monterey, Napa, Nevada, Orange, Placer, Sacramento, San Bernardino, San Luis Obispo, San Mateo, Santa Cruz, Sierra and Yuba counties) due to power outages caused by severe winter storms that began on Dec. 26, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and includes November 2021 Emergency Allotments issued on Dec. 4 and 11, 2021. The waiver is in effect through Jan. 25, 2022.

Incident: Severe Storms and Power Outages

Began on Oct. 22, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On Nov. 4, 2021, FNS approved California Department of Social Services' request to issue mass replacements to impacted households. This waiver approval allows households in specific [ZIP C]odes in 15 counties to receive replacement of benefits due to severe storms and Public Safety Power Shutoffs that began on Oct. 22, 2021, through Oct. 28, 2021.

Incident: Power Outages

Began: Oct. 11, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On Oct. 22, 2021, FNS approved California Department of Social Services' request to issue mass replacements to impacted SNAP households in certain [ZIP C]odes in 14 counties as a result of extreme wind and Public Safety Power Shutoffs that began on Oct. 11, 2021.

Incident: Wildfires

Began: July 20, 2021

Disaster Supplemental Nutrition Assistance Programs (D-SNAP)

- On Oct. 8, 2021, FNS approved California’s request to operate D-SNAP in six counties—Lassen, Nevada, Placer, Plumas, Tehama and Trinity—in response to the impact of wildfires that began on July 20, 2021. The state agency will begin the 7 day application period on Oct. 18, 2021 and continue through Oct. 26, 2021.

Incident: Wildfires and Power Outages

Began: June 24, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On Sept. 29, 2021, FNS approved California’s request to waive the statutory definition of “food” under Section 3(k)(1) of the Food and Nutrition Act of 2008, as amended, and companion regulations at 7 *CFR* 271.2.¹ The waiver applies to the counties of Butte, Glenn, Humboldt, Mendocino, Plumas, Shasta, Siskiyou, Tehama, and Trinity. This waiver approval allows SNAP households to purchase hot foods with SNAP benefits through Oct. 28, 2021 to replace food lost as a result of wildfires that began on July 14, 2021, and continue. FNS has notified SNAP authorized retailers in the approved county of the hot foods waiver approval. Retailers may need as much as 24–36 hours to make changes that will allow for sale of hot foods.
- On Sept. 29, 2021, FNS approved a California Department of Social Services amended request to waive timely reporting of food loss for households in Shasta County. This waiver approval allows impacted households to make a request for replacement of SNAP benefits, as well as August 2021 Emergency Allotments issued on Sept. 4, 2021, for replacement of food purchased with SNAP benefits that was lost as a result of power outages due to the Fawn Fire that began on Sept. 22, 2021. The waiver will be in effect through Oct. 22, 2021.
- On Sept. 24, 2021, FNS approved the California Department of Social Services’ amended request to waive timely reporting of food loss for households in Riverside County. This waiver approval will allow impacted households to make a request for replacement of SNAP benefits. The waiver will be in effect through Oct. 1, 2021.
- On Sept. 20, 2021, FNS approved the California Department of Social Services to allow SNAP households in 83 impacted [ZIP C]odes of 27 counties additional time to seek replacements via the individual attestation process, including in some areas previously approved for a waiver of timely reporting of food loss. This waiver approval allows impacted households to make a request for replacement of SNAP benefits for replacement of food purchased with SNAP benefits that was lost as a result of power outages and Public Safety Power Shutoffs from Aug. 1, 2021, through Aug. 19, 2021. The waiver will be in effect through Oct. 1, 2021.
- On Sept. 8, 2021, FNS approved California’s request to waive the statutory definition of “food” under Section 3(k)(1) of the Food and Nutrition Act of 2008, as amended, and companion regulations at 7 *CFR* 271.2.² The waiver applies to the counties of Butte, El Dorado, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, and Yuba. This waiver approval will allow SNAP households to purchase hot foods with SNAP benefits through Oct. 3, 2021 to replace food lost as a result of multiple wildfires that began on July 14, 2021 and continue. FNS has notified SNAP authorized retailers in the approved counties of the hot foods waiver approval. Retailers may need as much as 24–36 hours to make changes that will allow for sale of hot foods.
- On Sept. 5, 2021, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in Kern County. This waiver approval will allow impacted households to make a request for replacement of regular SNAP benefits, as well as July 2021 Emergency Allotments issued on Aug. 7, 2021, for replacement of food purchased with SNAP benefits that was lost as a result of power outages due to the French Fire that began on Aug. 30, 2021. The waiver will be in effect through Sept. 29, 2021. On Aug. 30, 2021, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in Riverside County. This waiver approval allows impacted households to make a request for re-

¹<https://www.ecfr.gov/current/title-7/subtitle-B/chapter-II/subchapter-C/part-271/section-271.2>.

²<https://www.ecfr.gov/current/title-7/subtitle-B/chapter-II/subchapter-C/part-271/section-271.2>.

- placement of SNAP benefits, for replacement of food purchased with SNAP benefits that was lost as a result of power outages and the Westward Fire that began on Aug. 25, 2021. The waiver will be in effect through Sept. 24, 2021.
- On Sept. 3, 2021, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in San Bernardino County. This waiver approval will allow impacted households to make a request for replacement of regular SNAP benefits, as well as July 2021 Emergency Allotments that were issued on Aug. 7, 2021, for replacement of food purchased with SNAP benefits that was lost as a result of power outages due to the Railroad, Roadside, and South Fires that began on Aug. 25, 2021. The waiver will be in effect through Sept. 24, 2021.
 - On Aug. 23, 2021, FNS approved a California Department of Social Services request to waive timely reporting of food loss for households in Trinity and Shasta counties for food that was lost as a result of the McFarland and Monument fires. For Trinity County, FNS approved the waiver to allow impacted households sufficient time to report food purchased with regular SNAP benefits and subsequently lost. This waiver approval allows impacted households to make a request for replacement of SNAP benefits through Sept. 16, 2021. In Shasta County, FNS granted approval to allow impacted households in Shasta County sufficient time to report their loss of food. Replacements would be authorized for the amount of the loss, not to exceed the monthly allotment for the household, as well as the household's July 2021 Emergency Allotments that were issued on Aug. 7, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and EA benefits through Sept. 16, 2021.
 - On Aug. 16, 2021, FNS approved the California Department of Social Services' request to waive timely reporting of food loss for households in Yuba County. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and July 2021 Emergency Allotments issued on Aug. 7, 2021, for replacement of food purchased with SNAP benefits that was lost as a result of power outages and the Glen Fire that began on Aug. 11, 2021. The waiver will be in effect through Sept. 10, 2021.
 - On Aug. 12, 2021, FNS approved the California Department of Social Services' request to waive timely reporting of food loss for households in Siskiyou County. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and June 2021 Emergency Allotments as a result of power outages and the River Complex and Antelope Fires that began on July 30, 2021. The waiver will be in effect through Aug. 30, 2021.
 - On Aug. 9, 2021, FNS approved the California Department of Social Services' request to waive timely reporting of food loss for households in Nevada and Placer counties as a result of power outages and the River Fire that began on Aug. 4, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits through Sept. 3, 2021.
 - On Aug. 4, 2021, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in El Dorado County. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and July 2021 Emergency Allotments issued on Aug. 7, 2021 that were lost as a result of power outages and the Caldor Fire that began on Aug. 14, 2021. The waiver will be in effect through Sept. 13, 2021.
 - On July 29, 2021, FNS has approved the California Department of Social Services request to waive timely reporting of food loss for households in Mono County due to power outages and the Tamarack Fire. This waiver approval allows impacted households to make a request for replacement of SNAP benefits and June 2021 Emergency Allotments issued on July 17, 2021. The waiver will be in effect through Aug. 23, 2021.
 - On July 26, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in Lassen County, for replacement of food purchased with SNAP benefits lost as a result of power outages and the Beckwourth Complex Fire that began on July 12, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits through Aug. 11, 2021.
 - On July 22, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in Alpine County for the replacement of food purchased with SNAP benefits that was lost as a result of the power outages that began July 16, 2021. This waiver approval allows im-

ected households to make a request for replacement of SNAP benefits through Aug. 16, 2021.

- On July 21, 2021, FNS approved the California Department of Social Services' request to waive timely reporting of food loss for households in Mariposa County for the replacement of food purchased with SNAP benefits that was lost as a result of the River Fire that began on July 11, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits through Aug. 10, 2021.
- On July 15, 2021, FNS approved California's request to waive timely reporting of food loss for households in Mendocino County as a result of the Broiler Fire that began on July 7, 2021. This waiver approval will allow impacted households to make a request for replacement of SNAP benefits through Aug. 6, 2021.
- On July 12, 2021, FNS approved the California Department of Social Services request to waive timely reporting of food loss for households in Shasta County for replacement of food purchased with SNAP benefits that was lost as a result of wildfires that began on June 30, 2021. This waiver approval allows impacted households to make a request for replacement of regular SNAP benefits, as well as May 2021 Emergency Allotments issued on June 13, 2021. The waiver will be in effect through July 30, 2021.
- On July 7, 2021, FNS approved a California Department of Social Services request to waive timely reporting of food loss for households in Siskiyou County, for replacement of food purchased with SNAP benefits that was lost as a result of a wildfire that began on June 24, 2021. This waiver approval allows impacted households to make a request for replacement of SNAP benefits through July 26, 2021.

Incident: Mono Wind Event

Began: Jan. 18, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On April 6, 2021, FNS approved an extension to allow impacted households in California to make a request for replacement of SNAP benefits through April 30, 2021 as a result of power outages that began on Jan. 18, 2021.
- On Jan. 26, 2021, FNS approved California's request to waive timely reporting of food loss for households in Mariposa County. This waiver allows affected households to make a request for replacement of SNAP benefits through Feb. 21, 2021, as a result of the Mono Wind Event that began on Jan. 18, 2021.

Incident: Snowstorm

Began: Jan. 26, 2021

Supplemental Nutrition Assistance Programs (SNAP)

- On Feb. 4, 2021, FNS approved California's request to waive timely reporting of food loss for households in Shasta County as a result of a large snowstorm that began on Jan. 26, 2021, that caused the closure of vital roads and infrastructure, downed trees, and widespread power outages. This waiver approval allows affected households to make a request for replacement of SNAP benefits through Feb. 26, 2021.

Incident: Mountain View Fire

Began: Nov. 17, 2020

Supplemental Nutrition Assistance Programs (SNAP)

- On Nov. 25, 2020, FNS approved California's request to waive timely reporting of food loss for households in Mono County. This waiver allows affected households to make a request for replacement of SNAP benefits through Dec. 17, 2020, for replacement of food purchased with SNAP benefits that was lost as a result of the Mountain View Fire that began on Nov. 17, 2020.

Incident: Power Outages

Began: Oct. 14, 2020

Supplemental Nutrition Assistance Programs (SNAP)

- On Nov. 16, 2020, FNS approved California's request to issue mass replacements to impacted households as a result of power outages that occurred on Oct. 14, 2020. This waiver allows households to receive replacement of 35 percent of SNAP and Emergency Allotment benefits issued in October 2020, in the 174 approved [ZIP C]odes in 31 counties.

Incident: California Wildfires

Began: Sept. 4, 2020

Supplemental Nutrition Assistance Programs (SNAP)

- On Nov. 5, 2020, FNS approved California's request to operate D-SNAP in the ten counties, listed below, in response to the impact of wildfires that began on Sept. 4, 2020. The application period is Monday, Nov. 16, 2020 through Friday, Nov. 20, 2020.

Impacted counties: Fresno, Los Angeles, Madera, Mendocino, Napa, San Bernardino, San Diego, Shasta, Siskiyou and Sonoma counties.

Incident: California Wildfires

Began: Aug. 14, 2020

Supplemental Nutrition Assistance Programs (SNAP)

- On Oct. 26, 2020, FNS approved California's request to waive the statutory definition of "food" under Section 3(k)(1) of the Food and Nutrition Act of 2008, as amended, and companion regulations at 7 CFR 271.2. The waiver applies to 35 counties. This waiver allows SNAP households to purchase hot foods with SNAP benefits in the 35 approved counties through Nov. 22, 2020.
- On Oct. 6, 2020, FNS approved California's request to waive timely reporting of food loss for households in Shasta County. This waiver allows affected households to make a request for replacement of SNAP benefits through Oct. 26, 2020.
- On Oct. 6, 2020, FNS approved California's request to issue mass replacements to impacted households. This waiver allows households to receive replacement of 40 percent of September benefits in 16 [ZIP C]odes in 10 counties as a result of wildfires and power outages that began on Sept. 26, 2020.
- On Sept. 29, 2020, FNS approved California's request to operate D-SNAP in nine counties in response to the impact of wildfires that began Aug. 14, 2020. For Lake, Monterey, Napa, San Mateo, Santa Cruz, Solano, Sonoma and Yolo counties, the application period will begin no earlier than Oct. 14 through Oct. 16, 2020, then resume on Oct. 19 through Oct. 22, 2020. For Butte County, the application period will begin no earlier than Oct. 21 through Oct. 23, 2020, then resume on Oct. 26 through Oct. 29, 2020.
- On Sept. 24, FNS approved California's request to waive the statutory definition of "food" under Section 3(k)(1) of the Food and Nutrition Act of 2008, as amended, and companion regulations at 7 CFR 271.2. for six counties. This waiver approval allows SNAP households to purchase hot foods with SNAP benefits in the approved counties through Oct. 22, 2020.
- On Sept. 21, 2020, FNS approved California's request to issue mass replacements to impacted households. This waiver allows households to receive replacement of 50% of September benefits in the 83 [ZIP C]odes as a result of wildfires and power outages.
- On Sept. 15, 2020, FNS approved California's request to waive timely reporting of food loss for households in Siskiyou County. This waiver approval allows households to make a request for replacement of SNAP benefits through Oct. 8, 2020. These replacement SNAP benefits will allow households to replace food lost as a result of power outages and the Slater Fire that began on Sept. 8, 2020.
- On Sept. 14, 2020, FNS approved California's request to waive timely reporting of food loss for households in seven counties. This waiver approval allows households to make a request for replacement of SNAP benefits through Oct. 5, 2020, as a result of power outages and wildfires
- On Sept. 3, 2020, FNS approved California's request to issue SNAP mass replacements to impacted households. This waiver approval allows households to receive replacement of 50 percent of August benefits for 23 [ZIP C]odes in 12 counties as a result of wildfires and power outages.
- On Aug. 26, 2020, FNS approved California's request to waive the timely reporting of food loss in the eight affected counties listed below. This waiver approval allows households to request, by individual affidavit/attestation, replacement of SNAP benefits for food lost as a result of wildfires and power outages that began on Aug. 14, 2020. The waiver applies from Aug. 14, 2020, through Sept. 14, 2020.

Impacted counties: Lake, Monterey, Napa, San Mateo, Santa Cruz, Solano, Sonoma and Yolo.

- On Aug. 26, 2020, FNS approved California's hot food waiver request. This waiver allows SNAP households in the eight affected counties listed below to purchase hot foods and hot food products with SNAP benefits through Sept. 23, 2020.

Impacted counties: Lake, Monterey, Napa, San Mateo, Santa Cruz, Solano, Sonoma and Yolo.

Because many households within these counties have been displaced or have temporarily relocated to other parts of the state, the waiver is extended to the bordering counties of Alameda, Colusa, Contra Costa, Glenn, Marin, Mendocino, Sacramento, Santa Clara and Sutter.

Incident: Wildfire

Began: October 2019

Supplemental Nutrition Assistance Programs (SNAP)

- On Nov. 18, 2019, FNS approved a mass replacement request from the state of California to 104 [ZIP C]odes in 20 counties. The waiver approval will allow households in these affected [ZIP C]odes to receive replacement of 15% of the October SNAP benefit. These replacement SNAP benefits will allow households to replace food lost as a result of proactive de-energization of power lines by Pacific Gas and Electric and Southern California Edison that occurred from Oct. 23, 2019 through Oct. 31, 2019.
- On Nov. 1, 2019, FNS approved a waiver request from the state of California to waive timely reporting of food loss to households for the entire state of California. This waiver approval allows households in the affected areas to request a replacement of SNAP benefits through Nov. 22, 2019, to replace food lost as a result of Pacific Gas and Electric and Southern California Edison power outages that began Oct. 23, 2019.
- On Oct. 21, 2019, FNS approved California's request to issue mass replacements to 231 [ZIP C]odes in 28 counties. This waiver approval allows households in these affected [ZIP C]odes to receive replacement of 60 percent of the October SNAP benefit. These replacement SNAP benefits allow households to replace food lost as a result of proactive de-energization of power lines by Pacific Gas and Electric and Southern California Edison that began on Oct. 9, 2019. Child Nutrition Programs
- On Oct. 30, 2019, FNS approved a request from California for SFAs impacted by the public safety power outages. The California Department of Education made this request on behalf of SFA in 45 counties. The state agency reported that schools in the affected counties are experiencing spoiled food inventory, making compliance with the school meal pattern requirements difficult. Schools in the affected counties may serve and claim for reimbursement school lunch and breakfast meals that do not meet the meal pattern requirements, through Nov. 12, 2019.

Incident: Kincadee Wildfire

Began: October 2019

Child Nutrition Programs

- On Nov. 1, 2019, FNS approved the request for the National School Lunch Program (NSLP) and the School Breakfast Program (SBP) meal pattern flexibility in the 38 school food authorities (SFAs) in Sonoma County and six SFAs in Lake County impacted by the Kincadee fire effective Oct. 23, 2019 through Nov. 25, 2019.

Incident: California Earthquake

July 2019

Child Nutrition Programs

- On Aug. 1, 2019, FNS issued a letter approving a request for two school districts in Kern and San Bernardino Counties, California impacted by two major earthquakes. Trona Joint Unified School District and Sierra Sands Unified School District may serve lunches and breakfasts for reimbursement that do not meet the National School Lunch Program and School Breakfast Program meal patterns through Sept. 30, 2019. The state agency reported that the earthquakes have damaged numerous schools, homes, commercial structures, and roadways. This approval is expected to help Trona Joint Unified School District and Sierra Sands Unified School District overcome barriers to standard Program operations as the districts recover from the earthquakes.

- On July 12, 2019, FNS approved the California Department of Education's (CDE) request for flexibility in meal pattern requirements for SFA operating the Seamless Summer Option in communities affected by earthquakes in Kern and San Bernardino Counties on July 4 and 5, 2019. This approval allows affected schools to serve meals that do not meet the NSLP meal pattern, through Aug. 5, 2019.

Incident: California Earthquake

July 2019

Supplemental Nutrition Assistance Programs (SNAP)

- On July 9 and July 11, 2019, FNS approved California's requests to waive timely reporting of food loss for households in Kern County and San Bernardino counties; this waiver approval will allow households in Kern and San Bernardino County to make a request for replacement of SNAP benefits through Aug. 5, 2019. These replacement SNAP benefits will allow households to replace food lost due to power outages caused by earthquakes and aftershocks that began on July 4, 2019.

Incident: California Storms and Subsequent Power Outages

February 2019

Supplemental Nutrition Assistance Programs (SNAP)

- On March 4, 2019, FNS approved California's request to waive timely reporting of food loss to households in the counties of Lake, Sonoma and Mendocino. This waiver approval will allow households in these affected counties to make a request for replacement of SNAP benefits through March 26, 2019. These replacement benefits will allow households to replace food lost due to heavy rainfall and flooding resulting from storms that began on Feb. 25, 2019.

Incident: Snow Storms and Subsequent Power Outages

February 2019

Supplemental Nutrition Assistance Program (SNAP)

- On Feb. 25, 2019, FNS approved California's request to waive timely reporting of food loss to households in Shasta County and will allow households in the affected county to make a request for replacement of SNAP benefits through March 14, 2019. These replacement benefits will allow households to replace food lost due to power outages resulting from the snow storms.
- FNS also approved California's request to issue mass replacements of SNAP benefits for residents in impacted [ZIP C]odes in Shasta County that suffered food losses resulting from power outages caused by the snow storms that began on Feb. 12, 2019.

Incident: Camp, Hill, and Woolsey Fires

November 2018

Disaster Supplemental Nutrition Assistance Program (D-SNAP)

- On Nov. 29, 2018, FNS approved California's request to operate a D-SNAP in Butte County starting on December 12. Look for specific information regarding D-SNAP eligibility and operations on state web pages or call the state's SNAP hotline.
 - SNAP Hotline: 877-847-3663
 - *Disaster CalFresh*³
 - If you need assistance with or a replacement of your EBT card, please call the state's EBT customer service number at: 877-328-9677
- On Nov. 28, 2018, FNS approved California's request to operate a D-SNAP in certain [ZIP C]odes Los Angeles and Ventura counties starting on December 3. Look for specific information regarding D-SNAP eligibility and operations on state web pages or call the state's SNAP hotline.
 - SNAP Hotline: 877-847-3663
 - *Disaster CalFresh*⁴
 - If you need assistance with or a replacement of your EBT card, please call the state's EBT customer service number at: 877-328-9677

⁴<http://www.cdss.ca.gov/Disastercalfresh>.

Supplemental Nutrition Assistance Program (SNAP)

- On Dec. 18, 2018, FNS approved California's extension request to allow hot foods to be purchased at SNAP authorized retailers through Jan. 16, 2019. The waiver applies to the counties of Butte, Colusa, Glenn, Plumas, Sutter, Tehama and Yuba.
- On Nov. 29, 2018, FNS approved California's request to issue automatic disaster supplements to ongoing SNAP households in the following [ZIP C]odes in Butte County: 95916, 95928, 95942, 95954, 95965, 95966, 95969 and 95978.
- On Nov. 28, 2018, FNS approved California's request to issue automatic disaster supplements to ongoing SNAP households in the following [ZIP C]odes:
 - Los Angeles: 90263, 90290, 90265, 91302, 90264, 91012, 91301, 91304, 91307, 91361, 91362 and 91372;
 - Ventura: 91377, 91320, 91361, 91362, 93012, 93042 and 93065.
- On Nov. 21, 2018, FNS approved California's request to issue mass replacements of SNAP benefits for residents in the following impacted [ZIP C]odes:
 - Ventura County: 91377
 - Los Angeles County: 90263, 90290, 90265 and 91302
- On Nov. 19, 2018, FNS approved California's request to issue mass replacements of SNAP benefits for residents that suffered food losses due to power outages caused by the Camp Fire and proactive de-energization of power lines by the local utility. This approval applies to the following impacted [ZIP C]odes:
 - Butte County: 95978, 95942, 95954 and 95969
 - Plumas County: 95923, 95984, 95956, 95983, 96137, 95947, 95971, 95934 and 95915
- On Nov. 16, 2018, FNS approved California's request to allow; hot foods to be purchased at SNAP authorized retailers through Dec. 17, 2018. The waiver applies to the counties of Butte, Colusa, Glenn, Kern, Los Angeles, Orange, Plumas, Tehama, Santa Barbara, San Bernardino, San Luis Obispo, Sutter, Yuba and Ventura.
 - *Hot Foods Notice to Retailers*⁵
 - Retailers may need 24–36 hours to make changes that will allow for the sale of hot foods
- On Nov. 16, 2018, FNS approved California's request to waive timely reporting of food loss to households in the counties of Butte, Ventura and Los Angeles. This waiver approval will allow households in these affected counties to make a request for replacement of SNAP benefits through Dec. 10, 2018.

Disaster Household Distribution Program (DHD)

- On Nov. 21, 2018, FNS approved a request from California to operate a Disaster Household Distribution Program in Butte County and surrounding areas (Colusa, Glenn, Plumas, Tehama, Shasta, Sutter and Yuba Counties). The program is expected to serve up to 8,000 people with food boxes beginning November 26 and operating for approximately 2 weeks.

Child Nutrition Programs

- On Dec. 20, 2018, FNS approved California's request to extend disaster waivers for Paradise Unified School District. Paradise Unified School District may continue to serve and claim for reimbursement for school lunch and breakfast meals that do not meet the meal pattern requirements through March 1, 2019. Paradise Unified School District may also continue to serve all school lunch and breakfast meals to students at no cost and claim meals at the free reimbursement rate through March 1, 2019.
- On Nov. 30, 2018, FNS issued a disaster approval for Butte County in response to the Camp Fire. Schools in Butte County may serve and claim for reimbursement school lunch and breakfast meals that do not meet the meal pattern requirements through Dec. 31, 2018. Schools in Butte County may also serve all school lunch and breakfast meals to students at no cost and claim meals at the free reimbursement rate through Dec. 31, 2018.

Incident: Wildfire

Oct. 14, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On Oct. 24, 2018, FNS approved California's request to issue mass replacements of SNAP benefits for residents that suffered food losses resulting from power outages, which occurred when power was proactively shut down due to extreme fire conditions. This approval applies to the following impacted [ZIP C]odes:
 - Amador County: 95601, 95666, 95689, 95665 and 95629
 - Butte County: 95914
 - Calaveras County: 95257, 95255, 95232 and 95248
 - El Dorado County: 95636, 95634, 95726, 95684, 95633, 95720, 95635 and 95667
 - Lake County: 95426, 95461, 95467 and 95423
 - Napa County: 94508, 94567, 94576 and 94515
 - Placer County: 95631, 95714, 95717 and 95701
 - Yuba County: 95962, 95935 and 95919
- California intends to issue replacement benefits as early as Oct. 25, 2018.

Incident: Carr Wildfire

Began July 23, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On July 28, FNS approved California's request for timely household reporting of food loss for Shasta County. This waiver approval allowed households to make a request for replacement of SNAP benefits through Aug. 21, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the Carr Fire.
- On Aug. 8, FNS approved California's request for timely household reporting of food loss for Trinity County. This waiver approval will allow households to make a request for replacement of SNAP benefits through Sept. 5, 2018. These replacement SNAP benefits will allow households to replace food lost as a result of the Carr Fire.
- On Aug. 10, 2018, FNS approved the California request for automatic mass replacements in Shasta County. This waiver approval will allow households to receive replacement benefits without having to appear at a local SNAP office to sign an affidavit attesting to food loss, and will allow local DSS offices to operate the program in a more efficient and effective manner. This waiver applies to the following [ZIP C]odes: 96033, 96047 and 96087.
- On Aug. 15, 2018, FNS approved the California Department of Social Services' request to operate D-SNAP in Shasta County due to the impacts of the ongoing Carr Fire. The state agency accepted D-SNAP applications from Aug. 22 through Aug. 25, 2018, and will continue to accept application from Aug. 27 through Aug. 29, 2018. FNS also approved automatic supplements for ongoing SNAP households in [ZIP C]odes 96001, 96003, 96019, 96079, 96089, 96033, 96087, 96047 and 96095.
- On Aug. 16, 2018 FNS approved California's request to allow for hot foods to be purchased at SNAP authorized retailers. Due to the power outages, displacement from homes and structure loss caused by the Carr Fire, FNS has approved a waiver so that affected SNAP households in Butte, Glenn, Lassen, Modoc, Plumas, Shasta, Siskiyou, Tehama and Trinity counties are able to buy hot foods and hot food products with their SNAP benefits through Sept. 16, 2018.

Child Nutrition Programs

- On Aug. 10, FNS approved California's request for disaster waivers to assist schools impacted by the Carr Fire. These waivers apply to schools that operate the school lunch and school breakfast programs in Shasta County.
 - Schools in Shasta County may serve and claim all school lunch and school breakfast meals at the Free Reimbursement Rate, effective Aug. 13 through Sept. 30, 2018.
 - Schools in Shasta County may serve school lunch and school breakfast meals that do not meet the menu planning or meal pattern requirements, effective Aug. 13 through Sept. 30, 2018.

- California also has the discretion to execute the following flexibilities in Shasta County: Flexibility to allow organizations with current agreements to operate the Summer Food Service Program to open emergency feeding sites, Flexibility to allow Summer Food Service Program sites to be located at school sites during school closure, and Flexibility to designate any appropriate facility as an emergency shelter and waive Child and Adult Care Food Program application requirements.

Incident: Cranston Fire

Began July 25, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On August 6, FNS approved California's request for timely household reporting of food loss for Riverside County. This waiver approval allowed households to make a request for replacement of SNAP benefits through Aug. 23, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the Cranston Fire.
- On Aug. 13, 2018, FNS approved California's request to issue mass replacements for certain [ZIP C]odes in Riverside County. This waiver approval will allow the California Department of Social Services to automatically replace 30 percent of the July 2018 SNAP benefit for households affected by the Cranston Fire in the following [ZIP C]odes: 92536, 92539 and 92561.

Incident: Mendocino Complex Wildfire

Began July 27, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On July 31, FNS approved California's request for timely household reporting of food loss for Mendocino and Lake Counties. This waiver approval allowed households to make a request for replacement of SNAP benefits through Aug. 26, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the River and Ranch Fires.
- On Aug. 10, 2018, FNS approved the California request for automatic mass replacements in Lake and Mendocino Counties. This waiver approval will allow households to receive replacement benefits without having to appear at a local SNAP office to sign an affidavit attesting to food loss, and will allow local DSS offices to operate the program in a more efficient and effective manner. This waiver applies to the following [ZIP C]odes:
 - Lake County: 95458, 95464, 95485 and 95493;
 - Mendocino County: 95410, 95415, 95420, 95427, 95432, 95437, 95456, 95459, 95460, 95463, 95466, 95469, 95470, 95482, 95488, 95490 and 95494.
- On Aug. 20, 2018, FNS approved the California Department of Social Services' request to operate D-SNAP in Lake County. The state agency accepted D-SNAP applications from Aug. 22 through Aug. 25, 2018, and will continue to accept applications from Aug. 27 through Aug. 29, 2018. FNS also approved automatic supplements for ongoing SNAP households in [ZIP C]odes: 95458, 95464, 95485, 95493, 95453, 95423, 95451, 95443, and 95435.
- On Aug. 20, 2018, FNS approved an amended hot foods waiver so that affected SNAP households in Colusa, Lake, Mendocino, Napa, Sonoma, and Yolo counties are able to buy hot foods and hot food products with their SNAP benefits through Sept. 16, 2018.

Incident: Ferguson Wildfire

Began July 13, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On July 25, 2018, FNS approved California's request for timely household reporting of food loss for Mariposa County. This waiver approval allowed households to request replacement of SNAP benefits through Aug. 13, 2018. These replacement SNAP benefits allow households to replace food lost as a result of the Ferguson Fire.

Incident: Klamathon Wildfire

Began July 5, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On July 13, FNS approved California's request for timely household reporting of food loss for Siskiyou County, California. This waiver approval allowed households to make a request for replacement of SNAP benefits through Aug. 6, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the Klamathon Fire.

Incident: Pawnee Wildfire

Began June 23, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On June 29, 2018, FNS approved California's request for timely household reporting of food loss for Lake County, California. This waiver approval allowed households to make a request for replacement of SNAP benefits through July 23, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the Pawnee Fire.

Incident: Wildfires and Mudslides

Began Dec. 4, 2017 and Jan. 9, 2018

Supplemental Nutrition Assistance Program (SNAP)

- On Feb. 8, 2018, FNS approved the California Department of Social Services' (CDSS) request to operate a D-SNAP in 11 [ZIP C]odes within Los Angeles and San Diego counties due to the impact of multiple wildfires in December 2017. The approved [ZIP C]odes were: 91342, 91040, 91042, 91355, 91381, 91384 and 90077 (Los Angeles County) and 92028, 92003, 92084 and 92057 (San Diego County). CDSS accepted D-SNAP applications in Los Angeles County for 7 non-consecutive days, beginning Feb. 13 through Feb. 16, 2018, then resumed on Feb. 20, and ended on Feb. 22, 2018. CDSS accepted D-SNAP applications in San Diego County for 5 days, beginning Feb. 12, through Feb. 16, 2018. The state agency may have automatically issued a 1 month disaster supplement to all ongoing SNAP households in the 11 approved [ZIP C]odes. Ongoing households that lived or worked outside of these 11 [ZIP C]odes may have requested disaster supplements on an individual basis via a signed affidavit attesting to their disaster losses. Ongoing SNAP households already receiving the maximum monthly SNAP allotment for their household size were not eligible for disaster supplements. No household may receive more than the maximum monthly allotment for their household size.
- On Feb. 1, 2018, FNS approved a waiver so that affected SNAP recipients in Santa Barbara and Ventura counties were able to buy hot foods and hot food products with their SNAP benefits through Feb. 28, 2018.
- On Feb. 1, 2018, FNS approved the California Department of Social Services' (CDSS) request to operate a Disaster Supplemental Nutrition Assistance Program (D-SNAP) in Santa Barbara and Ventura counties due to the combined impact of multiple wildfires in December 2017 and mudslides in January 2018. CDSS accepted D-SNAP applications in Santa Barbara and Ventura counties for 7 non-consecutive days, beginning Feb. 6 through Feb. 9, then resumed on Feb. 12, and ended on Feb. 14, 2018. CDSS accepts applications at seven CDSS offices in the approved counties. The state agency may have automatically issued a 1 month disaster supplement to all ongoing SNAP households in the following 20 [ZIP C]odes that experienced either a power outage of more than 4 hours, mandatory evacuations, or both:
 - Santa Barbara: 93102, 93105, 93108, 93110, 93111, 93067, 93103 93117
 - Ventura: 93001, 93003, 93004, 93012, 93013, 93015, 93022, 93023, 93033, 93035, 93041 and 93060
- Because ongoing households may have been impacted in December, January, or both months, the state determined the amount of the supplement based on the household's size and composition in the earliest month it was affected. Ongoing households that lived or worked outside of these [ZIP C]odes may have requested disaster supplements on an individual basis via a signed affidavit attesting to their disaster losses. Ongoing SNAP households already receiving the maximum monthly SNAP allotment for their household size were not eligible for disaster supplements. No household may receive more than the maximum monthly allotment for their household size.
- On Dec. 21, 2017, FNS approved California's request to issue SNAP mass replacement benefits for certain [ZIP C]odes in Ventura County. This waiver approval allowed the California Department of Social Services to automatically replace 60 percent of the December 2017 SNAP benefit for households affected by

the wildfires in the following [ZIP Codes in Ventura County: 93001, 93004, 93012, 93022, 93033, 93035 and 93041. These replacement benefits allowed households to replace food lost as a result of the fires. On Dec. 22, 2017, FNS approved an amendment to California's request for mass replacement of SNAP benefits at 60 percent, in San Diego County, for the following [ZIP Codes: 91905, 91916, 91963, 91980, 92036, 92066, 92070 and 92086.

- On Dec. 10 and 13, 2017, respectively, FNS approved the California Department of Social Services' (DSS) requests to waive the 10 day reporting requirement under SNAP regulations at 7 CFR 274.6(a) for replacement of food purchased with SNAP benefits that was destroyed due to power outages or structural damage/loss of homes resulting from the California Wildfires that began on Dec. 4, 2017. The waiver applied to all of Ventura County and the impacted [ZIP Codes in Santa Barbara County: 93013, 93067, 93101, 93105, 93106, 93108, 93109, 93110, 93111, 93117, and 93436; Los Angeles County: 90077, 91020, 91040, 91046, 91202, 91203, 91205, 91206, 91208, 91209, 91214, 91221, 91331, 91342, 91355, 91392 and 91393; and San Diego County: 91901, 91905, 91906, 91916, 91917, 91931, 91934, 91935, 91948, 91962, 91963, 91980, 92003, 92026, 92027, 92028, 92036, 92054, 92056, 92057, 92058, 92059, 92060, 92061, 92065, 92066, 92069, 92070, 92082, 92083, 92084 and 92086. The waiver extended the time period for reporting loss of food until Jan. 4, 2018. These replacement SNAP benefits allowed households to replace food lost as a result of the fires.

SASHA GERSTEN-PAAL,
Branch Chief, Certification Policy Branch,
 Program Development Division,
 Supplemental Nutrition Assistance Program,
 USDA Food and Nutrition Service,
 Alexandria, VA

Re: Proposed Rule on Disaster Supplemental Nutrition Assistance Program (D-SNAP), Docket RIN 0584-AE00

Dear Ms. Gersten-Paal:

On behalf of the Western Center on Law and Poverty (Western Center) and the California Association of Food Banks (CAFB), we are submitting these comments on the United States Department of Agriculture's (USDA's) Food and Nutrition Service (FNS) Proposed Rule on the Disaster Supplemental Nutrition Assistance Program (D-SNAP). Our organizations have over a decade of experience and partnership in response to emergency food needs to prevent hunger following disaster in California. It has been our experience that D-SNAP is essential in helping households and communities during disaster recovery. The proposed rules take important steps toward ensuring D-SNAP is there to help Americans and their communities recovering following disaster.

About Our Organizations

Western Center represents California's poorest residents in policy and budget discussions affecting housing, health and public benefits, including SNAP. Western Center serves as one of the statewide support centers for Legal Services, providing technical assistance and training in the SNAP program, including D-SNAP, for legal services throughout the state. We also serve on several committees and task forces convened by the California Department of Social Services to advise on SNAP, the Electronic Benefit Transfer System (EBT) and public benefit online application and services and to support implementation of new policies. As such, Western Center has played a significant role in supporting the state's implementation of SNAP disaster response.

CAFB is a membership organization of 44 food banks from throughout the state with a shared mission to end hunger in California and a firm commitment to pro-

¹⁵ <https://www.fema.gov/disaster/5336/news-media>.

viding cutting-edge leadership in the anti-hunger community. CAFB's major programs include Farm to Family, which works with growers and packers to provide fresh produce to food banks; statewide programs for SNAP outreach and enrollment; robust state and Federal advocacy efforts; produce education; and member services that offer assistance with special projects as well as technical support. As such, CAFB has played a central role in disaster response in recent and historical disasters.

SNAP Provides Essential Anti-Hunger Benefits

Fifty years ago President Kennedy proposed the establishment of the Food Stamp Program, now known nationally as SNAP to confront hunger and malnutrition in the United States. The program now serves approximately one in seven Americans.

In California, SNAP is referred to as CalFresh and it is our state's first line of defense against hunger. Despite the deep commitment and breadth of our state's emergency food bag and soup kitchen programs, there is no program with the reach of CalFresh. CalFresh benefit allotments are calculated based on household income, resources, expenses and size. The maximum monthly allotment in FY 2013 is \$194 for a single person and \$649 for a family of four.¹ Nationally, only 41 percent of households receive the maximum allotment and 23 percent of household receive less than half of the maximum allotment.² In all cases, CalFresh benefits are only expected to supplement the food budgets of participating households, that is, CalFresh recipients are expected to use other income or other food assistance to make up the difference in their food budget.

As highlighted in a report from the Institute of Medicine (IOM),³ SNAP recipients are less likely to be food-insecure than eligible non-recipients; in other words, the program meets the central goal to alleviate hunger. Controlling for other factors, research has also shown that SNAP participants are not more likely than eligible non-participants to be overweight or obese and that the program does not contribute to the current obesity crisis in the U.S.⁴ In fact, by both improving dietary intake and reducing food insecurity, participation in Federal nutrition programs plays a critical role in obesity prevention. For this reason, increasing participation in the Federal nutrition programs, including SNAP, is a childhood obesity prevention strategy recommended by the IOM and the White House Task Force on Childhood Obesity.⁵

A strong and effective SNAP is crucial for ending hunger and improving health in America. Research shows that SNAP plays a critical role in alleviating poverty and food insecurity and in improving dietary intake, weight outcomes, and health, especially among the nation's most vulnerable children.⁶

On February 7, 2014, the President signed H.R. 2642 Conference Report (P.L. 113-79), known as the Agricultural Act of 2014 and commonly referred to as "The Farm Bill." This bill enacted several provisions negatively impacting the Supplemental Nutrition Assistance Program (SNAP), known as CalFresh in California. In Fiscal Year 2015, CalFresh reached 4,418,000 California residents, or 11% of the

state population (one in nine), and 78% of the families that received this essential anti-hunger benefit were families with children.⁷

More than 48.1 million Americans—15.3 million of them children—lived in households that struggled against hunger in 2014, according to USDA's data. The number of individuals in households that faced the deepest struggles with hunger—"very-low-food security"—was 5.5 percent in 2014.⁸ In California, where only 66% of those eligible for CalFresh receive it, food insecurity is high, with 13.5% of state residents experience hunger or food insecurity.⁹ Before the 2014 Farm Bill debate, a coalition led by Western Center on Law and Poverty called on Congress to use the act to address the unacceptable numbers of people experiencing hunger.¹⁰ Unfortunately, the 2012–2014 Farm Bill debate did not achieve this goal. Instead, while significant cuts were prevented, cuts (rather than a much needed expansion) were passed. The farm bill passed assumed \$8.6 billion in savings from SNAP, to be taken on top of the \$11 billion that took effect in November 2013, making families hungrier and more vulnerable to poor health.¹¹

With so many Americans already experiencing hunger, the resiliency of America's communities impacted by disaster is already compromised, making a strong the SNAP disaster response and D-SNAP program even more important.¹² While SNAP's entitlement structure allows it to respond quickly and effectively to changes in need, whether those are caused by economic downturns or disasters, the D-SNAP program is needed when the provisions offered through SNAP are not quick enough or sufficient to address a disaster that meets the standards required to receive a declaration from the President of the United States.

Our Comments to the Proposed Regulations

Disasters come in many forms. In California, the disasters we have experienced in the last decade have been as a result of fire, freeze and earthquakes. As the preamble to the proposed rules explains, the USDA has worked for decades with states and other partners to prevent hunger among disaster victims of disaster through SNAP and D-SNAP.

I. Support Retaining Agility of D-SNAP: Through D-SNAP procedures, FNS provides states with authority to get temporary SNAP benefits to disaster victims not already enrolled in SNAP and replacement and supplemental benefits to regular SNAP households affected by disaster. We appreciate that the D-SNAP framework retains agility for USDA response to the varied circumstances of each disaster and believe that this is one of the most important features of the proposed rule.

II. Mass Issuance Is Important Anti-Hunger Tool: The proposed rule preamble addresses mass issuance of automatic/replacement and supplemental benefits onto EBT cards in disaster areas. Replacement SNAP is a permanent feature of the program and all current recipients who have been displaced or impacted by an incidence (flood, power outage, fire, *etc.*) that has destroyed their food can apply for replacement Cal-Fresh after they have spent their monthly allocation (or a portion of it).¹³ As the preamble discusses, however, mass replacements generally may be in order in certain circumstances, when multiple SNAP households have experienced the same displacement or destruction of food. This mass replacement benefit is essential in responding to events that fall short of a disaster declaration, such as those experienced during the during the 12 month California electricity crisis of

¹⁰Letter of 175 California Organizations calling on the farm bill to strengthen SNAP: http://www.frac.org/pdf/FBStateLetter_CA.pdf.

¹¹These cuts also impacted the retail economy (according to the *Los Angeles Times*) and food banks have not been able to make up the loss in benefits (according to *USA TODAY*). SNAP cuts are job killers, too. The USDA-ERS estimates that for every billion in SNAP benefits cut, between 8,900 to 17,900 jobs are lost.

¹²According to the National Center for Disaster Response, Community resilience is generally defined as the ability to adapt to, withstand, or rapidly recover from a disaster or catastrophic event. Research suggests that communities have a greater capacity to withstand a disaster when its population is not suffering from deprivation of basic needs. More information on NCDR's description of the relationship between vulnerability and disaster recovery, go to: <http://ncdr.columbia.edu/research/recovery-resiliency/>.

¹³This is the California's form to apply for replacement CalFresh: <http://www.cdss.ca.gov/cdssweb/entres/forms/English/CF303.pdf>.

2000–2001. Mass replacements also allow administrators to respond more quickly in cases of significant disasters when a disaster declaration is pending. Mass replacement CalFresh was an important tool used in California’s 2015 fires.¹⁴ A mass replacement not only reduces likelihood of disaster victims experiencing hunger, it also reduces the administrative burden of SNAP caseworkers, many of whom are also impacted by a disaster directly or indirectly. We appreciate the work that USDA, states and the EBT stakeholders do to make SNAP mass issuance a reliable, targeted, efficient, and cost-effective method of getting the broadest relief to affected SNAP households in areas with demonstrated need.

III. Allowing for 30 Days to Prove Loss of Food: We strongly support the proposed rule in allowing 30 days (instead of 10) for SNAP households in disaster-declared areas to prove food loss for replacement benefit eligibility determination. The normal 10 day period provides too little time for many clients to learn about the right to prove food loss due to a misfortune and too little time for outreach workers and media to apprise them of the procedures to claim the loss. Additionally, we urge USDA to clarify that a power outage of 4 hours or more is sufficient not only for situations involving mass replacements (as referenced in the D–SNAP proposed rule preamble) but also is sufficient in individual cases of household misfortune.

IV. Workers Impacted by Disaster Should be Served: One of the most frustrating experiences in working with California’s disaster victims seeking D–SNAP over the past decade is having to tell people who have lost their jobs that they are not eligible for D–SNAP. This was especially the case in the 2007 San Diego Fire Storm,¹⁵ impacting many wealthy homes that employed low-wage earning gardeners, dry-cleaners, babysitters and other service professionals who lived in other areas, but were suddenly unemployed as a result of the fire and, because they were very-low-income, they were ineligible for UI benefits. It is well documented that disasters disrupt industries and local economic activity, thereby adversely impacting workers who reside outside the disaster area. We have recently learned, however, that some states have received D–SNAP approval for “households who resided or worked in these 12 counties on April 27, 2014, and who suffered disaster-related adverse effects from the severe storms and tornadoes were eligible for certification using D–SNAP criteria.”¹⁶ As such, we strongly support the proposed rule clarifying that states are allowed to extend D–SNAP eligibility to those who worked in the disaster area at the time of the disaster in addition to those who lived in the disaster area. We recommend that the Department improve the final rule in this area by requiring that a state that opts *not* to serve non-resident workers explain why it has made that decision. Doing so will inform states that serving this population is an option and encourage states to consider and document harm, or lack-thereof to people who do not reside in the disaster area but who have been economically harmed by the disaster.

V. Support Outreach Providers’ Role in Disaster Response: Outreach and application assisters are essential in connecting eligible people with benefits to which they are entitled. Our organizations have had significant experience in supporting application assisters in responding to disaster. During last year’s valley fires, CAFB helped to train and coordinate several application assisters from throughout the state travel to Lake County to support the D–SNAP outreach effort. CAFB supports food banks and outreach providers to plan for impending disasters.¹⁷ Western Center has successfully advocated for improved state disaster preparedness, including adding D–SNAP outreach in CalFresh outreach contract scopes of work.¹⁸ As such, we strongly support the proposed rule on D–SNAP requiring states to outline plans for D–SNAP outreach and believe that California offers a model for other states. While we are proud of the outreach partnerships our state rallied in response to recent fires, these efforts can be costly for all those involved and so we also encourage the Department to make additional Federal funds available to augment D–SNAP outreach reimbursement funds to support participation of

community partners for increased disaster response capacity to provide information and application assistance in the wake of disasters.

VI. Final Rules Should Be More Responsive of Vulnerable Households:

Households with persons with disabilities are particularly vulnerable to food insecurity and to hardship following disaster. We support the proposed rule requiring state D-SNAP Plans to address accommodations for disaster victims with disabilities. The final rule also should recognize that additional populations may need special accommodations or services to access D-SNAP, including seniors, migrant workers, families with children (who will be without school lunches and/or WIC) and rural and urban populations that may lack transportation and/or communication (broadband) networks, especially following a disaster. Our experience suggests several important accommodations for these populations: (a) having sufficient application sites; (b) allowing for phone interviews, (c) preparing for multiple card issuance locations (or pre-printed cards that need only to be loaded with benefits); and, (d) ensuring that intake offices are open 7 days, including over holidays and weekends. Regarding our recommendation that the proposed rule should be improved by allowing alternatives to face-to-face interviews for D-SNAP, it is important to note that the regular SNAP rules recognize that a face-to-face interview may present a hardship to potential clients. We appreciate that for many years now the Department has worked with states to minimize the barriers to SNAP access that traditional face-to-face interviews pose. The Department allows alternatives such as telephone interviews broadly, and, for elderly persons and persons with disabilities with stable incomes, lifts the requirement for a recertification interview at all. Disaster victims often have lost homes, cars, and telephone and internet access. In the wake of a disaster, use public transportation and public roads may be restricted. For example, in the Northern California fires earlier this year, gas stations were closed and travel was restricted for weeks. The final D-SNAP rule should recognize the reality of limited transportation in most disasters and incorporate lessons learned from regular SNAP application and recertification procedures and provide for alternatives to face-to-face interviews to better serve those who are need of D-SNAP.

VII. Improving Retail Experience during Disaster Response: We support the proposed rule requiring state D-SNAP Plans to address communications with food retailers and to reinforce the ability of hot food waivers. The prepared food waivers were essential in recent fire disaster responses. This provision has been important for many disaster victims to obtain meals, often while they lack shelter or kitchen facilities to prepare food. Giving retailers timely and accurate information about D-SNAP operations, including information about any hot food waivers, bolsters the effectiveness of the commercial infrastructure that underlies SNAP benefit redemptions. Similarly, we support the proposed rule requiring state D-SNAP Plans to address Electronic Benefit Transfer (EBT) issuance. EBT offers a mainstream, efficient way to provide public benefits to consumers. Anticipating the steps needed by government and its partners to issue D-SNAP benefits and/or replacement and/or supplemental SNAP benefits electronically in the wake of disaster is a proper component of D-SNAP Plans.

VIII. D-SNAP Should Never Create Government Debt: The proposed rule properly prohibits states from collecting benefit over issuances out of D-SNAP benefits and also provides that payment of disaster expenses via credit card, not only those paid by cash or check, will count when determining D-SNAP disaster expenses.

In closing, considering the great importance of SNAP and D-SNAP in preventing hunger and restoring the local economy following a disaster, we appreciate the proposed rules and believe that they will greatly increase the likelihood that United States residents hard hit by disaster will be resilient in the wake of the unthinkable.

Thank you for your service and for your consideration of our comments.

Sincerely,

Re: Notice of Agency Information Collection Activities—Best Practices in Disaster Supplemental Nutrition Assistance Program (D–SNAP) Operations and Planning—OMB Number 0584–NEW

Submitted via *regulations.gov*

Dear Mr. Williams:

On behalf of the Western Center on Law and Poverty, please accept this comment in response to the Notice of Agency Information Collection Activities: Best Practices in Disaster Supplemental Nutrition Assistance Program (D–SNAP) Operations and Planning.

About the Western Center on Law and Poverty

For over 5 decades, the Western Center on Law and Poverty (Western Center) has advocated on behalf of individuals with low incomes in every branch of California government—from the courts to the Legislature. Through the lens of economic and racial justice, we litigate, educate and advocate around health care, housing, and public benefits policies and administration. Western Center staff have decades of experience in working with legislators and state policymakers to improve SNAP, known as CalFresh in California. We have published countless advocate guides, chaired advisory committees, supported Federal and state legislation and, when necessary, filed and won litigation to protect the rights of SNAP recipients in California.

Western Center has also worked with Federal, state and local partners for over a decade to plan for and to administer D–SNAP, as called for and when approved. We have provided trainings,¹ crafted and helped to implement new policies,² served in the D–SNAP advisory workgroups and helped to draft the Disaster CalFresh Manual[.]³ It is with this experience that has brought us to submit these comments. Most recently, we have been working with the California Department of Social Services to prepare for D–SNAP implementation following the Presidential Declaration for Individual Assistance (FEMA 4558–DR) for Lake, Monterey, Napa, San Mateo, Santa Cruz, Solano, Sonoma, and Yolo Counties, which we hope will be approved.

SNAP is a Program Central to California’s Safety Net

Between January and March 2020, an average of 4.1 million Californians living in 2.2 million households received CalFresh benefits, with each individual receiving an average of \$123 monthly. Due to the COVID–19 Public Health Crisis and necessary shelter-in-place orders, these numbers increased to 4.8 million Californians in 2.6 million households by June 2020. On average, in California, each participant received an average of \$166 monthly in June 2020. The program is one of the most responsive to economic downturn caused by any reason, including natural disaster.⁴

D–SNAP Works to Address Hunger Following a Disaster

The Robert T. Stafford Disaster Relief and Emergency Assistance Act provides the Secretary of Agriculture with the authority to operate a D–SNAP when affected areas have received a Presidential major disaster declaration and when commercial channels of food distribution are available. The Food and Nutrition Act of 2008 provides the Secretary of Agriculture with the authority to establish temporary emergency standards of eligibility for households who are survivors of a disaster that disrupts commercial channels of food distribution after those channels have been restored. The United States Department of Agriculture (USDA) Food and Nutrition Services (FNS) have, on several occasions over the past decade, elected to approve the operation of D–SNAP under Stafford Act authority when affected areas have re-

⁴ <https://www.ppic.org/publication/the-cal-fresh-food-assistance-program/>.

ceived a Presidential disaster declaration for individual assistance. In California, this program is known as D-CalFresh (DCF).⁵

With a significant number of Californians already experiencing hunger or food insecurity, the resiliency of our communities impacted by disaster is already compromised. This makes the work of ensuring the SNAP disaster response and D-SNAP⁶ program are swift acting and robust is even more important.⁷ While SNAP's entitlement structure allows it to respond quickly and effectively to changes in need, whether those are caused by economic downturns or natural disasters, the D-SNAP program is needed when the provisions offered through SNAP are not quick enough or sufficient to address a disaster that meets the standards required to receive a declaration from the President of the United States to support individual assistance. It is for this reason that we are very proud of the track-record of cooperation and collaboration that California and the USDA FNS have had on securing approval and implementing this important benefit throughout the years. Still, some improvements to the program could make the program even more effective and its reach even further into impacted communities.

D-SNAP Should Be More Accessible Once Approved

Our experience suggests several important accommodations for disaster victims must be considered when designing a D-SNAP program. Disaster victims often have lost homes, cars, and telephone and internet access. In the wake of a disaster, use public transportation and public roads may be restricted. For example, in the Northern California fires that have ravaged our communities over the past several years, gas stations were closed and travel was restricted for weeks. We believe that ensuring multiple locations where can apply for D-SNAP, complete their interview and secure their D-SNAP EBT card for the entire period (including weekends and holidays) which the application period has been approved should be a priority in disaster responses. This access should also include allowing for a telephone interview, even when an entire county has been evacuated⁸ or for people who cannot physically go into any of the available locations. The lack of clear and consistent guidance from the USDA to ensure telephone and computer (out-of-office) application and interview for D-SNAP have especially frustrated our ability to plan for D-SNAP implementation during the COVID-19 Public Health Crisis. While state law and guidance requires CDSS to maintain mobile EBT issuance stations and to make these stations available to the county upon their request, this is not sufficient to meet the civil rights of people with disabilities during a disaster and the USDA FNS should remedy that by allowing online and over the phone processes for D-SNAP across the board.

Prepared Food Availability in Our Disaster Response

The prepared food waivers were essential in recent California fire disaster responses. This provision has been important for many disaster victims to obtain meals, often while they lack shelter or kitchen facilities to prepare food. Giving retailers timely and accurate information about D-SNAP operations, including information about any prepared food waivers, bolsters the effectiveness of the commercial infrastructure that underlies SNAP benefit redemptions. California consistently requests a hot-meal waiver in all D-SNAP application materials and the USDA proposed rule also suggested this as a component to state disaster planning, but the USDA should go further to make this provision automatically accessible to any state, without the rigmarole of preparing, submitting and getting approval of a waiver.

Continue to Reinforce Disaster Preparation and Disaster Recovery for Poorest Californians

Disasters come in many forms. In California, the disasters we have experienced in the last decade have been as a result of fire, freeze, drought, rain and earthquakes. With the passage of state law, California social services administrators are

⁵ <http://www.calfresh.ca.gov/pg2903.htm>.

⁶ https://www.fns.usda.gov/sites/default/files/D-SNAP_Disaster.pdf and https://www.fns.usda.gov/sites/default/files/D-SNAP_handbook_0.pdf.

⁷ According to the National Center for Disaster Response, Community resilience is generally defined as the ability to adapt to, withstand, or rapidly recover from a disaster or catastrophic event. Research suggests that communities have a greater capacity to withstand a disaster when its population is not suffering from deprivation of basic needs. More information on NCDR's description of the relationship: <http://ncdr.columbia.edu/research/recovery-resiliency/>.

⁸ This is a flaw in the Federal guidance. Western Center and the California Association of Food Banks submitted comments to the draft regulations calling for them to amend this provision of the regulations, but the rules have not been finalized.

now required by law to participate in planning for disaster, adequately represent the needs for individual assistance in Federal disaster requests, and implement Federal disaster aid if granted. We know these efforts will prevent hunger and hardship and contribute to the restoring local economies following a disaster. We suggest similar standards be set across the board nationally.

Goals for the Information Collection and Study

The notice provides examples of how it will seek input from community stakeholders, we advise that on the list of relevant stakeholders, you include legal services, SNAP EBT processors, national, state and local anti-hunger advocates, SNAP application assisters, SNAP nutrition educators, SNAP Employment and Training personnel, people with lived experience with hunger and poverty, disaster survivors, and representatives of particular population groups (such as older Americans, people with disabilities, rural residents, Tribal members, and various racial and ethnic group members and representatives).

Using Technology to Improve Access and Operations

As we mention above, we believe that people should have access to technologies that are already at work helping to streamline SNAP operations overall. For decades now, automatic mass SNAP replacement benefits have been transmitted quickly and efficiently onto EBT cards for existing SNAP participants who reside in impacted areas. There is no reason why these technologies cannot be used to ensure access to D-SNAP. In fact, there is no proven way to ensure the civil rights protections of D-SNAP eligible Americans without doing so. These include the use of online, telephone, texting and other mobile technology platforms in D-SNAP. Florida and Louisiana have been granted authority to conduct D-SNAP interviews by phone rather than in person (for Hurricane Irma and Michael in Florida and, during COVID-19, for Hurricane Laura in Louisiana). We believe that this authority should be available in all D-SNAP scenarios.

D-SNAP is an Essential Program That Can Be Improved

We appreciate the opportunity to submit these comments to the Department and are grateful that leaders are seeking to build upon the considerable experience that it and partner stakeholders have in preventing hunger both during and after a disaster. We hope that we can be of further assistance during the information collection process and will continue to consider ways to adapt D-SNAP tools to new scenarios, including to help in the COVID-19 Public Health Emergency and future pandemics or climate crisis situations, as we hope the Department will too.

Thank you for the opportunity to comment on the D-SNAP information collection. Please do not hesitate to contact me at the email or phone number below.

Sincerely,

JESSICA BARTHLOW,
Policy Advocate,
Western Center on Law and Poverty.

**A 2022 REVIEW OF THE FARM BILL
(STAKEHOLDER PERSPECTIVES ON SNAP)**

WEDNESDAY, JUNE 8, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON NUTRITION, OVERSIGHT, AND DEPARTMENT
OPERATIONS,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:17 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Jahana Hayes [Chairwoman of the Subcommittee] presiding.

Members present: Representatives Hayes, McGovern, Adams, Brown, Rush, Sablan, Carbajal, Lawson, Kuster, Panetta, Bacon, DesJarlais, Baird, Cammack, Thompson (*ex officio*), and Mann.

Staff present: Caitlin Balagula, Lyron Blum-Evitts, Lisa Shelton, Katherine Stewart, Caleb Crosswhite, Jennifer Tiller, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. JAHANA HAYES, A
REPRESENTATIVE IN CONGRESS FROM CONNECTICUT**

The CHAIRWOMAN. This hearing of the Subcommittee on Nutrition, Oversight, and Department Operations entitled, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on SNAP*, will come to order.

Welcome, and thank you for joining us here today. After brief opening remarks, Members will receive testimony from our witnesses, and then the hearing will be open to questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today.

And now I will start with my opening statement.

Good morning, and welcome to today's hearing, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on SNAP*. This hearing is one in a series of hearings to review the 2018 Farm Bill and prepare for the 2023 Farm Bill.

Today, we will receive stakeholder input on the Supplemental Nutrition Assistance Program, or SNAP, the 2018 Farm Bill provisions that impact the program, and how the COVID-19 pandemic has affected SNAP operations and what we can do in the upcoming farm bill to build on the decades of success of the SNAP program in combating hunger and food insecurity in America.

Forty-one million Americans currently participate in SNAP. Each of their stories are unique, and every person faces different chal-

lenges, so it is critically important that we understand that as part of our decision-making process. The positive impacts of SNAP have been particularly felt during the pandemic and are continuing to grow as participants receive more adequate benefits as a result of the 2021 Thrifty Food Plan reevaluation, which I know we will hear more about today from our witnesses.

In 2020, SNAP is estimated to have lifted 2.9 million Americans out of poverty. It provided economic stimulus to households in every community across the nation, supporting local grocery stores, farmers, distributors, and creating jobs. It is clear that SNAP works, and it works for our entire economy from farmers to consumers. Today, I am interested in hearing the ways we can improve upon the SNAP program and help make the program more equitable and accessible to those in need.

SNAP is also a highly responsive means-tested program, which serves as a stabilizer in times of economic downturn. Participation rates are high right now because of the pandemic. However, we are already seeing participation decrease as Americans begin to recover. In September 2020, SNAP participation peaked at 43 million. As of February of this year, participation has dropped by nearly two million people. That is how SNAP works. It responds in times of need.

Similarly, our farm support programs spend more when commodity prices are low. Our farm bill programs are designed that way because it just makes sense, and spending on both SNAP and farm programs fluctuates as a result.

Increased SNAP costs are also due to continued COVID-19 relief, which is tied to the end of the public health emergency, inflation, and the Thrifty Food Plan reevaluation, which assured that SNAP provided recipients with adequate support.

Finally, in Fiscal Year 2021, one in eight Americans or 13 percent of our country participated in SNAP. That means one in eight Americans were not sure they would be able to put food on their tables, one in eight Americans. But SNAP offered stability and assurance.

Thank you again to the Members and witnesses who are joining us here today, as well as those who have tuned in and are listening. I look forward to hearing more today about how we can improve outcomes for Americans facing food insecurity.

[The prepared statement of Mrs. Hayes follows:]

PREPARED STATEMENT OF HON. JAHANA HAYES, A REPRESENTATIVE IN CONGRESS
FROM CONNECTICUT

Good morning and welcome to today's hearing, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on SNAP*. This hearing is one in a series of hearings we are hosting to review the 2018 Farm Bill and prepare for the 2023 Farm Bill.

Today we will receive stakeholder input on the Supplemental Nutrition Assistance Program, or SNAP, the 2018 Farm Bill provisions that impact the program, how the COVID-19 pandemic has affected SNAP operations and what we can do in the upcoming farm bill to build on the decades of success of the SNAP program in combating hunger and food insecurity in America.

41 million Americans currently participate in SNAP. Each of their stories are unique and every person faces different challenges, so it is important that we understand that as part of our decision-making process.

The positive impacts of SNAP have been particularly felt during the pandemic and are continuing to grow as participants receive more adequate benefits as a re-

sult of the 2021 Thrifty Food Plan reevaluation, which I know we will hear more about from our witnesses.

In 2020, SNAP is estimated to have lifted 2.9 million Americans out of poverty. It provided economic stimulus to households in every community across the nation—supporting local grocery stores, farmers, distributors, and jobs.

It is clear that SNAP works, and it works for our entire economy, from farmer to consumer. Today, I am interested in hearing the ways we can improve SNAP and help make the program more equitable and accessible to those in need.

SNAP is also a highly responsive, means-tested program which serves as a stabilizer in times of economic downturn. Participation rates are high right now because of the pandemic. However, we are already seeing participation decrease as Americans begin to recover.

In September 2020, SNAP participation peaked at 43 million. As of February of this year, participation has dropped by nearly two million people. That is how SNAP works. It responds in times of need.

Similarly, our farm support programs spend more when commodity prices are low. Our farm bill programs are designed that way because it makes sense, and spending on both SNAP and farm programs fluctuates as a result.

Increased SNAP costs are also due to continued COVID-19 relief, which is tied to the end of the Public Health Emergency, inflation, and the Thrifty Food Plan reevaluation, which ensured that SNAP provides recipients with adequate support.

Finally, in Fiscal Year 2021, one in eight Americans—or 13 percent of our country—participated in SNAP. That means one in eight Americans were not sure if they would be able to put food on their tables, but SNAP offered stability and assurance.

Thank you again to the Members and witnesses joining us today as well as those who have tuned in and are listening.

I look forward to hearing more today about how we can improve outcomes for Americans facing food insecurity.

I'd now like to welcome the distinguished Ranking Member, the gentleman from Nebraska, Mr. Bacon, for any opening remarks he would like to give.

The CHAIRWOMAN. I would now like to welcome the distinguished Ranking Member, the gentleman from Nebraska, Mr. Bacon, for any opening remarks he would like to give and just to thank him for his help and just being a measured voice in these conversations. Mr. Bacon.

**OPENING STATEMENT OF HON. DON BACON, A
REPRESENTATIVE IN CONGRESS FROM NEBRASKA**

Mr. BACON. Well, thank you, Madam Chairwoman. And thank you to our witnesses for sharing your time, your expertise with this Subcommittee.

I was a freshman throughout the drafting and finalizing of the 2018 Farm Bill. To say the process is daunting and the work tremendous is simply an understatement, and we have a lot of work to do. We know that. Policy is tough, and it is exacerbated here by the reach and role of SNAP, a huge program, a program that is currently assisting more than 42 million people at a cost of \$9 billion per month.

This is why these hearings are so important, so we as policy-makers can understand what is working and what is not and how we can improve. And the latter is equally as important as the former. I know that SNAP helps people who are in dire straits, but I also know the fuzzy interpretation of the law and regulatory loopholes lead to questions on the integrity and strength of the program, which I hope we can discuss today and make improvements.

And equally important to today's conversation is an honest discussion about nutrition and health. We have a real opportunity to promote the consumption of healthy foods. What we are doing now is not working. Employment, healthcare costs, military readiness,

and general longevity are highly dependent on the foods we consume. U.S. stakeholders, together with policymakers, the Department, and other community organizations and local governments and recipients themselves are uniquely positioned to improve the health outcomes of millions of people. So, today, let's be bold. Let's rethink consumer education. Let's rethink how we can engage with recipients. And let's rethink how we use the billions of dollars attached to this program for better outcomes.

So with that, Madam Chairwoman, I am glad this hearing is finally taking place, and I look forward to the testimony and my colleagues' questions. With that, I yield back.

The CHAIRWOMAN. Thank you, Mr. Bacon. Let's be bold. I think we are on the same page.

I now recognize Ranking Member Thompson for any opening comments you would like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Madam Chairwoman, thank you so much. And thank you to each of our witnesses for your time and your testimony today.

When the full Committee hosted the Administration several weeks ago, I mentioned my frustration with colleagues who have drawn a line in the sand about future title IV policymaking. Since then, the Congressional Budget Office released its baseline assumptions, which includes \$1.1 trillion, 10 year score related to SNAP. So, I am doubling down today. There are things we can improve and probably even a few policies we can upend. We do not need to spend for the sake of spending or because it makes us feel better. If there is no impact or the impact is so minimal, how can we defend it?

Like many of you, I have spent my life serving people, and sometimes our best intentions cause irreparable hardship for families that we aim to help. Spending more money for the sake of spending it does not necessarily mean we are achieving our desired results or outcomes. We have to be prescriptive in our investments to be successful.

And, based on testimony that we will hear today, I also want to reiterate my concern that pandemic aid is morphing into endemic aid and that various issues caused by this Administration's own actions and at times inaction have stakeholders calling for permanent extensions. To say I disagree with those calls is an understatement. Let's have an honest discussion about where we have been and where we can go while keeping in mind the overarching goal of SNAP, to provide for improved levels of nutrition amongst low-income families, families that are struggling with financial distress.

And with that, thank you so much. I am looking forward to the hearing, and I yield back.

The CHAIRWOMAN. Thank you, Ranking Member Thompson, and thank you so much for being here today.

The chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony and to ensure there is ample time for questions.

I am pleased to welcome a distinguished panel of witnesses to our hearing today. Our witnesses bring a wide range of experience and expertise, and I thank you all for joining us. Our first witness today is joining us virtually, Mr. Daniel Giacomi, the SNAP program administrator for the State of Connecticut, Department of Social Services. He leads the day-to-day operations of the SNAP policy team and conducts oversight over the program in the State of Connecticut. This program helps over 217,000 households.

Our second witness is Mr. Mike Beal, the Chief Financial Officer of Balls Food Stores. Today, he is testifying on behalf of the National Grocers Association, the only trade association dedicated to the needs of independent, community-focused grocery retailers.

Our third witness is Mrs. Ty Jones Cox, the Vice President of Food Assistance Policy at the Center on Budget and Policy Priorities. In her role, she focuses on improving the effectiveness of the major Federal nutrition programs such as SNAP for low-income and middle-class families.

I would like to welcome all of our witnesses here today. We will now proceed to hearing your testimony. You will each have 5 minutes. The timer should be visible to you and will count down to zero, at which point your time has expired. We will begin with Mr. Giacomi.

Mr. Giacomi, when you are ready, please unmute yourself and begin.

Mr. GIACOMI. Thank you, and good morning, Chairwoman Hayes, Ranking Members Bacon and Thompson, and distinguished Members of the Subcommittee. As the Chairwoman said, my name is Dan Giacomi, and I am the SNAP program administration manager for the Connecticut Department of Social Services. I am honored to appear before you—

The CHAIRWOMAN. I am sorry, Mr. Giacomi, can you hold for a second?

Mr. GIACOMI. Sure.

The CHAIRWOMAN. I am not sure what is happening.

Okay. In the interest of time, I will go to Mr. Beal. We will have you begin so that we can work on the technical, and we will have Mr. Giacomi come up next.

Mr. Beal, if you don't mind if you could begin, that would be great.

STATEMENT OF MICHAEL J. BEAL, J.D., CHIEF FINANCIAL OFFICER, BALLS FOOD STORES, KANSAS CITY, KS; ON BEHALF OF NATIONAL GROCERS ASSOCIATION

Mr. BEAL. Sure. Good morning, Chairwoman Hayes, Ranking Member Bacon, and Members of the Nutrition, Oversight, and Department Operations Subcommittee. My name is Mike Beal, and I am currently the Chief Financial Officer of Balls Food Stores. Balls Food Stores currently owns and operates 26 retail grocery stores in the greater Kansas City, Kansas, and Missouri metropolitan area. We operate primarily under the Price Chopper and Hen House banners but have other stores as well. It is an honor and a privilege to be with you here today.

I am testifying on behalf of the National Grocers Association, the trade association representing the independent grocery stores

across this country. Balls Food Stores is a locally owned, third-generation, family-owned company started by Mollie and Sidney Ball in 1923. Our stores are full-service supermarkets and have accepted SNAP as a form of tender essentially since each location opened.

We make a point of doing substantial business with about 150 local family farmers located within 200 miles of Kansas City and have been doing so for more than 15 years. Independent grocers create markets for smaller producers, adding to the partnerships across our communities. My purpose today is to share with you the independent grocer's perspective on the value of SNAP and the importance of continued support of this program.

In 2020, SNAP was responsible for nearly 200,000 U.S. grocery industry jobs, earning wages totaling more than \$6.7 billion. SNAP is a shining example of a public-private partnership that builds strong communities. SNAP not only works as it is intended, but it also features one of the lowest error rates of any Federal program in existence. Independent community grocers are the key private partners with the Federal Government to administer SNAP, and I can attest that the program is critical to the health of local communities.

If it were not for SNAP, many local grocery stores would simply not exist in areas that need them most. Numerous urban and rural areas throughout the country are home to high concentrations of SNAP participants who rely on local grocery stores to access healthy and affordable foods. In many small towns, the local independent grocer is the only store in town that provides an anchor to the community.

NGA supports continued access to SNAP and expanding access to include online purchasing. While 47 states have launched SNAP online purchasing, independent retailers face significant barriers offering the program to consumers. NGA supports expanding online SNAP purchasing in all states and providing resources to develop a secure, easy-to-use online and app-based portal for EBT redemption to support smaller retailers. Establishing a system to accept online SNAP payments is a lengthy and expensive process requiring specific point-of-sale technology and website functions. Additionally, we support the creation of a USDA Technical Assistance Center to facilitate online purchasing and the use of a portal for smaller retailers, direct-to-consumer farmers, and farmers' markets. We ask for the Committee's support to streamline the difficult process that is hindering independent supermarkets from enabling SNAP for online grocery purchases.

In addition to increasing access, NGA supports increasing nutritional incentives to use SNAP benefits to purchase a variety of foods, including fruits and vegetables. We strongly believe this is a better solution than attempting to impose restrictions on choice. The dietary habits of SNAP and non-SNAP customers have been shown to be identical by the USDA. Consequently, restricting choice will not advance important public health goals. SNAP choice restrictions would require the Federal Government to identify, evaluate, and track the nutritional profile of the hundreds of thousands of foods that are available in today's grocery stores. It is far better to provide incentives such as the Gus Schumacher Nutritional Incentive Program, otherwise known as GusNIP, and the

Healthy Food Financing Initiative. Empowering consumers to purchase healthy fruits and vegetables is a much more successful long-term strategy to encouraging healthy eating than allowing the government to decide which food items a SNAP consumer may purchase.

NGA supports reducing barriers for retailers to participate in the nutrition incentive programs. The main barrier that retailers often run into when trying to participate in SNAP incentives is technical challenges to developing a point-of-sale system, or a POS, that automatically triggers a discount on produce based on EBT payment. This issue has actually prevented many retailers from even pursuing GusNIP projects. We suggest that these additional benefits be provided directly to EBT cards to simplify administration.

The final issue I would like to mention is operational fees. NGA supports the prohibition on the EBT processing fees in section 4006(d) [of the 2018 Farm Bill] and urges its extension. We believe this provision will prevent state EBT processors from imposing excessive fees and strengthen the ban on interchange fees. We hope that section 4006(d) can serve as a solution to restore competition to the contracting process so that more reliable firms have a shot at state EBT processing contracts.

In conclusion, we want to maintain our strong existing private-public partnership with the SNAP program that continues to serve our rural and urban customers. We hope to improve access to SNAP, including online purchasing, support customers in making healthy purchasing decisions, and reduce the administrative burden and fees on participating retailers.

Thank you for the opportunity to discuss these important issues today. I look forward to your questions.

[The prepared statement of Mr. Beal follows:]

PREPARED STATEMENT OF MICHAEL J. BEAL, J.D., CHIEF FINANCIAL OFFICER, BALLS FOOD STORES, KANSAS CITY, KS; ON BEHALF OF NATIONAL GROCERS ASSOCIATION

Good morning, Chairwoman Hayes, Ranking Member Bacon, and Members of the Nutrition, Oversight, and Department Operations Subcommittee. My name is Mike Beal, and I currently am the Chief Financial Officer of Balls Food Stores. I also spent 6 years as our first Chief Operating Officer. Balls Food Stores currently owns and operates 26 retail grocery stores in the greater Kansas City, Kansas and Missouri metropolitan area. We operate primarily under the Price Chopper and Hen House banners, but have other stores as well. It is an honor and a privilege to be here with you today.

Balls Food Stores is a locally-owned, third generation, family owned company started by Mollie and Sidney Ball in 1923. Our company is currently led by David Ball, who follows his father, Fred Ball, a person who was known nationally in the grocery industry for his innovation, character and charity to our community. Our stores are all full-service supermarkets and have accepted SNAP as a form of tender essentially since each location opened.

SNAP is a very important program for Balls Food Stores. Six of our stores have a high percentage of SNAP customers. Last year we opened a new store in an area that was previously described as a food desert, and the people who use it are very proud to have it available to them. We relied on a dependable SNAP program when making our investment choice and believe other independent grocers should be able to do the same.

We also make a point of doing substantial business with about 150 local farmers, and have been doing so for more than 15 years. Independent grocers create markets for smaller producers, adding to the partnerships across our communities.

I am very proud to be here on behalf of the National Grocers Association. NGA is the only national trade association dedicated solely to the needs of independent, community-focused grocery retailers and operators. NGA represents the 21,000 inde-

pendent community grocers and the wholesalers that service them. Independent community grocers account for 33 percent of all grocery sales, exceeding \$250 billion, and more than one million American jobs. We are inherently tied to the strength and vitality of the markets we serve—at the heart of local communities and the U.S. economy. Having often been in the business for generations, independent grocers are dedicated to their customers, associates, and communities.

Overview

My purpose today is to share with you the independent grocer's perspective on the value of SNAP and the importance of continued support for the program. In 2020, SNAP was responsible for nearly 200,000 U.S. grocery industry jobs earning wages totaling more than \$6.7 billion.

SNAP is a shining example of a public-private partnership. SNAP not only works as it is intended but it also features one of the lowest error rates of any Federal program in existence. Independent community grocers are the key private partners with the Federal Government to administer SNAP and I can attest that the program is critical to the health of local communities.

If it were not for SNAP, many grocery stores would simply not exist in areas that need them most. Numerous rural areas throughout the country are home to high concentrations of SNAP participants who rely on local grocery stores to access healthy and affordable foods. In many small towns, the local independent grocer is the only store in town and provides an anchor to the community.

SNAP is very important in rural areas. An Economic Research Service report released last November found that SNAP generated larger relative impacts in the rural economy than in the urban economy. Household expenditures of SNAP benefits annually increased rural economic output by 1.25 percent and rural employment by 1.18 percent. For the urban economy, SNAP benefits increased economic output by 0.53 percent and employment by 0.50 percent. SNAP has a positive economic impact on local economies. For every dollar spent locally in the SNAP program, \$1.80 in positive economic benefit is realized. This helps keep local economies stronger and recover more quickly from economic downturns. It also supports local jobs.

SNAP was a crucial lifeline during the pandemic. The additional benefits provided to recipients help them get needed foods in a variety of ways. Many did so at traditional grocery stores. Others took advantage of the growing ability to redeem benefits with online purchases. NGA supports continued access to SNAP for needy, hungry Americans.

Online Purchasing

While 47 states have launched SNAP online purchasing, independent retailers face significant barriers offering the program to customers. Establishing a system to accept online SNAP payments is a lengthy and expensive process, requiring certain point-of-sale technology and website functions. Additionally, the system requires USDA approval and must go through a testing process.

NGA strongly supports legislative proposals to improve online SNAP programs advanced by this Committee as part of the reconciliation bill and those contained in H.R. 1413 and S. 313, the Expanding SNAP Options Act. In particular, we support efforts to require the Secretary of Agriculture to implement online SNAP purchasing in all states. We also support providing resources to develop and maintain a secure, easy-to-use online and app-based portal for EBT redemption to support smaller retailers in offering products for online SNAP purchasing. And we support the creation of a USDA Technical Assistance Center to facilitate online purchasing and use of the portal for smaller retailers, direct-to-consumer farmers and farmers' markets. We also support this USDA Online SNAP TA Center sharing accurate, accessible information with the public about which local vendors participate in SNAP online purchasing.

It is important for the Committee to recognize the challenges that independent grocers face in accessing online systems. Independent grocers wish to offer this service to their customers, and many have applied to FNS to participate. However, barriers to participation include technical challenges, financial constraints to launch and continuously operate the program, and a lengthy application and approval process.

For many SNAP participants, the result is that the only options to use their benefits online are Amazon and Walmart. Yet, according to USDA Economic Research Service (ERS), independent grocers play an important role in helping to ensure food access for consumers, particularly in low-income and rural areas. ERS found that independent grocers outnumber chain grocery stores in rural areas and operate at higher rates in counties with a large share of Black and Hispanic citizens.

NGA has had to expend significant effort and resources helping our members through the online purchasing program set up because of limited help from the government. NGA has developed a “SNAP Online Purchasing Toolkit” that outlines the steps retailers may take to accept SNAP Electronic Benefit Transfer (EBT) payments online. The purpose of the toolkit is to provide guidance to independent supermarket retailers in adding SNAP online purchasing as a payment they can support.

We ask for the Committee’s support to streamline the difficult process that is hindering independent supermarkets from enabling SNAP for online grocery purchases so that we may continue to furnish essential goods to the members of our communities most in need.

SNAP Incentives

NGA supports increasing incentives for the use of SNAP benefits for the purchase of a variety of foods, including fruits and vegetables, a better solution in our view than attempting to impose restrictions on choice. The dietary habits of SNAP and non-SNAP customers have been shown to be nearly identical by USDA. Consequently, we do not believe that restricting choice will advance important public health goals.

Additionally, SNAP choice restrictions would require the Federal Government to identify, evaluate and track the nutritional profile of the thousands of foods that are available in today’s grocery stores, resulting in a complicated “food code.”

Currently no clear standard exists in the Federal Government for defining foods as good or bad, healthy or not healthy. With more than 650,000 food and beverage products on the market today and more than 20,000 introduced each year, creating those standards would be difficult, if not impossible. Defining foods as “in” or “out” means the government would pick winners and losers on grocery shelves and in grocery carts, increasing their influence over private enterprise and making decisions about what Americans can buy. According to USDA, establishing the nutritional profile of every food available would be a substantial undertaking. This expanded bureaucracy would mean increased, not decreased, administrative costs, without, we believe, any meaningful benefit for SNAP recipients.

Managing a SNAP eligible foods list would be a difficult task that would have to be staffed, maintained and communicated to retailers, customers, and manufacturers on a real-time basis. NGA members typically operate on a one to two percent profit margin, so the added cost of such a policy would be extremely difficult for supermarkets that serve a low-income population. The added cost to the retailer and inevitable stigma it would create for our SNAP customers would cause many of NGA’s members to drop out of the SNAP program entirely.

It is far better to provide incentives such as the Gus Schumacher Nutrition Incentive Program (GusNIP) included in prior farm bills, as well as the Healthy Food Financing Initiative. Empowering consumers to purchase healthy fruits and vegetables prevents stigma and is a much more successful long-term strategy to encouraging healthy eating than allowing the government to decide which food items a SNAP consumer may purchase.

Let me point out that the main barrier that retailers often run into is that it is technically challenging to develop a point of sale system (POS) system that automatically triggers a discount on produce based on the EBT payment tender that SNAP consumers use to purchase items using their monthly benefits. This issue has actually prevented many retailers from even pursuing GusNIP projects since it becomes so technically difficult to set up a program at the register. There is an immense need for a national Point of Sale (POS) solution for GusNIP, which will allow the program to expand and become scalable nationwide and get healthy foods into consumers’ hands. We also suggest that these additional benefits be provided directly to EBT cards to simplify administration.

NGA strongly supports the USDA’s recent announcement to provide \$25 million to support SNAP technology improvements to modernize the delivery of nutrition incentive programs. These improvements will provide certainty for businesses that want to ensure their communities have access to nutrition incentives.

Thrifty Food Plan

NGA applauded USDA’s announcement to permanently increase monthly SNAP benefits by 27% beginning Oct. 1, 2021. The increase was required by the 2018 Farm Bill’s provision to evaluate and update the Thrifty Food Plan (or TFP) by 2022. This is the first time that TFP has been updated with a major change since 1975. This benefit adjustment is overdue, and comes at a time when most needed.

Operational Fees

Two of the most impactful payments trends for grocery and other retail industries have, unfortunately, led to more costs for merchants: the growth in debit card usage and a rise in card-not-present transactions. And with the costs of card acceptance growing, we urge regulators and Congress to renew your interest in identifying the bad actors that continue to game the system and leave merchants holding the bag. Independent grocers operate on very thin margins. While we all want to make purchasing as convenient as possible, any fee that increases costs to grocers risks being passed on to consumers in the form of higher prices.

NGA supports the prohibition on EBT processing fees in Sec. 4006(d), and urges its extension. We believe this provision will prevent state EBT processors from imposing excessive fees and strengthen the ban on interchange fees. Additionally, EBT outages damage retailers' ability to sell food to low-income SNAP customers, who are impacted the most during outage scenarios. Little evidence suggests that state EBT processors have taken the appropriate steps to resolve this problem and outages are only becoming more and more frequent. We hope that Section 4006(d) can serve as a solution to restore competition to the contracting process so that more reliable firms have a shot at state EBT processing contracts.

In conclusion, we want to work to maintain our strong existing public-private partnership with the SNAP program and continue to serve our rural and urban customers. We hope to improve online purchasing and do as much as possible to provide incentives for consumers to make better purchasing decisions. We want to maintain benefit levels as much as possible. And we would like to provide responsible control of operational fees in order to make sure even more retailers are able to provide services.

We commend Congress for recent efforts to support a White House Conference on Food, Nutrition, Hunger, and Health. NGA plans to participate in this conference and we expect to support these SNAP reform proposals as part of our recommendations for the conference.

[Madam Chairwoman,] you have the special opportunity to serve on both this Committee as well as the Education and Labor Committee with jurisdiction over the child nutrition programs. We all know that a good breakfast is the best way to start the day, and that a good evening meal can be a reward for a day well spent. Let us do all that we can to allow as many people as possible to share in these blessings.

The CHAIRWOMAN. Thank you so much. We will now go virtually to Mr. Giacomi. If you are ready, please begin.

STATEMENT OF DANIEL R. GIACOMI, SOCIAL SERVICES PROGRAM ADMINISTRATION MANAGER, CONNECTICUT DEPARTMENT OF SOCIAL SERVICES, HARTFORD, CT

Mr. GIACOMI. Good morning, Chairwoman Hayes, Ranking Members Bacon and Thompson, and distinguished Members of the Subcommittee. My name is Dan Giacomi, and I am the SNAP program administration manager for the Connecticut Department of Social Services. I am honored to appear before you today to offer testimony concerning this critical and successful program utilized by millions of Americans each month.

In Connecticut, we currently provide SNAP assistance monthly to more than one in ten residents residing in all 169 towns. Through this, we see that SNAP significantly reduces food insecurity in our state and is one of the most effective tools at our disposal to boost the food industry and broader economy quickly and efficiently, especially in times of economic downturn. We also see how SNAP improves health outcomes and supports individuals in all aspects of life by providing essential nutrition and supports to its recipients.

First, we would like to commend Congress for the actions taken in the 2018 Farm Bill that gave Connecticut the tools we so critically needed to meet the unprecedented and unexpected challenges we have faced in recent years. In addition, the temporary flexibili-

ties Congress enacted to increase SNAP benefits and adjust administrative rules early in the public health emergency meant that we could preserve access to meaningful food assistance for families while operating under the social and economic disruptions experienced early in the pandemic. We firmly believe that the actions Congress took were fundamental to SNAP being one of the true success stories of our country's pandemic response.

Food insecurity in Connecticut, like many states, rose significantly as a result of the COVID-19 pandemic. Results from a report published in September 2021 by our partners at Connecticut Foodshare showed an overall 31 percent increase in food insecurity 1 year into the pandemic in our state.

As you look ahead to the next reauthorization of the farm bill, our experiences administering the SNAP program both during the 2018/2019 government shutdown and the subsequent pandemic have demonstrated the value and importance of program innovations, some of which I believe should be made permanent, but has also revealed additional steps that could be taken to strengthen the program in the future, making it more resilient in times of greater need and better able to include groups that have long been overlooked. Significant improvements can and should be considered in areas that would foster innovation, streamline service delivery, and simplify the administration of the program, as well as ensure its integrity and stability.

While not a comprehensive list, I will briefly touch on areas in which I believe this Committee and Congress should consider during the reauthorization. First and foremost, it is critical that we preserve access to broad-based categorical eligibility and the alignment of services with programs such as TANF and the National School Lunch Program, as doing so greatly simplifies access to SNAP, especially for working families, seniors, and people with disabilities.

Second, we should build upon and make permanent proven demonstration projects which streamline access to SNAP for vulnerable households while simultaneously cutting down on administrative expenses and increasing timeliness of case processing.

Next, we need to modify and expand the policies around access to SNAP benefits for college students and veterans with disabilities and allow for the purchase of hot or prepared foods outside of the Restaurant Meals Program. Allowing purchases such as the salad bar in grocery stores or the often-talked-about rotisserie chicken would give these individuals and all SNAP recipients the same flexibilities that other Americans depend upon.

Finally, the adaptations made over the past 2 years in response to the public health emergency have helped us better understand ways we can adjust program rules to meet the needs of our customers more flexibly. Opportunities are needed to further test and evaluate innovative approaches to SNAP administrative functions, such as cross-enrollment with other means-tested programs to provide space for states to transition out of the public health emergency, leveraging the lessons we have learned.

At the same time that we focus on commonsense approaches to simplifying SNAP, states are committed to maintaining program integrity as a top priority. Looking ahead, Congress can assist

states in their efforts to promote program integrity by helping equip them with tools that maintain accuracy and prevent fraud in the program. For example, I urge the Committee to support the USDA in advancing strategies that help states use third-party income databases to quickly identify earned income of SNAP participants, both improving program integrity and streamlining the enrollment process for households.

Coming out of the COVID-19 pandemic during a time when our aging workforce continues to grow and the number of individuals leaving the workforce increases, as well as the time where the farm bill is up for reauthorization, we collectively are at an inflection point where we have both tremendous opportunities to modernize and streamline the SNAP program to provide more equitable and effective services while also facing significant workforce challenges and complex requirements that threaten to stymie progress.

Thank you for your time and your work on this critical program.
[The prepared statement of Mr. Giacomini follows:]

PREPARED STATEMENT OF DANIEL R. GIACOMINI, SOCIAL SERVICES PROGRAM ADMINISTRATION MANAGER, CONNECTICUT DEPARTMENT OF SOCIAL SERVICES, HARTFORD, CT

Good morning, Chairwoman Hayes, Ranking Member Bacon, and distinguished Members of the Subcommittee. My name is Daniel R. Giacomini, and I am the Supplemental Nutrition Assistance Program (SNAP) Program Administration Manager for the Connecticut Department of Social Services (DSS). I am honored to appear before you today to offer testimony concerning a stakeholder's perspective on SNAP.

DSS is the state agency responsible for administering SNAP in Connecticut. We currently provide SNAP assistance to one in ten Connecticut residents—approximately 373,000 individuals in over 217,000 households in all 169 towns. As the SNAP administrator in Connecticut, DSS has first-hand knowledge of the complexities involved in determining eligibility for SNAP as well as creating and implementing SNAP policies, especially in comparison to other means-tested programs. SNAP eligibility is complicated largely because SNAP relies upon multiple eligibility factors and deductions and provides a benefit on a sliding scale rather than a flat grant. This experience informs our perspective on the administration changes to the program in the 2018 Farm Bill. But, more importantly, DSS has first-hand knowledge of how SNAP significantly reduces food insecurity in our state and stimulates local economies—particularly during times of economic downturns—as well as how SNAP improves health outcomes and supports individuals in all aspects of life, by providing essential nutrition to many working families, children, and elderly adults.

We would like to commend Congress for the actions taken in the 2018 Farm Bill and in the ensuing years that gave Connecticut the tools we so critically needed to meet the unprecedented challenges we have faced in recent years. In addition, the temporary flexibilities Congress enacted to increase SNAP benefits and adjust administrative rules early in the public health emergency meant that Connecticut DSS could preserve access to meaningful food assistance benefits for families while operating under the social and economic disruptions we experienced early in the pandemic. As we continue to phase out these flexibilities, Congress' foresight in the 2018 Farm Bill to direct USDA to update the Thrifty Food Plan is now helping SNAP benefits better keep pace with the rising cost of food in our country. This has undoubtedly supported the health and well-being of millions of Americans, but also was key to supporting local retailers in the economic recovery. SNAP remains one of the most effective tools at our disposal to boost the food industry and broader economy quickly and efficiently. We firmly believe that the actions Congress took were fundamental to SNAP being one of the true success stories of our country's pandemic response.

Food insecurity in Connecticut, like many states, rose significantly as a result of the COVID-19 pandemic, as evidenced in a report published in September 2021 by our partners at CT Foodshare's Institute for Hunger & Research Solutions.¹ Results

¹ <https://www.ctfoodshare.org/wp-content/uploads/2021/09/Food-Access-In-Connecticut-Report.pdf>.

from this study showed an overall 31% increase in food insecurity 1 year into the pandemic. Food insecurity was also greater in respondent households with children under age 18 (44%) compared to respondent households without a child (24%) and is greater in respondent households with people of color (43%) compared to respondent households where all members are white (26%).¹ Heightened food insecurity is also demonstrated by the volume of applications for SNAP assistance that we have received since the start of the pandemic. During the early days of the pandemic, DSS experienced a high of nearly 4,700 applications arriving weekly, a 330% increase from the number of SNAP applications received weekly in the period directly preceding the start of the pandemic, and we continue to receive over 3,000 applications per week a 176% increase from the number of SNAP applications received weekly in the period directly preceding the start of the pandemic.

Reflection on the 2018 Farm Bill

The 2018 Farm Bill has helped state agencies strengthen the impact of SNAP in many ways, both here in Connecticut and nationwide. First, as previously mentioned, the 2018 Farm Bill triggered a review of the Thrifty Food Plan (TFP), the first review in 46 years. For context, when the previous review was undertaken, a loaf of bread was \$0.28, a dozen eggs cost \$0.77, and milk was \$1.40 per gallon. The TFP review resulted in a modest increase in SNAP benefits equating, generally, to between \$12 and \$16 per person, per month. While this may not seem like an enormous increase to some, it was especially important at a time when the pandemic closed businesses and shut down offices, causing many individuals to lose work, be furloughed, or experience reduced hours, which in turn made them unable to meet their families' needs. Research from the previously mentioned CT Foodshare report showed that, 1 year since the onset of the pandemic, approximately $\frac{1}{3}$ of Connecticut residents were still experiencing a job disruption, with many changing shopping frequencies or purchasing habits, or relying on SNAP assistance. In addition, of the responses received in this report, 22% of the households indicated that they received SNAP benefits in the 3 months prior with nearly half of those respondents also said they had to seek additional food assistance, such as going to a food pantry, because their monthly SNAP benefits ran out before they received more.¹ While we continue to make progress recovering from the economic disruption of the pandemic, we now face record inflation placing further strain on the shoulders of families trying to feed their families. The greatest increase in food costs have come in food prepared at home, where costs as of March of this year are 10% more than they were last year.² That is why I believe the long-overdue review of the TFP was necessary and timely.

In addition to directly alleviating hunger at a time of significant societal disruption, the modest increase to the SNAP benefit resulting from the TFP review was important for broader economic and public health reasons. Research has shown that when SNAP benefits are increased, food expenditures increase, and when SNAP benefits are decreased, such as after the expiration of the SNAP benefit increase from the American Recovery and Reinvestment Act of 2009, food expenditures also decline, decreasing the affordability of a healthy diet.³ Additionally, it is known that when food insecurity is reduced, people are less likely to suffer from chronic illnesses such as Type 2 Diabetes, hypertension, high cholesterol, and heart and kidney disease. Additionally, "access to [SNAP] in childhood leads to a significant reduction in the incidence of 'metabolic syndrome' (obesity, high blood pressure, and diabetes) and, for women, an increase in economic self-sufficiency."⁴ Conversely, food insecurity is directly linked to poorer general and mental health.⁵ In fact, a study done by the USDA found that, in some cases, the level of a person's food security was an even greater predictor of chronic illness than income. "Income is signifi-

COPD = chronic obstructive pulmonary disease.

Source: USDA, Economic Research Service calculations using National Health Interview Survey data 2011–2015. Predicted prevalence estimates are adjusted for: survey year indicators, age, gender, employment, marital status, race/ethnicity, insurance status, highest education of any adult in household, number of children, family size, and household income-to-poverty ratio. Sample includes working-age adults in households at or below 200 percent of the Federal poverty line.

Improving access to nutritious food, in turn, leads to reduced healthcare spending, reduced likelihood of hospital visits, and overall better long-term health outcomes. In research released by USDA, 88% of SNAP participants reported facing at least one barrier to achieving a healthy diet throughout the month, with the most common barrier (reported by 61% of SNAP participants) being the affordability of healthy foods such as lean meat and fresh fruits and vegetables.⁷ Increasing families’ ability to afford nutritious food also brings better long-term health outcomes to future generations, as children who receive SNAP have improved health outcomes and higher educational attainment when compared to children not in SNAP households.⁵

The second area of the 2018 Farm Bill that I wish to touch on is the investment and changes in the SNAP Employment and Training (E&T) program. The Connecticut SNAP population is a diverse group with varying degrees of work readiness. In response, DSS’ voluntary SNAP E&T program is designed to help SNAP recipients gain valuable skills needed for self-sufficiency. Connecticut’s SNAP E&T program meets the wide range of work-related services needed by its SNAP participants by offering over 60 short-term vocational programs that are job focused and employer driven. Offerings range from 1 day security guard programs to 2 year associates degrees. In Connecticut, these activities are delivered through diverse partnerships with nonprofit community-based organizations and a private nonprofit college. In addition, in 2018, Connecticut became one of the first states in the nation to partner with every community college within the state’s college and university system, a process that began in 2011 and has become the pillar of our SNAP E&T program. With the flexibilities afforded through the 2018 Farm Bill, we are now exploring additional partnerships in the areas of pre-apprenticeships, apprenticeships

⁷USDA Food and Nutrition Service. *Barriers that Constrain the Adequacy of Supplemental Nutrition Assistance Program (SNAP) Allotments*. June 23, 2021. <https://www.fns.usda.gov/snap/barriers-constrain-adequacy-snap-allotments>.

and subsidized employment, services that we were unable to offer until the recent farm bill changes. However, because income from participating in these programs would often result in individuals becoming ineligible for SNAP, we are unable to support many participants through their successful completion of job training programs. To help ensure SNAP E&T can be more effective in helping families succeed for the long-term, I urge Congress to revisit ways we can tackle benefit cliffs by disregarding income while households participate in SNAP E&T programs.

Also, as required by the 2018 Farm Bill, Connecticut's SNAP E&T partners now provide case management services that are unique to SNAP E&T participants and help each participant succeed in their employment and training activities. These services include employability assessments, individualized service plans, progress monitoring, monthly case notes, and coordination with other service providers as well as referrals for Adult Basic Education or other support services that enable the participant to remain engaged in his or her employment or training activity. The on-site case management services identify, and address barriers faced by participants. Providing these additional supportive services and removing barriers supports participants' completion of their SNAP E&T program and has produced many success stories in the Connecticut E&T program.

One recent success story involves a 39 year old enrollee residing in Hartford, Connecticut who was a participant of Capital Workforce Partners' Integrated Basic Education and Skills Training (BEST Chance) program. The BEST Chance Program is an initiative that provides manufacturing, construction, carpentry, and culinary training for individuals attempting to re-enter the work force after incarceration with an emphasis on 18–24 year old individuals in the Hartford area. This particular individual registered with the SNAP E&T program's 3 month pre-manufacturing course at Manchester Community College in September 2019, looking for a second chance and hoping to gain self-sufficiency through a new career. After completing training, she began her supervised job search phase and endured multiple rejections due to a previous felony record. In spite of the rejections, she persevered and, with the assistance of the SNAP E&T program and Capital Workforce Partners, continued to look for manufacturing jobs. In April 2020, she secured an employment offer from Boat Works of South Windsor, Inc. despite the uncertain work environment caused by COVID–19. She is making above minimum wage in Connecticut and is hoping that her hard work and perseverance will continue to move her forward in her new profession.

Another such success story involves a young woman living in New Haven County. Having already obtained her bachelor's degree, she was enrolled in an MBA program and working as a bank teller, both part-time, when she became pregnant with her first child, who was born in March 2016. She transferred to an accelerated MBA program, and her second son was born in 2017. Being both a full-time student and mother to two young children became a challenge, and she had to quit her job and apply for SNAP benefits. She persevered and obtained her MBA in 2018. However, with no recent work history, finding employment in her field was difficult. She finally found employment; first a sales job, and next as an operations manager at Michaels on her way to her "dream Job": Senior Operations Manager at Amazon. She applied, unsuccessfully, for several Amazon positions that often required Six Sigma Certification, which she did not have. She then remembered and enrolled in Gateway Community College's SNAP E&T Business Professional and Office Assistant Training Certification program which included Six Sigma White Belt Certification. Through this program, she was hired by Amazon in October 2020 and is currently an Operations Manager II, on her way to her dream job.

It is through this Committee's funding and support for the SNAP E&T program in the 2018 Farm Bill that these individuals and others like them have been able to achieve goals they once thought unattainable.⁸ But SNAP E&T remains a program that is early in its growth and there remains opportunity for us to do more. With additional 100% SNAP E&T funding appropriated by Congress, Connecticut could increase the number of community providers, types of services, and percentage of SNAP participants reached. In addition, there's more we can do to make work pay and support SNAP participants working in earnest to achieve family-sustaining wages. While our ability to offer apprenticeships and subsidized employment is a critical new tool provided to SNAP E&T programs through the 2018 Farm Bill, many SNAP households would lose their eligibility as a result of participating in such a program. As noted previously, Congress can help mitigate benefit cliffs and support SNAP recipients' long-term success by excluding income from these SNAP E&T components while participants work towards the goal of self-sufficiency.

⁸<https://portal.ct.gov/DSS/SNAP/SNAP-Employment-and-Training/Success-Stories>.

A third change made by the 2018 Farm Bill that has been of significant importance during the past 24 months concerns the expanded approval of access to online purchasing for redeeming SNAP benefits. At the beginning of the COVID-19 public health emergency, when families stayed home to help our state stop the spread of the virus, DSS was inundated with phone calls, emails, and letters from individuals across the state looking for ways to safely obtain groceries, particularly for households that included children or elderly individuals as well as those households that included disabled or immunocompromised individuals. The pandemic exacerbated an existing issue for many SNAP households: limited access to transportation and availability of nearby grocery-store options.

Thankfully, a move towards online purchasing was already underway at the beginning of the pandemic because the 2014 Farm Bill authorized a pilot program to test online purchasing, and the 2018 Farm Bill moved it towards nationwide implementation. Accordingly, there was already a framework of SNAP-participating vendors who were able to rapidly scale up the online-purchasing pilot such that an estimated 90% of SNAP participants lived in states that had implemented the pilot by June of 2020, including Connecticut.⁹ In Connecticut, the online purchasing pilot began with three retailers and has since expanded to ten, including both local and national retailers as well as a partnership with a nationwide grocery delivery service. This pilot provided a critical opportunity for states to experiment and modernize services in a way that has proven to be beneficial for clients and for the country's overall public health. 49 states, as well as the District of Columbia, have now signed on to participate and offer this critical tool to their residents, with the majority having done so by the end of 2020. As access to the pilot expanded during 2020, so did use of online SNAP purchasing. In February 2020, the earliest month for which data is available, households redeemed less than \$3 million in SNAP benefits online, accounting for less than 0.1% of all benefits redeemed that month. This value grew exponentially through June 2020, when online SNAP and P-EBT redemptions totaled \$154 million, or 1.6% of total redemptions. Online redemptions grew each subsequent month through December 2020 to \$246 million—86 times the value in February.⁹

Monthly online SNAP and P-EBT benefit redemptions grew as the SNAP Online Purchasing Pilot expanded to almost all States in 2020

Notes: SNAP = Supplemental Nutrition Assistance Program. P-EBT = Pandemic Electronic Benefit Transfer. “Benefits redeemed online” excludes the value of transactions made online in which benefits are redeemed in-person at time of grocery pickup. “States with Online Purchasing Pilot” denotes the number of states (including D.C.) where the SNAP Online Purchasing Pilot was operational on or before the last day of the month.

Source: USDA, Economic Research Service using data from USDA, Food and Nutrition Service.

⁹Jordan W. Jones. *Online Supplemental Nutrition Assistance Program (SNAP) Purchasing Grew Substantially in 2020*. July 06, 2021. <https://www.ers.usda.gov/amber-waves/2021/july/online-supplemental-nutrition-assistance-program-snap-purchasing-grew-substantially-in-2020>.

However, this pilot is not without its challenges. The biggest being that at the moment participants must pay out of their own pocket for delivery, convenience, or service fees which, over time, may disproportionately impact elderly and disabled individuals and others with mobility barriers. These charges can vary greatly depending on order size, membership or subscription plans, flat rates, *etc.* In addition, placing an order online is difficult without a bank account or access to credit, because having a debit or credit card apart from a SNAP EBT card is often needed to cover delivery fees and other fees.¹⁰ This issue is exacerbated by the fact that, for the majority of states operating in the pilot, we still do not have the ability to allow our SNAP participants to use any non-SNAP cash funds that they may have associated with their EBT account for these purchases. I urge the Committee to direct USDA to establish a demonstration project that explores subsidizing fees fully or partially for purchases made online with SNAP benefits in order to support additional access to online food options for those who are often most in need of those services.

Looking Ahead: The 2023 Farm Bill

The next reauthorization of the farm bill presents the opportunity to review the program with the benefit of the lessons learned during the temporary government shutdown of 2019 as well as the COVID-19 pandemic that began in 2020. The experience of administering the program during the shutdown and the pandemic has demonstrated the value and importance of program innovations, some of which should be made permanent, but has also revealed additional steps that could be taken to strengthen the program in the future, making it more resilient in times of greater need and able to include vulnerable groups that have long been overlooked. Significant improvements can and should be considered in areas that would foster innovation, streamline service delivery, and simplify the administration of the program, as well as ensure its integrity and stability.

- First and foremost, it is critical that we **preserve access to Broad-Based Categorical Eligibility (BBCE)** and the alignment of services with programs such as TANF and the National School Lunch Program as doing so greatly simplifies access to SNAP especially for working families, seniors, and people with disabilities. BBCE directly benefits nearly 65,000 low-income Connecticut residents, 35% of whom are aged birth–18, as well as millions of Americans across the vast majority of states that rely on this flexibility. It helps working families by eliminating a “benefit cliff” and lets low-income households accrue savings to avoid debt, prepare for unexpected events, and become self-sufficient. In addition, it reduces the administrative burden on states processing SNAP applications, changes, and renewals which correlates to a direct reduction in SNAP administrative costs per case of which the state and Federal Government each pay a share.
- Second, we should **build upon and make permanent proven demonstration projects, such as the Elderly Simplified Application Project (ESAP) and Combined Application Project (CAP)**, which streamline access to SNAP for vulnerable households while simultaneously cutting down on administrative expenses and increasing timeliness of case processing. In addition, other means-tested programs such as TANF, Medicaid, or WIC should be looked at to determine whether cross enrollment, or automatic enrollment, would be appropriate and efficient in ensuring individuals receive all of the assistance they need without the burden of filling out multiple applications and providing the same verifications multiple times, again reducing the SNAP administrative costs per case rates.
- We also need to **modify and expand the policies around access to SNAP benefits for college students and Veterans with disabilities**. With the demographic makeup and rising expenses faced by the college student population as well as increase in Veterans of working-age with a service-connected disability, more should be done to ensure these individuals do not go hungry. In a report published in February 2020, $\frac{1}{3}$ of all respondents at the University of Connecticut reported low or very-low-food security as measured by items from the USDA’s standard assessment tool. This same report showed that students who are food-insecure were more likely to report that they have missed class,

¹⁰Lagisetty P., Flamm L., Rak S., Landgraf J., Heisler M., Forman J. A *Multi-stakeholder Evaluation of the Baltimore City Virtual Supermarket Program*. BMC PUBLIC HEALTH. 2017; 17(1): 837.

missed assignments, and have considered dropping out.¹¹ In response to the COVID–19 pandemic, The Consolidated Appropriations Act of 2021 temporarily expanded student eligibility to students applying for SNAP benefits who were eligible to participate in a state or federally funded work study, as well as those who have an expected family contribution (EFC) of \$0, exemptions not otherwise offered to this population. Through partnerships with our colleges and universities, DSS was able to quickly identify and provide direct outreach to nearly 27,600 students in Connecticut that fit these categories and otherwise may not have been eligible for SNAP benefits. Likewise, in a recent USDA study, it was found that food insecurity was 22.5% higher among disabled working-age Veterans than the average for all working-age Veterans. This is significant in that in 2019, over 13 million Veterans were of working age and one of the fastest growing and youngest groups of Veterans—those who served after September 11, 2001—is more likely to have a service-connected disability than Veterans from other service periods.¹² While DSS does provide support and SNAP outreach assistance in areas such as stand-down events, we believe an expansion of SNAP eligibility to more service-connected disabled, elderly and housebound Veterans will help to ensure those individuals have the support and access to food that they deserve.

- **Allow for the purchase of hot/prepared foods outside of the Restaurant Meals Program.** Since the passage of the Food Stamp Act in 1964, Americans' shopping and eating habits have evolved, and SNAP families need convenience and faster meal-preparation. In addition, the rule, as it is currently interpreted does not consider whether the food will or even can be consumed on premises or taken home to be eaten. This restriction is most harmful to our homeless population that often do not have the means to prepare their foods, as well as those recovering from a natural disaster or event that renders their home uninhabitable and therefore lack convenient access to a kitchen or the ability to heat up foods. These families are among those most in need and most struggle with the ability to utilize their benefits. Instead, they rely upon the ingenuity and kindness of store owners and clerks to resort to loopholes such as the complimentary heating of food after purchase. Also, it was evident at the onset of the pandemic, when grocery stores were struggling to keep shelves stocked, that the inability to purchase hot and prepared foods was a major problem for SNAP participants. Allowing the purchase of hot or prepared foods outside of a fast-food setting, such as the salad bar in grocery stores and supermarkets, or the often talked about rotisserie chicken, would give these individuals and all SNAP recipients the same flexibility that other Americans depend upon.

¹² <https://www.ers.usda.gov/webdocs/publications/101269/err-829.pdf?v=6491.5>.

- Finally, the adaptations made over the past 2 years in response to the public health emergency have helped us better understand ways we can **adjust program rules to meet the needs of our customers more flexibly**. Opportunities are needed to further test and evaluate innovative approaches to interviews, change reporting, Periodic Report Forms, and telephonic signatures to provide space for states to transition out of the public health emergency leveraging the lessons we have learned. For example, many states already operate Combined Application Projects (CAP), state-demonstration programs that aim to increase SNAP participation among SSI recipients by enrolling them automatically into SNAP. These “demonstration projects” have been operating for 27 years and have proven very successful in increasing food stamp participation among SSI recipients. However, it is severely underutilized with only 17 states having some version of the CAP in place. This should become a regular component of the program with no cost neutrality, a provision in demonstration projects where states have to evaluate data to ensure the project should not cost more than it would have cost to add new participants under the regular SNAP program. In addition, other means-tested programs such as TANF, Medicaid, or WIC should be looked at to determine whether cross enrollment, or automatic enrollment, would be appropriate and efficient in ensuring individuals receive all of the assistance they need without the burden of filling out multiple applications and providing the same verifications multiple times to multiple agencies. This is especially important as state agencies, like many industries, face challenges in recruiting and retaining staff. Collectively, we need to think differently about the way we properly invest in technology and partnerships to ensure we continue to deliver on our core mission while doing more with less. Of similar importance is the alignment of QC process with those processes used to determine eligibility would ensure fair, accountable, and equitable processes for both the states and those we serve.

At the same time that we focus on common sense approaches to simplifying SNAP, states are committed to maintaining program integrity as a top priority. The public health emergency forced Connecticut to temporarily adapt many of our program rules to ensure families could continue to access their benefits safely and reliably. But through it all, we have continued to prioritize conducting quality control reviews, completing reviews both on the Federal and state levels throughout the pandemic, and participating in quarterly trainings with FNS staff in a multitude of QC areas including Able-Bodied Adults Without Dependents (ABAWDs). In fact, we have doubled down on these investments, adding five new review staff members

in the past year, and resuming a state process on hold since 2016 that requires DSS eligibility supervisors to each review at least 20 SNAP cases each month processed by both new and seasoned staff members to ensure robust case reviews are completed and program integrity remains at the forefront. As we get closer to the end of the public health emergency and approach a new normal in our program operations, we are in a strong position to continue our progress maintaining program integrity as we see it already providing results seen in the USDA's current posted payment error rates showing Connecticut's FY2022 error rate well below the national average.

Looking ahead, Congress can assist states in their efforts to promote program integrity by helping equip them with tools that help maintain accuracy and prevent fraud in the program. I applaud Congress for the investments made in the 2018 Farm Bill to create a National Accuracy Clearinghouse (NAC) that helps states identify and pursue individuals that seek to obtain SNAP benefits in multiple states, a process manually done today via email and faxed requests. The early efforts to scale this project have been promising and Connecticut looks forward to utilizing the lessons learned from the pilot states as we integrate our eligibility system into the NAC as it becomes nationwide. I also urge the Committee to support the USDA in advancing strategies that help states make optimal use of third-party income databases that can quickly identify earned income of SNAP participants, both improving program integrity and streamlining the enrollment process for households. Lastly, as fraudsters find new ways to steal SNAP participants' benefits through tactics such as identify theft and card cloning or skimming, Congress can help support states with the staffing and technology resources needed to detect, prevent, catch, and enforce penalties against these attempts to defraud the program while ensuring those unknowingly victimized by these individuals or groups do not lose the benefits to which they are entitled.

Conclusion

While the areas above reflect some extremely important areas of the SNAP program, they by no means represent a comprehensive list of programmatic areas or policies that can be implemented or modified to strengthen and improve an essential entitlement utilized by millions of Americans each month. Coming out of the COVID-19 pandemic, during a time when the percentage of the aging workforce continues to grow and the number of individuals leaving the workforce increases, as well as a time where the farm bill is up for reauthorization, states and this Committee are at an inflection point where we have both tremendous opportunities to modernize and streamline the program to provide more equitable and effective services while also facing the threat of workforce challenges and complex requirements that that threaten to stymie progress.

The actions of this Committee through the reauthorization of the farm bill in 2023 will play a crucial role in helping to unlock the potential advancements we can make in SNAP in the coming years, modernizing the program and its eligibility requirements while not sacrificing program integrity. It can do so by ensuring regular reviews and updates to the Thrifty Food Plan, continuing to expand the funding flexibility and range of SNAP E&T, modernizing the program by making permanent and providing support for no-cost online purchasing, maintaining the vital program simplification rules that helped us through the pandemic: BBCE, ESAP, expanded student eligibility, and interview/process streamlining, investing in new ways to help states stop more sophisticated electronic fraud techniques, and ensuring durable program stability for this critical part of the social safety net as clearly demonstrated during the program's success both before and during the pandemic.

The CHAIRWOMAN. Thank you so much for being here with us today. I now recognize Mrs. Cox for 5 minutes. Please begin when you are ready.

STATEMENT OF TY JONES COX, J.D., VICE PRESIDENT OF FOOD ASSISTANCE POLICY, CENTER ON BUDGET AND POLICY PRIORITIES, WASHINGTON, D.C.

Mrs. Cox. Chairwoman Hayes, Ranking Member Bacon, Members of the Subcommittee, thank you for the opportunity to testify. I am Ty Jones Cox, Vice President of Food Assistance Policy at the Center on Budget and Policy Priorities here in Washington, D.C. I will discuss three things today: why SNAP is so important, the

need for the updated Thrifty Food Plan, and how Congress can strengthen SNAP as part of the next farm bill.

SNAP is our most effective anti-hunger program. That is largely because everyone who is eligible can get benefits, and the program expands automatically to meet rising needs in tough times. SNAP provides tens of millions of low-income seniors, kids, and working adults with money to buy food in their local communities. About 92 percent of benefits go to households with income at or below the poverty line, and 54 percent go to households experiencing deep poverty. As a legal aid attorney in Virginia, I saw how SNAP was a critical piece of the patchwork of services that my clients used to feed their children when their wages just were not enough to close the gap.

In addition, SNAP acts as a first responder during emergencies and natural disasters. We saw how SNAP was critical in fighting food insecurity and other hardships during the pandemic. Because of SNAP and other relief measures by Congress, food insecurity did not surge during the pandemic the way it did during the Great Recession. SNAP is associated with better, short- and long-term outcomes in health, education, and self-sufficiency.

While SNAP is an effective tool in reducing food insecurity, the benefit amount had not kept up with the changing times. The revised Thrifty Food Plan raised SNAP benefits, helping households better afford a healthy diet. Average SNAP benefits went from about \$4.25 per person per day to about \$5.45 per person per day, which is obviously still quite modest. The Agriculture Department revised the Thrifty Food Plan at the specific direction of Congress and the bipartisan farm bill that was signed by President Trump.

About 2.4 million people, including more than one million children, are lifted above the poverty line because of this modest increase, based on a Center on Budget and Policy Priorities estimate that uses the supplemental poverty measure and Census data. That is something to celebrate, right? Previously, SNAP benefits were woefully inadequate, given the struggles of many households to buy and prepare healthy foods, and they were not aligned with the most recent dietary recommendations. This revision to the Thrifty Food Plan was needed, overdue, and one thing I think about is how many more children could have been lifted out of poverty if we had done something earlier.

The farm bill is the time for Congress to strengthen SNAP. Although I do not consider this a comprehensive list, I want to suggest two areas for the Committee to consider. First, SNAP does not reach all groups of eligible low-income people, and the Committee could strengthen SNAP to reduce the risk of food insecurity for these groups. For example, about ½ of adults over 60 participate in SNAP. Certain immigrants and college students who are experiencing food insecurity do not qualify for SNAP, and others are reluctant to participate or unaware they qualify. SNAP's 3 month time limit on non-disabled unemployed adults excludes many unemployed or underemployed workers, including veterans. And residents of Puerto Rico, American Samoa, and the Northern Mariana Islands are excluded from SNAP and instead receive food assistance through block grant programs that are not as responsive as SNAP.

Congress should consider how to ensure that SNAP program operations and oversight keep pace with technology and innovation. Out of necessity, SNAP adopted some technological improvements during the pandemic and proved that others were viable. The farm bill will be an opportunity to assess where these changes can be institutionalized or expanded. Participants in agencies are used to having to make do with outdated systems, and participants are accustomed to having subpar service. And this should no longer be acceptable in our Federal programs.

To wrap up, I want to highlight a sobering reality that should make all of us want to do more in fighting food insecurity. In 2021, one in four Black households with children and one in five Latino households with children was food-insecure. This is a crisis that has been going on for decades, even before the pandemic revealed these stark disparities. One in four is sobering. How do we let this kind of hardship persist year after year? This is a huge disadvantage for these children, even as they are just getting started in life. And we know that it will affect their health, education, and well-being for the rest of their lives. This cannot be how we operate. And I look forward to working together that we can change this.

Thank you again for the opportunity to testify.

[The prepared statement of Mrs. Cox follows:]

PREPARED STATEMENT OF TY JONES COX, J.D., VICE PRESIDENT OF FOOD ASSISTANCE POLICY, CENTER ON BUDGET AND POLICY PRIORITIES, WASHINGTON, D.C.

Thank you for the opportunity to testify today. I am Ty Jones Cox, Vice President of Food Assistance Policy at the Center on Budget and Policy Priorities (CBPP), an independent, nonprofit, nonpartisan policy institute located in Washington, D.C. CBPP conducts research and analysis on a range of Federal and state policy issues affecting families with low and moderate incomes. The Center's food assistance work focuses on improving the effectiveness of the major Federal nutrition programs, including the Supplemental Nutrition Assistance Program (SNAP, formerly food stamps). I have worked on SNAP policy and operations for more than 15 years, starting as a legal aid attorney in Virginia where I represented clients in their fair hearing and during their engagement with the Department of Social Services. Much of my current work is providing technical assistance to state officials and advocates, who wish to explore options and policies to improve SNAP operations to more efficiently serve eligible households. My team and I also conduct research and analysis on SNAP at the national and state levels. CBPP receives no government funding for our policy work or operations.

My testimony today explains SNAP's critical roles in fighting food insecurity and poverty; in supporting health and economic well-being; in defending against hardship during the COVID-19 pandemic; and in supporting people who are paid low wages. I'll also describe how the recent update to the Thrifty Food Plan, which is used to set the maximum amount of food assistance people participating in the SNAP receive, has increased the adequacy of SNAP benefits, allowing households to better afford a nutritious diet. Finally, I'll detail opportunities to strengthen SNAP in the next farm bill.

SNAP's Critical Role in Fighting Food Insecurity and Poverty

Research shows that SNAP is one of our most effective tools in reducing hunger and food insecurity, which occurs when a lack of resources causes household members to struggle to afford enough food for an active, healthy life during the entire year. As a result, it plays a critical role in our country.

Much of SNAP's success is due to its structure: it is designed so that everyone who is eligible can get benefits; it expands automatically to meet needs during tough times; and it focuses its benefits to the households with the least resources available to purchase groceries, assisting families with low income to obtain adequate nutrition, regardless of where they live. As of February 2022, SNAP was helping 41 million low-income people in the U.S. to afford a nutritionally adequate diet by providing them with benefits on a debit card that can be used only to purchase food

at about 254,000 retailers across the country. On average, SNAP recipients receive about \$5.45 per person per day in food benefits, not counting the temporary additional benefits during the current public health emergency. SNAP's reach shows the extensive need for nutrition assistance and SNAP's critical role in addressing it.

Consistent with its original purpose, SNAP provides a basic nutrition benefit to people with low incomes who cannot afford an adequate diet. SNAP is one of the only Federal benefit programs available to almost all households with low incomes; many other programs are limited to certain populations, such as families with children or people with disabilities, or have capped funding that limits the number of people who can receive benefits. Nearly 90 percent of SNAP participants are in households that contain a child under age 18, an older adult 60 years or older, or an individual with a disability. (See *Figure 1*.) Based on pre-pandemic data, about $\frac{2}{3}$ of SNAP participants are in families with children; over $\frac{1}{3}$ are in households with older adults (aged 60 or older) or people with disabilities. Nearly half of SNAP households are headed by a non-Hispanic white person, about a quarter by a non-Hispanic Black person, and more than a fifth by a Latino person (of any race). About seven percent of SNAP households are headed by a person who is Asian or another race.

Figure 1. Nearly 90 Percent of SNAP Recipients Are in Households With Children, Older Adults, or Disabled Adults

Recipients in households with:

CENTER ON BUDGET AND POLICY PRIORITIES | CBPP.ORG

Source: CBPP tabulations of USDA 2019 SNAP household characteristics data.

Children under age 18 constitute nearly half (43 percent) of all SNAP participants. Participation in SNAP also helps children receive school meals and confers eligibility to the Special Supplemental Program for Women, Infants, and Children (WIC). SNAP also benefits many households with workers paid low wages; the share of SNAP households that had earnings in an average month while receiving SNAP has risen over the past few decades, from 20 percent in 1992 to 29 percent in 2019.¹ Many households without earnings in a particular month are temporarily out of work and have worked recently and will work again soon.

SNAP reduces poverty and food insecurity by giving households benefits to buy groceries, which allows them to spend more of their budgets on other basic needs, such as housing, electricity, and medical care. SNAP reaches more than 80 percent of eligible households. It delivers the largest benefits to those least able to afford an adequate diet. About 92 percent of SNAP benefits go to households with incomes at or below the poverty line, and 54 percent go to households at or below half of

¹ Based on SNAP administrative data through 2019. Data are not available to know whether the trend continued during the pandemic.

the poverty line (about \$10,980 for a family of three in 2022). Families with the greatest need receive the largest benefits; these households, particularly households with children, also have higher rates of participation in the program.

These features make SNAP a powerful anti-poverty tool. SNAP kept nearly eight million people above the poverty line in the years before the COVID-19 pandemic, including 3.6 million children.² SNAP has one of the strongest anti-poverty effects among government economic security programs and is particularly effective at reducing deep poverty, that is, in lifting families' incomes above half of the poverty line.

SNAP reduces the overall prevalence of food insecurity by as much as 30 percent, and is even more effective among the most vulnerable, such as children and those with "very-low-food security," in which one or more household members skips meals or otherwise eats less during the year due to lack of money. The largest and most rigorous examination of the relationship between SNAP participation and food security found that food insecurity among children fell by roughly $\frac{1}{3}$ after their families received SNAP benefits for 6 months.³

SNAP is highly responsive to the economy. When more households are out of work or see their earnings fall, SNAP automatically expands to serve everyone who is eligible and applies. This mitigates hardship during a recession and gets money into the economy quickly, acting as stimulus for the economy overall. Low-income individuals generally spend all of their income meeting daily needs such as shelter, food, and transportation, so every dollar in SNAP that a household receives, including during a downturn, enables the family to spend an additional dollar on food or other basic needs. Nearly 78 percent of SNAP benefits are redeemed within 2 weeks of receipt and 96 percent are spent within a month.⁴ During the Great Recession and the COVID pandemic, policymakers turned to SNAP as an efficient mechanism for getting additional help to households struggling to afford food and contending with significant income losses and for bolstering aggregate demand, thereby reducing the duration and depth of the economic downturn.

Research backs up how SNAP can act as economic stimulus. Every dollar in new SNAP benefits generates business for local retailers of all types and sizes, and increases the Gross Domestic Product by \$1.50 during a weak economy. Similarly, the Congressional Budget Office (CBO) and Moody's Analytics found that SNAP has one of the largest "bangs-for-the-buck" for increasing economic activity and employment among a broad range of stimulus policies.⁵

SNAP also acts as a first responder in the wake of the emergencies and natural disasters, providing critical food assistance to vulnerable households. After disasters, the U.S. Department of Agriculture (USDA) and states work together to provide quick, targeted assistance. This can include replacing participants' benefits to compensate for lost food, providing temporary Disaster SNAP (D-SNAP) benefits to non-participants who have suffered significant loss, and relaxing program requirements to ease access and relieve undue burden on staff.

SNAP's Role in Supporting Health and Economic Well-Being

SNAP is associated with improved outcomes in health, education, and self-sufficiency. SNAP participants are more likely to report excellent or very good health than low-income non-participants. Research comparing long-term outcomes of individuals in different areas of the country when SNAP expanded nationwide in the 1960s and early 1970s found that access to SNAP during pregnancy and in early childhood improved birth outcomes and long-term health as adults. Studies have linked SNAP to improved educational attainment, higher rates of high school completion, and improved labor market outcomes in adulthood. Older SNAP partici-

pants are less likely than similar non-participants to forgo their full prescribed dosage of medicine due to cost. SNAP may also help low-income seniors live independently in their communities and avoid hospitalization.

SNAP is linked with reduced health care costs. On average, after controlling for factors expected to affect spending on medical care, low-income adults participating in SNAP incur about \$1,400, or nearly 25 percent, less in medical care costs in a year than low-income non-participants. The difference is even greater for those with hypertension (nearly \$2,700 less) and coronary heart disease (over \$4,100 less). Two other studies also found an association between SNAP participation and reduced health care costs of as much as \$5,000 per person per year.⁶

SNAP enables low-income households to afford more healthy foods. Because SNAP benefits can be spent only on food, they boost families' food purchases. The updated Thrifty Food Plan (TFP), discussed more below, resulted in higher benefit levels, which will help households better afford a healthy diet featuring more whole grains, different-colored fruits and vegetables, and lean proteins. The fact that SNAP can only be used for food purchased from grocery stores or other food retailers likely encourages better nutrition among participants, because it shifts food spending away from restaurants. In addition, all states operate SNAP nutrition education programs to help participants make healthy food choices.

SNAP Acted as a First Line of Defense Against Hardship During Pandemic

After the onset of the COVID-19 pandemic, SNAP responded quickly to deteriorating economic conditions, pushed back against food insecurity and other forms of hardship, and supported families during periods of unemployment, earnings loss, and uncertainty. Moreover, Congress acted expeditiously to temporarily modify and expand SNAP—changes that states implemented quickly and effectively—to deliver additional food assistance to households in communities across the country.

In March 2020, when Congress enacted and President Trump signed the first legislation to address the health and economic impacts of COVID-19, hunger was poised to soar. Calls requesting help with food to state “211” numbers, which households in need of help can use for human services referrals, were over four times greater in late March through mid-May 2020 than earlier in 2020.⁷ The food bank network Feeding America distributed 42 percent more food in the second quarter of 2020 than it did in the first quarter, and food banks were growing increasingly concerned about their ability to meet the increased need.⁸

During the Great Recession, the share of households that were food-insecure rose from 11.1 percent in 2007 to 14.7 percent in 2009, according to Agriculture Department estimates. Yet during the COVID-19 pandemic, because of SNAP's structural ability to respond to increased need as well as the robust relief effort in SNAP and other efforts—including unemployment insurance and economic impact payments—the typical annual measure of food insecurity in 2020 was unchanged from the 2019 level of 10.5 percent.⁹

This overall figure obscures that food insecurity under the annual measure did rise for households with children and for households headed by Black adults; people of color have faced higher levels of food insecurity for decades. (See *Figure 2*.) And other Census data show higher levels of food insufficiency (a different measure of food hardship, in which adults report that their household sometimes or often did not have enough to eat in the last week) during the pandemic than what the annual data show. But it's clear that SNAP and other forms of economic support prevented food insecurity from surging during the pandemic the way it did during the Great Recession.

Because of SNAP's structure, participation can expand automatically in response to job and income losses, and policy changes enacted during the pandemic boosted caseloads modestly as well. SNAP is available within a month—often within a week—of a household's application, so it was one of the first forms of economic relief available to many low-income families during the pandemic when people lost jobs, had their hours cut, or were unable to work because of illness.

The number of SNAP participants grew from 37 million in an average month just before the pandemic to 43 million in June 2020. (The total number of individuals helped by SNAP during the pandemic is higher than these point-in-time figures because households enrolled in and left the program over the course of the last 2 years.) The number of people participating in SNAP has declined since the summer of 2020, but in February 2022 (the most recent data available) more than 41 million people participated, 12 percent above the February 2020 level. CBO forecasts the number of SNAP participants will continue to decline in coming years and ultimately fall below pre-pandemic levels. After a downturn, SNAP caseloads tend to remain elevated for a number of years. One reason is that during a crisis, families who may have already been eligible apply for SNAP as they face greater need and uncertainty. Such households may continue to participate in the program, receiving benefits to augment their low earnings until their earnings rise enough to make them wholly ineligible.

Beginning in March 2020, Congress temporarily modified SNAP rules to further reduce hardship and support the economy, taking advantage of SNAP's ability to deliver benefits quickly and efficiently on households' electronic benefit transfer (EBT) cards. These changes included:

- **Emergency allotments (EAs).** In March 2020 Congress gave states and USDA the flexibility to provide emergency SNAP benefit supplements, which all states did. Congress authorized USDA to approve EAs for as long as the Federal Government has declared a public health emergency and the state has issued an emergency or disaster declaration. As of May 2022, about 15 states had ended their disaster declarations and were no longer providing EAs. In states providing EAs, all households receive the maximum benefit for their household size; if the difference between the maximum benefit and the house-

hold's original benefit under the SNAP benefit formula is less than \$95, then the household's EA is increased so the total EA benefit is no lower than \$95.¹⁰

- **A 15 percent SNAP benefit boost.** Congress acted in December 2020 to raise SNAP maximum benefits by 15 percent from January through June 2021. The American Rescue Plan extended the increase through September 2021, when the increase ended.
- **The Pandemic-EBT program (P-EBT).** Congress created P-EBT in March 2020 as a temporary program to provide benefits to households with children who miss out on free or reduced-price school meals due to the pandemic. Congress later extended and expanded it to provide benefits to cover certain younger children and during the summer, when food insecurity among children rises.

While not SNAP benefits, P-EBT is delivered on SNAP's EBT cards and state SNAP agencies played a leadership role in standing up this new program within just a few months. P-EBT reduced the share of families where children experienced very low food security by 17 percent, according to Brookings Institution research. The program reduced food insufficiency, by 28 percent, the same study found. The effects were larger in states that had higher rates of school closures during the pandemic.¹¹ States' ability to provide P-EBT benefits is tied to the Federal public health emergency. All or nearly all states offered P-EBT benefits during the past couple of school years and last summer. Currently more than half of states have USDA-approved plans to issue P-EBT benefits for the 2021–2022 school year when schools are closed or attendance is disrupted due to COVID–19, and USDA recently issued guidance to states regarding P-EBT for summer 2022.

Average SNAP benefits across all households rose from about \$120 per person per month before the pandemic to about \$230 in the summer of 2021. Since then, SNAP pandemic relief has fallen after the 15 percent benefit boost ended and states have started to pull back on emergency supplements. When the emergency allotments end—as has happened already in some states and will happen in other states with the end of the Federal public health emergency—SNAP households see their benefits fall by an average of about \$80 per person per month, or about 33 percent, though the exact amount depends on the household's income and other circumstances. The average SNAP benefit per person per day drops from about \$8 to about \$5.45. Fortunately, because of the update to the Thrifty Food Plan, described below, SNAP benefits after the EAs end are far more adequate than they otherwise would have been.

During the pandemic Congress also:

- Temporarily suspended SNAP's harsh 3 month time limit, which takes benefits away from many adults under age 50 without children in the home when they don't have a job for more than 20 hours a week;
- Loosened the general rule that makes many college students ineligible for SNAP;
- Allowed waivers of certain administrative process requirements in SNAP to enable administrators to deliver benefits promptly and safely even as caseloads surged and eligibility staff worked from home; and
- Increased funding for the nutrition assistance block grants in Puerto Rico, American Samoa, and the Northern Mariana Islands and funded additional commodity purchases for emergency food programs.

The pandemic highlighted the critical role that SNAP plays in delivering resources quickly to individuals and their communities. It also reinforced the excep-

¹⁰The Trump Administration originally set EAs at the amount that raised each SNAP household's benefits to the level of the SNAP maximum allotment—which helped those households that didn't otherwise receive the maximum allotment, but left out the 40 percent of SNAP households who have the lowest incomes and already received the maximum allotment. In April 2021, USDA revised the emergency allotment calculations to include the lowest-income households so each household now receives at least an additional \$95 a month. See USDA, "USDA Increases Emergency SNAP Benefits for 25 million Americans," April 1, 2021, <https://www.fns.usda.gov/news-item/usda-006421>.

¹¹Lauren Bauer, Kristina Ruffini, and Diane Whitmore Schanzenbach, "An Update on the Effect of Pandemic EBT on Measures of Food Hardship," Hamilton Project, September 29, 2021, <https://www.brookings.edu/research/an-update-on-the-effect-of-pandemic-ebt-on-measures-of-food-hardship/>. As explained above, very-low-food insecurity is the most severe form of food insecurity where children have to take steps such as skipping meals because they lack resources. Food insufficiency is a different measure where adults report that their household sometimes or often did not have enough to eat in the last week.

tional dedication and perseverance of the state officials across the country who administer the program with compassion and integrity.

SNAP Supports Workers Paid Low Wages

SNAP is an important support for workers who are paid low wages. Millions of people in the U.S. work in jobs with low wages, unpredictable schedules, and no benefits such as paid sick leave—all of which contribute to high turnover and spells of unemployment. SNAP provides monthly benefits that help fill gaps for workers with low and inconsistent pay and can help workers afford food during periods when they are looking for work.

Several features of SNAP's benefit structure make it an effective support for workers. During the pandemic, SNAP has helped millions of households experiencing unemployment and a turbulent job market. However, SNAP's harsh 3 month time limit for unemployed adults not raising children cuts off benefits for participants who may be looking for work or who face barriers to work, creating hardship with no significant impact on employment among those affected.

SNAP helps workers in low-paying jobs put food on the table. The share of SNAP households that worked in an average month while receiving SNAP grew over the past 3 decades, until the onset of the pandemic. Work rates rose among all SNAP households, but especially among households with children. This trend continued despite the large job losses in the Great Recession.

Close to $\frac{2}{3}$ of working SNAP participants work in service, office and administrative support, sales, or professional occupations. Many of the jobs most common among SNAP participants, such as service or sales jobs like cashiers, cooks, or home health aides, often feature low pay and irregular work hours, and frequently lack benefits such as paid sick leave.¹² These conditions make it difficult for workers to earn sufficient income to provide for their families and may contribute to volatility such as high job turnover. SNAP supplements these workers' low pay, helps smooth out income fluctuations due to irregular hours, and helps workers when they temporarily lose employment, enabling them to buy food and use their limited resources on other basic necessities.

The pandemic has disproportionately impacted the low-paid labor market and SNAP participants seeking work. The majority of jobs lost in the crisis were in industries that pay low wages, with the lowest-paying industries accounting for 30 percent of all jobs but 59 percent of the jobs lost from February 2020 to October 2021, according to Labor Department employment data. Jobs were down nearly twice as much in low-paying industries (4.5 percent) as in medium-wage industries (2.6 percent) and roughly 15 times as much as in high-wage industries (0.3 percent) during this period.¹³ Workers who were born outside the U.S. (including individuals who are now U.S. citizens) experienced larger job losses than U.S.-born workers.

Black and Latino workers experienced a far slower jobs recovery than white workers—reflecting historical patterns rooted in structural racism. By May 2022, however, unemployment rates for Black and Latino workers had returned to pre-pandemic levels, though they still are substantially higher than unemployment rates for white workers. Some 6.2 percent of Black workers and 4.3 percent of Latino workers were unemployed in May 2022, compared to 3.2 percent of white workers.

The majority of SNAP participants who can work do so, either while receiving SNAP or before and after. Many turn to SNAP when they are between jobs. Among SNAP participants who are working-age, non-disabled adults, more than half work while receiving SNAP—and 74 percent work in the year prior to or the year after receiving SNAP. For families with children and at least one working-age, non-disabled adult the work rates are even higher: 75 percent of households with children include someone who works while receiving SNAP and nearly 90 percent of such households include someone who works in the year prior to or the year after receiving SNAP.¹⁴ This shows that joblessness is often temporary for SNAP participants.

The low pay and instability in many low-paid jobs can contribute to income volatility and job turnover: workers paid low wages, including many who participate in SNAP, are more likely than other workers to experience periods when they are out of work or when their monthly earnings drop, at least temporarily. These dynamics

¹² Brynne Keith-Jennings and Vincent Palacios, "SNAP Helps Millions of Low-Wage Workers," Center on Budget and Policy Priorities, May 17, 2017, <https://www.cbpp.org/research/food-assistance/snap-helps-millions-of-low-wage-workers>.

¹³ CBPP, "Tracking the [COVID]-19 Economy's Effects on Food, Housing, and Employment Hardships," updated February 10, 2022, <https://www.cbpp.org/research/poverty-and-inequality/tracking-the-covid-19-economys-effects-on-food-housing-and>.

¹⁴ CBPP analysis of the 2014 panel of the U.S. Census Bureau's Survey of Income and Program Participation.

lead many adults to participate in SNAP for short periods, often while between jobs or when their work hours are cut. Others, such as workers with steady but low-paying jobs or those unable to work, participate longer-term.

People working for low pay are underserved in many states. Even though SNAP provides an important support for these workers, this population is often particularly hard to reach. In 2019, 72 percent of individuals with earnings who were eligible for SNAP participated compared to 82 percent of all eligible people, according to USDA estimates.¹⁵

SNAP's design supports work. Some policymakers have raised concerns that programs that provide assistance for low-income families may discourage work if participants are worried that they will face a “cliff” where they lose their benefits entirely if they take a job or increase their earnings above the program's income limit. SNAP contains three features that result in a fairly small benefit cliff for households with income at the upper end of SNAP's income eligibility limit.

First, SNAP's standard benefit formula (in place outside of the current public health emergency) targets benefits based on a household's income and expenses, but the program phases out benefits *slowly* with increased earnings and includes a 20 percent deduction for earned income to reflect the cost of work-related expenses and to function as an additional work support. As a result, each additional dollar of earnings results in most households experiencing a decline of only 24¢ to 36¢ in SNAP benefits. Most SNAP households see an increase in their total income when their earnings rise modestly—particularly if they are in the income range where the Earned Income Tax Credit is increasing as earnings rise—even if some other benefits begin to phase down as well. As a result of the earnings deduction, a household with earnings will receive a larger SNAP benefit than a household of the same size and gross income in which income comes from unearned sources.

SNAP does, however, limit gross income to 130 percent of the Federal poverty line, creating a small but meaningful benefit cliff or benefit loss for some households who see their earnings increase from just below to just above that level. This loss of SNAP would cancel out more of the increased earnings than is the case for lower-income households, and, depending on how much the household had increased its earnings, the household may not be better off over a narrow income range.

For example, a single parent with two children working full time at \$13.50 an hour would have income at 128 percent of the poverty level and receive about \$317 a month from SNAP, making up about 12 percent of their total monthly income. If their hourly wage increased by 50¢ (or \$87 a month), lifting the household's income just above 130 percent of FPL (\$2,379 for a family of three per month in Fiscal Year 2022), the family would become ineligible for SNAP under the Federal income eligibility cut-off. In this circumstance, the household's loss of SNAP benefits would more than cancel out the higher earnings; their total monthly resources would decline by about \$230 per month.¹⁶ (The parent may see further wage increases over time, now building from a higher base, and at that point their higher earnings would make the family better off.)

Fortunately, states currently have an option to lift the gross income limit through “broad-based categorical eligibility.” This state option is the second protection in SNAP against a benefit cliff. More than 30 states have taken advantage of the option thereby allowing benefits to phase out gradually for all working households. Consider the previous example in a state that used the categorical eligibility option to adopt a higher gross income limit. The household's SNAP benefit would drop by only about \$30 a month when their income rose, so the household would still be better off with the higher-paying job. The option allows states to smooth SNAP's phase out and eliminate the relatively modest benefit cliff; states that adopt the option ensure that if a working household is able to increase their earnings, their SNAP benefits phase out slowly and evenly.

The third protection against a benefit cliff is SNAP's structural guarantee to make food assistance available to every household that qualifies under program rules and applies for help. SNAP households that leave the program because they find a job or get a raise and no longer qualify can count on SNAP being available if they need help again later. Without this guarantee a household that loses its job might have to wait until funding became available to resume benefits—as occurs now with child

¹⁵Alma Vigil, “Trends in USDA Supplemental Nutrition Assistance Program Participation Rates: Fiscal Year 2016 to Fiscal Year 2019,” USDA, March 2022, <https://www.fns.usda.gov/snap/trends-participation-rates-fy-2016-2019>.

¹⁶CBPP calculation based on fiscal year 2022 SNAP benefit parameters and fiscal year 2019 SNAP household characteristics data. We assume no emergency allotments are in effect. In this example, this family claims the \$177 standard deduction and the 20 percent earned income deduction and has \$1,407 monthly shelter costs.

care and other benefits that are constrained by funding limitations from serving all who are eligible. That SNAP can serve all who qualify for its benefits lowers the perceived risks of working, making it easier for low-income families to take a chance on a new job or promotion.

SNAP's time limit does not increase work effort but does cut people off benefits. SNAP's role as the nation's primary anti-hunger safety net has long had a gaping hole. Non-elderly adults without children in their homes can receive benefits for only 3 months every 3 years, unless they are working at least 20 hours a week or can document they are unable to work. Most states offer little if any help in meeting the 20 hour requirement, so the rule is actually a time limit on benefit receipt, cutting off all individuals who are unable to find enough hours of work. States can temporarily waive the time limit in areas where there are insufficient jobs. Due to the pandemic, the time limit is temporarily suspended nationwide.

Research shows that taking food away from households does not lead to increased work effort or earnings. A recent USDA report adds to the growing evidence that the time limit doesn't lead to SNAP participants finding a job.¹⁷ By taking SNAP away, the time limit leaves people with fewer resources to buy food and puts them at risk of food insecurity.

Additional research supports these findings. A recent paper showed that SNAP's time limit reduced participation in the program by 53 percent among those subject to the time limit, again with no effects on employment.¹⁸ Earlier research found people subject to the time limit lost SNAP benefits and that losing SNAP eligibility did not increase employment but did increase the number of days people reported being in poor health.¹⁹

Studies also confirm that individuals potentially subject to the time limit are more likely to have significant barriers to employment, such as lack of a high school diploma or GED, a felony conviction, or lack of transportation or a driver's license, and have higher rates of homelessness and mental or physical conditions that can impact their ability to work.

Thrifty Food Plan Update Increasing SNAP's Benefit Adequacy

SNAP's purpose is to help participants afford a variety of healthy foods. SNAP benefit levels are tied to the cost of the Department of Agriculture's Thrifty Food Plan, a food plan intended to provide adequate nutrition at a budget-conscious cost.

The bipartisan 2018 Farm Bill directed USDA to reevaluate the Thrifty Food Plan to better reflect the modern cost of a healthy diet by 2022 and every 5 years thereafter. (See *Figure 3*.) USDA's updated Thrifty Food Plan, which was issued in August 2021 (meeting the statutory timeframe) and went into effect at the start of fiscal year 2022, increased SNAP's purchasing power, raising average benefits per person per day by about \$1.20 to about \$5.45 in fiscal year 2022, which will help millions of families' ability to add a greater variety of fruits, vegetables, and other healthy foods to their diet.²⁰

TITLE IV—NUTRITION

Subtitle A—Supplemental Nutrition Assistance Program

SEC. 4001. REQUIREMENTS FOR ONLINE ACCEPTANCE OF BENEFITS.

(a) **DEFINITION.**—Section 3(o)(1) of the Food and Nutrition Act of 2008 (7 U.S.C. 2012(o)(1)) is amended by striking “or house-to-house trade route” and inserting “, house-to-house trade route, or online entity”.

(b) **ACCEPTANCE OF BENEFITS.**—Section 7(k) of the Food and Nutrition Act of 2008 (7 U.S.C. 2016(k)) is amended—

- (1) by striking the heading and inserting “ACCEPTANCE OF PROGRAM BENEFITS THROUGH ONLINE TRANSACTIONS”;
- (2) in paragraph (4) by striking subparagraph (C), and
- (3) by striking paragraph (5).

SEC. 4002. RE-EVALUATION OF THRIFTY FOOD PLAN.

Section 3(u) of the Food and Nutrition Act of 2008 (7 U.S.C. 2012(u)) is amended by inserting after the 1st sentence the following:

“By 2022 and at 5-year intervals thereafter, the Secretary shall re-evaluate and publish the market baskets of the thrifty food plan based on current food prices, food composition data, consumption patterns, and dietary guidance.”

SEC. 4003. FOOD DISTRIBUTION PROGRAM ON INDIAN RESERVATIONS.

(a) **IN GENERAL.**—Section 4(b) of the Food and Nutrition Act of 2008 (7 U.S.C. 2013(b)) is amended—

by striking paragraph (4) and inserting the following:

It had been 15 years since USDA last revised the TFP and nearly 60 years since it reexamined the TFP's real purchasing power. The revised TFP is a model food plan that's more: in sync with what families with low incomes eat, or would eat if less budget constrained; attuned to the realities of time-strapped families; and reflective of scientific evidence for a nutritious, varied diet that includes more whole grains, different-colored fruits and vegetables, and lean proteins (including seafood).

SNAP expects families receiving benefits to spend 30 percent of their net income on food. Families with no net income receive the maximum benefit, which is set at the cost of the Thrifty Food Plan. For all other households, the monthly SNAP benefit equals the maximum benefit for that household size minus the household's expected contribution.

Before TFP Update, Evidence Showed Benefits Were Inadequate

Before USDA's revision, the Thrifty Food Plan had been adjusted only for inflation since the 1970s, even as our understanding of what constitutes a healthy diet changed. That left SNAP benefits badly out of line with the most recent dietary recommendations and the economic realities most struggling households face when trying to buy and prepare healthy foods.

Prior to the TFP revision, many families struggled once SNAP benefits ran out. About ¼ of all households exhausted virtually all their benefits within a week of receipt, and more than half exhausted virtually all benefits within the first 2 weeks. Numerous studies have found that late in the benefit cycle (that is, toward the end

of the month), SNAP participants consumed fewer calories (with the probability of going an entire day without eating tripling from the first to the last day of the month), were likelier to experience food insecurity, visited food pantries more frequently, and may have been more likely to visit emergency rooms or to be admitted to a hospital because of low blood sugar. In addition, at the end of the benefit month, children's test scores were lower and they were more likely to misbehave in school.²¹

Scientific evidence now emphasizes the importance of eating a broad range of somewhat more costly foods, including more whole grains, red, orange, and leafy green vegetables, lean proteins, and seafood. To prepare a healthy diet, families must have enough money to buy ingredients, as well as the time needed to plan meals, buy and prepare food, consume meals, and clean up. With the increase in women's labor force participation since the 1970s, and with many parents working multiple jobs, many families lack this time for food preparation.

To stay cost-neutral over the years, the TFP had relied on a limited set of less-expensive foods, had assumed that families can spend a considerable amount of time preparing meals mostly from scratch, and had not accounted for varying family types and dietary needs. As a result, SNAP benefits had fallen short of what many people need to buy and prepare healthy food.

Impact of TFP Increase

The update to the TFP resulted in a meaningful but modest SNAP benefit increase. The 21 percent increase in maximum SNAP benefits raised the average benefit from about \$4.25 per person per day (without the temporary, pandemic-related increases that are now in place but expire in the coming months) to about \$5.45 per person per day in Fiscal Year 2022. (See *Figure 4*.)

Figure 4. Thrifty Food Plan Revision Meaningfully Increased Average SNAP Benefits Per Person Per Day

Note: TFP = Thrifty Food Plan. Figures do not include temporary, pandemic-related SNAP benefit increases (likely to expire in coming months).

Source: CBPP analysis of 2019 SNAP household characteristics data for Fiscal Year 2022.

Reduces Poverty

About 2.4 million people, including more than one million children, will be lifted above the poverty line because of this modest increase, based on a CBPP estimate that uses the Supplemental Poverty Measure and Census data for 2017.²² The TFP adjustment is projected to cut the number of children participating in SNAP whose families have annual incomes below the poverty line by 15 percent and will reduce the number of children in poverty overall by 12 percent, we estimate. In addition, the TFP adjustment will reduce the severity of poverty for another 20.5 million people, including 6.2 million children.

Of the roughly 23 million people the change will lift above or closer to the poverty line, 9.4 million are white, 6.5 million are Latino, 5.3 million are Black, and 900,000 are Asian.²³

Improves Food Security

More adequate SNAP benefits can help reduce food insecurity, research shows. Those improvements can have long-term impacts, such as supporting economic mobility and reducing health care costs. Children participating in SNAP face lower risks of nutritional deficiencies and poor health, which can improve their health over their lifetimes. SNAP also can affect children's ability to succeed in school. One study, for example, found that test scores among students in SNAP households are highest for those receiving benefits 2 to 3 weeks before the test, suggesting that SNAP can help students learn and prepare for tests—and that when benefits run out and families are struggling to afford groceries, children's ability to learn is diminished.²⁴

Improving the adequacy of SNAP benefits is particularly important in addressing disproportionately high rates of food insecurity among Black and Latino households. Poverty and food insecurity rates are higher among Black and Latino households due to racism and structural factors, including unequal education, job, and housing opportunities, that contribute to income disparities.

Improves Nutritional Outcomes

These higher benefit levels will help households better afford a healthy diet featuring enough different fruit and vegetables, a recent USDA study simulating the impact of the benefit increase found.²⁵ And with fewer cost constraints on their food budgets, participating households can better meet dietary guidelines for fruit and vegetable consumption while leaving more of their benefits to purchase other types of nutritious foods.

In research we helped support, economists Michele Ver Ploeg and Chen Zhen found that increasing SNAP benefits is expected to increase spending on groceries, improve the dietary quality of food purchases, and increase the amount of key nutrients, such as iron and calcium.²⁶ In another study, economics professors Patricia

²²These CBPP estimates are based on the U.S. Census Bureau's March 2018 Current Population Survey, using tax year 2017 tax rules that account for the Tax Cuts and Jobs Act. They include corrections for underreported benefits from SNAP, Supplemental Security Income, and Temporary Assistance for Needy Families from the Department of Health and Human Services/Urban Institute Transfer Income Model (TRIM). At the time of the TFP adjustment, the most recent version of TRIM was based on tax year 2017. The estimates reflect a pre-pandemic economy and regular SNAP program rules and do not account for temporary measures enacted to help reduce hardship during the pandemic, such as the temporary increase in the Child Tax Credit.

Anderson and Kristin Butcher found that boosting SNAP benefits would raise not only the amount that low-income households spend on groceries but also the nutritional quality of the food purchased.²⁷

Anderson and Butcher estimated the impact of an increase in SNAP benefits of \$30 per person per month—slightly less than the \$36 per-person, per-month increase due to the TFP update. The researchers found that a \$30 monthly increase would result in about \$19 per person per month more in food spending. (This is less than the SNAP benefit increase because the added benefits free up household income for other necessities such as rent, utility bills, or non-food items that SNAP doesn't cover.) That increase in food spending, in turn, would raise consumption of more nutritious foods, notably, vegetables and certain healthy sources of protein (such as poultry and fish), and less fast food. The increased food spending would also reduce food insecurity among SNAP recipients.

Opportunities to Strengthen SNAP in the Next Farm Bill

There is strong evidence that SNAP is working well, but there are certainly parts of the program that should be improved. The coming farm bill is a time to address areas of the program that could be more effective. It is still early in the farm bill process, and this list is not comprehensive, but rather is meant to suggest possible areas for the Committee to consider.

Ensure SNAP Reaches More Low-income People Who Face Food Insecurity

USDA estimates in recent years, prior to the pandemic, that SNAP reached more than 80 percent of people who qualified for benefits. But some people face barriers to gaining access and either participate at lower rates or may not be eligible. A major area for consideration is how to strengthen SNAP to address the risk of food insecurity for these populations, many of whom are disproportionately people of color.

Bring parity to food assistance in Puerto Rico, American Samoa, and the Commonwealth of the Northern Mariana Islands. Despite higher levels of poverty than the rest of the U.S., these three Territories are excluded from SNAP (unlike Guam and the Virgin Islands) and instead receive block grants for nutrition assistance. Because of the block grants' low, capped levels, these territories have more limited eligibility and/or benefit levels and the programs are not able to respond to changes in need because of economic downturns or disasters.

For example, Puerto Rico's household food assistance program, the Nutrition Assistance Program (NAP, or PAN for its name in Spanish, Programa de Asistencia Nutricional) is one of the most important programs helping people meet basic needs in Puerto Rico. On average about 1.3 million people participated in NAP in 2018, about 2/5 of the territory's population. But because it is a capped block grant, NAP's support is more limited than SNAP. Puerto Rico sets eligibility and benefit levels to keep the program's cost within the fixed Federal funding limits, which means these levels aren't solely based on, and can't fully respond to, need.

As a result, under regular NAP rules (not including the recent temporary disaster benefits), a parent of two children who lost a job and had no other income received an average of \$376 in monthly NAP benefits in March through June 2019.²⁸ By comparison, a parent of two children who lost a job and had no other income would have received the maximum monthly SNAP benefit of about \$505 in the continental United States in 2019, and more in Alaska, Hawai'i, Guam, and the Virgin Islands. SNAP's funding structure also enables it to respond to changes in demand, including those due to natural disasters or recessions, which NAP, with its limited funding, can't.

Congress recently funded USDA to conduct research to help determine the information and changes that would be needed to transition Puerto Rico to SNAP, including administrative changes and the development of a methodology to determine SNAP benefit levels based on food price data and consumption data for Puerto Rico. The data used to estimate the Thrifty Food Plan for SNAP is not available for Puerto Rico, but available data on food prices suggests that they are higher in Puerto Rico than in other parts of the U.S.

Similarly, the Commonwealth of the Northern Mariana Islands (CNMI) receives insufficient funding for food assistance despite high levels of poverty. A 2016 USDA-funded study of the feasibility of including the CNMI in SNAP reported that more

²⁷ Patricia Anderson and Kristin Butcher, "The Relationships Among SNAP Benefits, Grocery Spending, Diet Quality, and the Adequacy of Low-Income Families' Resources," CBPP, June 14, 2016, <https://www.cbpp.org/research/food-assistance/the-relationships-among-snap-benefits-grocery-spending-diet-quality-and>.

²⁸ CBPP, "A Brief Overview of the Nutrition Assistance Program," <https://www.cbpp.org/research/food-assistance/a-brief-overview-of-the-nutrition-assistance-program>.

than half of the CNMI's population had income below the Federal poverty level, and median household income in the CNMI was less than half the median income in Guam, its nearest neighbor, and in the United States as a whole.²⁹ Like Puerto Rico, the CNMI has had to set eligibility and benefit levels far lower than in the states, the District of Columbia, and Guam and the Virgin Islands. Under a new memorandum of understanding, the CNMI's benefit amounts have increased, eligibility was expanded, and a contingency reserve fund was created to be available to meet unanticipated needs. But additional changes are needed to allow food assistance in the CNMI to reach full parity with SNAP.

USDA and Congress have made some progress in recent years in taking steps to address the needs in the territories, document the challenges, and assess the feasibility of changes that would be needed to bring parity to the food assistance provided to these territories' residents, but more needs to be done, in consultation with the territories, to achieve parity in food assistance.

End SNAP's 3 month time limit, which excludes many unemployed or underemployed workers. As described above, one of SNAP's harshest rules limits unemployed individuals aged 18 to 50 not living with children to 3 months of benefits in any 36 month period when they aren't employed or in a work or training program for at least 20 hours a week. This rule is a time limit on benefits and not a work requirement, as it is sometimes described, because states are not required to provide any way for an individual to meet the requirement—and most do not. Thus, an individual looking for work, or working fewer than 20 hours, will lose food assistance after 3 months.

Those subject to this rule have extremely low incomes and often face barriers to work such as a criminal justice history, racial discrimination, or health impairments. They also tend to have less education, which is associated with higher unemployment rates. In addition to being a harsh policy that takes critical food assistance away from people who need it without any significant positive impact on employment, the rule is one of the most administratively complex and error-prone aspects of SNAP law. Many states also believe the rule undermines their efforts to design meaningful work activities for adult SNAP recipients as the time limit imposes unrealistic dictates on the types of job training that will permit someone to continue to receive basic food assistance so they can eat. For these reasons, many states and anti-hunger advocates have long sought the rule's repeal or moderation.

Congress suspended the time limit during the COVID-19 public health emergency in recognition of the pandemic's effects on the labor market. Rep. Adams through H.R. 4077, the Closing the Meal Gap Act of 2021, and Rep. Lee, through H.R. 1753, the Improving Access to Nutrition Act of 2021, (both with numerous cosponsors) would end the time limit, restoring eligibility for many individuals who will have food assistance taken away once the public health emergency ends, regardless of their own circumstances, due to a misguided policy that has been shown to increase food insecurity while having no positive impact on employment.

Raise participation rates among eligible older adults. Many older adults have limited income from Social Security and or Supplemental Security Income and could benefit from SNAP benefits, which before the pandemic averaged about \$120 a month for households with members 60 years or older. But only about half (48 percent in 2019) of eligible adults aged 60 and over participate in SNAP, though participation rates have risen modestly in recent years.³⁰ Moreover, most who would qualify for SNAP also would qualify for Medicare Savings Programs, which defray Medicare premiums and/or cost-sharing charges for seniors near or below the poverty line who are not enrolled in the full Medicaid program, and for the Low-Income Subsidy for the Medicare Part D prescription drug benefit. But participation rates in these programs among low-income seniors also are very low. While these programs have similar eligibility rules, the differences can be confusing and older adults typically must apply for them via different duplicative processes and may not be aware of the assistance that is available.³¹ Tackling low participation rates

³⁰ Alma Vigil, "Trends in USDA Supplemental Nutrition Assistance Program Participation Rates: Fiscal Year 2016 to Fiscal Year 2019," USDA, March 2022, <https://www.fns.usda.gov/snap/trends-participation-rates-fy-2016-2019>.

³¹ Medicaid and CHIP Payment and Access Commission, "Report to Congress on Medicaid and CHIP," Chapter 3, June 2020, <https://www.macpac.gov/wp-content/uploads/2020/06/June-2020-Report-to-Congress-on-Medicaid-and-CHIP.pdf>.

across programs would address food insecurity as well as help low-income seniors make ends meet overall.

Lower barriers to SNAP participation among certain immigrants and college students experiencing food insecurity. SNAP eligibility rules for immigrants and college students are very complicated. Many individuals in these groups who have low income and for whom assistance with affording food could ease hardship and help them improve their future health and economic well-being are not eligible for SNAP benefits. Others who do qualify are not aware they are eligible; are reluctant to participate out of concern about possible ramifications for their immigration status, even though those concerns are generally not accurate; or face barriers navigating SNAP's sometimes complicated and burdensome application procedures.

Participation by eligible people who are immigrants and children in families that include immigrant adults has decreased substantially in recent years, according to USDA estimates, likely due in large part to the Trump Administration's efforts to discourage immigration and to change the public charge rules to include SNAP and other health and economic support programs. Between 2016 and 2019, the participation rate for eligible people who are immigrants dropped from 66 percent to 55 percent and for children who are U.S. citizens who live with adults who are immigrants from 80 percent to 64 percent.³²

We recommend Congress consider how to improve access to SNAP for low-income immigrants and college students and other groups who cannot qualify or who have low participation rates because of confusion or because they face enrollment barriers.

Allow formerly incarcerated individuals with drug felony convictions to participate in SNAP. Denying food assistance to people who have completed their sentences makes it harder for them to get back on their feet and may contribute to high re-arrest rates, which are up to 50 percent for people with prior drug offenses.³³ Given that formerly incarcerated people also face barriers and discrimination in employment and housing, it's not surprising that 91 percent are food-insecure.³⁴ While most states have restored eligibility to *some* individuals affected by the ban, these limited restorations leave too many individuals who have completed their sentences and are complying with parole or probation ineligible for SNAP. SNAP's drug felon ban also disproportionately affects people of color, reflecting—and amplifying—the stark racial disparities in the criminal justice system, with impacts extending to these individuals' children and other family members.³⁵

Support Tribal sovereignty and strengthen food security in Native communities. American Indians and Alaska Natives experience food insecurity at a much higher rate than white people. The 2018 Farm Bill included administrative improvements to the Food Distribution on Indian Reservations (FDPIR) program, which provides food packages to Native American families who live in designated areas near reservations and in Oklahoma as an alternative to SNAP. The bill also authorized demonstration projects through which Indian Tribal Organizations, instead of USDA, can directly purchase commodities for their FDPIR food packages. Congress should work with tribal stakeholders to build on this progress and strengthen food security in Native communities.

Redesign SNAP Performance Measurement to be More Human Centered

SNAP's current performance measurement system emphasizes preventing improper payments. States and USDA take their roles as stewards of public funds seriously and have a rigorous measurement system in place to assess the accuracy of eligibility and benefit determinations. States are assessed fiscal penalties if their payment error rates are persistently too high.

When a household applies for SNAP it must report its income and other relevant information; a state eligibility worker interviews a household member and verifies the accuracy of information using third-party data matches, paper documentation from the household, and/or by contacting a knowledgeable party, such as an employer or landlord. When errors do occur they are overwhelmingly from unintention-

tional mistakes by applicants or recipients, eligibility workers, or other state agency staff, rather than fraud.

It is critical that SNAP have a strong system in place to assess and address program integrity. But it is also important that the measures states and USDA take do not undermine the program's purpose to deliver food assistance to households that face difficulties affording an adequate, healthy diet.

Currently information is not available to policymakers or the public about how well SNAP is working in terms of the *human* experience of accessing benefits. The 2018 Farm Bill eliminated SNAP performance bonuses, which were tied to low or improving payment error rates, participation rates among eligible people, and delivering benefits promptly within Federal timelines. But states still are subject to fiscal penalties for high payment error rates, which places a disproportionate emphasis on payment accuracy over access for low-income families.

In collaboration with the Center on Budget and Policy Priorities, Code for America developed a National Safety Net Scorecard to put forward a package of metrics that Federal and state governments could use to track program performance over time and across states or other jurisdictions.

The measures in the National Safety Net Scorecard measure performance across three categories:

- **Equitable access:** These metrics help assess whether the programs are open to all eligible people. Are online, telephone, and in-person services available and accessible to all people? How difficult is it to apply? Are people who apply satisfied with their experience?
- **Effective delivery:** Measures in this category examine the smoothness of the process after a person applies. How long does it take to receive benefits? How common is it for cases to be denied for procedural reasons as opposed to reasons related to financial eligibility? Are people who remain eligible able to successfully maintain eligibility?
- **Compassionate integrity:** Finally, this category assesses whether people are receiving the benefits to which they are entitled. What share of eligible people participate? How accurate are eligibility and benefit determinations? How smooth is the appeals process?

Some states measure some of these types of metrics as part of their operations or to make the case to the public that they are running successful programs. But there is a need for leadership to make progress toward this vision through Federal legislation in the farm bill, administrative action, and further state innovation.

Ensure SNAP Program Operations and Oversight Keep Pace With Technology

The farm bill presents an important opportunity to reassess program operations and ensure SNAP keeps pace with technological and other changes. The pandemic has presented challenges and opportunities that resulted in the program adapting quickly out of necessity. Some technological changes, such as online shopping and remote eligibility practices, that probably would have occurred over time did so instead on an accelerated timeframe. Below are some areas Congress should consider to support these advancements.

- **Online purchases.** Probably the best example of an accelerated timeframe around technology is the rapid expansion of online purchases during the pandemic. Though less than ten percent of SNAP benefits are redeemed online, USDA rapidly expanded the number of states and the number of stores that allow recipients to redeem their benefits online. The provisions from the last two farm bills that piloted and studied online benefits were a big reason that USDA, states, and retailers were able to expand so quickly during the pandemic. This next farm bill presents an opportunity to continue the progress from recent years and improve access to online benefits for participants.
- **EBT.** The original roll-out of EBT revolutionized SNAP benefit delivery, beginning more than 30 years ago. The Committee should consider, in collaboration with USDA and other stakeholders, whether to incorporate advancements in retail transactions, such as mobile payment options, while protecting program integrity and ease of use for participants.
- **The National Accuracy Clearinghouse (NAC).** The 2018 Farm Bill provided that USDA and states should expand to nationwide a pilot program that several states use to share data on their SNAP participants and prevent individuals from participating in more than one state. An evaluation of the NAC found that less than 0.2 percent of SNAP participants were participating in multiple states. In addition to improving program integrity, the NAC holds promise as a customer service improvement for applicants because it can help participants

who move from one state to another disenroll more quickly from benefits in their former home state so that their new home state can open their SNAP case. Congress should monitor the roll out of the NAC nationwide, which is underway and expected to accelerate later this year, to ensure that it does not pose challenges to privacy or vulnerable individuals' access to benefits.

- **Ensuring accessibility of certification and recertification.** Gradually over recent decades, SNAP and other income support and health programs have transformed from very labor intensive in-person application and recertification processes to making far greater use of online, telephone, and other technological tools. States adapted and expanded these tools very quickly during the pandemic when they needed to move to remote operations. These tools, combined with the temporary flexibilities that Congress and USDA allowed during the pandemic, helped states manage their workloads and helped participants gain and maintain access to the program.

Congress should consider revisions to SNAP rules that would support the use of technology in the SNAP certification process. For example, telephonic signatures and text messaging have shown promise in improving access for some households. Making use of available electronic data sources, when relevant, timely, and accurate can lower documentation burdens on households and state agencies. However, technology does not work for all SNAP households. For example, some households do not have telephones or internet access. Some households, including some with elderly or disabled members and those experiencing homelessness, may prefer an in-person process rather than navigating online and telephone communications. It is important that the program balance the use of promising technology with ensuring that states' certification processes are accessible to everyone.

The recertification process is another area the Committee could focus on where technology could be used to improve customer service. Most households need to reapply for SNAP every year (or for every 2 years for households with elderly or disabled members) and are required to submit periodic reports about changes in income and some other circumstances halfway through that period. But the recertification and reporting processes present hurdles for many households that result in eligible households losing out on benefits because of mail issues, difficulty scheduling telephone issues, a verification problem, or other procedural issues. Funding to support states making more use of certain technological advancements such as text messaging, reliable third-party data sources, or information from other programs could help keep eligible households connected to SNAP and save state agencies from needing to spend more time processing re-applications from households that lose benefits for procedural reasons.

- **Using data for outreach and enrollment.** Many individuals and families who have low incomes qualify for a package of benefit programs, but they often need to apply separately and provide paperwork multiple times to apply for and maintain different benefits. In some cases, a program can use data (such as income) that another trusted program has collected and verified to reduce burdens on state and local administrators and enable applicants to avoid having to provide the same paperwork to multiple offices. For example, all participants in SNAP, Medicaid, and Temporary Assistance for Needy Families monthly cash assistance are "adjunctively eligible" for WIC, which means the WIC program does not need to redetermine financial eligibility, but the family still must contact the WIC agency to apply.³⁶

In other cases states can use information provided to one program to trigger an application for another program, using a check box, for example, or for targeted outreach. These kinds of linkages hold substantial promise to improve efficiency and program participation but can be tricky for states and the Federal Government because of different administrative and jurisdictional structures. But leadership from Congress in creating the legal authorities and the expectation of cross-program enrollment, collecting and sharing data and best practices, and offering funding to support these efforts could help elevate the issue and smooth the way.

³⁶ Sonal Ambegaokar, Zoë Neuberger, and Dorothy Rosenbaum, "Opportunities to Streamline Enrollment Across Public Benefit Programs," Social Interest Solutions and Center on Budget and Policy Priorities, November 2, 2017, <https://www.cbpp.org/research/poverty-and-inequality/opportunities-to-streamline-enrollment-across-public-benefit>.

Conclusion

SNAP is a highly effective program that alleviates hunger and poverty, has positive impacts on the long-term outcomes of those who receive its benefits, and supports people in low-paid jobs and those between jobs. While there are ways in which SNAP could be improved, I urge you to protect SNAP so that it can continue to play its critical role in supporting food security and to make changes that will strengthen its effectiveness, particularly among racial and ethnic groups with high rates of food insecurity due to historical structural inequities.

The CHAIRWOMAN. Thank you to all our witnesses for your very powerful and informative testimony.

At this time, Members will be recognized for questions in the order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes in order to allow us as much time as possible to get through questions. Please keep your microphones muted until you are recognized in order to minimize background noise.

I will now begin with the gentleman from Massachusetts, Mr. McGovern. If you are on the panel, you are recognized for 5 minutes for your questions.

I am sorry. Mr. McGovern is not here. I now recognize the gentleman from Illinois, Mr. Rush.

How about the gentleman from California, Mr. Carbajal?

The gentleman from Florida, Mr. Lawson, you are now recognized for 5 minutes.

Mr. Lawson, we can't hear you. If you can unmute yourself.

Mr. LAWSON. Okay. I think you can hear me now.

The CHAIRWOMAN. Yes, sir. Please begin.

Mr. LAWSON. Okay. Madam Chairwoman and Ranking Member Bacon, I want to thank you all for having this hearing. One of the first things that I want to talk about is—and I guess this goes to Mr. Beal. In your testimony, Mr. Beal, you mentioned that the SNAP program kept a large number of small grocery stores in business. They might not exist right now during this pandemic. Could you further elaborate on that? And I am very interested in that statement that you made.

Mr. BEAL. Certainly, Representative. Yes, we operate stores on both sides of the state line. We operate stores in more affluent areas. We operate stores in more demographically challenged areas. As an example of what I mean by that, we recently—actually last July—opened a brand-new store. It was a replacement store that was in an area where over 25 percent of our total store sales are SNAP customers. And our store was losing money in that location. It was underserving the market. And we opened a new store in what would have otherwise been considered a food desert. And the residents and all the customers around that store were so grateful. They consider it their store. We are so proud to be a part of the community.

We know of another situation in Kansas City where a grocer closed the doors and couldn't get another grocer to go in. It was purchased by the landlord, who was a nonprofit agency in a predominantly Black customer base, as well as administrative. Our company worked with that landlord who now became a grocery owner for 18 months to help them get into the business, to learn the business. But they would not have a store in that area but for the SNAP program because so many of their customers and con-

stituents were on SNAP benefits. And we did this because we are a community partner. We didn't charge anything for paying all their bills, for paying their payroll. It wasn't our bank account. It was their cash. But we provided all those administrative services for 18 months to help them get in the business. And I assure you that had it not been for SNAP, that store wouldn't have survived, and neither would our new store have opened up in the area that we opened the new store last July.

Mr. LAWSON. Okay. Thank you. Now, Mr. Beal, there are specific ways that Congress can support these retailers and growers in the upcoming farm bill to make it easier for them to participate in SNAP online purchasing program. Do you have any recommendations that you could give to us for this farm bill?

Mr. BEAL. Certainly. The online SNAP process is very complicated. There are really three areas that I would like to share with the Committee that could be very helpful. First, NGA in particular would love the USDA to create a technical assistance center, and we believe that will go a long way toward solving these three issues. But, the first thing is there are no clear guidelines in terms of what it takes to get certified as an online SNAP grocer. There is nowhere to go. There is no central repository, no portal, anything we can go to. And so, each retailer is kind of out there on their own to try and figure out how to get online-certified.

Second is that when you do attempt to do this, you can send a letter of intent to the USDA, and it is like sending something out into a black hole. We don't get any kind of acknowledgment that the letter of intent or the inquiry has been received. You don't hear anything back from them. It could be 6 weeks, it could be 9 weeks, it could be something longer. You don't even have any idea whether you sent it to the right party.

And third, when it comes to certifying for online SNAP, the certification process is much different from what the states do with the WIC program, where the whole platform is certified. But with online SNAP, it is every single banner that an operator operates that has to get certified, even if the platform itself is the same and the only difference is the pricing on the products and the name on the banner. And, as I mentioned, we operate a number of different banners in our company; predominantly two, but we operate four different banners overall. And so, for us to certify—and that certification could be anywhere from 9 months to a year to get certified you have to go through that process with every single banner and not with the individual platform. So it is very, very cumbersome. And if the Committee could address those issues, particularly with a technical assistance center, it would be much appreciated by independent grocers.

Mr. LAWSON. Okay. Thank you. Very good. Madam Chairwoman, my time is running out, but if I get a chance at the end to talk a little bit more about students' access to SNAP. With that, I yield back.

The CHAIRWOMAN. Thank you so much, Mr. Lawson.

I now recognize the gentleman from Nebraska, Ranking Member Bacon.

Mr. BACON. Thank you, Madam Chairwoman, and I appreciate the opening comments from all three of our panelists today. And

my first questions are for Mr. Giacomo and Mrs. Cox. How can we better promote healthy foods for SNAP recipients? What are some logical, good ways we could help urge healthier eating? And I will go to Mr. Giacomo first.

Mr. GIACOMI. Thank you, Representative. I am very proud in the work that we do here on our SNAP Nutrition Education Program. I would love to see further investment in that program. That program goes out and meets people where they are at, looking at their dietary needs, and provides them with nutrition education, with exercise, with meals, things of that nature that allows that.

Second, I would say that, as Mr. Beal mentioned in his testimony, healthy nutrition incentive programs are definitely a way in which we could promote healthier eating. If you incentivize individuals by saying we will provide you with a rebate refund, additional SNAP dollars for all fruits and vegetables, things of that nature that you purchase, I believe that in itself would promote and would allow individuals to purchase these items and further stretch out the benefits that they receive each month.

Mr. BACON. Thank you, Mr. Giacomo. Mrs. Cox?

Mrs. COX. Thank you. Yes, so SNAP enables households to afford more healthy food, right? The fact that they are able to get these benefits, the other income they have, they are able to shuffle it around and purchase the food.

A couple of things. So, SNAP benefits, since they only can be purchased in grocery stores, they are actually more likely to purchase food that is healthier because the food in a grocery store is usually healthier than food that is purchased outside at a restaurant. Also, as both Mr. Giacomo and Mr. Beal said, there are the fresh incentives. And so, in a prior position that I had at AARP Foundation, we actually operated a pilot for older adults in Fort Lauderdale, Florida, where those who had hypertension, high blood pressure, or obesity, we actually gave them a gift card to purchase at a grocery store where they could only buy fresh fruits or vegetables or frozen vegetables. And we saw real change in their A1C, their hypertension, and their high blood pressure 3 and 6 months later. So, while the research doesn't show that restricting food makes people purchase more healthy food, we do see that incentives—when you are actually giving people Double Up Bucks or some other incentive to purchase fresh fruits and vegetables—works.

Mr. BACON. Thank you. I find it very insightful. A question for Mr. Beal. We have had some discussions in the past about what Mrs. Cox referred to about restricting what foods you could buy if they are unhealthy. And there is a lot of debate—is cranberry juice healthy and diet sodas not? I mean, there are a lot of different debates on this. But the main thing that we hear from—is from the grocery stores—how hard it would be to administer a program like that. Could you give us some insights on that as well? Because I think that that is a key factor in limiting what we can really do here. Go ahead.

Mr. BEAL. Thank you for offering me a chance to answer that question, because in our experience, we do participate in the Double Up Food Bucks Program. I testified in November 2016 regarding that, and we have been running that program now for 7 years,

and, as in Mrs. Cox's testimony, that has resulted in better food nutrition for those beneficiaries.

So, before we switched POS systems, we had what is called a loyalty program. And you may be familiar with a loyalty card that many grocers offer where you can track the purchases and stuff. And we had a system that was what I would call a Cadillac or the Maserati that made it very, very easy for us to conduct the Double Up Food Bucks Program. After we were forced to switch POS programs for other issues, we found out it became very challenging because the issue is on the Double Up Food Programs there is incentives provided for fresh produce purchasing, but the SNAP benefit is a tender type, okay? And so that transaction needs to know that it is only paying for, under the Double Up Food Bucks, fresh fruits and vegetables. And typically, the tender type doesn't know anything about what is in the order. It just knows the totals. And that is the reason for having and requesting a technical assistance center through the USDA that can help grocers marry up the two, what is in the order along with the payment.

We work with a local agency, nonprofit agency by the name of Mid-America Regional Council, MARC, that administers the program. And it is very cumbersome, but we do it in our stores, all 26 stores, to help provide that benefit. We're getting ready, MARC is getting ready to write a grant similar to what Mrs. Cox mentioned where we can participate in a program where doctors will write scripts that would be funded by a gift card program through the GusNIP program for SNAP customers, Medicaid customers, to just purchase fresh fruits and vegetables. But that is what the challenge is, is that the form of payment doesn't realize what is in the order. And you need to know that to make sure that you are only paying for what you want.

Mr. BACON. Thank you very much. My time has expired.

Mr. BEAL. Sorry.

The CHAIRWOMAN. Don't be sorry. That was really good information. Thank you.

I now recognize the gentleman from Massachusetts, Mr. McGovern. You can unmute and begin your questioning for 5 minutes.

Mr. MCGOVERN. Thank you, Madam Chairwoman. First of all, thank you for holding this hearing. And I want to thank the Administration for all it has done during the public health emergency to improve access to SNAP and the important but overdue increase in benefits for the Thrifty Food Plan.

And I want to start by reminding everyone that COVID showed us just how easily people can fall from stability into instability. And while our world continues to be unpredictable, it is essential that people know that there is support for them when times get hard.

So yesterday, I had a meeting with Dawn Pierce, who is from Idaho. She is going to be speaking at one of the upcoming listening sessions for the White House Conference on Hunger, Nutrition, and Health. But a few years back, she was working as a hospice nurse. And despite being someone who was taking care of other people's loved ones, she found herself in a place where she couldn't financially take care of her own loved ones. And she told me her story. And the thing that stuck out to me the most was that she was ridi-

culed multiple times at the grocery store when she was buying food for her family using her EBT card. In fact, she was told that, quote, “She didn’t look like someone who was on food stamps.”

And the reality is that the stigma starts with the rhetoric that comes out of this place, out of the Capitol. The stereotypes about people using SNAP are harmful and simply not true. And I know these stereotypes are advanced because there are some who are trying to push an agenda to try to diminish the program or cut the program. The fact of the matter is, is that $\frac{3}{4}$ of SNAP households with at least one working-age, non-disabled adult work while receiving SNAP. And we know that the harsh time limit for SNAP of 3 months of enrollment without a job does not increase employment. It throws people off of benefits and increases hunger. And yet there are people who still are holding onto that as something that we need to enshrine.

The bottom line is that people who aren’t working, and who are on SNAP, are often children, seniors, and disabled adults. And most participants who can work, do so. So, I really get frustrated when people spend their time trying to make it harder for people to access SNAP as if everybody’s dream is to be financially insecure enough to be on SNAP. Access to SNAP helps people move their lives forward faster.

And so, we need to start treating people with dignity, and how we draft and pass the next farm bill, starting here in this room, can send one of two messages: that we either care about people and we understand the importance of SNAP for people who are experiencing hard times, or we do not.

And I will just also say that many of the waivers put in place during the COVID-19 emergency just made life easier for people. And it will be a missed opportunity on our part if we do not reauthorize them before they expire.

So let me end by saying that if seeing your constituents and Americans across this country waiting in lines at food banks during COVID doesn’t move us all to do something more and appreciate the importance of programs like SNAP, I am not sure anything will. And let me be clear. I will not support any farm bill that guts the nutrition safety net for millions of Americans. I am not going to support passing legislation that increases hunger in this country. We have an opportunity to have a more thoughtful discussion in the aftermath of COVID. Again, I want to thank the Administration for their leadership and their sensitivity during this difficult time.

SNAP is an important program that deserves our support. And by the way, it also helps our farmers. There is an economic stimulus to this benefit as well. So, I just want to go on record to say as we look at the next farm bill, we need to find ways to strengthen the program, and we need to learn from its successes in the recent months. And again, Madam Chairwoman, thank you for your leadership on this, and I look forward to working with you as we move forward on the next farm bill.

The CHAIRWOMAN. Are you yielding back? You still have time, Mr. McGovern.

Mr. MCGOVERN. Well, I mean, again, the only other thing I would say is that it is important for us to talk to people with lived

experiences because, oftentimes, we say things in this Committee or on the House floor that may make a good soundbite in some circles but do not reflect the reality of what people are experiencing in this country. So, I have been talking to a lot of people with lived experiences, and SNAP has been a lifeline for them and their families. So, again, this needs to be an important part of the farm bill, one in which we strengthen the program and not try to punish people or try to diminish people who need the benefit.

And with that, I yield back.

The CHAIRWOMAN. Thank you, Mr. McGovern. Thank you for your partnership. Now, your time has expired.

I now recognize the gentleman from Pennsylvania. Mr. Thompson, you are recognized for 5 minutes for questions.

Mr. THOMPSON. Thank you, Madam Chairwoman.

Mr. Beal, when trying to get into the weeds, which is what we need to do with this farm bill, is preparing for the next one. And thank you all for your kind comments about the 2018 Farm Bill. I was the Nutrition Subcommittee Chairman during that process. It is near and dear to my heart. As a young couple, my wife and I, not under the Agriculture Committee jurisdiction, but Education and Labor, we were on the WIC program starting out as a young couple when we were expecting our first child, so I appreciate these programs. I want to make sure they are done right. I want to make sure that they are pathways to opportunity, meeting the immediate nutritional needs of these families who find themselves usually temporarily in financial distress. And the question is, how do we help them also move out of financial distress?

But my question is more of a technical question for you. I just had the check in. When section 4006 of the 2018 Farm Bill was drafted, when that was done, policymakers were very clear it was temporary. There basically was a moratorium on the processing fees because that had gotten to be a problem for our vendors, our independent grocers, our large grocery stores, our convenience stores. And so, we basically did a 5 year prohibition. But we also asked that, while providing interim certainty, that an expectation that stakeholders would all come to the table to coordinate and find practical compromises for this next farm bill, which, as we all know—so we have basically just under $\frac{1}{3}$ of this farm bill is left. Nineteen months from now it expires. We need to be prepared to reauthorize.

To the best of your knowledge, can you tell me about how that has been complied with? What has been the effort to stakeholders to come together to kind of coordinate and find practical compromise with the processors on these fees, so we have some suggested recommendations and solutions going into the next farm bill.

Mr. BEAL. Thank you for your question, sir. I can only speak from personal experience, but I will tell you of a recent experience that I had that kind of demonstrates what the quandary is. And, I am not a member of the board of NGA or FMI, which is Food Marketing Institute, but I do know that our wholesaler, Associate Wholesale Grocers out of Kansas City, it is a significant independent co-op. They held a roundtable discussion about 3 weeks ago Friday, maybe 4. Senator Marshall was there, and it was a dis-

cussion concerning EBT and electronic fees. You might be impressed with some of the parties that were there, but representatives from Kroger, from Walmart, many independent grocers, many state association convenience stores were there, and they were places for members of the banking community to be there. MasterCard and Visa did not send anybody to represent to sit down and talk about that, about the issues facing us.

I do know that most grocers make, on average, if they are lucky, one percent. I am not talking about the big public companies.

Mr. THOMPSON. Yes.

Mr. BEAL. And I will tell you that our credit card fees and debit fees, which debit is much preferred, was more than 1.12 percent of our business. And we don't get 100 percent of our tenders paid with credit card fees. But every time that there is a class-action settlement with the industry, and it has happened at least three times over the last 24 years I have been back in the grocery business, the rates just go up that the retailers get charged to pay for their fees. And I do know we have had a number of discussions amongst committees, other grocers about how the argument that there is so much fraud and stuff that is out there that they have to pay for with their fees can be easily simplified and totally abolished with the use of a PIN, with a credit card like they do in the majority of Europe. And so, the technology is out there. That is the same credit card companies, Visa and MasterCard. But there has, to my knowledge, been no discussion jointly with the banking industry and Visa and MasterCard to try and reduce the fees and rein them in. And we have the highest fees, credit card, electronic payment fees of any country in the world that I am aware of. And many countries have done something about it. So, we would welcome the opportunity.

Mr. THOMPSON. Well, I appreciate the effort that was made on this, very much so. And I am disappointed in, the stakeholders, as you had mentioned, that failed to show that this was—the expectation was set forth in the farm bill was for all the key stakeholders, not just the folks in the grocery business, the retail business, but quite frankly, also the processors. And, I would encourage them. We have a little shy of $\frac{1}{3}$ of the term of this farm bill left to go, I guess, before this one expires. And my expectation is the processors would come to the table and join you all to have a part, whether you were able to come to some agreement or some reasonable agreement that is left to be seen. But there is no excuse not to be at the table for the discussion.

Mr. BEAL. Can I clarify one thing just for the sake of factual.

Mr. THOMPSON. Please.

Mr. BEAL. Any time we are working with electronic payments, there is a processor which really just takes all the payments from the retailer and sends them off to basically MasterCard, Visa, and Discover.

Mr. THOMPSON. Right.

Mr. BEAL. So, it is not really the processors who charge a fixed fee per transaction, and it is well less than 1¢ in most cases, at least in our industry. It is Visa, MasterCard, Discover, Amex—the most expensive that actually charge the fees that we get hit with. And the chargebacks that we are still getting hit with, even though

they have come out with security on the EMV cards, still exist to this day, regardless of what they say. We would welcome that opportunity, but it is going to take a push from Members of Congress and from the committees to make that happen in my opinion.

Mr. THOMPSON. Thank you very much. Thank you, Madam Chairwoman.

The CHAIRWOMAN. Thank you, Ranking Member Thompson.

I now recognize the gentleman from California. I remind Members to keep their comments to 5 minutes. We extend some grace to our Ranking Member because he is our Ranking Member. Thank you.

Mr. Carbajal, please unmute and begin.

Mr. CARBAJAL. Thank you very much, Madam Chairwoman, and thank you to the witnesses here today testifying.

SNAP is critical to ensuring millions of Americans do not go hungry. When SNAP recipients use their benefits, Congress should not be overly scrutinizing every single purchase. We should let families make decisions, as other families do, that are best for them.

I certainly share the goal of many of my colleagues interested in promoting healthier eating by SNAP recipients and making sure that, like the rest of America, they get as much education as possible. But a few of my colleagues are doing more to regulate the ability of a SNAP recipient to buy a bag of chips than they are to ensure that someone purchasing an AR-15 is not a danger to others or themselves and/or qualified to own such a gun.

We also don't see near this level of scrutiny when the United States Government provides oil companies with subsidies. Sure, they could spend those subsidies however they want. We know that the USDA has proven that dietary habits of SNAP participants and non-participants are very similar. We know that participation in SNAP is linked with improved nutritional outcomes, compared to non-participants at similar income levels. We also know that SNAP is a successful public-private partnership, and for every \$1 the government spends on SNAP, up to \$1.50 is returned to the economy. There is a positive return to the economy from this very important program, and there is no evidence that SNAP purchases are contributing to poorer health outcomes.

Mr. Beal, can you elaborate on what benefits you see consumers and businesses receiving from a system that incentivizes healthy food choices instead of limiting what food SNAP recipients can purchase?

Mr. BEAL. I am not exactly certain what you are asking, but I can tell you from our participation with the Double Up Food Bucks Program, and not only do we work with MARC, the local agency, but the University of Kansas Medical Center, and they have actually done studies on improved health outcomes, similar to what Mrs. Cox mentioned with regard to the prescription program.

I also can tell you that when I have worked with the State of Kansas and Missouri—particularly Kansas, when they were considering a sugar tax on products that are being sold in stores—that it is very similar to the to the situation where we talked about restriction of certain food choices. Where the industry, the retailers, the people that have to abide by these rules and regulations would be left in a quandary and a great deal of uncertainty as to what

items would qualify if we started going down that road to limit choice. One person's version of what is healthy compared to somebody else and we could get nutritionists who would generally agree, but necessarily not agreeing on everything would be a bureaucratic nightmare for the USDA, but also for all the grocers that are asked to enforce a program and honor the program. And I would expect that there would be compliance issues and inspections, like there are today.

And so, not knowing what the specifics would be of what items would qualify or not, but to allow customers the choice, my personal view is—not NGA's—that that incentives like what we are talking about with the Double Up Food Bucks and with the prescription program, where we can actually focus on people's health outcomes and healthier eating, is a very, very strong way to go and would maximize the opportunities for people to improve health outcomes as well. I don't know if I answered your question.

Mr. CARBAJAL. Thank you. You did very good for not understanding my question completely. So, you did great. Thank you.

Mrs. Cox, in your testimony, you mentioned how food insecurity can cause long-term harm to children and families. Can you speak more to how hunger can impact life outcomes, and conversely, the benefits of SNAP on educational achievement and health outcomes?

Mrs. COX. Sure. Thanks for the question. So, we know that food insecurity impacts a child's ability to learn, pay attention in school, and grow. And so, research shows that children participating in SNAP, they face lower risk of nutritional deficiencies and poor health, which can improve their health over their lifetime. Also, SNAP helps children succeed in school, right? We understand that when children are hungry, they are not able to pay attention and they are also having behavioral issues.

There was a study that found that test scores among students in SNAP households are highest for those receiving benefits 2 or 3 weeks before the test. So, that suggests that SNAP can help students learn and prepare for tests and that when benefits run out and families are struggling for groceries, children's ability to learn is diminished.

To the last piece of just kind of the importance of SNAP for children overall, when children are fed, they are able to learn, they are able to pay attention, and they are able to grow. And I think that SNAP is an investment in long-term outcomes for our children and the health of our country.

Mr. CARBAJAL. Thank you very much. I am out of time. I yield back, Madam Chairwoman.

The CHAIRWOMAN. Right in the middle of a sip of water. Thank you so much, Mr. Carbajal.

I now recognize the gentleman from Tennessee, Mr. DesJarlais. If you are on the platform, can you unmute and begin your questions?

Mr. DESJARLAIS. I am. Thank you, Madam Chairwoman. I appreciate the opportunity to participate, and I thank the witnesses for participating in what is a very timely hearing. Considering the pending global food shortage, the record inflation, the price and cost of groceries, people are struggling all across the country. And, we want to make sure going into next year with this farm bill that

we have all the information and data we need to make sure that this program is stable and that we can provide it to the people who really need it.

And, Mr. Giacomi, I wanted to ask you a few questions as we prepare for this monumental task in the upcoming year. During the early days of the pandemic, your Connecticut Department of Social Services experienced a high of nearly 4,700 applicants arriving weekly, which was a 330 percent increase in the number of applications received weekly prior to the start of the pandemic. And now you are still receiving over 3,000 applications per week, which is up 176 percent.

So, I struggle a little bit with these numbers. One, I want to talk a little bit about work requirements; but two, businesses all across the country, certainly not just across Tennessee's 4th District, are struggling with labor shortages. And it is estimated from the U.S. Chambers of Commerce that we have 11.4 million job openings right now and up to six million unemployment workers. So, it looks like there is about two jobs for every worker that is out there looking for jobs. So, what are you finding in Connecticut in terms of people trying to find work that can't? Are you keeping any data on this? And are there any current requirements that people are seeking work?

Mr. GIACOMI. Thank you, Representative. The Department of Social Services does not track employment data to that extent. What we do track is we do have a very robust employment and training program, in regards to SNAP, which allows SNAP recipients not receiving TANF to have training in all sorts of industries, especially those that are most in need right now when you look at manufacturing, health care, *et cetera*. What we are seeing is individuals are still participating very robustly. They are attending our community college programs, our community-based organizations. They are able to come out with these degrees or certificates, and they are able to find employment, which then essentially—or hopefully—the intent is to allow them to be in a position to support themselves and no longer need assistance.

Mr. DESJARLAIS. Yes, I mean, that sounds good, but it doesn't reconcile with those numbers. The numbers that you are still seeing that are applying in this program that you say is effective doesn't seem to be working based on those numbers.

Again, trying to help us here as we write this farm bill, why do you suggest the necessity of broad-based categorical eligibility is so important when others consider it to be a loophole where people that are maybe wealthy are not necessarily qualified for SNAP continue to get benefits?

Mr. GIACOMI. So, I will say with broad-based categorical eligibility, it is not an automatic funnel into the program itself. While it allows us to give individuals, especially those in working families, the opportunity to apply and not necessarily be automatically rejected because of their gross income, they still do have to meet a net income test of a 100 percent of the FPL before they are able to receive assistance. So, those individuals that perhaps are wealthier or otherwise that are able to apply and perhaps get in the door under a 185 percent FPL still have to show us that their

need is there, and they meet this net income test prior to us providing them any benefits.

Mr. DESJARLAIS. Do you track at all? I mean, with the influx of illegal immigration across the southern border and it is record numbers, and this is going to obviously cause a drain on the SNAP program, are you tracking that at all?

Mr. GIACOMI. We do have numbers on those that are applying. I will say that if an adult comes in and is not identified as a permanent resident or in a qualifying category, they would not be eligible for assistance. So, we are not necessarily tracking the number of individuals that are coming in that we are denying because of this reason.

Mr. DESJARLAIS. Yes, I am just going to interrupt because my time is short. That is a talking point that I say you can Google how many non-U.S. citizens receive SNAP, and it says it is very difficult to get it. But that is not actually true because if you are a child under 18 or if you say you are seeking asylum, which pretty much everybody is right now, it is refugee status or asylum-seeking. So, all these people do qualify for the SNAP program, and for some reason we just want to ignore that. There is going to be a global food shortage. Americans are hungry, and we need to worry about taking care of Americans first.

And my time has expired. But I thank you for your participation.

Mr. GIACOMI. Thank you, Madam Chair, if I may respond really quickly to clarify my statement.

[The information referred to is located on p. 922.]

The CHAIRWOMAN. And we will get back to you on that, sir, please. I will give you time. Thank you.

The gentleman yields back.

I will just add something for the record. Only U.S. citizens and certain lawfully present non-citizens may receive SNAP benefits. Non-citizens who are eligible based on their immigration status must also meet other SNAP eligibility requirements, such as income and resource limits. Some specific, very specific, non-citizen groups are eligible without a waiting period, and they include refugees, asylees, victims of trafficking, Iraq and Afghan immigrants who worked as translators, interpreters, or were employed by the U.S. Government and received special immigrant visas. Other non-citizens can be considered after a waiting period if they are a legal, permanent resident and have worked for 10 years or of another qualifying status for 5 years. So, the idea that undocumented immigrants who are coming over the border automatically qualify for benefits like SNAP is just not true.

Mr. DESJARLAIS. Well, Madam Chairwoman—

The CHAIRWOMAN. I now recognize the gentlewoman from New Hampshire—

Mr. DESJARLAIS.—with all due respect, if you are going to reclaim my time, Madam Chair—

The CHAIRWOMAN.—Representative Kuster, you have 5 minutes. You can unmute yourself and begin your questioning.

Ms. KUSTER. Thank you, Madam Chairwoman, and thank you for that important clarification. And I think that is an example of what Representative McGovern was talking about with the stigma

and the inaccurate information that has been spread about people who need assistance to keep their children fed.

I appreciate this hearing, and I know this is not directly germane to SNAP, but I do want to mention, particularly after the last exchange, that food security programs are interwoven. And I cannot let this opportunity pass without commenting on the approaching cliff that students are facing when the school meal pandemic waiver expires at the end of this month.

Let's remember—and we have heard testimony today to this effect—children cannot learn when they are hungry. And I strongly believe that universal free school meals are a sensible investment in our young people and in the future of this country and our economy. Even if we don't pursue universal meals now—and by the way, for the record, I believe we should—letting these waivers expire will have a painful and abrupt impact upon students and their families, as well as creating an administrative nightmare for our schools. It does not need to happen this way. We have been at the ready to advance a reasonable extension in the House, and I hope that the Senate will get on board before we reach that cliff in just a few weeks.

Now, having said that, let me turn back to SNAP and how we can use the 2023 Farm Bill to continue to strengthen this critical lifeline for American families. As I mentioned at our hearing earlier this spring with Under Secretary Dean, I believe that the SNAP program's administrative flexibilities granted since 2020 have made an incredible difference in mitigating hunger throughout the COVID-19 pandemic. I have introduced legislation to make permanent the telephonic signature flexibility, which allows states to process SNAP applications without expensive technology and saves applicants from having to make the trip to a state office just to fill out paperwork.

Mr. Giacomi mentioned several of these COVID relief flexibilities in his testimony, including telephonic signatures. So, Mr. Giacomi, let me turn to you. Could you elaborate on the impact that the flexibilities have had on the ground, both for your department's administrative work and how families have been helped in securing benefits that they so desperately needed during COVID?

Mr. GIACOMI. Certainly. And thank you for the question. The flexibilities that we received throughout the public health emergency have been pivotal to our success in our ability to be able to serve the residents of Connecticut for the past 2 years. It was in March of 2020 that, quite suddenly, our offices closed for a period of time due to a shutdown here in Connecticut. And we had to pivot to a new way of serving individuals that perhaps we had been unable to do prior or were not experienced in doing. So, things such as that telephonic signature that you mentioned allowed us to have these individuals call us on the telephone, not be burdened to come into the office to find a closed door, not to try and have to go to the library or other institution that has internet access, or things of that nature in order to receive assistance. They were able to call us up on the telephone.

It also helped us to reduce churn, or the period of time that an individual is receiving and then perhaps is closed and goes back on to assistance. We were able to utilize some reports that we had of

individuals that were in danger of closing at the end of the month, get on the telephone, call those individuals and say, "Hey, listen, we have this opportunity for you to be able to renew your benefits directly from the telephone, if you are willing to take it," and keep those individuals receiving benefits and not having to worry about taking time off of work to come into the office or to complete a form or things of that nature. So, I think that flexibility, along with the others that were provided to us throughout the pandemic, as we said, were monumental and were definitely necessary in order for us to be able to do the work that we do.

Ms. KUSTER. Thank you. Shifting gears, I want to cover how we continue to strengthen SNAP in rural areas. And I think it is worth re-emphasizing that SNAP not only helps rural patrons but helps rural grocers remain economically viable. Mr. Beal, can you share briefly more from the retailer's perspective about how SNAP supports both stores and recipients in rural communities?

Mr. BEAL. Thank you for the opportunity. Even though we operate 26 stores in the greater Kansas City metro area, we have two stores that are in outlying areas, one that is in Harrisonville, Missouri, and its county seat. It is more rural. And I would say that most Americans underappreciate how many SNAP recipients live in rural America. I think there is a general perception that it is all in the big cities, where there are a fair percentage of SNAP recipients. But I would say not having enough money to afford groceries is an equal opportunity situation that isn't limited to the urban areas of town. And we see it in terms of—

The CHAIRWOMAN. I am sorry, Mr. Beal, the gentlelady's time has expired.

Ms. KUSTER. Thank you. I yield back.

The CHAIRWOMAN. Thank you. Thank you, Representative Kuster.

I now recognize the gentleman from Indiana, Mr. Baird, for your questioning. You have 5 minutes. Please begin.

Mr. BAIRD. Thank you, Madam Chairwoman. And thank you, Ranking Member, for holding this hearing about the SNAP program. And it is always insightful to me to hear from witnesses that are actually involved in the process, and I think that is important for us to make decisions on this Committee about the next farm bill.

So, I am going to start. Mr. Beal, you mentioned and I took down three things that were concerning to you, one of those being that there are no clear guidelines. The second was no response. Many times you don't get a response back. But the third one you mentioned, you said certifying online banners and there may be more than one banner. And that may be, to me in my mind, was a barrier to try and make it a smooth process for getting folks moving. So could you elaborate on that, well, on the banners, please?

Mr. BEAL. Certainly, sir. What I mean by banner is a trade name. So, I mentioned that we operate Hen House stores and Price Chopper stores. Those are considered different banners. And under the online SNAP program, you have to certify each of the banners, even though the underlying technology—I am a lead investor in a medical technology company the platform itself is the platform that needs to be certified. When it comes to WIC situations, it is the

platform that is certified, but with the online SNAP, it is the actual banner that needs to be certified. So, you have to go through the same process, the certification, even though there is a different name on the stores you operate.

Mr. BAIRD. So, continuing in that vein, what do you see would be helpful to make that more efficient?

Mr. BEAL. To come up with a situation or requirements that are similar to WIC, where you get the platforms certified. And once the underlying technology is certified as being secure, efficient for the retailer, that after that, once the platform has been certified, you don't have to recertify it just because you operate different trade names on the retail stores.

Mr. BAIRD. Thank you. I want to change just a little bit, but I do want to ask you, in terms of helping individuals make healthy choices for their diet, I think that is important. So, what do you think is an effective way for consumers to make those kinds of decisions while they are in the grocery store? And then, what can we do to stimulate them to stick to that kind of decision-making to their benefit long-term? So, if you have any thoughts there.

Mr. BEAL. Yes. And thank you for inquiring. As previously discussed, I think it is a general consensus that anytime you cook at home and you make your meals from fresh foods, that you are going to have healthier food outcomes than you would eating from fast food or from restaurants and stuff. So, any type of program incentives that could be a part of the SNAP program like the GusNIP program is today, that would encourage the eating of fresh fruits and vegetables. We hear nutritionists tell us, and we firmly believe that if you shop the outside, the perimeter of the store, you get in all the perishable departments, and that is where the healthier choices are for consumers. And so, any types of incentives along the lines of the GusNIP program are very, very highly recommended by us.

Mr. BAIRD. Thank you. And I am going to turn to maybe all the witnesses with this question. Sometimes, good intentions—I am talking about government programs—the good intentions don't really end up helping the people that we would like to help in a manner that we would like to help. And so, what can we do? Because we are coming down with this farm bill. What what do you think we can do to improve our models and our modes of delivery that really makes this program more efficient? Mr. Beal, we can start with you.

Mr. BEAL. I would say one thing in particular is to reduce any future administrative, regulatory, and financial burdens for the administration of the program. Like what we were talking about with the interchange fees, electronic fees would be a start, not allowing restrictions on the SNAP program because, as I mentioned earlier, you will be—you being the Members of the Committee and the USDA—would be forced to make choices between winners and losers on the food products that are in the store. And we have over 100,000 SKUs (stock keeping units), or what you would call UPCs (Universal Product Codes), in our database that some of our stores carry. And there are over 600,000 items, potential items, food items, and new items—over 20,000 a year coming out—and you would be forced to do that. So, I would strongly encourage that we

stay away from that and go towards an incentive program where there is encouragement for the healthier eating.

Mr. BAIRD. Thank you very much. And I am sorry I have run out of time, and so I don't have time to get to the other two witnesses. But some time I would be interested in hearing your thoughts.* Thank you. I yield back.

The CHAIRWOMAN. Thank you, Mr. Baird.

I now recognize the gentleman from Illinois. Mr. Rush, you have 5 minutes for questioning. Please unmute and begin.

Mr. RUSH. Thank you, Madam Chairwoman, for this outstanding hearing, very informative. And I want to thank all of our witnesses who are appearing before us today.

Madam Chairwoman, SNAP, as you know, is a necessary program, and my constituents certainly agree. And it is vital that we strengthen this program and build upon its successes in the next year's farm bill. One of the ways that I believe that we can strengthen the bill is by eliminating the asinine and the pointless and the extremely harmful restrictions that currently exist, prohibiting SNAP recipients from spending some of their SNAP funds on hot and prepared food. Madam Chairwoman, that is nothing but gross discrimination and biases built into this aspect of what is really a wonderful program.

As we have heard from witnesses today, we already make SNAP recipients jump through far too many hoops in order to receive these benefits. It is beyond ridiculous, Madam Chairwoman, that we prohibit them from buying hot food while allowing them to purchase the same food if it was at a lower temperature. How insulting can we be? And that is why, Madam Chair, I am proud to partner with Representatives Grace Meng and Brian Fitzpatrick earlier this year to introduce the SNAP PLUS Act of 2021 (H.R. 6338), which will fix this [inaudible] loophole in our social safety network.

Mr. Giacomi, I was happy that you, in your witness statement, that you supported lifting the restrictions on the purchase of hot and prepared food. Can you now tell the Subcommittee about the benefits that lifting those horrendous, unnecessary, very discriminatory restrictions will have to SNAP beneficiaries?

Mr. GIACOMI. Certainly. Thank you, Representative Rush. American shopping and eating habits have evolved. SNAP families need convenience and faster meal preparation. As a father of two children—two young children, I should say—I know what it is like to have to juggle between sports and other activities after school, and then also worrying about preparing a meal to make sure that my kids have something healthy and nutritious to eat. I know that I have the flexibility to be able to go to the store and get that rotisserie chicken that we have talked about or pick up a salad for myself and my household. I believe all Americans should have that same choice. I don't think that this rule, as it is written now, considers whether or not the food will even be consumed on the premises or taken home to eat.

I think that this rule, in itself, is most harmful to our homeless population, as well as those recovering from a natural disaster, be

* **Editor's note:** the responses to the information referred to are located: for Mr. Giacomi, on p. 923; and Mrs. Cox, on p. 924.

it in their town or their home, and cannot cook their food and need more choice. So, as I said, I think that it is a commonsense approach to looking at the flexibilities that Americans have, looking at the purchasing power of SNAP, and things of that nature, and adjusting to be in tune with the current situation that we see as Americans here.

Mr. RUSH. Would this provision that we are advocating, will it result in any financial or monetary increases for the American taxpayer?

Mr. GIACOMI. Not from my perspective. Perhaps Mr. Beal coming from the National Grocers Association may have a different perspective there.

Mr. RUSH. Well, I see I am running out of time, and so I yield back the balance of my time.

The CHAIRWOMAN. Thank you, Representative Rush.

I now recognize the gentlewoman from Florida. Mrs. Cammack, if you are ready, please unmute and begin your questions.

Mrs. CAMMACK. All right. Thank you, Madam Chairwoman. I am just going to jump right into questions because I know that we are kind of bouncing back and forth. But I will start with Mrs. Cox. Your testimony lauds the Administration for their update to the Thrifty Food Plan and mentions how the update will raise consumption of more nutritious foods beyond the simulations supported by CBPP. Can you walk me through the library of research that supports this claim? Are we missing an opportunity to study actual health outcomes rather than measuring consumption?

Mrs. COX. So, there is still more research to be done, right? But the research that has been done shows that the purchase of healthier foods, like leafy greens, lean proteins, as well as prepared items, saves families time, and it is also saving money. The Academy of Nutrition and Dietetics supported the Thrifty Food Plan update because it also gives families better access to healthier food. So, just a quick reminder that it just went into place in October of 2021, so we still have time and there is research to be done to show the actual improvement in how much the Thrifty Food Plan will benefit families.

Mrs. CAMMACK. Well, and I think we can all agree that saving time and money isn't always the more nutritious option. Convenience sometimes comes at a cost, oftentimes, a lot of times comes at a cost, and sometimes that is in the form of less healthy food.

I will open this up to all of our witnesses. Generally, I am concerned that SNAP promotes a perverse business of poverty. As someone who about a decade ago was homeless and my family has faced food insecurity, I can speak to the fact that a lot of the programs seem to miss the mark and seem to perpetuate more of a handout than hand-up type mentalities. So, you see organizations across the country that have come to expect continued or increased need in order to remain solvent instead of working themselves out of a job. They tend to just grow. So particularly in terms of Federal dollars and getting more Federal dollars, how are we engaging non-traditional partners in the delivery of services, and how do we rely more on the private-sector, which has more of a proven ability to deliver efficiency and results with minimal red tape? And we can

start with you, Mrs. Cox, and work our way through the witnesses here today.

Mrs. COX. No problem. So, to get to one particular point you made about working ourselves or organizations not working themselves out of business because of poverty. So, SNAP covers 41 million people, and that shows because there is immense need in this country, right? We are still coming out of a pandemic, so there has to be an ability for this country to catch those people when they are struggling. And that is what the programs do. The fact that there is continued need doesn't mean that the programs aren't working. They are actually working as intended because SNAP actually expands when there is need and it contracts when the need lessens. And so, when need is less, SNAP will also—the amount of SNAP participants will also reduce. And we have seen that before. Do you want me to yield some time to another?

Mrs. CAMMACK. Yes, I see—

Mrs. COX. Okay.

Mrs. CAMMACK.—Dan kind of chomping at the bit here, so I appreciate that, Mrs. Cox. I appreciate you yielding.

Mr. GIACOMI. Thanks, Representative. I will say this. Per person per day, benefits are around \$5 or so for SNAP participants. To me, in my opinion that is extremely low, especially when we look at the price of foods nowadays as well as other areas of inflation. What I will say is that I think states are in the best position to identify the need, whether it be of their workforce, whether it be of the state administrators, *et cetera*, and identify what work model works best for them. So, in my opinion, if you are asking me, I think allowing states to be able to look at their workforce, see what works best and respond in kind would be the way to go about things.

Mrs. CAMMACK. Excellent. Any remaining—

Mr. BEAL. Mike Beal, is it okay?

Mrs. CAMMACK. There we go.

Mr. BEAL. In response to your question. I would second that testimony. And from a grocer's perspective, I do believe that the administrative burden currently to grocers because of the SNAP program, is about as painless as it gets, with the exception of the online. It is very, very efficient for stores to take and perform the SNAP with as little red tape as possible currently.

Mrs. CAMMACK. Thank you. My time has expired. I appreciate it. Thank you. And with that, I yield back. Madam Chairwoman.

The CHAIRWOMAN. Thank you, Mrs. Cammack.

I now recognize the gentleman from California. Mr. Panetta, you have 5 minutes. When you are ready, you can begin.

Mr. PANETTA. Thank you, Madam Chairwoman. I appreciate this. And thank you to the witnesses for being here discussing a very important topic as well, first of all, as we know, as the country saw and experienced throughout the pandemic—and that is, obviously, access to our Supplemental Nutrition Assistance Program.

Obviously, we have the farm bill coming up in 2023, and I do hope to be a part of this Committee in which I can continue to ensure that obviously SNAP not just plays a majority role in the farm bill, but that it grows and expands. And I think we have some good evidence, based on what we saw during the pandemic, as to how important and how vital and how crucial the Supplemental Nutri-

tion Assistance Program is. But we also want to make it more and more accessible.

So, what I would ask you is—and either of you can answer this question—is what is my opening argument for when I talk about SNAP when it comes to the farm bill? Obviously, I think we understand the basics, but what opportunities are there? How can we improve participation to make sure that those who are eligible are actually connected to this very, very important benefit?

Mrs. COX. I will start. I think your opening argument would be that SNAP as it is, the structure itself, we need to maintain it, right? We saw how important and quickly it was able to respond during the recession and thanks to the great efforts of Congress to add additional boost, it was quick, and people would spend their money right in their communities. So, first, we want to keep the structure.

Second, when we talk about access, a piece of it is looking at those people who are not eligible or who think they are not eligible and don't know that they are eligible, like we mentioned, some college students and we are talking about some veterans.

And then, another key piece for the Center is the 3 month time limit for unemployed adults without children in their home. This is just a harsh time limit. And there is no research that shows taking away food from people is going to make them be able to work. We have to remember that the people who we are talking about on SNAP are usually low-wage workers. They are the ones that are in hospitality, are frontline workers in grocery stores, and those were the places that were hardest hit, so they are the ones that are having the hardest time to work, right, and with finding work.

As a legal aid attorney, I had clients who worked, and they still were eligible for SNAP. So, I think it is about making sure to protect the structure and ensure those who are eligible are able to get on. And we look at those who are eligible and don't know, and make sure that they know that they are eligible. So, I will yield some of my time to my fellow witnesses.

Mr. PANETTA. Sure. Mr. Beal?

Mr. BEAL. Yes. Thank you for your question. As a retailer, we are just part of the delivery mechanism, right? I don't have anything to do with eligibility qualification. But here is what I do know. Food is a very basic human need. We all know that, right? And I will tell you what we see anecdotally. When people don't have the money to buy food, we know what happens. They are still going to find a way to get food. And what we see when they can't afford the food—we see it in our stores today increasing because of inflation, the price of gas, housing, and everything else—is that we see our theft go up. Which is what we call *shrink*, okay? And people have to solve that need for the very basic of all human needs, right? And so, that is what we see in our stores going up and increasing. And we also discuss that with other retailers in our share groups, and we are very concerned about that. So, that is just an anecdotal piece of evidence.

Mr. PANETTA. Understood. Thank you. Going back to you talked about college and obviously as a supporter, original cosponsor of the EATS Act (H.R. 1919, Enhance Access To SNAP Act of 2021), I think we can do better to level the playing field, especially when

it comes with our college students. Can you go into some of the college student SNAP rules and how difficult they can be and how we can streamline them?

Mrs. COX. Sure. So, currently, anyone who attends college more than part-time is ineligible for SNAP unless they are taking care of a child that is 6 years and older, working at least 20 hours, or maybe participates in work study or a part of another kind of employment and training program. So, it is a really strict exemption. And I think that this rule was made at a time when the idea of a traditional college student isn't what we really see now. And so, it is time to think about who are our traditional college students now. And, maybe think about ways that we can make sure that those who are really in need are still able to access benefits in college so they can finish.

Mr. PANETTA. Great, great. My time is up. I just want to thank both of you, not just for your service, but providing me evidence in which I hope to use next year, especially with the 2023 Farm Bill and securing our Supplemental Nutrition Assistance Program. Thanks to both of you. I yield back, Madam Chairwoman.

The CHAIRWOMAN. Thank you, Mr. Panetta.

Seeing no Minority Members on the platform, I now recognize the gentleman from the Northern Mariana Islands. Mr. Sablan, you are recognized. Please unmute and begin your questions.

Mr. SABLAN. Yes, Madam Chairwoman, thank you very much for holding today's hearing on this very important topic. I am just—Mr. Giacomi, I will—again, thank you to all the witnesses for joining us today. But Mr. Giacomi, SNAP employment and training programs helps SNAP participants gain skills training or work experience to increase their ability to obtain regular employment that leads to economic sufficiency, at least enough so they don't need help with nutrition assistance. But these federally-funded state-administered programs also help reduce barriers to work by providing individuals with support services such as transportation, childcare as they prepare for and obtain employment. And as mentioned by Mrs. Cox, funding for these programs is not available to communities like the Northern Mariana Islands, which are not included in SNAP and instead receive block grants. So, how important to Connecticut is the employment and training program connected to SNAP?

Mr. GIACOMI. Thank you, Representative. It is extremely important. It is one of our top tier pillars in Connecticut for the SNAP program is to be able to offer SNAP employment and training. You will see if you happen to get a chance to read my written testimony two very valuable success stories of our SNAP employment and training program. We are very proud of the work we do. We are very proud to be able to partner with all of our community colleges here in the state, as well as community-based organizations. And we see the fruits of our labor. And we feel that, through employment and training, it is one of those tangible pieces of the SNAP program and the support that SNAP provides outside of just the nutrition that allows individuals to become self-sufficient, to have the training, obtain a job, and be able to support themselves and their families, going forward.

Mr. SABLAN. Thank you. And let me now, Mrs. Cox. Mr. Giacomi just told us how important these education and training programs are to Connecticut and how successful it has been to beneficiaries of SNAP. Have you also seen similar situations or results in the several states where SNAP, of course, is available?

Mrs. COX. Yes, great. And thank you for that question. We have seen a lot of success stories. Specifically, Washington State has a really amazing E&T program where they are able to kind of provide wraparound services where people are getting the necessary training and they are actually trained and placed into positions, in a field that they will be able to keep work. So, there is apprenticeship. There is subsidized employment with certain industries. I would love to give you more information specifically on Washington State. And I also believe I have read about the State of Louisiana also having a pretty comprehensive and successful E&T program, so I am happy to give you more information on that.

[The information referred to is located on p. 925.]

Mr. SABLAN. Thank you. And, it just is very important to provide this skill training, these education opportunities to those, especially in the United States, especially to those, some of them who live in the poorest part of the country, like the Northern Mariana Islands, American Samoa, and Puerto Rico. And so, looking at the 2023 Farm Bill, it is my hope that we could include language that would allow the inclusion of education and training programs to those receiving block grants.

Madam Chairwoman, thank you. Thank you for this hearing, and I yield back my time.

The CHAIRWOMAN. Thank you, Mr. Sablan. I now recognize the gentlewoman from Ohio, Ms. Brown. You have 5 minutes. Please unmute and begin your questions.

Ms. BROWN. Thank you, Madam Chairwoman. And thank you to our expert panel for being here today. Your perspectives are helpful as we look ahead to the next farm bill.

The SNAP program has proven to be an anti-poverty program that has shown time and time again to be effective and efficient. The SNAP program feels very close to home, as almost one in four people in my district receives monthly SNAP benefits. It is important that, as we look ahead to the next farm bill, we are thinking about how to improve the SNAP program so that it works for each participant, no matter if you are a senior, a veteran, a family with young children, disabled or simply have fallen on hard times.

So, Mrs. Cox, you mentioned in your testimony how quickly the SNAP program was able to adapt during the COVID-19 pandemic. What do you attribute that to, and what are some of the ways to streamline and modernize the SNAP program as we are thinking about the next farm bill?

Mrs. COX. Thank you for that question. So, the reason it was able to respond so quickly is because of its structure, right? Literally, its ability to expand and contract. So, it is based on need. When there are more people who have need, more people are able to get SNAP and then they are quickly able to spend those SNAP benefits in their local communities. So, that is one.

And your second question was about how we could strengthen it. And I think there are a couple of pieces when we think about how

to strengthen it, going forward. One is when people come in, they are usually eligible or connected to other benefits. So, if we start to think about how do we use data better, right? We know these individuals; they are showing up. How do we share data across programs to make sure people get on? As well as something that Mr. Beal brought up about the online purchasing, so once you are on, we are getting you on, we are sharing data, we are using telephonic signature, a lot of new things that we learned during the pandemic. How do we make sure that people are able to access their benefits so those in rural communities, those who are able to get to the grocery store, they are better able to use online purchasing pilots? That would be another strategy, I would suggest.

And then the last one, also around access, in addition to connecting people based on data is also really taking a look at some of the categories of people who either think they are eligible, like we talked about, or those who really are eligible and seeing if there is an opportunity to rethink our rules, like the rule around college students and also the time limit.

Ms. BROWN. Thank you so much.

Mr. Beal, from the grocers' perspective, can you share what are some of the ways to streamline and modernize the SNAP program as we are thinking about the next farm bill?

Mr. BEAL. Thank you for your question. I have already shared the comment about creating a technical assistance center as part of the USDA to help retailers get online, but also the GusNIP incentive program, which I think has a lot to do with encouraging greater nutrition and nutritional eating habits. The technical assistance center would go a very long way towards helping find solutions for grocers right now that are forced to navigate individually on their own. Those are two really, really big issues.

But I would also note from experience from working in the Double Up Food Bucks Program, that despite what the common notion may be, there are many other people out there that are eligible and would qualify for SNAP benefits who aren't even aware of that. And so, the communication piece, we have learned that it is dependent upon a lot of nonprofit agencies for these individuals to find out. And oftentimes there are stigmas associated with it that they choose not to participate in the program. And so, that is a challenge. I am not sure how to solve that challenge except with better communication. But this technical assistance center would go a long way towards helping create incentives to get healthier eating, too.

Ms. BROWN. Thank you so much. One of the most important provisions in the last farm bill was the reevaluation of the Thrifty Food Plan. This has been a crucial and long overdue update, and it comes at a time when it is most needed. Mrs. Cox, can you talk about why it is important for the Thrifty Food Plan to be reevaluated often? And in your view, how often should it be revisited?

Mrs. COX. Thanks for that question. So, as we know, the Thrifty Food Plan update was long overdue, right? The amount of benefits people were getting hadn't risen, other than for inflation, since the 1970s. And we saw how many things have changed from the 1970s to now and how working families consume and cook food. So, I think that it was important to have the current revision.

As far as how often, I think I would leave that up to USDA because they are better equipped to figure out exactly what families need. But it is something we want to make sure to keep our eye on because times are changing as we see all the time and what people eat and how much time they have.

Ms. BROWN. Well, thank you. The nutrition programs are critical in helping people get back on their feet in these difficult times, and so I do believe that these programs cannot be a bargaining chip that gets subjected to partisan politics. And I see my time has expired. So, with that, I will yield back. Thank you, Madam Chairwoman.

The CHAIRWOMAN. Thank you.

I now recognize the gentlelady from North Carolina, Ms. Adams. You have 5 minutes. Please unmute and begin your questions.

Ms. ADAMS. Thank you, Chairwoman Hayes and Ranking Member Bacon, for hosting today's hearing. And to our witnesses, thank you as well for your testimony.

The Supplemental Nutrition Assistance Program, SNAP, is one of the most effective tools that we have to combat hunger and food insecurity. In the last year, the reevaluation of the Thrifty Food Plan increased benefits by an average of \$36 per month per SNAP recipient. Prior to 2021, the Thrifty Food Plan was last updated in the 1970s.

Tens of millions of Americans depend on SNAP for their meals, even though SNAP benefits are not sufficient to feed families or prevent child hunger. And that is why I have introduced my Closing the Meal Gap Act (H.R. 4077), which will strengthen the SNAP program for millions of people affected by COVID-19, as well as older Americans, people with disabilities, children, struggling parents, students, unemployed and underemployed people, and veterans. Mr. Giacomini, states have a significant responsibility in administering SNAP and related programs shouldering 50 percent of those costs. So, your testimony detailed the positive changes to SNAP made in the 2018 Farm Bill. What should the Committee prioritize in the 2023 Farm Bill to improve SNAP rollout for state agencies?

Mr. GIACOMINI. Thank you, Representative. I think you made a tremendous point there in saying the costs associated and the burden associated with administering the program. That burden is shared not only by states themselves, but also by the Federal Government, who is paying the other 50 percent, but also about clients who are trying to navigate these rules that are often changing or difficult to understand or remember or what have you. So, if I was to prioritize anything, it would be to simplify the administration of the program for both states and individuals, allowing for funding for increased online or telephonic options, and base eligibility upon other means-tested programs. If you are receiving SSI, for example, you should not have to reapply or apply for SNAP benefits when the government has already decided that your income and assets are low enough that you qualify for SSI. Allowing individuals time to do other things than having to go to multiple agencies to apply for different programs, provide the same verifications often multiple times to these programs, allows them to do things like plan out meals, looking for work, things of that nature. So, simplifying

it works, I think for, as I said, both the recipients and the agencies in most cases.

Ms. ADAMS. Okay. Thank you, sir. Thank you.

Mrs. Cox, during times of economic upheaval, lawmakers have turned to SNAP to make sure that our neighbors in need can still put food on their tables. As a result of the COVID-19 pandemic, our country experienced one of our greatest economic upheavals, with millions of jobs lost and incomes cut. So how did SNAP respond in this time of crisis? And what lessons have we learned from this? And what should we be applying, going forward?

Mrs. COX. Thanks for that question. So, SNAP did exactly what it is meant to do, right? It responded to rising need. It responded quickly to those deteriorating economic conditions, and it actually pushed back against food insecurity and other forms of hardship that we saw since it was able to deliver additional food assistance. We saw calls to 211 requesting help with food and visits to food banks spiked dramatically in the early weeks of the pandemic, but the annual measure of overall food insecurity actually remained level. So, it shows that the quick actions of Congress and SNAP structure itself actually warded off a lot of pain.

I think what we learned is that SNAP's structure and its ability to expand is useful and we want to keep that. And I think a few lessons that we can take is that how do we be more innovative in the delivery and redemption of SNAP? Kind of piggybacking off of Mr. Beal and Mr. Giacomi, the expansion of online purchasing pilot and the increased use of the telephonic signature I think are our big takeaways.

Ms. ADAMS. Great. Well, thank you very much. And hopefully we will take advantage of those takeaways and do the right thing because it is right. Thank you so much for your responses. And, Madam Chairwoman, I yield back.

The CHAIRWOMAN. Thank you. I now recognize myself for 5 minutes for questioning.

Expanding SNAP eligibility has a proven track record of lifting families out of poverty and improving health outcomes. Several states and Territories have received additional emergency SNAP benefits as a result of COVID-19 relief efforts. That includes disabled veterans who often hesitate to apply for SNAP benefits but are nearly 22 percent more likely to experience food insecurity.

Mr. Giacomi, I appreciate your perspective and your focus on efforts to help families with the highest needs. What improvements do you recommend in the upcoming farm bill to ensure that veterans are able to access SNAP without facing unnecessary burdens?

Mr. GIACOMI. Thank you. As you will see in my testimony as well, my written testimony, veterans are a group of individuals that have long been overlooked. I think there is a need to look at the income that they are receiving and see whether or not that is something that can be excluded in eligibility determination. I think there is also a way of looking at perhaps the disability rating for veterans and expanding upon that to allow for more veterans to qualify for SNAP assistance in order to receive the help that they need.

The CHAIRWOMAN. Thank you. I introduced legislation, the Feed Hungry Veterans Act (H.R. 7272), to tackle this very issue, and I look forward to working to be sure that this provision is included in any upcoming farm bill.

In our State of Connecticut, 77,000 people are lifted out of poverty every year by SNAP, including an estimated 31,000 children. Broad-based categorical eligibility has been proven to ease the benefits cliff that exist for recipients that are close to the income and assets level, allowing them to remain eligible. Connecticut utilizes broad-based categorical eligibility to set our gross income limit at 185 percent of the Federal poverty line and waives SNAP assets limit, which would otherwise prevent recipients from saving or having assets that exceeded \$2,500. Can you elaborate on the effectiveness of this Connecticut formula and the impacts we have seen on beneficiaries and administrators of the program?

Mr. GIACOMI. Certainly.

The CHAIRWOMAN. From high-cost states. I want to just add that we are a very high-cost state, so it is important.

Mr. GIACOMI. Absolutely. And that was what I was going to mention as well. What we see in Connecticut is that there are residents in around 35,500 households that are able to take advantage of the SNAP program because of our increased gross income level through broad-based categorical eligibility. These are individuals that not only, as I said, are our working poor, they are individuals that are working families that have children. We see that 35 percent of these families, 35 percent of these individuals, rather, are aged birth to 18.

So, allowing them to get in the door, so to speak, because as I mentioned previously, they do still have to meet other criteria in order to receive assistance, then opens up other opportunities, such as the ability to receive WIC, Head Start, the National School Lunch Program, and a host of other areas that allow them to not have to decide between paying rent or buying clothes for their children and feeding themselves and their kids that month. So, I believe it has been a tremendous impact on our residents. But, as you mentioned, it is also a tremendous help administratively. It allows our eligibility workers to not focus on minute changes each month and instead ensuring that the benefits that we are giving are correct and are proper and looking at cases and ensuring that only individuals that are eligible to receive do receive the benefits.

The CHAIRWOMAN. Thank you.

Mrs. Cox, the Families First Coronavirus Response Act (P.L. 116-127) included provisions that temporarily suspended the time limit for ABAWDs. While we are coming up on the end of that, and the pandemic is still happening, can you elaborate on why the waiver of the time limit continues to be important?

Mrs. COX. Sure. Thanks for that question. So, what we saw in this pandemic, right, was a huge upheaval where most of the jobs that our SNAP participants usually participate in—whether it is in grocery stores, at factories, as childcare workers, as home health aides—those were the jobs that were lost, and so those were the jobs that are still taking a while to open back up. So, it is super important at this time that we make sure that that time limit isn't implemented.

And one thing that I know we look at is the overall national unemployment rate. And what happens with the national unemployment rate is it really masks local unemployment levels, right? So, the unemployment rate in one place, it looks very different than an unemployment rate in a different place. So I don't think we can look at it from a national unemployment rate to make decisions on local conditions.

The CHAIRWOMAN. Thank you. Thank you for that answer, Mrs. Cox. Seeing no other Members on the platform. I think that concludes our Member questions. Before we adjourn, I invite the Ranking Member to share any closing comments he may have.

Mr. BACON. Thank you. I will just simply say I appreciate our three panelists. Thanks for your insights. And with that, I will yield back.

The CHAIRWOMAN. Thank you to the Members of the Committee for attending this critical hearing today. And I join the Ranking Member in thanking our panelists, who offered very different and unique but equally important perspectives to this issue that we are all attempting to tackle.

As we continue to review the 2018 Farm Bill and look forward to the 2023 Farm Bill, I will keep in mind what each of you has said today. It is clear that hunger continues to be a pervasive issue in our nation. In the upcoming farm bill I will work to ensure SNAP, in conjunction with other Federal nutrition programs, meets the needs of millions of Americans who struggle with food insecurity.

Finally, as we were reminded by our Chairman during the last SNAP hearing, the farm bill is special. It is one of the few long-standing, bipartisan legislative packages in Congress with a long history of passing, with a large coalition of support from urban, suburban, and rural Members. Congress joins together to pass the farm bill every 5 years because it supports our nation's food system, from the farmer to the consumer and everyone in between, especially hungry children. SNAP is at the heart of that coalition because, like the farm bill itself, it provides support to every part of the food economy.

In closing, I would just like to invite Mr. Beal to, if you would, I would be very interested to hear the end of your answer on the impact on rural communities and ways that we can improve the program from all of our witnesses. Anything that was not covered today, I invite you to share that for the record, because that is definitely for the attention of every Member on this Committee. Thank you all for joining us today.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any question posed by a Member. This hearing of the Subcommittee on Nutrition, Oversight, and Department Operations is now adjourned.

[Whereupon, at 12:15 p.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED BLOG BY HON. DON BACON, A REPRESENTATIVE IN CONGRESS FROM NEBRASKA

Congress Must Act to Help States Realign Medicaid and SNAP Renewals

May 16, 2022

By CHLOE GREEN, American Public Human Services Association & HANNAH MANIATES, National Association of Medicaid Directors

In March 2020, Congress acted swiftly to pass bipartisan legislation to respond to the COVID-19 pandemic. This legislation—the *Families First Coronavirus Response Act (FFCRA)*¹—included changes to Medicaid and the Supplemental Nutrition Assistance Program (SNAP) to ensure that people would continue to receive timely and safe access to benefits during this time of crisis. Due to a “continuous enrollment” requirement in the FFCRA, Medicaid programs have not disenrolled members during the Federal COVID-19 public health emergency (PHE) declaration. While this policy was critical to ensuring people had reliable access to health care during the PHE, it meant that households maintained benefits even if they did not meet the usual eligibility criteria for the program. The FFCRA also granted SNAP programs additional flexibilities to adjust issuance methods and application and reporting requirements; *these flexibilities were crucial*² to increasing equitable access to SNAP benefits as demand for nutrition assistance reached unprecedented levels early in the pandemic.

When the Federal public health emergency declaration ends, state Medicaid programs *will be required*³ to redetermine eligibility for all of their members, at the same time as the SNAP administrative flexibilities expire. With the vast majority of states jointly processing SNAP and Medicaid eligibility, the expiration of these flexibilities will create a massive operational undertaking for state agencies—and could lead to delays and poorer customer service for members.

Realigning Medicaid and SNAP Renewals will Reduce Burden for Families

Because eligibility for both Medicaid and SNAP is primarily based on household income, many people participate in both programs: as of 2017, *89% of children*⁴ receiving SNAP benefits were also enrolled in Medicaid or CHIP. *Most states use integrated models*⁵ to simultaneously process Medicaid and SNAP eligibility, which reduces the amount of paperwork that families must complete to apply for or renew their benefits, while also reducing workload for state agencies.

During the COVID-19 public health emergency, state Medicaid and SNAP programs have been operating under different rules for their redeterminations and recertifications of eligibility. However, in creating these much-needed flexibilities for members and administrative staff, SNAP and Medicaid recertification dates have become misaligned for many households—potentially doubling the amount of paperwork each year that families will have to complete moving forward.

At the end of the Federal public health emergency, *states will have up to 14 months*⁶ to redetermine eligibility for their entire Medicaid caseload, representing a crucial opportunity to re-align these dates. However, the FFCRA’s SNAP periodic reporting and recertification date flexibilities are set to expire at the end of the PHE, meaning that states will lose a key tool for realigning certification dates.

State Agencies Face Urgent Workforce Challenges

State Medicaid and SNAP agencies are facing another major challenge: bringing on enough employees to handle the massive amount of work associated with Medicaid redeterminations. Over the past 2 years, *state Medicaid agencies have been preparing*⁷ for the end of the public health emergency by cross-training staff from

¹ <https://www.congress.gov/116/plaws/publ127/PLAW-116publ127.pdf>.

⁵ <https://www.kff.org/report-section/medicaid-and-chip-eligibility-enrollment-and-cost-sharing-policies-as-of-january-2020-findings-from-a-50-state-survey-enrollment-and-renewal-processes/>.

⁶ <https://www.medicaid.gov/federal-policy-guidance/downloads/sho22001.pdf>.

⁷ <https://www.medicaid.gov/resources-for-states/downloads/state-unwinding-best-practices.pdf>.

other agencies to help with redeterminations, leveraging vendors and third-party contractors to support case processing, and re-hiring retired eligibility workers.

SNAP agencies, however, face unique restrictions on the types of workers they can use. Unlike in Medicaid, SNAP agencies are *federally required*⁸ to use “merit system employees” for certification interviews and eligibility determinations, meaning that they cannot use contract workers or consultants for most functions. In states where SNAP staff also conduct Medicaid redeterminations, this means that agencies will be facing a tidal wave of work with limited options for deploying short-term contractors to help. This could lead to issues with timeliness of application processing, increased churn, and poorer customer service.

Congress Must Act to Support States with Integrated Eligibility Systems

Realigning Medicaid and SNAP renewals is an important policy goal. The Centers for Medicare and Medicaid Services have authorized additional flexibilities for Medicaid programs, including the use of 1902(e)(14)(A) waivers, to streamline the redetermination process following the end of the public health emergency. But Congress must act to give SNAP programs similar flexibilities.

Specifically, Congress should do three things to help states with integrated SNAP and Medicaid eligibility systems:

1. **Extend flexibilities that allow the USDA to adjust SNAP issuance methods and application/reporting requirements.** This will help states with integrated eligibility systems re-align Medicaid and SNAP renewal dates, reducing administrative burden on families.
2. **Expand non-merit staffing flexibilities for the SNAP program.** This would allow states to bring on additional short-term staff to help process Medicaid redeterminations in integrated eligibility states following the end of the Federal public health emergency, ensuring timeliness and good customer service.
3. **Provide states with adequate planning time and resources.** Congress has *considered new legislation*⁹ that would change how and when states conduct Medicaid redeterminations. States would need time to prepare for this type of change—including time to implement IT systems changes, train staff, and communicate with members—so at least 120 days of advance notice is essential. Congress should also provide states with a phase down of the enhanced Federal funding that is tied to the public health emergency to ensure states have the resources they need to conduct redeterminations.

The COVID-19 pandemic has had significant impacts on Medicaid and SNAP programs, which are facing increased demand, a reduced workforce, and changing Federal regulations. In order to mitigate the negative impact of the end of the public health emergency on families, Congress must give states the tools they need to transition off of COVID-related flexibilities. These tools will ensure that states can continue delivering efficient, effective, and high-quality services to the millions of people served by Medicaid and SNAP.

SUPPLEMENTARY MATERIAL SUBMITTED BY DANIEL R. GIACOMI, SOCIAL SERVICES PROGRAM ADMINISTRATION MANAGER, CONNECTICUT DEPARTMENT OF SOCIAL SERVICES

Insert 1

Mr. DESJARLAIS. Do you track at all? I mean, with the influx of illegal immigration across the southern border and it is record numbers, and this is going to obviously cause a drain on the SNAP program, are you tracking that at all?

Mr. GIACOMI. We do have numbers on those that are applying. I will say that if an adult comes in and is not identified as a permanent resident or in a qualifying category, they would not be eligible for assistance. So, we are not necessarily tracking the number of individuals that are coming in that we are denying because of this reason.

* * * * *

Mr. GIACOMI. Thank you, Madam Chair, if I may respond really quickly to clarify my statement.

⁸ <https://www.fns.usda.gov/snap/non-merit-system-personnel-guidance-call-centers-2020-revision>.

⁹ <https://www.finance.senate.gov/download/finance-committee-build-back-better-text->.

The Connecticut Department of Social Services (DSS) does not provide SNAP benefits to undocumented non-citizens; rather, it provides SNAP benefits only to certain lawfully present non-citizens who have been granted a qualifying immigration status, in accordance with Federal law. *See generally*, 8 U.S.C. §§ 1611 (restricting eligibility for certain Federal benefits only to qualified aliens) and 1641 (defining the term “qualified alien”).*

Therefore, DSS does not track the number of undocumented non-citizens receiving SNAP benefits because it simply does not provide such benefits to these individuals, and accordingly there is no such thing as a drain on the SNAP program as a result of providing benefits to undocumented non-citizens.

Insert 2

Mr. BAIRD. Thank you. And I am going to turn to maybe all the witnesses with this question. Sometimes, good intentions—I am talking about government programs—the good intentions don’t really end up helping the people that we would like to help in a manner that we would like to help. And so, what can we do? Because we are coming down with this farm bill. What what do you think we can do to improve our models and our modes of delivery that really makes this program more efficient? Mr. Beal, we can start with you.

* * * * *

Mr. BAIRD. Thank you very much. And I am sorry I have run out of time, and so I don’t have time to get to the other two witnesses. But some time I would be interested in hearing your thoughts. . . .

The next reauthorization of the farm bill presents an opportunity to review the program with the benefit of lessons learned during the temporary government shutdown of 2019 and the COVID–19 pandemic that began in 2020. The experience of administering the program during the shutdown and the pandemic has demonstrated the value and importance of program innovations, some of which should be made permanent, but has also revealed additional steps that could be taken to strengthen the program in the future, making it more resilient in times of greater need and able to include vulnerable groups that have long been overlooked. Significant improvements can and should be considered in areas that would foster innovation, streamline service delivery, and simplify the administration of the program, and these improvements should be done in a way that ensures the program’s integrity and stability.

First and foremost, it is critical that we preserve access to Broad-Based Categorical Eligibility (BBCE) and the alignment of SNAP services with programs such as TANF and the National School Lunch Program, as doing so greatly simplifies access to SNAP, especially for working families, seniors, and people with disabilities. BBCE directly benefits nearly 65,000 low-income Connecticut residents, 35% of whom are aged birth to 18 years, as well as millions of Americans across the vast majority of states that rely on this flexibility. It helps working families by eliminating a “benefit cliff” and lets low-income households accrue savings to avoid debt, prepare for unexpected events, and become self-sufficient. In addition, it reduces the administrative burden on states processing SNAP applications, changes, and renewals, which correlates to a direct reduction in SNAP administrative costs per case, costs that the state and Federal Governments share.

Next, we should build upon and make permanent proven demonstration projects, such as the Elderly Simplified Application Project (ESAP) and Combined Application Project (CAP), which streamline access to SNAP for vulnerable households while simultaneously cutting down on administrative expenses and increasing timeliness of case processing. In addition, other means-tested programs such as TANF, Medicaid, and WIC should be looked at to determine whether cross enrollment, or automatic enrollment, would be appropriate and efficient to ensure individuals receive all of the assistance they need without the burden of filling out multiple applications and providing the same verifications multiple times, again reducing SNAP administrative costs per case.

Finally, the adaptations made over the past 2 years in response to the public health emergency have helped us better understand ways we can adjust program rules to more flexibly meet the needs of our customers. Opportunities are needed to further test and evaluate innovative approaches to interviews, change reporting, Periodic Report Forms, and telephonic signatures to provide space for states to transition out of the public health emergency leveraging the lessons we have learned. For example, many states already operate Combined Application Projects (CAP),

* **Editor’s note:** the referenced statutes, 8 U.S.C. §§ 1611 and 1641, are retained in Committee file.

state-demonstration programs that aim to increase SNAP participation among SSI recipients by enrolling them automatically into SNAP. These “demonstration projects” have been operating for 27 years and have proven very successful in increasing food stamp participation among SSI recipients. However, it is severely underutilized with only 17 states having some version of the CAP in place. This should become a regular component of the program with no cost neutrality, a provision in demonstration projects where states have to evaluate data to ensure the project should not cost more than it would have cost to add new participants under the regular SNAP program. In addition, other means-tested programs such as TANF, Medicaid, or WIC should be looked at to determine whether cross enrollment, or automatic enrollment, would be appropriate and efficient to ensure individuals receive all of the assistance they need without the burden of filling out multiple applications and providing the same verifications multiple times to multiple agencies. This is especially important as state agencies, like many industries, face challenges in recruiting and retaining staff. Collectively, we need to think differently about the way we properly invest in technology and partnerships to ensure we continue to deliver on our core mission while doing more with less.

Mr. BAIRD. Thank you. And I am going to turn to maybe all the witnesses with this question. Sometimes, good intentions—I am talking about government programs—the good intentions don’t really end up helping the people that we would like to help in a manner that we would like to help. And so, what can we do? Because we are coming down with this farm bill. What what do you think we can do to improve our models and our modes of delivery that really makes this program more efficient? Mr. Beal, we can start with you.

* * * * *

Mr. BAIRD. Thank you very much. And I am sorry I have run out of time, and so I don’t have time to get to the other two witnesses. But some time I would be interested in hearing your thoughts. . . .

There is strong evidence that SNAP is working well, but there are certainly parts of the program that could be improved. Two opportunities that come to mind are: (1) redesigning SNAP performance measurements to be more human centered and (2) ensuring SNAP program operations keep pace with technology.

- (1) SNAP’s current performance measurement system emphasizes preventing improper payments. States and USDA take their roles as stewards of public funds seriously and have a rigorous measurement system in place to assess the accuracy of eligibility and benefit determinations. States are assessed fiscal penalties if their payment error rates are persistently too high. It is critical that SNAP have a strong system in place to assess and address program integrity. But it is also important that the measures states and USDA take do not undermine the program’s purpose to deliver food assistance to households that face difficulties affording an adequate, healthy diet. Currently information is not available to policymakers or the public about how well SNAP is working in terms of the *human* experience of accessing benefits. The 2018 Farm Bill eliminated SNAP performance bonuses, which were tied to low or improving payment error rates, participation rates among eligible people, and delivering benefits promptly within Federal timelines. But states still are subject to fiscal penalties for high payment error rates, which places a disproportionate emphasis on payment accuracy over access for low-income families. This means that if states face fiscal penalties for high error rates but aren’t evaluated on or incentivized to improve access, they have an incentive to erect barriers to eligible households that may be more error-prone.

In collaboration with the Center on Budget and Policy Priorities, Code for America developed a National Safety Net Scorecard to put forward a package of metrics that Federal and state governments could use to track program performance over time and across states or other jurisdictions. The measures in the National Safety Net Scorecard measure performance across three categories:

- a. **Equitable access:** These metrics help assess whether the programs are open to all eligible people. Are online, telephone, and in-person

services available and accessible to all people? How difficult is it to apply? Are people who apply satisfied with their experience?

- b. **Effective delivery:** Measures in this category examine the smoothness of the process after a person applies. How long does it take to receive benefits? How common is it for cases to be denied for procedural reasons as opposed to reasons related to financial eligibility? Are people who remain eligible able to successfully maintain eligibility?
- c. **Compassionate integrity:** Finally, this category assesses whether people are receiving the benefits to which they are entitled. What share of eligible people participate? How accurate are eligibility and benefit determinations? How smooth is the appeals process?

Some states measure some of these types of metrics as part of their operations or to make the case to the public that they are running successful programs. But there is a need for leadership to make progress toward this vision through Federal legislation in the farm bill, administrative action, and further state innovation.

- (2) The pandemic presented challenges and opportunities that resulted in the program adapting quickly out of necessity. Some technological changes, such as online shopping and remote eligibility practices, that probably would have occurred over time did so instead on an accelerated timeframe. Congress could consider evaluating and continuing to support these advancements. Online purchasing is probably the best example of an accelerated timeframe around technology during the pandemic. Though less than ten percent of SNAP benefits are redeemed online, USDA rapidly expanded the number of states and the number of stores that allow recipients to redeem their benefits online. The next farm bill presents an opportunity to continue the progress from recent years and improve access to online benefits for participants. Congress should consider revisions to SNAP rules that would support the use of technology in the SNAP certification and recertification processes, while maintaining alternatives for people who lack access to adequate internet service or face other barriers to using technology. For example, telephonic signatures and text messaging have shown promise in improving access for some households without compromising program integrity.

These are a few ways that we can improve the models and modes of delivery to make SNAP work best for participants and applicants.

Insert 2

Mr. SABLAN. Thank you. And let me now, Mrs. Cox. Mr. Giacomini just told us how important these education and training programs are to Connecticut and how successful it has been to beneficiaries of SNAP. Have you also seen similar situations or results in the several states where SNAP, of course, is available?

Mrs. COX. Yes, great. And thank you for that question. We have seen a lot of success stories. Specifically, Washington State has a really amazing E&T program where they are able to kind of provide wraparound services where people are getting the necessary training and they are actually trained and placed into positions, in a field that they will be able to keep work. So, there is apprenticeship. There is subsidized employment with certain industries. I would love to give you more information specifically on Washington State. And I also believe I have read about the State of Louisiana also having a pretty comprehensive and successful E&T program, so I am happy to give you more information on that.

All states must operate an Employment and Training (E&T) program as part of SNAP. These programs vary widely because the SNAP statute allows states to require participation in E&T as a condition of receiving benefits (such approaches are referred to as "mandatory E&T") or to offer training and services without any consequence for their SNAP benefits should an individual be unable to participate (referred to as "voluntary E&T"). USDA's research has found that mandatory E&T usually results in high rates of termination from SNAP, with little to no improvement in employment or income, so E&T in these cases is harmful to SNAP participants.

There are promising examples of states that have helped individuals receive the training, experience and support they need to find and keep employment and increase their earned income. These are all voluntary E&T programs. As I mentioned in my testimony, Washington State has built an impressive workforce development system with SNAP E&T as an essential component. Studies have shown participants who complete the training increase their earnings.

Louisiana's SNAP E&T program supports over 25 community and statewide organizations that provide training and support services to a wide range of individuals, including homeless families, individuals recently released from the criminal legal system, and young, at-risk adults.

Several states provide E&T services through their community college networks, including California, Connecticut, Iowa

Oklahoma is a good example of a state that operated a mandatory E&T program that consisted of job search, but moved in 2017 to a voluntary education and services model after finding the job search program did not yield positive results.

SUBMITTED LETTER BY SAM SCHAEFFER, CHIEF EXECUTIVE OFFICER, CENTER FOR
EMPLOYMENT OPPORTUNITIES, INC.

June 8, 2022

Hon. JAHANA HAYES,
Chairwoman,

Subcommittee on Nutrition, Oversight,
and Department Operations,
House Committee on Agriculture,
Washington, D.C.;

Hon. DON BACON,
Ranking Minority Member,

Subcommittee on Nutrition, Oversight,
and Department Operations,
House Committee on Agriculture,
Washington, D.C.

Dear Chair[woman] Hayes and Ranking Member Bacon:

On behalf of the Center for Employment Opportunities (CEO), I write to provide our perspective on the Supplemental Nutrition Assistance Program (SNAP) and SNAP Employment & Training (SNAP E&T) program for the Subcommittee on Nutrition, Oversight, and Department Operations hearing, "A 2022 Review of the Farm Bill: Stakeholder Perspectives on SNAP." Thank you for holding a hearing on this important topic. In CEO's experience, SNAP E&T is one of the few workforce programs that reaches individuals returning home from incarceration, providing food security, access to training via partners like CEO, and critical support services such as reimbursement for transportation costs in the first 90 days of an unsubsidized job.

CEO is the country's largest reentry employment organization, providing daily work and daily pay to justice-involved individuals facing the highest barriers to employment in 32 cities across 12 states through a transitional job and vocational training strategy. CEO engages with SNAP and SNAP E&T as critical resources for individuals reentering their community following incarceration. The United States has one of the highest incarceration rates in the world with 431 sentenced individuals per 100,000 residents in state and Federal prisons. In some states as many as 1 in 18 individuals are on probation or parole. Each year, more than 600,000 individuals return home from incarceration in need of a job.

Around half of CEO participants begin our program with no prior work experience. Additionally, more than half of CEO participants are young adults between the ages of 18 and 30 years of age, and come to CEO with significant barriers to employment, such as longer criminal histories, severe terms of incarceration, and more stigmatized convictions. CEO offers a transitional job-focused model that is proven to improve multiple outcomes for these individuals. CEO's vision is that anyone returning home from incarceration has employment and the opportunity for economic mobility aligned with their goals.

A randomized control trial conducted by MDRC found that recently released CEO participants were significantly less likely to again be incarcerated (-16%) or convicted of a crime (-22%) compared to the control group, which received basic job search services. Those who enrolled in CEO within 3 months of release generated more than \$3 in benefits for every \$1 in costs. A recent quasi-experimental evaluation in New York State found that CEO participants were 52% more likely to be employed 1 year after and 48% more likely to be employed 3 years after beginning services than the comparison group.

Immediate access to SNAP provides stability and an immediate resource for individuals released from prison with no income. Furthermore, access to SNAP E&T facilitates employment through third-party partners like CEO; we are SNAP E&T 50/50 partner in all 12 of our states. If individuals are eligible for SNAP, then they are often eligible to participate in SNAP Employment & Training (E&T), including paid work experience.

CEO's program model offers immediate work and pay, combined with wrap-around support and tools that lead to gainful unsubsidized employment. Christopher

Oaks, one of our recent Oklahoma City participants who now has a career counseling individuals on housing, stated, “Coming out of prison and immediately receiving SNAP benefits, in addition to my daily income from CEO; that was a game-changer for me. I don’t know what I would’ve done without it.”

In the last farm bill, Congress recognized the value of paid training for people coming home by allowing subsidized employment, including transitional jobs, and apprenticeships as allowable activities under E&T. In 2021, USDA–FNS finalized the Subsidized Work-Based Learning (SWBL) rule under the Work Experience component of SNAP E&T. This rule reinforces Congress’s support for job training services to reach high barrier populations, like justice-impacted individuals, who are likely not able to step away from the workforce to engage in unpaid training.

To participate in SNAP E&T, an individual must receive SNAP benefits that month. Unfortunately, because there is not an explicit statutory exemption, USDA finds that for purposes of SNAP eligibility and benefit determination, income from SNAP E&T SWBL training activities is subject to the income limit as if it was from standard employment. Income from SNAP E&T now affects benefits levels and potentially makes a household ineligible for SNAP. That means if an individual engages in 40 hours of paid training earning minimum wage for that jurisdiction or more, they may lose SNAP benefits and cannot complete their skills training. Further, some state agencies are hesitant to even offer training that individuals may not be able to complete due to lost benefits and have cited this as a reason not to expand SNAP E&T services to include SWBL.

Fixing this issue not only would help participants in their journey to independence and on a career pathway, but it would also expand the number of participants able to benefit from this proven model and likely the number of states where the model would be deployed. Excluding SNAP E&T income from countable SNAP income would result in more robust, quality training programs. For example, an individual enrolled at CEO could receive immediate stability and skills training in a transitional job and then concurrently pursue a multi-week paid training to receive their commercial driver’s license, resulting in a higher quality job placement.

As you can see, SNAP and SNAP E&T are being utilized in an effective and proven way to reduce recidivism and help justice-impacted individuals transition to full-time employment and re-integration with society. With a small technical fix to the income disregard issue—that we believe to be an unintended consequence of the flexibility for the SNAP E&T program provided in the last farm bill—SNAP E&T providers around the country could help more individuals complete important transitional employment and skills development.

Thank you for the opportunity to share CEO’s perspective on SNAP and SNAP E&T and thank you for the Subcommittee’s ongoing work on ensuring these programs function as Congress intended. Please don’t hesitate to contact us with any questions as you work to develop the next farm bill.

Sincerely,

SAM SCHAEFFER,
Chief Executive Officer.

SUBMITTED QUESTIONS

Questions submitted by Hon. Al Lawson, Jr., a Representative in Congress from Florida

Response from Michael J. Beal, J.D., Chief Financial Officer, Balls Food Stores; on behalf of National Grocers Association

Question. In my state, GusNIP a competitive USDA grant program, funds Fresh Access Bucks, a statewide incentive program that increases the purchasing power of SNAP recipients to buy fresh fruits and vegetables.

This question is for all panelists, given the importance of GusNIP and its effectiveness in promoting local economies, increasing the consumption of fruits and vegetables in underserved communities, and driving positive health outcomes, what additional incentives should Congress include to increase GusNIP participation or expand existing programs?

Answer. This important program has all of the great benefits you listed in your question and should be expanded to reach more consumers. To do this, the GusNIP program should be streamlined so program benefits can be provided through EBT cards and more retailers can participate. While the current model works well and helps target the programs limited resources, retailers need the assurance of reliable

benefits and up-to-date technology. Retailers should be allowed to opt into participation their normal USDA channels and states should be consulted when targeting limited resources to high need areas. Additionally, one major enhancement to expand the program would be to offer some reimbursement of IT expenses required to modify the POS systems or the loyalty programs of retailers that may choose to participate in the GusNIP program, at least up to some dollar amount that could be documented to the nonprofit sponsor of local grocer's program. Retailers are ready to work with Congress to expand this program and support healthy eating in our communities.

Response from Daniel R. Giacomi, Social Services Program Administration Manager, Connecticut Department of Social Services

Question 1. Mr. Giacomi, you mentioned the importance of expanding access to SNAP benefits for college students to address the growing food insecurity among this population.

What will be the effect of the end of the SNAP eligibility waivers for college students at the end of the public health emergency (PHE) and why is it important that bills like mine, H.R. 6272, The College Student Hunger Act, which makes permanent the temporary eligibility waivers, are passed before the PHE ends?

Answer. More can be done to ensure students in higher education do not go hungry. It must be acknowledged that the student landscape is not the same as it was when SNAP eligibility criteria were developed. Perhaps contrary to the common perception of a college student who lives on campus in student housing, or who continues to live at home with parents, the majority of college students in fact live off campus away from their parents. This has largely been consistent since 2000. For example, in May 2018, Dr. Robert Kelchen, professor and head of the Department of Educational Leadership and Policy Studies at the University of Tennessee, Knoxville, used data from the National Postsecondary Student Aid Study to find that only 15.6% of all undergraduate students lived on campus in the 2015–16 academic year.^{1*}

Prior to the pandemic, college students already faced disturbing levels of food insecurity. In a report published in February 2020, 1/3 of all respondents at the University of Connecticut reported low or very low food security as measured by the USDA's standard assessment tool. This same report showed that students who were food-insecure were more likely to report that they missed class and assignments, and have considered dropping out.² Furthermore, these students had lower GPAs than their food-secure classmates. The pandemic exacerbated this problem nationwide. After the pandemic's onset, 38% of students across the country said they regularly missed meals, and 36% of students reported knowing someone who dropped out due to food insecurity during the pandemic.³

To address this issue, The Consolidated Appropriations Act of 2021 temporarily expanded SNAP student participation exemptions to students approved for work study and who are not participating in work study rather than only those students participating as well as added a new exemption for those who have an expected family contribution (EFC) of \$0. Through partnerships with state educational organizations, the Connecticut Department of Social Services was able to quickly identify and provide direct outreach to nearly 27,600 students in Connecticut that fit these categories and who otherwise may not have been eligible for SNAP benefits.

Should these flexibilities expire, the thousands of students who gained eligibility for SNAP benefits would lose this assistance and food insecurity would undoubtedly grow among this population.

Question 2. In my state, GusNIP a competitive USDA grant program, funds Fresh Access Bucks, a statewide incentive program that increases the purchasing power of SNAP recipients to buy fresh fruits and vegetables.

This question is for all panelists, given the importance of GusNIP and its effectiveness in promoting local economies, increasing the consumption of fruits and vegetables in underserved communities, and driving positive health outcomes, what additional incentives should Congress include to increase GusNIP participation or expand existing programs?

Answer. When food insecurity is reduced, people are less likely to suffer from chronic illnesses such as Type 2 Diabetes, hypertension, high cholesterol, and heart

¹<https://robertkelchen.com/2018/05/28/a-look-at-college-students-living-arrangements/>.†

* **Editor's note:** footnotes annotated with † are retained in Committee file.

³<https://www.insidehighered.com/news/2021/05/27/how-manage-covid-impacts-student-health-habits>.†

and kidney disease. Additionally, “access to [SNAP] in childhood leads to a significant reduction in the incidence of ‘metabolic syndrome’ (obesity, high blood pressure, and diabetes) and, for women, an increase in economic self-sufficiency.”⁴ Conversely, food insecurity is directly linked to poorer general and mental health.⁵ In fact, a study done by the USDA found that, in some cases, the level of a person’s food security was an even greater predictor of chronic illness than income. “Income is significantly associated with only three of the ten chronic diseases—hepatitis, arthritis, and COPD—while food insecurity is significantly associated with all ten.”⁶

Improving access to nutritious food, in turn, leads to reduced healthcare spending, reduced likelihood of hospital visits, and overall better long-term health outcomes. In research released by USDA, 88% of SNAP participants reported facing at least one barrier to achieving a healthy diet throughout the month, with the most common barrier (reported by 61% of SNAP participants) being the affordability of healthy foods such as lean meat and fresh fruits and vegetables.⁷ Increasing families’ ability to afford nutritious food also brings better long-term health outcomes to future generations, as children who receive SNAP have improved health outcomes and higher educational attainment when compared to children not in SNAP households.⁵

Given this clear evidence, I strongly support increased GusNIP program funding. Notwithstanding that support, I would also advocate for increased SNAP programmatic funding and authority to provide more benefits to recipients, with a particular focus on incentivizing the purchase of fruits and vegetables, especially those bought locally. This could be accomplished through increased funding for Healthy Incentives Program (HIP) plans as well as funding for technology advances that allows farmers’ markets, direct market farms, CSAs, and others to participate in the online purchasing program.

Response from Ty Jones Cox, J.D., Vice President of Food Assistance Policy, Center on Budget and Policy Priorities

Question 1. Mrs. Cox, you mentioned the importance of expanding access to SNAP benefits for college students to address the growing food insecurity among this population.

What will be the effect of the end of the SNAP eligibility waivers for college students at the end of the public health emergency (PHE) and why is it important that bills like mine, H.R. 6272, The College Student Hunger Act, which makes permanent the temporary eligibility waivers, are passed before the PHE ends?

Answer. SNAP has restrictive and complicated eligibility rules for college students. Some students who come from low-income backgrounds and continue to struggle with food insecurity may not be eligible for SNAP; others may be eligible but do not participate in SNAP because they are not aware they qualify or face difficulty navigating SNAP’s sometimes complex application procedures.

In December 2020, Congress temporarily expanded SNAP eligibility for college students to include students who are eligible to participate in state or Federal work study or have no “expected family contribution” as part of the Federal financial aid determination. This expanded eligibility will end 30 days after the Federal public health emergency for COVID-19 is lifted. At that point, college students who are participating in SNAP will lose eligibility when they come up for recertification unless they can show that they qualify for one of a much more limited set of student exemptions under the normal program rules. Congress should work to better understand the extent to which college students are eligible for and able to participate in SNAP and lower barriers to SNAP for low-income college students experiencing food insecurity.

Question 2. In my state, GusNIP a competitive USDA grant program, funds Fresh Access Bucks, a statewide incentive program that increases the purchasing power of SNAP recipients to buy fresh fruits and vegetables.

This question is for all panelists, given the importance of GusNIP and its effectiveness in promoting local economies, increasing the consumption of fruits and vegetables in underserved communities, and driving positive health outcomes, what additional incentives should Congress include to increase GusNIP participation or expand existing programs?

Answer. Nutrition incentive programs can be an effective strategy to improve fruit and vegetable consumption among SNAP participants. For example, a USDA study, using rigorous methodology, found that offering financial incentives for purchasing fruits and vegetables increased SNAP participants' consumption of fruits and vegetables by 25 percent.

Congress has substantially increased support for SNAP fruit and vegetable incentives over time; this initiative has grown from a small pilot in the 2008 Farm Bill to a permanent program with projects across the country. Congress has also provided significant supplemental funding for GusNIP during the pandemic, including \$75 million in the Consolidated Appropriations Act, 2021 and nearly \$40 million through supply chain funding from the American Rescue Plan Act. The 2018 Farm Bill established a Nutrition Incentive Program Training, Technical Assistance, Evaluation, and Information Center with the goal of collecting, evaluating, and sharing project data from GusNIP grantees to better understand program outcomes and best practices for incentive program design and implementation. These findings could be instructive as Congress considers avenues to strengthen GusNIP in the upcoming farm bill.

A 2022 REVIEW OF THE FARM BILL
(ECONOMIC PERSPECTIVES ON TITLE I COMMODITIES AND
TITLE XI CROP INSURANCE)

THURSDAY, JUNE 9, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON GENERAL FARM COMMODITIES AND RISK
MANAGEMENT,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 9:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Cheri Bustos [Chair of the Subcommittee] presiding.

Members present: Representatives Bustos, Craig, O'Halleran, Lawson, Austin Scott of Georgia, Crawford, Allen, Rouzer, Mann, Miller, Thompson (*ex officio*), and Baird.

Staff present: Lyron Blum-Evitts, Carlton Bridgeforth, Prescott Martin III, Joshua Tonsager, Josh Maxwell, Patricia Straughn, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. CHERI BUSTOS, A
REPRESENTATIVE IN CONGRESS FROM ILLINOIS**

The CHAIR. This hearing of the Subcommittee on General Farm Commodities and Risk Management entitled, *A 2022 Review of the Farm Bill: Economic Perspectives on Title I Commodities and Title XI Crop Insurance*, will come to order.

I want to say welcome and thank you for joining today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today.

I am pleased to chair this hearing as producers around the country are in different stages of the growing season and dealing with varying weather conditions. Winter wheat farmers in the South are starting harvest, with many dealing with historic drought conditions. At the same time, corn, soybean, oil seed, and sugarbeet growers further to the north are still trying to get their crops in amid widespread flooding.

Since the 2018 Farm Bill was written, farmers have experienced the economic impacts of a trade war with China, marketing and supply chain disruptions caused by the pandemic, historic weather events, and now extreme volatility in commodity and input markets caused in part by Putin's unjustified and unprovoked war in

Ukraine. In particular, the most consistent issue I hear from farmers and stakeholders back home in Illinois is the price and availability of fertilizer, not only for their production this year, but also what it could mean for next year's crop as well.

All of these conditions have had implications for how our farm bill programs have been functioning. And our intent with today's hearing is to gather input from this panel of experts on what these conditions have meant for how our commodity programs have worked as a safety net and the role that the Federal Crop Insurance Program has played in helping producers manage risk.

During the past year and a half, this Subcommittee has been focused on understanding the situation on the ground and the needs of our producers. We held a hearing on the efficacy of the farm safety net almost a year ago and heard important testimony from producers, a crop insurance agent, and an ag economist, and it is clear the situation is much different today than it was at that time. And earlier this year we heard from Under Secretary Robert Bonnie about the state of our farm bill programs.

Today, we have the privilege to hear from a distinguished panel of agricultural economists on the state of play, and I look forward to your testimony.

[The prepared statement of Mrs. Bustos follows:]

PREPARED STATEMENT OF HON. CHERI BUSTOS, A REPRESENTATIVE IN CONGRESS
FROM ILLINOIS

Good morning, and thank you to our witnesses and to my colleagues for joining us at this early hour.

I am pleased to chair this hearing as producers around the country are in different stages of the growing season and dealing with varying weather conditions.

Winter wheat farmers in the south are starting harvest, with many dealing with historic drought conditions. At the same time, corn, soybean, oilseed, and sugarbeet growers further to the north are still trying to get their crops in amid widespread flooding.

Since the 2018 Farm Bill was written, farmers have experienced the economic impacts of a trade war with China, marketing and supply chain disruptions caused by the pandemic, historic weather events, and now extreme volatility in commodity and input markets caused in part by Putin's unjustified and unprovoked war in Ukraine.

In particular, the most consistent issue I hear about from farmers and stakeholders back home in Illinois is the price and availability of fertilizer, not only for their production this year, but also what it could mean for next year's crop as well.

All of these conditions have had implications for how our farm bill programs have been functioning. And our intent with today's hearing is to gather input from this panel of experts on what these conditions have meant for how our commodity programs have worked as a safety net and the role that the Federal Crop Insurance Program has played in helping producers manage risk.

During the past year and a half, this Subcommittee has been focused on understanding the situation on the ground and the needs of our producers. We held a hearing on the efficacy of the farm safety net almost a year ago and heard important testimony from producers, a crop insurance agent, and an ag economist, and it is clear the situation is much different today than it was at that time. And earlier this year we heard from Under Secretary Robert Bonnie about the state of our farm bill programs.

Today, we have the privilege to hear from a distinguished panel of agricultural economists on the state of play and I look forward to your testimony.

The CHAIR. I would now like to welcome the distinguished Ranking Member, the gentleman from Georgia, Mr. Austin Scott, for any opening remarks he would like to give.

**OPENING STATEMENT OF HON. AUSTIN SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

Mr. AUSTIN SCOTT of Georgia. Thank you, Chair Bustos. And thank you to the economists that are joining us today to share their perspectives on the state of the ag economy and the performance of the farm safety net and risk management tools in the farm bill.

I would be remiss if I didn't say that the ag economy is the rural economy. And for those of us who live in rural America who do not farm, we recognize the impact of agriculture on our daily lives. Between weather, global events, skyrocketing inflation, and regulatory uncertainty, farmers and ranchers today are struggling to make sound business decisions in the face of extreme uncertainty. The provisions we established in the 2018 Farm Bill were meant to help farmers manage some of that risk. Today, I am looking forward to hearing from our witnesses about how those policies are working.

While all Americans are dealing with the impact of high and rising inflation, I would argue that the farm sector of the economy is the one that is most vulnerable to these impacts. As JFK said, they buy "everything at retail, sell it at wholesale, and pay the freight both ways." Many ag commodities are fetching high prices, but the cost of inputs continue to skyrocket. Transportation is more expensive, and labor is increasingly hard to find. Any softening of crop prices could spell disaster for the rural economy because production costs continue to rise.

I am extremely frustrated with an Administration who is absolutely tone-deaf to what is happening on the farm. Senior officials suggest that the remedy for high gas prices is for more Americans to drive electric vehicles, or the USDA's most recent announcement of which they seek to transform the food system, one rooftop garden at a time. This Administration is clearly showing their lack of regard for the full-time farmers and ranchers that produce our food. And instead of going on Jimmy Kimmel, perhaps the Administration could remove the excise tax on diesel fuel and reduce the cost of farming.

There are certainly many factors that contribute to skyrocketing production costs, but it is undeniable that many of these wounds are self-inflicted by our current political leadership. Yesterday, I spoke to a farmer that I represent. He told me that during the 2019 planting season he was paying \$2.71 a gallon for truck fuel, \$2.08 a gallon for tractor fuel. His quote yesterday was \$5.55 a gallon for truck fuel and \$5.21 a gallon for tractor fuel. Those increases of 104.8 percent and 150.5 percent respectively would be higher had the Governor of the State of Georgia not removed Georgia's tax on diesel.

Crop protection tools that farmers rely on are under assault from the left wing enviro-activist. Yet the solicitor general filed a brief in the Ninth Circuit that fundamentally undermined EPA's preemptive authority of crop protection tools. The list goes on of the damage this Administration is doing.

I am interested in testimony of our witnesses today, particularly how it relates to the impact inflation production costs will have more farmers, ranchers, and if our current safety net is inadequate.

But instead of only looking for solutions by more Federal assistance, this Subcommittee also needs to pay attention to policies and actions that increase the cost of growing food and work to remedy that.

Thank you, Madam Chair, for convening this hearing. Thanks for the witnesses before us today. I yield back.

The CHAIR. All right. Thank you, Mr. Scott.

I will now recognize the Ranking Member of our full Committee, Mr. Thompson, for any opening statement he would like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Madam Chair, thank you so much, much appreciation to you, Chair Bustos, Ranking Member Scott, and the four witnesses with us today.

This hearing is happening at a critical time as it relates to the work of the Agriculture Committee. Farmers are combating incredible challenges as they need to feed, clothe, and fuel this great nation and the world. The headlines of the recent article in the *Wall Street Journal* tell the story well, such as, quote, “Farmers feel the squeeze of inflation,” end quote, or quote, “‘Farms are failing’ as fertilizer prices drive up cost of food,” end quote, and another headline, quote, “Farmers are racing against poor weather to plant crops,” end quote. That is just scratching the surface of the challenges our producers face.

Additionally, 2 weeks ago, the Congressional Budget Office released the updated baseline for USDA mandatory programs, which paints a challenging picture for this Committee as we looked to reauthorize the farm bill and make key improvements along the way. The critical Title I support programs, ARC and PLC, spent about \$5 billion or 24 percent less than expected in the 4 years after passage of the 2018 Farm Bill, and the 10 year expected cost of these programs is down nearly \$7 billion. And because of their counter-cyclical design, these programs spending less would typically be a good sign because, as it indicates, commodity prices are higher.

However, this is not translating to drastically higher farm profitability because the inputs required to produce crops have skyrocketed as well. In just 1 year, the cost per acre for nitrogen fertilizer is up 130 percent, farm diesel is up 110 percent, and according to USDA’s Economic Research Service, farm production expenses are expected to jump by over \$20 billion in 2022.

All these factors are ones we must weigh as we begin to consider necessary reforms to farm bill programs. There is no better way to understand the current market dynamics and inform the process than to hear from the agriculture economists with us today. Over the past 2 decades, each farm bill has taken a unique route to enactment, whether it was the 2002 Farm Bill that was done early, the 2008 Farm Bill that was vetoed and overridden not once but twice, the 2014 Farm Bill that took 2 years of extensions to get across the finish line, or the 2018 Farm Bill that first failed on the House floor but was only enacted with record support in both chambers in the year that it was introduced. Each one is different, yet the one constant is the preparation, diligent work and input from stakeholders that ultimately led to success.

So again, I want to thank the Chair and the Ranking Member of this Subcommittee for convening this hearing, and I eagerly look forward to hearing from our witnesses, farmers, ranchers, and foresters who are in the fight to produce safe, abundant, and affordable products that we all rely upon, and they deserve the best possible policies to aid in that fight. It is incumbent upon us to make sure that they know that we are right there with them. And despite all the challenges, we will have their backs in the 2023 Farm Bill.

Thank you, Madam Chair, Ranking Member, and I yield back.

The CHAIR. Thank you, Mr. Thompson. And thank you for being so good about attending our Subcommittee hearings. You have been wonderful on that.

The chair would request that any other Members submit their opening statements for the record so the witnesses may begin their testimony and to ensure that there is ample time for questions.

We are pleased to welcome our four distinguished expert witnesses to our hearing today. We have two in person here in Washington, D.C., in our hearing room. We have two who will be virtual. We are going to start with some introductions. I am going to introduce a couple, and then we have a couple of our Members up here who will introduce a couple of our folks who are our witnesses today. And then you will have your opening statements after we start with our introductions.

So our first witness is from my home State of Illinois, Dr. Joseph Janzen, who is an Assistant Professor at the Department of Agricultural and Consumer Economics at the University of Illinois Urbana-Champaign, and he contributes to *farmdoc Daily*, an online resource for farmers across the country.

So to introduce our second witness, I will yield to the gentlewoman from Minnesota, Congresswoman Angie Craig.

Ms. CRAIG. Thank you so much, Chair Bustos. I appreciate the opportunity to introduce Mr. Robert Craven to the Subcommittee. Mr. Craven is the Associate Director of the Center for Farm Financial Management at the University of Minnesota, where he also serves as an Extension Economist. In his leadership role with the Center for Farm Financial Management, Mr. Craven has led the development of FINPACK, which is a nationally recognized ag credit analysis software. His work to help producers better benchmark their performance and make informed and strategic economic decisions has made a positive impact for thousands of family farmers. He has taught more than 450 workshops designed to help farmers maximize their financial decisions and effectiveness, including farm management and marketing. And he has spoken at dozens of ag conferences and seminars. In addition to all of this work, Mr. Craven is still involved in his family's farming operation in southwestern Minnesota. Mr. Craven, your work to help family farmers really maximizes the effectiveness of commodity programs and crop insurance, and it is incredibly important and impactful. We are lucky to have you in Minnesota.

The CHAIR. Thank you, Congresswoman Craig.

To introduce our third witness today, I am pleased to yield to the gentleman from Arkansas, Mr. Rick Crawford.

Mr. CRAWFORD. Thank you, Madam Chair. I want to introduce Dr. Ron Rainey, who is the Assistant Vice President of the Division of Agriculture and Center Director for the Southern Risk Management Education Center. Dr. Rainey has decades of experience as an extension agricultural economist with the University of Arkansas, and I appreciate his work for our state and appreciate him being here with us today.

The CHAIR. Thank you, Mr. Crawford.

Our fourth and final witness today is Dr. Joe Outlaw, who is with us here in person, who is a Professor and Extension Economist and who is the Co-Director of the Agricultural and Food Policy Center at Texas A&M.

So welcome again to all four of our witnesses today. We will now proceed with your testimony. You will each have 5 minutes. The timer should be visible to you and will count down to zero, at which point your time has expired. If you can honor that as best as possible, that would be great. Dr. Janzen, please begin when you are ready.

STATEMENT OF JOSEPH P. JANZEN, PH.D., ASSISTANT PROFESSOR, AGRICULTURAL AND CONSUMER ECONOMICS, DEPARTMENT OF AGRICULTURAL AND CONSUMER ECONOMICS, UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN, URBANA, IL

Dr. JANZEN. Chair Bustos, Ranking Member Scott, Members of the Subcommittee, thank you for the opportunity to participate in today's hearing. My name is Joe Janzen. I am an Assistant Professor of Agricultural and Consumer Economics at the University of Illinois, where I am a contributor to the farmdoc project. farmdoc is a leading extension platform providing U.S. agriculture with integrated information and analysis to improve farm business decision-making and policy outcomes. As a member of the farmdoc team, I have published peer-reviewed academic research and outreach articles for industry and policymakers on commodity market analysis and the interplay between commodity prices and agricultural policy.

My testimony focuses on changes in commodity prices related to the ongoing war in Ukraine and their implications for current and future U.S. farm policy, specifically the relationship between price levels and Title I farm programs. These programs are an important component of the farm safety net generally used to address the economic consequences of low commodity prices for U.S. farmers over periods longer than the single production cycle covered by crop insurance.

I want to highlight the following: Our expectations for commodity prices are an important determinant of the policymaking process, setting the parameters of these safety net programs. We are currently in a period of high commodity prices. Since the beginning of 2022, corn, wheat, and soybean prices have increased by 20 to 50 percent from already elevated levels. Supply disruptions due to the Russian invasion of Ukraine are a major cause of the price change, but inventory reductions over the past 4 years; poor growing season weather in the United States, South America, and elsewhere around the world; and strong demand from China and other im-

porters are important contributing factors. Current market price structure suggests elevated corn, wheat, and soybean prices for the duration of the marketing period for the 2022 crop, and lower but still historically elevated prices for the 2023 crop.

U.S. farmers do face challenges related to adverse weather and rising costs. However, higher prices for corn, soybeans, and wheat for farmers of those crops are expected to improve profitability for U.S. farmers relative to 2021. For example, University of Illinois crop budgets show expected revenue increases larger than concurrent growth and farm input prices for fertilizer and energy that are also high, in part as a consequence of the Russian invasion of Ukraine. What makes this input situation so difficult is more so the uncertainty around supply chains and the ability to procure the fertilizer and other inputs necessary to produce the food that we all eat.

Recent policy proposals have included the use of Title I commodity programs to incentivize U.S. farmers to fill the gap in global supply related to the war in Ukraine. This is a difficult challenge because Ukraine and Russia are low-cost producers of corn, wheat, and other commodities. Commodity supply from Ukraine and Russia can only really be replaced with higher cost production from other parts of the world.

Experiences under the 2018 Farm Bill do offer some lessons for policy responses to this situation. Since 2018 Title I commodity programs have played a diminished role in the farm safety net relative to *ad hoc* programs intended to compensate farmers for specific price declines related to the U.S.-China trade war, and the coronavirus pandemic that did not trigger payments under standing programs.

This experience suggests there are a number of trade-offs among objectives for U.S. farm policy, including decoupling program payments from production to avoid distorting market price incentives, targeting program payments to specific realized losses, and delivering timely program payments. For example, a rapid timely response to an observed price change is likely to impair targeting of that program to specific losses. For example, the Coronavirus Food Assistance Program in 2020 compensated farmers for price declines between January and July of that year. That proved temporary.

Targeting programs to encourage U.S. production when prices are historically high runs counter to the principle that U.S. farm programs should be decoupled from production, a principle that was maintained throughout that series of *ad hoc* programs developed by USDA. Using Title I or similar programs to increase supply response would also create long-term budget liabilities, and their impact on production and thus on the global market situation may be small.

In summary, there is a limited role for farm policy, especially Title I commodity programs, to address the consequences of the war in Ukraine. Current and expected future prices are providing U.S. farmers with a strong incentive to meet this challenge, and they are making every effort to do so, as we have seen, in spite of the ongoing weather and other challenges that they face.

Thank you and I look forward to your questions.

[The prepared statement of Dr. Janzen follows:]

PREPARED STATEMENT OF JOSEPH P. JANZEN, PH.D., ASSISTANT PROFESSOR, AGRICULTURAL AND CONSUMER ECONOMICS, DEPARTMENT OF AGRICULTURAL AND CONSUMER ECONOMICS, UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN, URBANA, IL

[Chair] Bustos, Ranking Member Scott, and Members of the Subcommittee: Thank you for the opportunity to participate in today's hearing.

My testimony focuses on changes in commodity prices related to the ongoing war in Ukraine and their implications for current and future U.S. farm policy. I specifically focus on the relationship between price levels and Title I farm programs, the primary farm safety net tool used to address the economic consequences of low commodity prices for U.S. farmers in the medium to long-run. In doing so, I highlight the following points:

- Commodity price expectations are an important determinant of the policy-making process, especially for setting reference prices and other commodity program parameters.
- Disruptions to global agricultural commodity trade due to the war in Ukraine are significant and likely to persist through the upcoming 2022/23 marketing year and beyond. Higher prices are expected to improve profitability for U.S. farmers with revenue increases larger than concurrent growth in farm input costs that are part of the impact of the war on commodity markets.
- Since the 2018 Farm Bill, Title I commodity programs have played a diminished role in the farm safety net relative to *ad hoc* programs intended to compensate farmers for specific price declines that did not trigger payments under existing programs.
- Using Title I farm programs to address the economic consequences of the war in Ukraine for agriculture is likely to present trade-offs similar to those encountered in the design and implementation of *ad hoc* farm programs between 2018 and 2021.
 - Policy incentives to increase U.S. production to meet supply shortfalls elsewhere in the world are likely less to be effective than market incentives. Putting such policy incentives in standing programs runs counter to policy efforts in the past thirty years to reduce market distortions from U.S. farm policy.
 - Making program payments timelier is likely to impair targeting of payments to realized losses. Efforts to improve targeting of programs to realized farm losses may affect production decisions and distort markets.

The importance of price expectations for commodity programs

Fluctuations in agricultural commodity prices are directly connected to farm bill policy making. Farm programs under Title I and Title XI of the farm bill are intended to be countercyclical to market prices; they provide a safety net to farmers from the economic consequences of low prices. Broadly speaking, Title [I] programs provide support to farmers when prices are below long-run levels, especially but not exclusively the levels defined in legislation. Title XI crop revenue insurance pays indemnities to farmer policy holders when short-run, within-year price changes contribute to revenue declines below a given revenue guarantee.

Since the level of the safety net provided by Title I programs is a policy parameter defined in legislation, this testimony focuses on deviations from long-run price levels and their relationship to Title I farm programs. Empirical evidence is presented for corn, soybeans, and wheat which comprise a majority of principal crop acres in the U.S.

There is a long-standing debate in U.S. farm policy about the degree to which program parameters should be fixed in legislation or set flexibly according to mechanisms designed by policy makers.¹ Expectations about future price levels play an important role in this debate since a fixed support may provide no assistance when prices end up higher than expected or larger than anticipated support when prices are lower than expected at the time legislation is set (Zulauf 2012; Coppess, Paulson, and Zulauf 2018).

The debate over fixed *versus* flexible commodity programs has led the provision of separate programs under Title I that vary in the degree to which program parameters are fixed in legislation. Price loss coverage (PLC) makes payments relative to fixed reference prices. Agricultural Revenue Coverage (ARC) makes payments relative to a rolling average revenue calculation that depends on market conditions in

¹Title XI crop insurance programs are flexible according to this dichotomy and are not discussed here.

the preceding 5 years (Schnitkey, *et al.*, 2022). Title I also includes the Marketing Assistance Loan (MAL) program which provides loan deficiency payments when prices fall below a (lower) price floor called the loan rate.²

Since the 1990s, U.S. farm policy makers both in Congress and the executive have generally sought to avoid production effects from Title I programs by decoupling program payments from crop choice and acreage decisions. Such production effects would exacerbate or extend period of low prices. The primary mechanism for decoupling is payments on so-called base acreage and production rather than current production. Broadly speaking, Title [I] programs tend to receive less attention and lower funding when current and expected future prices are high.

The War in Ukraine and Agricultural Commodity Prices

Agricultural commodity prices are currently at historically high levels. One proximate cause of high prices, especially for wheat and corn, is the ongoing Russian invasion of Ukraine. Anticipated prices for the 2022 U.S. wheat crop, represented by the new-crop futures contract price, are now roughly 50% higher than on January 1, 2022. New-crop corn futures prices are $\frac{1}{3}$ higher and soybean futures prices 20% higher over the same period.

Figure 1. Expected 2022 harvest-time futures prices for corn, soybeans, and wheat, January 1 to May 27, 2022

Source: Bloomberg.

As shown in *Figure 1*, the largest price increases took place immediately following the initial Russian invasion of Ukraine on February 24, 2022. Price increases at that time were greatest for wheat, especially for soft red winter (SRW) and hard red winter (HRW) wheat futures prices (HRW prices are omitted for clarity in *Figure 1*). These wheat classes have similar protein content and are viewed as closer substitutes to the wheat exported from Russia and Ukraine, compared to other wheat classes grown in the U.S. such as Hard Red Spring (HRS).

While all nearly all agricultural commodity prices have increased in 2022, price increases have been especially large for wheat and corn because of the importance of Ukraine and Russia in global markets for these commodities. On average between

²The MAL program also facilitates commodity marketing through the provision of loans secured by agricultural commodities but that aspect of the program is not discussed here.

the 2016–17 and 2020–21 marketing years, Ukraine and Russia were responsible for 28% of world wheat exports and 17% of world corn exports.³

The conflict has limited exports with significant quantities of agricultural commodities essentially stuck inside Ukraine. Estimated Ukrainian ending stocks for the 2021/22 marketing year are expected increase dramatically. Current USDA estimates for 2021/22 Ukrainian corn and wheat ending stocks are roughly four times higher than the previous 5 year average. Outside of Ukraine, conflict-related constraints on Black Sea shipping and sanctions on Russia have also limited the movement of agricultural commodities. Production is expected to be lower in 2022 as the conflict restricts the availability of crop inputs and limits farming operations, but the inability to move commodities out of the region is expected to further increase commodity stocks inside Ukraine.

The conflict has limited exports with significant quantities of agricultural commodities essentially stuck inside Ukraine. Estimated Ukrainian ending stocks for the 2021/22 marketing year are expected increase dramatically. Current USDA estimates for 2021/22 Ukrainian corn and wheat ending stocks are roughly four times higher than the previous 5 year average. Outside of Ukraine, conflict-related constraints on Black Sea shipping and sanctions on Russia have also limited the movement of agricultural commodities. Production is expected to be lower in 2022 as the conflict restricts the availability of crop inputs and limits farming operations, but the inability to move commodities out of the region is expected to further increase commodity stocks inside Ukraine.

Price increases observed in early 2022 were not solely caused by lower Ukrainian and Russian commodity exports. First, commodity markets were more susceptible to supply shocks because inventories, a key measure of commodity scarcity, had been drawn down in the years leading up to the current 2021/22 marketing year, particularly in major exporting countries where corn and wheat inventories have been declining since 2018. Commodity markets exhibit higher volatility and a tendency to spike in the short run when inventories cannot be used to mitigate the effects of supply shortfalls.

Second, there have been a series of supply shocks outside of Ukraine and Russia that have pushed the global commodity supply and demand balance toward higher prices. Drought reduced 2021/22 crop production in South America with the impact strongest in soybean prices. News of the drought moved prices higher in January and February 2022 in advance of the war in Ukraine (as shown in *Figure 1*). Similarly, drought limited wheat in the U.S. Great Plains in 2021 and drought and poor conditions for the 2022 U.S. wheat crop contributed to higher wheat prices. Strong demand from major agricultural commodity importers, especially China, also contributed to high prices. Finally, knock-on impacts of higher prices, especially export restrictions imposed by some exporting nations have exacerbated price impacts.

The war in Ukraine is of great concern to global commodity markets with an impact possibly larger and more persistent than other supply shocks. While the amount of grain removed from global commodity markets due to the war is significant, quantity changes implied by other supply shocks are similar in magnitude. However, the war in Ukraine may have longer-term market implications because the Black Sea region is a low-cost producer of corn, wheat, and other agricultural commodities (Langemeier and Zhou 2022b; 2022a). Moreover, crop production areas in this region are located close to ports to facilitate efficient transportation to importing nations. This means that in most cases, any importing nation seeking alternatives to crop supplies from Ukraine or Russia will only find more expensive options.

Current forward markets indicate high prices will persist at least until the end of the 2022–23 marketing year. *Figure 2* visualizes the set of futures market prices for delivery at different time horizons on specific days in early 2022. These prices represent some indication of price expectations at a given time horizon. The figure show that the initial market reaction to the war in Ukraine was very much concentrated in the short and medium-run; prices for delivery during the current 2021/22 marketing year and prices for the 2022 crop increased, but long-run price expectations moved only a little. This was especially true for the SRW wheat market. In the roughly 3 months since the start of fighting in Ukraine, longer-horizon prices have increased more than short-horizon prices.

³All production, export, and stocks data referred to in this testimony come the USDA Foreign Agricultural Service PS&D database: <https://apps.fas.usda.gov/psdonline>.

Figure 2. Forward Curves for Crop Futures Prices as of Specific Dates in 2022

SRW Wheat

Corn

Soybeans

Source: Bloomberg. Note: Shaded areas represent prices for delivery during a specified marketing year.

The economic consequences of these higher prices for U.S. farmers are muddled somewhat by concurrent increases in fertilizer and energy costs that are in part related to conflict in Ukraine. Russia and its ally Belarus are major fertilizer producers and exporters. Similarly, Russia is a major producer and exporter of oil and natural gas. Data on fertilizer and crude oil price levels shown in *Figure 3* indicate that a broad basket of U.S. fertilizer prices approximately tripled between January 2021 and March 2022. Similarly, the benchmark West Texas Intermediate crude oil price nearly tripled over the same timeframe. High fertilizer and energy prices encourage farmers to economize on input use. This is concerning, because it may limit

the ability for U.S. and other farmers to respond to higher output prices with increased production, particularly in the short run.

Figure 3. Weekly Fertilizer and Crude Oil Prices, January 2018 to May 2022

Source: Green Markets/Bloomberg.

The net effect for U.S. farmers of higher prices for outputs like corn, wheat, and soybeans and inputs like fertilizer and energy is nonetheless expected to be positive. Figure 4 shows expected revenue for corn, soybean, and wheat production on Illinois crop farms relative to fertilizer, fuel, land, and other costs. University of Illinois farmdoc crop budget estimates show rising output prices are expected to more than compensate for large fertilizer and fuel price increases. Though fertilizer and fuel expenses are expected to nearly double from 2021 to 2022, expected operator returns given average crop yields are substantially higher in 2022 than in 2021. Fertilizer and fuel costs simply do not comprise a large enough share of expenses to offset revenue increases.

Figure 4. Costs and Net Returns as a Proportion of Expected Revenue for Illinois Crop Farms, 2021 and 2022

Source: Crop Budgets, Illinois, <https://farmdoc.illinois.edu/management#handbook-crop-budgets>.

Note: Quantities represent springtime forecasts of marketing year total revenue and costs. Corn and soybeans data are for high productivity land in Central Illinois. Wheat data are for Southern Illinois. Land costs are

based on realized land costs in 2021 which are an average of land ownership, share rent, and cash rent costs.

Price Levels and Agricultural Policy Under the 2018 Farm Bill

To provide a sense of the level of government safety net support provided by Title I commodity programs under current market conditions, compare current price levels to fixed support levels defined in the 2018 Farm Bill. Two key price levels defined in the 2018 Farm Bill are the effective reference price and the national loan rate. The effective reference price is higher than the loan rate, so it defines the initial level of farm safety net support.

Farm payments under the Price Loss Coverage program occur when marketing year average (MYA) prices as calculated by USDA fall below the effective reference price. The MYA price is a benchmark representing average price received by farmers for a given commodity produced in a given marketing year. By definition, the MYA price is only known at the end of the marketing year, so farm payments under this Title I farm program are made after the marketing year has ended.

Figure 5 plots the MYA price and effective reference price for corn, soybeans, wheat during the 4 marketing years since the 2018 Farm Bill. Realized prices were generally close but not significantly above or below reference prices in the 2018/19 and 2019/20 marketing years. This resulted in limited PLC payments for corn and soybeans and modest PLC payments (relative to payments under the 2014 Farm Bill) for wheat. Prices for the 2020/21 and 2021/22 marketing years were generally well above the effective reference price for these commodities, a condition expected to persist into 2022/23.

Figure 5. Intra-year and Marketing Year Average Farm Prices for Corn, Wheat, and Soybeans, 2018/19 to 2021/22

Soybeans

Source: USDA/Bloomberg. Note: Intra-year daily spot prices represent the price of corn and soybeans in Central Illinois and hard red winter wheat in Kansas City on a given day.

While the MYA price has generally determined the magnitude of Title I commodity program support, price levels within a year may substantially exceed the MYA price. Intra-year spot prices are plotted in *Figure 5* for corn, soybeans, and wheat. These prices represent the current value of the commodity on a given day. By definition, higher than MYA prices will occur within a marketing year. However, the presence of such prices can create the perception of economic losses because only a small portion of each marketing year's production is sold at the higher than average price level.

Figure 5 also shows the level of national loan rates, the price level below which the marketing assistance loan program payments are triggered. For corn, wheat, and soybeans, loan rates have been well below market prices during the 2018 Farm Bill period. Payments to farmers under the marketing assistance loan program have been negligible. Recall that payments to farmers under the MAL program are made on actual production. This may create an incentive to produce more when expected prices are low. Low MAL program payments therefore imply potential market distortions related to the program have been similarly insignificant.

While commodity program payments have generally been small during the 2018 Farm Bill period, direct government payments to farmers have not. *Figure 6* shows that nominal government payments far exceeded levels observed in the recent past between 2018 and 2021. Direct farm payments in calendar year 2020 were estimated to be approximately \$46 billion, higher in both nominal and real terms than any year recorded, including previous peaks during the 1980s farm crisis and the period of low commodity prices from 1998 to 2005.

Approximately 80% of direct farm payments between 2018 and 2021 came from programs were *ad hoc*: designed to quickly address specific issues. These programs sought to quantify specific economic damages related to the U.S.-China trade conflict, the coronavirus pandemic, and other disasters. The largest *ad hoc* programs were the Market Facilitation Program (MFP) related to the U.S.-China trade conflict and the Coronavirus Food Assistance Program (CFAP).

MFP and CFAP were notable in that program payments for commodities discussed here—corn, wheat, and soybeans—were defined relative to projected or observed price declines over specified time intervals. MFP payments were calculated relative to commodity-specific payment rates that can be compared to price changes (Janzen and Hendricks 2020). CFAP payments were based on specific price declines that occurred between January 2020 and specific dates later that year.

MFP and CFAP attempted to provide greater support to farmers in a timelier manner than is the case with farm bill programs. Payments were made on actual production or acreage during this period, although USDA attempted to limit possible production distortions through program design. Attempting to provide *ad hoc* payments before the end of a production cycle (as is common with many farm bill programs) required USDA to predict the magnitude of the economic harm caused by the trade war and the pandemic for specific commodities at specific points in time.

The prevalence of *ad hoc* payments since 2018 suggests that the existing farm safety net provided in past farm bills had real or perceived inadequacies in the context of the economic harm caused by the trade conflict and the pandemic. Existing programs did not provide support to U.S. farmers under the market conditions that existed between 2018 and 2021. Any payments from existing Title I programs would have been made much later than was the case for MFP, CFAP, and other *ad hoc* programs.

Figure 6. Nominal Direct Government Payments to Farmers by Calendar Year, 1990–2022F

Implications for Title I Commodity Programs

The war in Ukraine has prompted discussion of a global food price crisis. Relevant to Title I commodity programs, there is an active debate about the extent to which U.S. farm policy can and should address the supply shortfall caused by the war in Ukraine. For example, the Biden Administration recently proposed the use of higher fixed price supports under the marketing assistant loan program to encourage production (Swanson, *et al.*, 2022). This proposal and similar efforts to boost U.S. production using policy incentives run counter to the principle that U.S. farm programs should avoid market price distortions by decoupling program payments from production. Using Title [I] programs to increase supply response would also create long-term budget liabilities. Most importantly, increasing countercyclical market support may not increase crop production by much if at all, since expected payments from these programs would be small given current price expectations.

More broadly, using Title I farm programs to address the economic consequences of the war in Ukraine for food security and agriculture is likely to face trade-offs similar to those encountered in the design and implementation of Title I and *ad hoc* farm programs between 2018 and 2021. Farm safety net policy has generally attempted to achieve the following objectives (among others):

1. Targeting: Program payments are matched to specific enumerated economic damages sustained by farmers.
2. Decoupling: Program payments do not affect acreage and crop choices decisions for farmers.
3. Timeliness: Program payments are received as close as possible to the time when economic losses are incurred.

Experience with Title I and *ad hoc* farm payments suggests it is difficult to simultaneously achieve all three objectives. For instance, the main mechanism for decoupling Title [I] commodity programs—making payments on base acres rather than actual acres—ensures that payments are not exactly matched to realized losses (Zulauf, *et al.*, 2020). *Ad hoc* payments were able to avoid production distorting impacts by announcing payments after planting or paying common payment rates

across a wide range of crops, but these mechanisms are either infeasible for a program designed to exist for 5 years, or come at the expense of targeting.

Recent experience also suggests that program payment timeliness often conflicts with other goals, especially targeting. For example, the MFP attempted to identify economic damage to U.S. farmers caused by the trade conflict prior even to the 2018 harvest period. The full market implications of the trade conflict were not known when the program was announced, and this created considerable disagreement about whether MFP payment rates overcompensated certain commodities and regions. Improvements in payment timeliness almost certainly came at the expense of targeting.

Similarly, payments made under CFAP, especially the second round of those payments, aimed to compensate farmers for price declines between specific dates in 2020, using the January 15, 2020, pre-pandemic price level as a baseline. Some of the price declines identified by CFAP proved to be largely temporary. Again, efforts to provide timely assistance to farmers resulted in *ad hoc* payments that were not targeted to realized economic losses that met the criteria for coverage in the 2018 Farm Bill. Current Title I programs, by focusing on the marketing year average price as the outcome of interest, do a good job of focusing on long-lived, economically significant losses experienced by most producers of a given commodity.

In the current period of elevated price expectations, it is most important to note that Title I commodity programs are by design less active. Efforts to apply Title I policy levers as a means to address other objectives related to global food security and the war in Ukraine are likely to come at the expense of existing objectives, especially the goals of targeting payments to specific losses and decoupling payments from production.

The CHAIR. Thank you Dr. Janzen.
Mr. Craven, please begin when you are ready.

STATEMENT OF ROBERT H. CRAVEN, ASSOCIATE DIRECTOR AND EXTENSION PROFESSOR, CENTER FOR FARM FINANCIAL MANAGEMENT, DEPARTMENT OF APPLIED ECONOMICS, UNIVERSITY OF MINNESOTA, ST. PAUL, MN

Mr. CRAVEN. Chair Bustos, Ranking Member Scott, and Members of the Subcommittee, thank you for the opportunity to speak with you today. I am sorry I can't be there in person.

I am Bob Craven, extension economist and Associate Director of the Center for Farm Financial Management at the University of Minnesota. The Center has a long history of providing decision support tools and training to agricultural producers and the professionals that support them. One of our major efforts is farm benchmarking to help producers better understand their financial performance and make better decisions. We collaborate with farm business management programs in over 20 states to provide tools and educational support. These programs work with individual producers on the record-keeping, planning, and analysis of those records.

Currently, the analyses from producers in 12 of these states are then loaded anonymously into the FINBIN database, the largest public searchable database of farm financial information in the U.S. There are currently over 3,300 producers in the database with data that spans over 20 years. The FINBIN data is the basis for my presentation today.

I am going to go ahead and share some charts on the screen so that you can look along with me on those. *Chart 1* shows median net farm income over the past 26 years. Net farm income is the amount available for family living, taxes, and net worth growth. 2013 through 2019 represented a period of low net farm income. The average rate of return on assets during that period was 2.5 percent. Under four percent is considered weak. 2020 and 2021 saw a significant improvement in profitability. The median income in 2021 was just over \$166,000, up from just under \$109,000 in 2020. ROA in 2021 was much improved at 11 percent.

Chart 2, hang on, *chart 2* provides the net farm income by different farm types. As you can see, hog farms had an excellent year in 2021. Crop and beef farms also had increased profitability over the past 2 years, but the beef farms in our database always struggle with profitability. Dairy farms did well in 2020, but their net income declined slightly in 2021.

Chart 3 shows working capital as a percent of gross income. This is a measure of the liquidity or the ability of the business to meet short-term financial obligations. It is the first line of financial defense in low-income years. Over 30 percent will be considered a strong position. Crop, beef, and hog farms all improved their liquidity positions substantially over the past 2 years. Dairy farms showed only a slight increase in 2021, but they are in a much stronger position than they were at the end of 2018.

Chart 4 shows average net farm income displayed in the blue bars. We are using averages here. Median values were provided in the charts above. Government payments are displayed by the red line. We have included PPP loan forgiveness and government payments which had a significant impact in the payments for 2020 and 2021. From 2007 to 2013, there was a little variability in government payments. Many of the payments at that time were from direct programs. ARC and PLC were first introduced in 2014. 2015 through 2019 were very low-income years for Midwest farmers, so in those years, government payments made up a substantial percent of net farm income. This chart shows that 2020 would have also been a low-income year had it not been for COVID-related *ad hoc* payments.

Chart 5 shows the breakdown of government payments by type. The maroon portion of the bars represents ARC and PLC payments. The purple bar represents what I have termed *ad hoc* government payments. In 2020 and 2021 this includes PPP loan forgiveness. Certainly, *ad hoc* payments and PPP were a significant portion of support from 2018 through 2021. The low ARC/PLC payments in 2021 reflect good yields in commodity prices in 2020.

The final *chart 6* shows net farm income and government payments by different farm size. The lower axis is gross farm income in thousands. Government payments increased as farm size increased, but as a proportion of net farm income, it decreases. In

2021 for a farm that grossed \$100,000–\$250,000 government payments comprise 31 percent of net farm income. For operations grossing over \$2 million it was only 20 percent.

In conclusion, our data illustrate that traditional commodity programs have not provided the major part of the support to react to the shocks that have hit commodity agriculture in recent years. *Ad hoc* programs filled in the gaps. In recent years, both Title I commodity and *ad hoc* programs have been an important safety net for agriculture producers. If you have additional questions about the data in FINBIN, don't hesitate to reach out to me. Thanks for your time and attention, and I look forward to your questions.

[The prepared statement of Mr. Craven follows:]

PREPARED STATEMENT OF ROBERT H. CRAVEN, ASSOCIATE DIRECTOR AND EXTENSION PROFESSOR, CENTER FOR FARM FINANCIAL MANAGEMENT, DEPARTMENT OF APPLIED ECONOMICS, UNIVERSITY OF MINNESOTA, ST. PAUL, MN

Introduction

[Chair Bustos], Ranking Member Scott, and Members of the Subcommittee, thank you for the opportunity to speak with you today. I am Bob Craven, Extension Economist and Associate Director of the Center for Farm Financial Management at the University of Minnesota. The Center has a long history of providing decision support tools and training to agricultural producers and the professionals that support them. One of our major efforts is farm benchmarking to help producers better understand their financial performance and make better decisions. We collaborate with farm business management programs in over 20 states to provide tools and educational support. These programs work with individual producers on their record keeping, planning, and analysis of those records. Currently, the analyses from producers in 12 of these states are then loaded anonymously into the FINBIN database (*finbin.umn.edu*)—the largest public searchable database of farm financial information in the U.S. There are currently over 3,300 producers in the database with data that spans over 20 years. The FINBIN data is the basis for my presentation today. Please note we do not have 2021 data from all the states yet, so much of what you will see for 2021 is from Minnesota farms.

Farm Income

Chart 1. Median Net Farm Income Trend

Chart 1 shows the median net farm income over the past 26 years. Net farm income is the amount available for family living, taxes, and net worth growth. 2013 through 2019 represented a period of low net farm income. The average rate of return on assets (ROA) during that period was 2.5%. Under 4% is considered a weak

ROA. 2020 and 2021 saw a significant improvement in profitability. The median income in 2021 was \$166,297, up from \$108,781 in 2020. The ROA in 2021 was much improved at 11%.

Chart 2. Median Net Farm by Farm Type

Chart 2 provides the net farm income by different farm types. As you can see, hog farms had an excellent year in 2021. Crop and beef farms also had increased profitability over the past 2 years but the beef farms in our database always struggle with profitability. Dairy farms did well in 2020, but their net income declined slightly in 2021.

Liquidity

Chart 3. Working Capital as a Percent of Gross Income

Chart 3 shows working capital as a percent of gross income. This is a measure of the liquidity or the ability of the business to meet short term financial obligations. It is the first line of financial defense in low income years. The higher the percentage, the better. For this measure, over 30% would be considered a strong working capital position. Crop, beef and hog farms all improved their liquidity position substantially over the past 2 years. Dairy farms showed only a slight increase in 2021 but are in a much stronger position than they were at the end of 2018.

Government Payments

Chart 4. Government Payments *versus* Average Net Farm Income

Center for Farm Financial Management
Copyright © 2022 University of Minnesota

FINBIN Database.

Chart 4 shows average net farm income displayed by the blue bars in the figure. We are using averages here. Median values were provided in the charts above. Government payments are displayed by the red line. We have included PPP loan forgiveness in government payments which has had a significant impact on the payments in government payments which has had a significant impact on the payments for 2020 and 2021. From 2007 to 2013 there was little variability in government payments. Many of the government payments at that time were from direct programs. ARC and PLC were first introduced in 2014. 2015 through 2019 were very low income years for Midwest farmers, so in those years government payments made up a substantial percent of net farm income. This chart shows that 2020 would have also been a low income year had it not been for [COVID] related *ad hoc* payments.

Chart 5. Government Payments by Program Type

Chart 5 shows a breakdown of government payments by type. The maroon portion of the bars represent ARC and PLC payments. These payments lag a year from the data they are based on. The purple bar represents what I have termed *Ad Hoc* government payments. In 2020 and 2021 this includes PPP loan forgiveness. Prior to 2018 this category also included the conservation payments. Certainly, *ad hoc* payments and PPP were a significant portion of support from 2018 through 2021. The

Center for Farm Financial Management
Copyright © 2022 University of Minnesota

low ARC/PLC payments in 2021 reflect good yields and commodity prices in 2020. It was a year of excellent profits and ARC and PLC payments were not triggered for most of these producers.

Chart 6. Government Payments by Size of Farm

Net Farm Income vs. Government Payments, 2021

Average by Gross Income in Thousands

Center for Farm Financial Management
Copyright © 2022 University of Minnesota

FINBIN Database.

Chart 6 shows net farm income and government payments by different farm size. The lower axis is gross farm income in thousands. The government payments increase as farm size increases, but as a proportion of net farm income it decreases. In 2021, for a farm that grossed \$100–\$250,000, government payments comprised 31% of net farm income. For operations grossing over \$2,000,000 it is only 20%.

Conclusion

Our data illustrates that traditional commodity programs have not provided the major part of the support to react to shocks that have hit commodity agriculture in recent years. *Ad Hoc* programs filled in the gaps. In recent years both Title [I] Commodity and *ad hoc* programs have been an important safety net for agricultural producers.

If you have additional questions about the data in FINBIN, don't hesitate to reach out to me at [Redacted]. Thank you for your attention.

The CHAIR. Thank you, Mr. Craven.
Dr. Rainey, please begin when you are ready.

STATEMENT OF RONALD RAINEY, PH.D., ASSISTANT VICE PRESIDENT AND PROFESSOR, DIVISION OF AGRICULTURE, UNIVERSITY OF ARKANSAS SYSTEM; DIRECTOR, SOUTHERN RISK MANAGEMENT EDUCATION CENTER, U OF AR, FAYETTEVILLE, AR

Dr. RAINEY. Madam Chair and Committee Members, thank you for the opportunity to present here today. My name is Ron Rainey, and I am humbled to provide input into this important deliberative process. I have almost 3 decades of experience working primarily as an extension agricultural economist across the food value chain with the University of Arkansas, our state's flagship land-grant university. I currently serve as Assistant Vice President of the Division of Agriculture and Center Director for the Southern Risk Management Education Center.

Farmers across the South continue to adapt to the challenging agricultural environment made worse by the pandemic, current microeconomic trends, climate variability, and disrupted supply chains. The growing challenges of inflationary pressure and supply chain issues will push 2022 net farm income lower as a result of sharply higher cost of inputs, particularly fertilizer and fuel. Increasingly adverse weather events are creating additional hurdles that challenge farm viability.

Many of our specialty crop producers have limited crop insurance options, and the added cost sometimes results in minimal risk-reducing strategies being implemented on their farms. The number of insurance products that have been made available have expanded in recent years. For example, whole farm revenue, dairy margin, forage, to name a few, but still gaps in coverage remain. For example, the poultry sector, which is the largest single agriculture industry in many southern states, is dominated by contract production. Yet contract growers have virtually no access to insurance products. Even where newer insurance product offerings are available, a lack of understanding on the functionality of a number of these more specialized products is a persistent problem that hampers use of crop insurance.

The Agricultural Risk Protection Act of 2000 (Pub. L. 106–224) authorized the Secretary of USDA to carry out the program the Partnership for Risk Management Education. Under this authority, NIFA partnered with four regional extension risk management centers to carry out a nationally competitive grant program Extension Risk Management Education. The Southern Risk Management Education Center at the University of Arkansas had been part of the ERME program since 2009, serving the southern region. SRMEC's goal is to empower producers to manage risk and to understand and manage their ability to understand those risks and increase profitability of southern agriculture by delivering programs designed to change risk management behavior among key producer populations.

The Center annually manages \$2 million in competitive grants that seek to empower producers to manage risk on their individual operations through educational offerings, primarily to land-grant institutions, though faculty and community-based organizations as well. We offer two grant programs. One focuses on a full range of risk management activities and tools, and the other seeks to enhance the use and understanding of Federal crop insurance.

The ERME program routinely collaborates with Risk Management Agency to promote RMA resources and to engage with its regional offices on the ways to engage and support our farmers and ranchers. Both programs collaborated to jointly develop and distribute a primer *Introduction to Risk Management Education*, which is a publication that details a consistent approach across the five risk areas that we address: production, marketing, finance, legal, and human.

The Southern Center also has ongoing conversations with crop insurance industry, individual companies, National Crop Insurance Services, and the Crop Insurance Professionals Association on ways to collaborate on company agent trainings, as well as on ways to engage with our farmers and our ranchers. SRMEC is working

with partners across the region to offer continuing education credits to enhance crop insurance industry stakeholder understanding of emerging issues in agriculture, and best management practices for engaging diverse producer groups.

The Census of Agriculture reveals that most socially disadvantaged farmers and ranchers on average operate relatively smaller-size farms, thereby leveraging smaller operating loans to produce their crops each year. It should be noted that USDA program historical equity and access issues have played a significant role in limiting the opportunities for socially disadvantaged farmers and ranchers to gain economies-of-scale, increasing their farm size, and investing in innovative or new machinery. The lack of opportunity to scale up results in lower productivity and relatively higher input costs on average.

Even when socially disadvantaged farmers and ranchers participate in USDA programs, they receive a disproportionately lower level of Federal support in terms of funds to reinvest in their farms. The cumulative impact of these lower support levels over an extended period of time results in real differences in terms of size of operation, equipment, facilities, and seriously compromising the viability of socially disadvantaged-owned operations.

Another issue that continues to plague socially disadvantaged farmers and ranchers is real and perceived trust issues resulting from current and past experiences and ongoing confrontations. For example, there are a number of producers who refuse to enter a USDA office even in 2022 because of fear based on past experiences of disparate treatment, of the ability or probability of losing their land or being foreclosed on a loan under what they would feel would be less-than-fair conditions. Therefore, the ability to build and restore trust in relationships is a critical hurdle to effectively reach marginalized producers and their communities with USDA programs and resources.

To carry out our programs——

The CHAIR. Dr. Rainey?

Dr. RAINEY. Yes, ma'am?

The CHAIR. Your time has expired. Can you wrap it up like in a couple of seconds?

Dr. RAINEY. Yes, ma'am. So we annually collaborate to carry out our programs with both 1862 institutions, 1890 institutions with some of their outreach specialists. And I just want to close by highlighting a program that we recently launched in partnership with Dr. Outlaw and his center to launch *Southern Ag Today*, which is a collaboration to do a daily news analysis, which focuses on southern agriculture and its producers. Thank you.

[The prepared statement of Dr. Rainey follows:]

PREPARED STATEMENT OF RONALD RAINEY, PH.D., ASSISTANT VICE PRESIDENT AND PROFESSOR, DIVISION OF AGRICULTURE, UNIVERSITY OF ARKANSAS SYSTEM; DIRECTOR, SOUTHERN RISK MANAGEMENT EDUCATION CENTER, U OF AR, FAYETTEVILLE, AR

My name is Ron Rainey and I am humbled to provide input into this important, deliberative process that means so much to all of our farmers, ranchers, and rural communities. I have almost 3 decades of experience working primarily as an Extension Agricultural Economist with the University of Arkansas, our state's flagship, Land-Grant University. I currently serve as Assistant Vice President of the Division

of Agriculture and Center Director for the Southern Risk Management Education Center.

Current Economic Update on Southern Agriculture

Farmers across the South continue to adapt to the challenging agriculture environment made worse by the pandemic, current macroeconomic trends, climate variability, and disrupted supply chains. However over the last 2 years, according to USDA estimates farm incomes have increased with a forecast for growth in 2022 in terms of gross farm income levels. But the growing challenges of inflationary pressure and supply chain issues will push net farm incomes lower as a result of sharply higher costs of inputs, particularly fertilizer and fuel. Increasingly adverse weather events are creating additional hurdles for farm viability.

The current silver lining is the solid market prices and outlook for the near-term price changes which should sustain throughout the marketing year and into next year. These prices are evident across traditional row-crop commodities and for most of the specialty crop items. It should be noted that average gross farm and net farm income estimates obscure the difficulties occurring on the extreme ends of our farm distributions. Across our small- and mid-sized farms and even some of our large scale commercial operations, farm profitability remains a challenge.

Many specialty crop producers have limited crop insurance options and the added costs sometimes results in minimal risk reducing strategies being implemented. The number of insurance products available for producers has expanded in recent years: whole farm revenue, dairy margin, forage, to name a few. Still, gaps in coverage remain. For example, the poultry sector—which is the largest single agricultural industry in many southern states—is dominated by contract production. Contract growers have virtually no access to insurance products.

Even where newer insurance product offerings are available, a lack of understanding on the functionality of a number of these more specialized products is a persistent problem. Additional training is needed to improve farmer and rancher understanding and use of these products. There also appear to be training needs for insurance companies and agents on the array of available products. Some producers complain about the lack of a company/agent offerings in terms of a desired insurance product(s) as well as a lack of engagement with certain producer groups. Some of the limited engagement seems to occur from a specialization within the crop insurance companies. If an insurance company's portfolio of clients in a particular region is made up primarily of large scale commercial row-crop farms, they may have little incentive to cultivate business among small, specialty crop, and/or livestock producers, particularly on products for which sales or underwriting procedures are more difficult, such as whole farm revenue insurance.

Role of Southern Risk Management Education Center (SRMEC)

The Agricultural Risk Protection Act (ARPA) of 2000, authorized the Secretary of USDA to carry out the program, Partnerships for Risk Management Education. Under this authority NIFA partners with four regional Extension Risk Management Education (ERME) Centers to carry out a national competitive grants program in Risk Management Education to educate agricultural producers about the full range of risk management activities. The Southern Risk Management Education Center (SRMEC) at the University of Arkansas has been a part of ERME since 2009, serving 13 states and two Territories—the Southern Region. SRMEC's goal is *to empower producers* to manage risks. The Center strives to improve producers' ability to manage risk and increase profitability of southern agriculture by delivering programs designed to change risk management behavior among key producer populations.

The ERME authorizing language has been amended through successive legislation, namely the 2008, 2014, and 2018 Farm Bills. As amended, the language describes the purpose of this risk management partnership as “educating agricultural producers and providing technical assistance to agricultural producers on a full range of farm viability and risk management activities, including futures, options, agricultural trade options, crop insurance, business planning, enterprise analysis, transfer and succession planning, management coaching, market assessment, cash flow analysis, cash forward contracting, debt reduction, production diversification, farm resources risk reduction, farm financial benchmarking, conservation activities, and other risk management strategies.”

Section 11125 of the Agricultural Improvement Act of 2018 provides authority for the USDA NIFA to expand the Partnerships for Risk Management Education program to serve a new audience, defined as “producers that are underserved by the Federal crop insurance program”. ERME implemented the expanded program by offering two separate grant pools within our annual request for applications (RFA)

that seeks education project proposals: risk management education (our traditional program area), and producers underserved by crop insurance.

SRMEC works with a ten member advisory council made up of public and private agricultural stakeholders that are strategically and intentionally engaged to serve our region's diverse agriculture sector—commercial, small, diversified, row-crop, livestock, organic, sustainable, urban, and specialty. Representation includes farmers, ranchers, 1862 and 1890 land-grant university faculty, and community based organization representatives. The Center annually manages \$2 Million in competitive grants that seek to empower producers to manage risk on their individual operations through educational offerings. To manage our two separate grant pools, SRMEC employs a ten member advisory council and a seven member evaluation panel made up of public and private agricultural stakeholders to identify our grant regional priority areas and capacity building efforts across the region. Additionally our advisory council and crop insurance evaluation panel serve as reviewers for our grants selection process using a transparent merit-based process.

Engagement with Risk Management Agency (RMA) and crop insurance industry

The ERME program routinely collaborates with RMA to promote RMA resources and to engage with its regional offices. Both programs collaborated to jointly develop and distribute a primer, *Introduction to Risk Management* (Crane, Gantz, Isaacs, Jose, and Sharp, 2013). The publication details ERME and RMA's consistent approach to managing risks across five areas: production, marketing, finance, legal, and human. The document not only defines each risk area but details specific tools and strategies to successfully mitigate the unique risks that agricultural producers face. Beyond the publication and on-going communications, each ERME Center has RMA representation on its advisory council. SRMEC has an RMA representative on our Advisory Council and two representatives on our crop insurance evaluation panel. We communicate on program and funding areas to build on the synergies of each program to serve farmers and ranchers. SRMEC actively engages with multiple regional offices and has on-going conversations with RMA administrators on ways to enhance outreach efforts and resources.

Last, SRMEC has on-going conversations with the crop insurance industry—individual companies, National Crop Insurance Services, and Crop Insurance Professional Association (CIPA)—on ways to collaborate on company/agent trainings. The pandemic interrupted planning for a company/agent training in collaboration with CIPA, but those discussions are on-going. SRMEC envisions offering continuing education credits to enhance crop insurance industry stakeholder understanding of emerging issues in agriculture and best management practices for engaging diverse producer groups.

Current Condition for SDFRs

The Census of Agriculture reveals that most socially disadvantaged farmers and ranchers (SDFRs) on average operate relatively smaller sized farms, thereby leveraging smaller operating loans to produce their crops each year. It should be noted that USDA program historical equity and access issues have played a role in limiting the opportunities for SDFRs to gain economies of scale—increasing farm size and investing in innovative or new machinery/technology. The lack of opportunities to scale up results in lower productivity and relatively higher input costs on average. Even when SDFRs participate in USDA farm programs, they receive a disproportionately lower level of Federal support in terms of funds to reinvest in their farms. The cumulative impact of lower support levels over an extended period of time—10 year, 20 year horizon, *etc.*—results in real differences in terms like size of operation and equipment/facilities, seriously compromising the viability of SDFR-owned operations.

I serve on the board of directors for the Socially Disadvantaged Farmer and Rancher Policy Research Center at Alcorn State University. The Policy Research Center actively organizes and examines research, data, and producer feedback to provide insights to enhance understanding of SDFR conditions and policy recommendations to enhance their economic viability and survival. The Policy Research Center notes the following discrepancy in risk management/crop insurance subsidies. As Federal crop insurance subsidies programs have increased, the “subsidy gap” has widened between White and Black farmers. Because crop insurance subsidies are based on the value of a producers' crop, the larger subsidy premiums go to producers with the highest sales. The vast majority of farmers that receive the highest subsidies are White. The 2017 USDA Census Report, indicates that slightly over 2,500 Black farmers had product sales for more than \$50,000, compared to 500,000 white producers. Almost 50% (16,891) of all (35,470) Black owned farms had less

than \$2,500 in sales. With premium subsidies being linked to the value of the crop, it is a safe estimate that between 95–97% of crop insurance subsidies have gone to white producers.

Another issue that continues to plague SDFRs is real and perceived trust issues resulting from current/past experiences and on-going confrontations. For example, there are a number of producers who refuse to enter a USDA office even in 2022 because of fear-based on experiences—of disparate treatment, losing their land or being foreclosed on a loan under less than fair conditions. Therefore, the ability to build and restore trust and relationships is a critical hurdle to effectively reach marginalized producers and their communities with USDA programs/resources. The resulting community impact of inequitable access to Federal and state programs have played a significant role in individual and community wealth levels across both urban and rural areas.

In terms of crop insurance, my past experience with managing education projects reveals that technical assistance in record-keeping, business planning, and tax preparation are core areas to build and maintain viable businesses. These fundamental processes are directly linked to credit access and indirectly linked to use of crop insurance. Additional technical assistance in these core areas could enhance producer understanding of ways to leverage crop insurance products to support their businesses.

Overview of working with 1862, 1890 Land Grants & Community-Based Organizations

As SRMEC director, I have been privileged to work with a collection of public and private agricultural stakeholders assisting our farmers and ranchers across the region and nationally. SRMEC has intentionally engaged with diverse stakeholder groups to build meaningful relationships across region and nationally. This includes engagement with diverse farm types and producer backgrounds as well as grower organizations. We collaborate annually with 1890 Extension and outreach specialists, primarily small farm program (2501) directors and community based organizations that serve an array of producer groups ranging from African American, Native American, Hmong, Organic, Sustainable, Livestock, Row-Crop, Greenhouse & Nursery, to name a few. Within the 1862 land-grants, we collaborate with the region's farm management committee—Southern Extension Economics Committee. The committee is made up of agricultural economists from the region's land-grant institutions, primarily those with Extension responsibilities. Annually, the Center supports the region's premiere academic outreach meeting, the Southern Outlook Conference, which is hosted by Southern Extension Economics Committee. SRMEC features its collaborations with the farm management committee and 1890 partners on our website, <https://srmec.uada.edu/>.

Last, SRMEC partnered with the Agricultural and Food Policy Center at Texas A&M to lead a collaborative effort among the Southern Extension Economics Committee to offer *Southern Ag Today* (SAT). SAT is a daily insight and analysis on issues impacting southern farmers and producers and is a timely resource for anyone—farmers, ranchers, Extension educators, lenders, policy makers, and media—who wants a better understanding of the issues affecting agriculture in the region.

The CHAIR. All right, very good. Thank you, Dr. Rainey. I appreciate that.

Dr. Outlaw, please begin when you are ready.

STATEMENT OF JOE L. OUTLAW, PH.D., PROFESSOR, EXTENSION ECONOMIST, AND CO-DIRECTOR, AGRICULTURAL AND FOOD POLICY CENTER, DEPARTMENT OF AGRICULTURAL ECONOMICS, TEXAS A&M UNIVERSITY, COLLEGE STATION, TX

Dr. OUTLAW. Chair Bustos, Ranking Member Scott, and Members of the Subcommittee, thank you for the opportunity to testify on behalf of the Agricultural and Food Policy Center at Texas A&M University as you focus on opportunities to enhance Title I and XI programs.

As many of you know, the primary focus of AFPC has been to analyze the likely consequences of policy changes at the farm level with our one-of-a-kind data set of information that we collect from

commercial farmers and ranchers located across the United States. Working closely with 675 commercial producers has provided our group with a unique perspective on agricultural policy. Currently, we maintain the information to describe and simulate 94 representative crop and livestock operations in 30 states.

In order to provide perspective on Titles I and XI, I wanted to briefly summarize a recent report that looks at farm profitability in 2022 relative to 2021 for our 64 representative crop farms in the face of higher input and output prices. For this report, we asked our panel members to provide their cost per acre for each of those years. While some producers were able to benefit by locking in input prices early in 2021 for this year's crop, most indicated very little ability to do so. The news is full of stories about inflation averaging 8.5 percent so far this year for the average American. The lowest year-over-year inflation farmers are saying is twice that on seed with most commodity categories many times higher.

The following are highlights of the analysis that are relevant for today's hearing. Net cash farm income in 2021 included a significant amount of *ad hoc* assistance. Absent another infusion in 2022, we estimate that significant increases in input prices will result in a decline in net cash farm income in 2022 relative to 2021. However, despite the income reduction from 2021, most crops will likely still result in positive net cash farm income for the representative crop farms. The noticeable outlier is rice. Two-thirds of rice farmers are facing losses in 2022. Having worked with farmers over the last 30 years, I want to make sure you understand we are talking about historic amounts of capital that farmers are putting at risk.

Throughout my career, I have referred to the programs of Title I and Title XI as the three-legged stool that serves as a safety net for U.S. producers. Agriculture Risk Coverage, ARC, and Price Loss Coverage, PLC, and the Non-recourse Commodity Loan Program serve as two of the legs while the Federal Crop Insurance Program serves as a third leg.

Price Loss Coverage was established in the 2014 Farm Bill using the cost of production as a basis for setting a level of protection for each covered commodity through reference prices. PLC rates worked fine while inflation was fairly low. However, the reference prices are in dire need of increases to remain relevant. Producers' costs have increased substantially, and the current reference prices are not providing a relative amount of protection.

Agriculture Risk Coverage was also established in the 2014 Farm Bill. ARC uses a 5 year moving average of historic prices and yields to establish a benchmark that is used to determine the level of protection producers received. While good when coming off of relatively high prices, ARC proves worthless when prices declined or remained relatively flat. Since ARC has a reference price embedded in the calculations, raising reference prices will make ARC attractive as a revenue protection safety net alternative.

Assuming these two alternatives are used, going forward, instead of forcing producers to pick the tool ARC or PLC they want, I would suggest allowing them to receive the benefits of whichever is higher in a given year. This would cost nothing more than if producers have chosen wisely.

Historically high input costs have also highlighted the shortcomings of basic safety nets on prices and/or gross incomes alone. This may present an opportunity to explore adding margin coverage. However, I would urge you to proceed with caution. Dairy offers a constructive example. Dairy margin coverage was added in the 2014 Farm Bill, but the initial version was a flop that has taken years and a lot of money to improve.

The Non-recourse Loan Marketing Program works as it was designed. The rates have largely remained unchanged over the past 30 years, losing ground to inflation. The rates need to be raised to increase the amount of the crop that is being protected, which will cost money.

Federal crop insurance is an enormously successful public-private partnership that stands today as the primary safety net tool for U.S. producers. As I have said many times in front of Congress, do no harm to crop insurance and stop outside interest groups from trying to tie provisions of their pet projects to crop insurance, for example, linking climate change practice adoption to insurance program subsidy levels.

While this hearing is about the farm bill, I would be remiss if I didn't mention the last 5 years of *ad hoc* disaster assistance. I believe the upcoming farm bill provides an opportunity to help address some of the shortcomings of *ad hoc* assistance that that *ad hoc* assistance was designed to address.

Madam Chair, thank you. This completes my statement.
[The prepared statement of Dr. Outlaw follows:]

PREPARED STATEMENT OF JOE L. OUTLAW, PH.D., PROFESSOR, EXTENSION ECONOMIST, AND CO-DIRECTOR, AGRICULTURAL AND FOOD POLICY CENTER, DEPARTMENT OF AGRICULTURAL ECONOMICS, TEXAS A&M UNIVERSITY, COLLEGE STATION, TX

[Chair] Bustos, Ranking Member Scott, and Members of the Subcommittee, thank you for the opportunity to testify on behalf of the Agricultural and Food Policy Center (AFPC) at Texas A&M University as you focus on opportunities to enhance Title I and XI programs. As many of you know, the primary focus of AFPC has been to analyze the likely consequences of policy changes at the farm level with our one-of-a-kind dataset of information that we collect from commercial farmers and ranchers located across the United States.

Our Center was formed at Texas A&M University more than 30 years ago at the request of Congressman Charlie Stenholm to provide Congress with objective research regarding the financial health of agricultural operations across the United States. Since that time, we have worked with the Agricultural Committees in both the U.S. Senate and House of Representatives, providing Members and Committee staff objective research regarding the potential farm-level effects of agricultural policy changes.

Working closely with 675 commercial producers located across the United States has provided our group with a unique perspective on agricultural policy. Currently, we maintain the information to describe and simulate 94 representative crop and livestock operations in 30 states. We have several panels that continue to have the original farmer members we started with back in 1983. We update the data to describe each representative farm relying on a face-to-face meeting with the panels every 2 to 3 years. We partner with the Food & Agricultural Policy Research Institute (FAPRI) at the University of Missouri which provides projected prices, policy variables, and input inflation rates. The producer panels are provided *pro forma* financial statements for their representative farm and are asked to verify the accuracy of our simulated results for the past year and the reasonableness of a 6 year projection. Each panel must approve the model's ability to reasonably reflect the economic activity on their representative farm prior to using the farm for policy analysis.

In order to provide perspective on Titles I and XI, I wanted to briefly summarize a recent AFPC report that looks at farm profitability in 2022 relative to 2021 for our 64 representative crop farms in the face of higher input and output prices.¹

For this report, we asked our panel members to provide their costs per acre for 2022 versus 2021 for the major input categories. The average for each category across all respondents is presented in *Table 1*. Updated commodity prices for the 2021/22 and 2022/23 marketing years and policy variables were obtained from the FAPRI-MU Bulletin #01-22 entitled *U.S. Agricultural Market Snapshot*, April 2022 (*Table 2*). While some producers were able to benefit by locking in input prices early in 2021 for this year's crop, most indicated very little ability to lock in these prices even when using their normal tax management strategy of prepaying inputs. Simply, the input suppliers would not lock in a price until the producers agreed to take delivery. Almost every respondent stated they were going to do their best to reduce input usage in the face of the highest costs of production they had ever experienced.

The news is full of stories about inflation that is averaging 8.5 percent so far this year for the average American. The lowest year-over-year inflation farmers are seeing is twice that on seed with most categories many times higher. Commodity prices, while generally higher in 2022, are up less than eight percent. If not for the incredible productivity of the U.S. farmer, there would be a major financial crisis in agriculture.

Table 1. Average Percentage Change in Representative Farm Input Costs/Acre from 2021 to 2022.

	Seed	Nitrogen Fertilizer	Phosphorus & Potassium Fertilizer	Herbicide	Insecticide	Fungicide	Fuel & Lube
Percentage Change 2021 to 2022	16.58%	133.62%	92.75%	64.23%	40.25%	36.02%	86.63%

Table 2. Projected Commodity Prices Reported in FAPRI April 2022 Update, Marketing Years 2021/22 and 2022/23.

	2021/22	2022/23	Percentage Change
Corn (\$/bu)	\$5.78	\$6.06	4.84%
Wheat (\$/bu)	\$7.60	\$8.08	6.32%
Soybean (\$/bu)	\$13.27	\$14.22	7.16%
Grain Sorghum (\$/bu)	\$5.87	\$6.14	4.60%
Barley (\$/bu)	\$5.27	\$5.60	6.26%
Oats (\$/bu)	\$4.30	\$4.00	-6.98%
Upland Cotton (\$/lb)	\$0.910	\$0.871	-4.29%
Seed Cotton (\$/lb)	\$0.464	\$0.443	-4.53%
Peanuts (\$/lb)	\$0.238	\$0.240	0.84%
Sunflower Seed (\$/lb)	\$0.318	\$0.324	1.89%
Canola (\$/lb)	\$0.318	\$0.295	-7.23%
All Rice (\$/cwt)	\$15.80	\$15.84	0.25%
Long Grain Rice (\$/cwt)	\$13.75	\$14.03	2.04%

The following are highlights of the analysis that are relevant for today's hearing:

- Net cash farm income in 2021 included a significant amount of *ad hoc* assistance. Absent another infusion of assistance in 2022, we estimate that significant increases in input prices will result in a huge decline in net cash farm income in 2022 (compared to 2021).
- Despite the significant reduction from 2021, higher commodity prices for most crops will likely still result in positive net cash farm income for most of AFPC's representative crop farms. The noticeable outlier is rice— $\frac{2}{3}$ of the rice farms are facing losses in 2022.
- The analysis hinges on producers receiving the higher commodity prices forecasted by FAPRI with average yields. With drought being experienced across a significant portion of the country and many other areas facing excess moisture, this assumption may be overly optimistic.
- Having worked with farmers located across the U.S. over the last 30 years, I want to make sure you understand we are talking about historic amounts of capital that farmers are putting at risk

¹*Economic Impact of Higher Crop and Input Prices on AFPC's Representative Crop Farms*, AFPC Briefing Report 22-05. <https://www.afpc.tamu.edu/research/publications/files/716/BP-22-06.pdf>.

Throughout my career, I have referred to the programs in Title I and Title XI as the three-legged stool that serves as the safety net for U.S. producers. The specific commodity programs in Title I have changed over that time, but all generally have the same objective to make-up for shortfalls in prices or incomes. The current programs, agriculture risk coverage (ARC) and price loss coverage (PLC) and the non-recourse commodity loan program, serve as two of the legs while the Federal Crop Insurance Program serves as the third leg.

The following are what I believe to be the most significant shortcomings of all three legs of the stool. Most of my suggestions require additional resources that may be difficult to secure but are necessary.

Price Loss Coverage (PLC) was established in the 2014 Farm Bill using the cost of production as the basis for setting the level of protection for each covered commodity through reference prices. Counter-cyclical price protection programs like PLC have been used in the U.S. since the 1970s with the notable exception of the 1996 Farm Bill. In the PLC program, I believe your colleagues decided to cover a significant amount (roughly 75% to 85%) of total costs of production realizing the likely negative consequences of providing price protection at higher levels. PLC rates worked fine while inflation was fairly low; however, the reference prices set in the 2014 Farm Bill and continued in the 2018 Farm Bill are in dire need of increases to remain relevant. Producers' costs have increased substantially, and the current reference prices are not providing a relevant amount of protection.

Agriculture Risk Coverage (ARC) was also established in the 2014 Farm Bill as a second attempt at providing producers a revenue-based safety net program to replace the overly complicated and not widely used average crop revenue election (ACRE) program first used in the 2008 Farm Bill. ARC uses a 5 year moving average of historical prices and yields to establish a benchmark that is used to determine the level of protection producers receive. While good when coming off of relatively high prices, ARC proved worthless when prices declined and remained relatively flat, providing little protection to producers. This is why that while widely chosen over PLC early in the 2014 Farm Bill, ARC was largely abandoned as a choice of safety net program in recent years. The problem with ARC is that it assumes the historical revenue levels were the appropriate levels that producers should be supported at without any basis such as protecting some level of costs for making that claim. Since ARC has the reference price embedded in the calculations, raising reference prices will make ARC more attractive as a revenue protection safety net alternative.

Assuming these two alternatives are used going forward, instead of forcing producers to pick the tool (ARC or PLC) they want, I would suggest allowing them to receive the benefits of whichever is higher in a given year. This would cost nothing more than if the producers have chosen wisely and selected the appropriate tool and would take a major decision away that only serves as a major distraction to their work in trying to grow a crop. Historically high input costs have also highlighted the shortcomings of basing the safety net on prices and/or gross incomes alone. This may present an opportunity to explore adding margin coverage. However, ARC & PLC have been popular, so I would urge you to proceed with caution. Dairy offers an instructive example. Dairy margin coverage was added in the 2014 Farm Bill, but the initial version was a flop that has taken years (and a lot of money) to improve.

The Non-recourse Marketing Loan Program works as it was designed more than 4 decades ago; however, despite modest increases for some commodities in the 2018 Farm Bill, the rates have largely remained unchanged over the past 30 years, losing ground to inflation. Providing producers the ability to take out a storage loan or receive a loan deficiency payment on a crop is a very useful marketing tool. The rates need to be raised to increase the amount of the crop that is being protected which will cost money but is significantly less expensive to do at current price levels.

Federal crop insurance is an enormously successful public-private partnership that today stands as the primary safety net tool for U.S. producers. This is due to the program largely using futures prices to annually adjust the amount of protection producers can select. While crop insurance is popular with producers, the little-known secret in the farming community is that bankers "encourage" producers to purchase buy-up levels of crop insurance as a means of protecting the producer and the operating loan banks make to producers. As I have said many times in front of Congress, do no harm to crop insurance and stop outside interest groups from tying provisions of their pet projects to crop insurance—for example, linking climate change practice adoption to insurance program subsidy levels. This runs the risk of creating an unlevel playing field for producers by distorting protection levels and leaving some producers with less protection due to their lack of feasible climate change mitigation alternatives.

While this hearing is about the farm bill, I would be remiss if I didn't mention the last 5 years of *ad hoc* disaster assistance. I believe the upcoming farm bill provides a clear opportunity to help address some of the shortcomings *ad hoc* assistance was designed to address. In the case of WHIP, WHIP+, and ERP, they all essentially are designed to help cover the large deductibles producers face in their crop insurance policies. While the *ad hoc* assistance over the last 5 years has been vital, it comes LONG after the disaster has come and gone and has been limited to specific causes of loss. Perhaps most important, *ad hoc* assistance is, by definition, not guaranteed. Farmers already face enough risks and uncertainty—ideally, they wouldn't have to guess at what the safety net might look like as they struggle to put a crop in the ground.

[Madam Chair,] that completes my statement.

The CHAIR. Thank you, Dr. Outlaw.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will each be recognized for 5 minutes each in order to allow to get to as many questions as possible. Please keep your microphones muted until you are recognized in order to minimize background noise. For starters, I will recognize myself for 5 minutes and start with our line of questioning.

And my questions just so all four of you are paying attention, I would like all four of you to address it. And, Dr. Janzen, I am going to ask you to address it first, just because you are from my home State of Illinois, all right, so you get that that benefit. So here you go. What is an appropriate metric we should be using to evaluate how the safety net should be structured? ARC kicks in when there are relatively significant drops in revenue compared to the previous few years. PLC kicks in when prices drop below a set level. And producers face risk now of tightened margins. How should we think about an appropriate structure of the farm safety net? This is really to help us start laying the foundation for what do we want to consider as we look at the 2023 Farm Bill. Dr. Janzen, we will start with you.

Dr. JANZEN. I think an appropriate measure, a starting point is the level of price. And looking to—there is a long-standing debate about whether we should have sort of flexible or fixed parameters. And it is something that I think it would—if Congress wants to step up and say that we know what the long run level of price is at which we would like to fix the safety net, then the PLC reference price is that parameter in current policy and likely to be something similar in policy, going forward.

So we need to decide what that price is. And it is important to remember that that is the season average price, not the price on one day, but the price over the course of an entire year. And I think it is important to recognize that we have a situation right now, where prices are high, but people are worried about price declines. But it is important to sort of wait until those price declines are realized and we understand what net farm income is in a given year before we sort of define whether there is a realized loss that is worth having some sort of policy intervention to cover.

The CHAIR. Very good. And, Dr. Outlaw, if you can answer the question as well.

Dr. OUTLAW. I tend to take a little bit different view. I look at the cost of production as basically something that tells me that we need to cover a good portion of the cost if we are going to keep people producing in this country. And one of the things that our center

has done for various Members of Congress over time was look at a lot of different ways of trying to attach escalators to the reference price, for example, that would take into consideration cost increases, and so that producers wouldn't be caught flat whenever prices—what we know is going to happen turn, Madam Chair, is that the prices are going to decline, but the input prices are going to stay up for a while. And they always do. And that is going to lead people to what we call a cost price squeeze. And so either looking at some sort of margin or building in the ability to ratchet up the reference price with costs is my suggestion.

The CHAIR. Thanks, Dr. Outlaw.

Dr. Rainey, is there anything that you would have to add to either one of those responses?

Dr. RAINEY. Again, I would focus in on the comments made by Dr. Outlaw. I think that the margins—because just focusing on price, you get in the situation we have now where input costs are increasing and inflationary pressures. And so you are going to have some intense pressure where that safety net will be weakened.

The CHAIR. Thanks, Dr. Rainey. And then, Mr. Craven, anything else to add?

Mr. CRAVEN. I would just second Dr. Outlaw's comments. We have looked at cost reduction for corn in Minnesota for 2023, and it is \$5.18, which is a long ways away from where we currently have in reference prices.

The CHAIR. Very good. Dr. Janzen, I am going to address my second question to you. I appreciate you sharing your insight on what you shared about commodity prices and the implication of Putin's invasion of Ukraine and the current and future farm policy. You talked about how the recent increases in commodity prices are expected to be larger than growth in input costs for corn, soybean, and wheat farmers for the marketing year of the 2022 crop. Coming into this growing season, and with the uncertainty producers face over input costs and market prices, can you talk about the sort of considerations that farmers are making in their inputs for this year and looking ahead to next year?

Dr. JANZEN. Right. There is tremendous uncertainty, and the capital required is massive. And those put everyone on sort of a little bit of unstable footing. The question I think for this, under the aegis of this Committee is related to what losses have occurred. And as of yet, those losses are not yet realized. We do have a crop insurance program that will step in, in the situation where production declines occur because of weather or other things beyond the control of the producers. That safety net is in place, and we have to let that sink in and play out.

The CHAIR. We could talk a lot deeper about this, but with the time expired, I will now recognize the gentleman from Georgia, Mr. Austin Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Madam Chair.

And Mr. Craven, when you put that number up there on the *ad hoc* assistance, I assume that include the USDA Food Box Program, is that correct?

Mr. CRAVEN. Yes, that is correct.

Mr. AUSTIN SCOTT of Georgia. Okay.

Mr. CRAVEN. We didn't differentiate, so if the *ad hoc* included PPP loan forgiveness, the WIC programs, CFAP, the QLA payments, so there was a long list of payments that were in that *ad hoc* category.

Mr. AUSTIN SCOTT of Georgia. Okay. I will ask staff to do this, but I would like to see that chart without the food box and other things in there simply because I do know farmers who are literally carrying their crops under it, and had it not been for the food box program where we did some unusual things where we actually purchased the commodities from the farmers and delivered them to the American citizens, I can tell you we would have had a lot of hungry people inside this country.

And I do think that as this Committee pushes forward, if we deal with the crop insurance system in an appropriate manner, then there for the majority of the time should be less *ad hoc* assistance, including disaster assistance, if we get the crop insurance program correct. Would you agree with that, as an economist? That if crop insurance is handled properly, that we would need less *ad hoc* assistance?

Mr. CRAVEN. I would agree with that. And, I didn't talk much about crop insurance in my presentation.

Mr. AUSTIN SCOTT of Georgia. That is fine.

Mr. CRAVEN. I certainly think that is the basis that almost all producers rely on, at least commodity producers in terms of the first support net that we have out there.

Mr. AUSTIN SCOTT of Georgia. Let me mention, we have talked some about Russia and production costs. One of my farmers sent me these numbers. In May of 2019 he was paying \$248 a ton for nitrogen. In May of 2022, just a few days ago, he paid \$682 a ton. I think as we talk about Russia and even Belarus, we have to remember that Russia is the number one producer of nitrogen. And Russia and Belarus are number two and number three, I believe, in potash production, which we all depend on for the yields that we have in this country.

And so as we have touched on higher operating revenue in 2022, we have to have a long-term outlook for production agriculture inside this country. And so the 2022 forecasts are based on expected yields. Inputs have gone up, particularly fertilizer and diesel. I know many farmers are looking to save costs by applying less nutrients. We had an issue where Union Pacific curtailed fertilizer shipments. Now I understand that they undid that. But certainly if you don't have the ability to get the nutrients in the crop in a timely manner, then that impacts yield. If farmers are not able to get the nutrients on their crops, if this prevalent behavior results in lower yields, how concerned are you that actual operator returns would be significantly less than currently anticipated? Dr. Outlaw?

Dr. OUTLAW. Oh, very concerned. Aside from price, weather concerns around the country are still making it where some crops are not even in yet. So the producers that we deal with reach out to me on a daily basis, talking about the fact of individual instances of not being able to get different inputs, whether it be chemicals or nutrients. And this was a real challenge and it has kind of proved to be a challenge. Farming is an extremely difficult thing to do, even though they make it look these look easy at times. And

if we have any kind of weather blip, we are going to not have the yields. And as was stated earlier, we are going to have even worse price situation than when we thought.

Mr. AUSTIN SCOTT of Georgia. Well, I think navigating over the next year is going to be difficult for our farm families, but we have to have a crop insurance system that is going to allow them to navigate over the next decade. I don't want my country to become dependent on foreign sources of food, and I don't know any American that does. I would suggest that none of you has spoken about the removal of some of the products, I mean, glyphosate, Dicamba. As you remove those products from the farmers' tools, what is that going to do to the yields in this country? Dr. Outlaw?

Dr. OUTLAW. They are going to go down.

Mr. AUSTIN SCOTT of Georgia. I think that is important for Americans to understand, that as liberals use the courts and other things to remove the products that we need as farmers to produce the food supply for America and the rest of the world, that as our yields go down, the prices for Americans at the grocery store is going to go up.

With that, Madam Chair, I will yield back.

The CHAIR. Thank you, Mr. Scott.

I will now recognize the gentleman from Arizona, Mr. O'Halleran.

Mr. O'HALLERAN. Thank you, Madam Chair and Ranking Member, for this meeting today. It is important for getting prepared for the farm bill.

I have been interested in hearing what I have so far this morning. And it is my belief that we have to find a way for better flexibility, innovation, and timely action. Congress and government in the whole have to start to understand that these dynamic markets that we are seeing now are not going to go away anytime soon, and we have to be prepared for that in the long run. And that means being on our feet and ready to move instantly in many cases, as the world changes and climate changes.

Arizona has experienced the worst drought the region has seen in 1,200 years, and it is going to get worse. The arid climate and skyrocketing temperatures have only worsened since we passed the 2018 Farm Bill, and it is essential we update critical safety net programs to reflect these changes.

Nationally, producers are contending with high fuel and fertilizer costs. On top of this, producers are facing extreme drought conditions, run the risk of ultimately not being able to grow their crop because of soaring temperatures and wildfires. In fact, my last time in the district last week, as I went around it, it is probably—I have lived in Arizona now for 28 years. I have never seen conditions like this and with no relief in sight. Whether it is the Southwest or the South or anywhere else in our great country and the world, we have something that has to be overcome, and we can't do it by half measures.

So, Dr. Outlaw, because of more frequent and severe weather events, Congress authorized an *ad hoc* disaster assistance to supplement crop insurance and support uninsured producers. And how are producers in drought-stricken areas faring in the current state of the farm economy?

Dr. OUTLAW. Oh, specifically, due to the program you mentioned, you all have passed WHIP and the WHIP+ and then the new program that recently was rolled out is going to provide a lot of protection, which will help producers when they have had a loss, and it will help cover a portion of the deductible that they don't get paid on. So that has been a very important aspect of the programs.

Mr. O'HALLERAN. Thank you. Another question, are our crop insurance and disaster programs adequately supporting farm incomes affected by drought?

Dr. OUTLAW. Well, I would have to say they are because crop insurance is very strong. And, the way it works, most of their commodities, the price that establishes the amount of coverage is adjusted off of the futures market, which on an annual basis is really good. When prices are moving up, we have a lot of protection. So producers have a lot of protection through their products right now. And then with the new *ad hoc* disaster program that is going to pay part of the deductible back because of some sort of a loss, one of those being drought, then they are going to be made more whole is the way to say it. They are not going to be made whole but more whole.

Mr. O'HALLERAN. Thank you, Doctor. And, Dr. Rainey, Arizona's First Congressional District is home to many rural and Tribal communities that you know about, and many may not always have easy access to risk management programs. Could you please talk about the work the Southern Risk Management Education Center does to help underserved producers manage their risk and the type of outreach the Center does to these communities?

Dr. RAINEY. Yes, so we provide grants to actually hold face-to-face outreach trainings to help explain those different insurance products to the various groups, farmers and ranchers that are interested in them. We try to make connections with risk management agencies so that there is an additional agency there to help make the connection to some of the companies and the agents to talk about the different products and services that are available. So we are there as an educational endeavor to try to make those connections to make that process more transparent so that our farmers can not only understand the environment that they are facing, but understand the specific tools or what may be best for them to use, what insurance product would work best for them.

Mr. O'HALLERAN. Thank you, Dr. Rainey. And I see my time is almost up and I yield back. Thank you, Madam Chair.

The CHAIR. Thank you, Mr. O'Halleran.

I now recognize the gentleman from Pennsylvania, the Ranking Member of our full Committee, Mr. Thompson.

Mr. THOMPSON. Madam Chair, thank you so much. First question is, Dr. Outlaw, in your testimony, you mentioned the potential for Congress to explore a margin program. That is a concept that I have been interested in as, by and large, dairy producers in Pennsylvania have been pleased with how the Dairy Margin Coverage has functioned after we made key improvements in the 2018 Farm Bill. Could you perhaps explain a bit further on how something like that might work for row crops in particular, and what would be the benefits of a margin-based program *versus* a support based on price alone?

Dr. OUTLAW. Well, clearly the benefit is that it would take into consideration both the cost side and the revenue side where we are largely protective of the revenue side in this country. That would definitely be one of those things that I would hope that you would ask our center to look into for you, or for this Committee because it would—on the surface it sounds relatively easy. I know that those of you that were involved in the dairy program know that it took a little bit of time to get it to where that worked well.

Mr. THOMPSON. Yes.

Dr. OUTLAW. And what I would say is maybe you would want to consider doing a pilot for a certain commodity because while it was very simple to—among us economists, we would come up with, well, on the on the cost side, fertilizer, clearly fuel and labor, and there are a whole lot of things that would matter for a certain set of crops that might not matter as much for another set of crops. So we would have to be really careful to make sure that we did it balanced, but it would be worth looking at for sure.

Mr. THOMPSON. Yes, absolutely. I mean, there are a lot of variables in farming, right, soil types, climate, moisture. But the bottom line is that agriculture is a business. At the end of the day, it is not what you bring in, it is the margin you are left with. And I have tremendous concerns with where we are heading right now.

On that note, while prices for most commodities are at high levels and some paint a rosy picture for agriculture, I think it is mostly by folks who really don't understand that farming is a business, and at the end of the day, it is the margin you are left with, if any. I am not optimistic about this.

Net farm income projections are based on an expectation of average yields, which is not a given. Additionally, it will only take some softening of prices before producers may be underwater, as you have well-stated. Commodity prices can drop overnight, but input costs, once they are up there, it is difficult to see them lower. Would any of our witnesses care to speculate—I am asking for your crystal balls now I guess—about how long we might expect bullish commodity markets? And when prices do begin to moderate, how long would you expect it would take for production expenses to the fall? Or is this the new normal? And I know it is speculation.

Dr. JANZEN. I think we can say from the price signals that we see right now, prices will remain elevated for the 2023 crop. The new 2023 prices for delivery for that harvest are still well above historic levels, levels that, say, wouldn't cause the PLC program to kick in, for example.

Now, probably the biggest factor is obviously the war in Ukraine. Some resolution to that conflict will lower commodity prices, both on the output side and the input side. But I think you are right, that there is significant concern that even on the input side, there are a host of issues around the world that would leave input prices elevated. And that is that is a concern for us agriculture, going forward.

Mr. THOMPSON. Yes, just the clearing of those mines in the port of Odessa to allow those grain elevators to be offloaded so they can be refilled. Any of the other witnesses, any thoughts or comments on that particular question?

Mr. CRAVEN. I guess as we look back, Congressman, at 2012 and how many years it took for costs to come back in line with lower prices, it was a 4 or 5 year process before things got lined back up again. So it takes a long time to get those back down, as Joe pointed out earlier.

Mr. THOMPSON. Yes, now, I am going to tee this one up and would love to follow up individually with you just because all the time remaining. I have been hearing a lot about—and I want to kind of look at the economic impact on commodity prices, but it is a total curveball. It has to do with solar fields being on fertile farmlands. And I think some of our other Members of the Committee are hearing about this as well. That is putting out policies that—policies have impact, right? I am recently hearing a lot of discussion and concern that government policy is incentivizing placement of solar farms on fertile farm, not marginal, but fertile farm land driving up the competition for leasing acreage, and that is really important for our young and beginning farmers. And so I would love to follow up with you, any thoughts you might have in writing or in person, if this is or could be a significant input cost variable going forward, just cost of acreage.*

Thank you, Madam Chair.

The CHAIR. All right. Thank you, Mr. Thompson.

I now recognize the gentleman from Florida, Mr. Lawson.

Mr. LAWSON. Thank you, Madam Chair and Ranking Member Scott, for hosting this important hearing. I would like to welcome all of the panel to the Committee because it is very important area.

Federal crop insurance is a hugely successful public-private partnership, that today's stands as the primary safety net for the U.S. producers. However, in your testimony, Mr. Rainey, you discuss a lack of understanding among insurance companies on available products and the lack of engagement with certain producers. What do you believe, Mr. Rainey, Congress can do to bridge the gap and encourage insurance companies and their agents to diversify their portfolio and continue to outreach to socially disadvantaged farmers?

Dr. RAINEY. I do think that it is a pervasive issue. And sometimes I think it is just some of the economics of it because—so if I am an insurance agent and company and I am in a high intense row crop commercial area, if I got a portfolio full of large-scale, commercial, row-crop producers, I may not even take the time to learn about whole farm revenue, which is what our specialty crop—what some of our small growers would be interested in. So any way to enhance that training or understanding because at the end of the day, some of those agency companies will tell those farmers, oh, we don't offer that or they will try to send them to someone else. And some of it is just a profit motive. So as you explore that engagement, I think there is some education with the companies and agents on—to me, it is an entrepreneurship opportunity to diversify their staff to serve this need and really look at what is an economic benefit to those companies and those agents to serve those underserved areas if you will. I think that will be a first step is to really

* **Editor's note:** the responses to the information referred to are located: for Dr. Janzen, on p. 1013; Mr. Craven, on p. 1014; and Dr. Outlaw, on p. 1014.

have a real discussion with the companies and agents about—or understanding on the areas that they are not serving because I think there is a lack of understanding of crops outside of their traditional audience that they have historically served.

Mr. LAWSON. Okay. Thank you. And I would just like to say my district is no stranger to the worsening and more frequent severe weather events and importance of *ad hoc* disaster assistance of our producers. The next question will be—this question is for all the panel. As we enter into the negotiation of the farm bill, should Congress consider a permanent disaster program? How do you believe a permanent system could build upon existing Title I and Title XI programs? And this is for the panel.

Dr. OUTLAW. I will take the first shot. Thank you. In general, the crop insurance industry and the products that are available are sufficient. What we have found over time is that natural disasters don't worry about what policy you bought. And so it has been a case where there has been added help provided to cover a portion of the deductible area.

It is certainly within logical thinking to think that if we have done this 5 years in a row, likely, we are going to continue to do this. There are going to be natural disasters. And it would be helpful if there was a plan in place or a set of rules in place of exactly how it was going to work so that producers would understand what kind of help they might get if this happened and not leave it to chance or whether you get something passed.

Mr. LAWSON. Anyone else like to respond?

Dr. JANZEN. The issue in developing a standing disaster assistance program is always how to define what constitutes a *disaster* and when will the government step in and when will they not. And that is why these programs have been *ad hoc*. And the crop insurance program does a good job of defining the *types* of losses that will be covered. And so a standing disaster assistance program looks a lot like insurance but covering the things that we didn't know about the future.

Mr. LAWSON. I tell you what, I reclaim my time, Dr. Outlaw, you mentioned in your written testimony that producers should not be forced to choose between Agriculture Risk Coverage and Price Loss Coverage, but the farmer should receive benefits from whichever is higher in a given year. Could you comment on that for me please, sir?

Dr. OUTLAW. Yes, sir. In the 2014 Farm Bill, that decision was a one time for the life of the farm bill decision. And it really stressed producers out trying to make that decision for the next 5 years, much less what is going to happen this year. The 2018 Farm Bill changed that and made it an annual decision after the first 2 years. And producers would have to decide on an annual basis which of those two products they wanted to go to. All I am saying is take the decision away from them and allow them—if there is a benefit to be had, allow to have the higher of the two. A lot of times they are both going to be negative or, I mean, not negative but zero. But they are good at farming, and they don't want to make this decision. And really, it puts a lot of undue stress on them. Just give them whichever would be higher, and it can be scored that way.

Mr. LAWSON. Okay, my time has run out. Madam Chair, I yield back.

The CHAIR. Thank you, Mr. Lawson. I now recognize the gentleman from Arkansas, Mr. Crawford.

Mr. CRAWFORD. Thank you, Madam Chair.

Dr. Outlaw, you may recall, not long ago, back in March, we had this conversation about the state of the rice industry. And, as the Representative of the largest rice-producing district in the nation and largest rice-producing state in the nation, obviously, I have some concerns about that. It should be talked about here, the farm safety net, particularly PLC, isn't working well for rice producers under the current circumstances. And obviously—and we have talked about this. We know we need to enhance that in the next farm bill.

But, you also mentioned during that hearing, you said the rice industry was not doing well. The rice farmers are not seeing the increases in prices as other commodities are but experiencing the same pressure with regard to input costs. I have done a little bit of math just since we have been sitting here, and I am not a mathematician, but based on the conventional enterprise budget in Arkansas cost per acre, roughly \$554 per acre, of that, 48 percent is fertilizer costs. I mean, just fertilizer cost accounts for almost $\frac{1}{2}$ of that enterprise budget. Average yield, 169 bushels an acre. You are a heck of a lot better at this than me, but those numbers look like they don't really pencil out well. You were working on a study for Senator Boozman as well as Congresswoman Letlow. Can you give me an update on that and how those numbers are shaking out if it has gotten worse?

Dr. OUTLAW. Yes, sir. The testimony today included the analysis of the request from Senator Boozman, and it showed that the only farms we have that really aren't going to cash flow this year are rice farms. And $\frac{2}{3}$ of them will not cash flow. So we have 15, so you can do the math. That is 10 out of 15 will not cash flow. Certainly for other industries that prices have risen and it is it isn't a big concern. But for this industry in particular, there are a lot of reasons for that, which I would call trade distortions from other countries. There are a lot of reasons why rice is different. But certainly, I would think that there would be cause for this body and the larger body to do something for rice starting this year.

Mr. CRAWFORD. And what would you suggest? Because, we can spitball about ideas to help, crop-specific. Rice is one of those that is kind of a staple item outside of the United States. So we rely on—we look to foreign markets to move our rice. In fact, we are not one of the biggest rice-producing nations in the world, yet we are in the top five in exports. Is that not true?

Dr. OUTLAW. Yes.

Mr. CRAWFORD. So what do we do to enhance that? I mean, should we put a little more emphasis in our trade relationships with regard to rice? I know it is a sensitive area, particularly in Asia. But I mean, what would you suggest? And, in the absence of—I mean, we are not going to reauthorize the farm bill today, but what could we do?

Dr. OUTLAW. Well, certainly, holding other countries accountable to what they have agreed to do, and trade negotiations is number

one. And I think there are a couple in particular we could talk about. But short of that, I would say that, hopefully, there would be a situation with some bill that was going to move this year that you could increase, add some assistance targeted towards rice producers. I don't usually say those types of things, but this is completely different than for every other crop. And unless we want to lose producers, which basically rice has got a different infrastructure, we are going to lose that infrastructure. And unless we want to worry about doing that, then we need to provide some help relatively soon.

Mr. CRAWFORD. Relatively soon, and what type of help would we be talking about? Now we mentioned in our last visit in this room, we talked about the potential for indexing production costs. When the farm bill in 2014 was implemented, we were basing that on 2012 figures, so we were already 2 years behind, but we made the mistake of not indexing those production costs. So now bringing that into 2020, you have seen a huge disparity in cost of production in the last several years. Is that an appropriate response?

Dr. OUTLAW. Yes, I think so. And obviously, as was stated earlier, we have spent a lot of money on CFAP and MFP for losses that were likely to happen that didn't actually materialize completely that we thought, and I am telling you, these losses are going to happen. And so, specifically, the mechanism to do it, I think that you could use some of the formulas from CFAP in particular and adjust them and get some money to the producers.

Mr. CRAWFORD. Thank you. I have run out of time, but I appreciate your input. Thank you.

The CHAIR. Thank you, Mr. Crawford.

I now recognize the gentleman from Georgia, Mr. Allen, for 5 minutes.

Mr. ALLEN. Thank you, and I appreciate this hearing today. Obviously, it is timely because I had the folks with Farm Bureau in my office yesterday, livestock folks, and now we have a shortage of hay because of the drought. And so I don't know. Every time we turn around, we have another emergency. But, Chair Bustos and Ranking Member Scott, I thank you for holding this important hearing and to talk about these threats, particularly to our food supply.

As we come closer to the time when Congress will write a new farm bill, it is important that we hear from all of you on how these programs are working for our farmers and what improvements need to be made. I believe that our main approach to writing new farm bills should be a cautious one. The years since 2018, when the most recent farm bill was signed into law, have been so chaotic and unprecedented, not only from the overall economic picture in this country, for example, the war on fossil fuel, and now it appears there is a war on agriculture, we shouldn't make major changes to Title I and Title XI programs unless we are able to fully evaluate the potential consequences of those changes.

Before turning to questions, I will make one final comment. Though commodity prices are higher right now, input prices are rising at an even faster rate. And of course, we have heard that in your testimony. If my farmers have no way of protecting their margins, we could have another 1982 here, which was the last time

that we had unprecedented inflation and a lot of guesswork on how—so many surprises out there. And coming from the business community, surprises are a real problem.

Dr. OUTLAW, again, I thank you for your testimony. It is particularly timely when I am hearing from all my farmers about the rising input of prices right now. Can you talk more about how we might better protect farmers and deal with all of these changes? Now, obviously, the war in Ukraine, we can all say, “Gosh, I wish we would have done more to prevent that because now we are seeing the repercussions of it.” And, frankly, I don’t know why the world’s sitting around allowing one country to cause famine throughout the world. I mean, there ought to be repercussions for that. But at any rate, have you looked at any options as to what we can do with the present situation?

Dr. OUTLAW. Well, yes, sir. Our group has looked—over time, we have been asked by various Members of Congress to look at indexing up the reference prices to more closely account the cost changes that their producers are dealing with. And so we have done that a lot of different times, and it is difficult to do. And it is difficult to do in real time because most of the official data we get from USDA has lagged and things like that. But certainly, it is worth looking at, again, specifically in this environment. It has been brought up a couple of times about margin protection for crop producers. That would include both the price side and the cost side. While it is complicated, as is anything we do, anything worth doing. The protection measures that we use are going to matter a lot as we go forward, so just because it is complicated or hard to do doesn’t mean we shouldn’t look at it.

Mr. ALLEN. Well, from my economic experience, supply and demand is what guides everything. We know because of events around the world, demand is going up. And of course, I think the world is going to be looking at the United States to put forth every effort to make sure people aren’t starving to death. That is going to require farmers for bigger yields, borrow more money and farm more acres. And so as far as demand, have you made any projections on what this thing could look like?

Dr. OUTLAW. In particular, our group works with FAPRI out of the University of Missouri to do that side of the national and international price projections. But having done all this for 30+ years, like Joe said earlier, these prices are going to come down. We can’t anticipate what is going to happen with the war stuff. That is the only reason why I would be sitting here saying I have no idea.

Mr. ALLEN. So how are prices going down if demand is exceeding supply?

Dr. OUTLAW. One of the things that will happen was—well, we had higher prices before Ukraine, and the reason why was because we had droughts around the world and other problems. So those are going to get satisfied a little bit, and then Ukraine won’t be quite as big a problem, I think.

Mr. ALLEN. Right. Okay. As far as a lack of agronomic inputs, a lot of my farmers have signed on to a petition dealing with that, and I am about to run out of time, but the 2022 MPCPI policy, could you comment on that proposal?

Dr. OUTLAW. I am not sure I heard what you said.

Mr. ALLEN. Farmers in my district have signed on to a petition which requests that a lack of agronomic inputs be included as covered peril under the 2022 MPCCI policy. Can you comment on that?

Dr. OUTLAW. I would say that—

[The information referred to is located on p. 1015.]

The CHAIR. Why don't we give you time to answer that later? The time has expired by more than a minute, so I am going to go ahead and move on.

Mr. ALLEN. Okay. Well, I am sorry.

The CHAIR. Thank you, Mr. Allen.

I now would like to recognize Mr. Mann from the State of Kansas, for 5 minutes.

Mr. MANN. Great. Thank you, Madam Chair, for letting me ask questions, and thank you for hosting this hearing.

President Eisenhower was from Kansas, grew up in my district, and he used to say that: "Farming looks mighty easy when your plow is a pencil and you are a thousand miles from the corn field." And there is a lot of lot of truth in that.

I think we are having a lot of conversations about the input side, which is what we need to be talking about, the biggest issue facing the First District of Kansas today and moving forward. I think we have to acknowledge that to a large degree this is self-inflicted. I mean, this irrational war on fossil fuel is the basic reason we have seen these input prices increase. It is also self-inflicted because this war against our chemicals and how modern agriculture works, this just makes no sense, the policies that we are pursuing, so that happens. And then things come along that may or may not be within our control like Ukraine that just exacerbates the problem. So I think we have to acknowledge that.

We all know this crop insurance is absolutely vital. And it does two things: It benefits farmers, but it also benefits Americans because we have never had to rely on another country for our food supply. We get that wrong, the whole world looks entirely different. Certainly, our country looks different.

And I know we have talked a little bit of this, but for you specifically, Dr. Outlaw, given the ability to make some changes to crop insurance this year—and I think we need to use a scalpel and not a sledgehammer—but what specific changes would you make, would you advise that we consider making to the crop insurance program in this next farm bill?

Dr. OUTLAW. Really, I don't have very many changes other than there is a situation right now with the basically the ethanol situation, USDA capped the A&O for agents, and that has caused a problem with providing insurance policies to the specialty crops. And that to me is one of those things—I am not an expert on it, but I have been reading about it, and it is one of those things that needs to be adjusted sooner rather than later.

In terms of the rest of the crop insurance products, obviously, we have a really good system in place where new policies can be developed and the government helps policies be developed and paying for the costs, which will make it more likely. So I really can't say that there is anything else that really needs to be looked into for crop insurance other than that A&O issue that, again, I am not an expert on but I know it is out there.

Mr. MANN. Okay. Based on recent drought monitoring indexes in Kansas, and we have some areas that are 10" to 15" behind annual rainfall this year, so in areas of the country, certainly severe drought, which is leading to less forage, less hay, less ability for our livestock producers who also are facing record inputs. A question for you, Dr. Rainey, can you speak more to the value of the current risk management products available to our livestock producers?

Dr. RAINEY. I think that they have been enhanced recently. I still think that there is—as farmers learn of these products, I think there are opportunities for technical assistance to help enhance the understanding in how to use those products more effectively. I think if you are going back to what you were talking about in general crop insurance, I think that the metric is protection to the farmers and ranchers. And as we look—and sometimes we can look and see where their product is being used or not and actually just do some follow up to get some feedback on why products aren't being used. And sometimes that is the indicator of that lack of understanding or additional work being needed to change some of the parameters of the program.

Mr. MANN. Great.

Dr. RAINEY. And so I think that especially I have heard a lot of success stories from a lot of our livestock farmers in terms of the forage, in terms of drought products that have been advanced that are really helpful as we see this enhanced issues with climate variability.

Mr. MANN. Yes, thank you. Last, I will just say, while we are discussing these tools available to farmers and ranchers across the country, I think we also have to take a moment to discuss the impact of some of the Administration's proposed changes to the Tax Code. Specifically, President Biden's most recent budget once again included eliminating the stepped-up basis and also includes imposing capital gains taxes on farms, ranchers, and businesses that have been held in a family for over 90 years or more. I am calling this the farm killer tax because it would destroy the livelihood of producers across the country.

Dr. OUTLAW, my last question would be to you. Have you examined what the impact of changes to the Tax Code would have on farms and ranches? And can you expand on what an elimination of a stepped-up basis or the new farm killer tax would mean for farm country?

Dr. OUTLAW. Yes, so we actually did a study at the request of Ranking Member Thompson and Senator Boozman last year that, across all of our 94 farms, 98 percent of them would be affected by the elimination of stepped-up basis at an average cost of \$750,000 extra in tax.

Mr. MANN. Yes, once again, in my view stepped-up—or this would be self-inflicted nonsense, and we got to make sure we don't let that happen to our ag producers.

So thank you. With that, I yield back.

The CHAIR. Thank you, Mr. Mann.

I now recognize Mr. Rouzer from the State of North Carolina for the next 5 minutes.

Mr. ROUZER. Thank you, Madam Chair. And I appreciate our witnesses being here today very much.

Energy and food are both critical to our national security, and not just that, everybody's survival, basic survival. I certainly don't mean to be pessimistic, but I think the next several years are going to be pretty challenging. I don't see inflation going anywhere for the next several years. Interest rates are going to be a lot higher. Much higher input costs are going to be with us for some time.

And a subject I want to explore a little bit that really hasn't been discussed today in terms of the direct payment that was put in place in the 2002 Farm Bill for our program crops. If you look at that period of time, 2002 to 2014, of course, not all things are comparing apples to apples necessarily; but, we didn't have as much *ad hoc* assistance. Again, not all things are equal, but I do think that is notable. What are the pros and cons to reinstituting that? One of the nice things about it was it was WTO-compliant, it was simple, it was easy. When we did have *ad hoc* disaster assistance payments, it was easy to piggyback on. Again, everything has its pros and cons. But I was just curious from the panel, if you can discuss your thoughts on that. And maybe now is a good time to reinstitute that, given the input costs that are going to continue to be exceptionally high. And it is simple. It is easy as compared to some of these other alternatives. Any thoughts on that? Dr. Outlaw, I will start with you.

Dr. OUTLAW. Okay. Sure. I have studied this my whole career, and really, there was nothing at all wrong. The producers liked the direct payments. There became a lot of different names for these payments, but they started off as PFC payments and that changed over time. But really what happened was that we had a good series of good years in agriculture and they were very hard to defend, giving payments to producers when they didn't need them. And so people were thinking about just going to a situation—and it was brought up a number of different times by different people on could a trigger be put in place so the fixed payment comes if things are needed and that doesn't happen if it doesn't trigger again? It makes it kind of a countercyclical payment, but at least it is a fixed amount and the producer would know what they were going to get. It has been like that a lot of different ways, but I will just—I don't want to take all the time. But in my opinion, the public opinion of giving producers money when things got good was what ended that program.

Mr. ROUZER. Sure. Well, obviously, we are in a different environment now. So, the ground might be a little more fertile.

Any other comment or thoughts?

Dr. JANZEN. I think it just speaks to the issue of targeting that I mentioned in my testimony, the idea that the demand for assistance tends to be greater at different times. And the demand from producers for assistance is stronger in certain times than others. And if you provide payments in times when that demand is low, that is not going to achieve the policy objectives that we want, which is to keep farmers going through those tough times.

Mr. ROUZER. Any other comment from any other panelist?

Mr. CRAVEN. I guess, Congressman, in the material I presented, the ARC/PLC payments remained relatively flat through the last 5,

6 years. In fact, it is down in 2021. The direct payments wouldn't react to the kind of situation we have seen the last 3 or 4 years. And the *ad hoc* payments have certainly been the thing that have helped producers in this period. And I am not sure a direct payment would react quick enough.

Mr. ROUZER. Okay. Any other thoughts? One quick last thing. There is one thing worse than high input costs, and that is no inputs. I am concerned about the availability of fertilizer as we move forward. Any thoughts on that or any insight that you all might be able to provide on that front? Any projections?

Dr. OUTLAW. If you read the press as much as the rest of us have to, you would feel a little bit encouraged that they are going to get the bottlenecks figured out. But certainly, the industry has a lot of questions that somebody needs to ask.

Mr. ROUZER. My time has expired. I yield back. Thank you.

The CHAIR. Thank you, Mr. Rouzer. I now would like to recognize Mr. Baird from Indiana, who is on with us virtually, for the next 5 minutes. Mr. Baird, your camera is off. Oh, it looks like maybe it is on now if you can—

Mr. BAIRD. Thank you, Madam Chair. And I really appreciate this Committee. I appreciate this hearing. And I always learn something.

So I was really just listening in to hear all the comments. And I think the farm bill is so important to the rural communities like my district in west central Indiana. So I really appreciate the expertise that you have with the Committee and the witnesses today. So thank you very much, and I will yield back.

The CHAIR. All right. Thank you, Mr. Baird.

So before we adjourn today, everybody has had a chance to ask questions, I would invite the Ranking Member to share any closing comments that he may have, Mr. Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Madam Chair. And I want to thank the people who have testified before the Committee today. I mean, your input will be key to us as we write the next farm bill. About 90 percent of the ag production in this country comes from around 12 percent of the farms. And whether you are a big farmer or a small farmer, the dollars in and the dollars out have to yield to positive revenue or you are not going to be in business. And this is not about every individual farm inside the United States. It is about domestic agriculture production and making sure that Americans aren't dependent on foreign sources of food, and it has everything to do with our independence as a country. And working through the next farm bill and how we handle crop insurance and disaster payments is key to making sure that we are able to keep our domestic ag production afloat during these hard times.

I want to thank you for coming. I want to thank the Chair for having the hearing. I think it has been a good hearing, and I look forward to continuing this discussion as we mark up the next farm bill.

The CHAIR. Very good. Thank you, Mr. Scott. Mr. Thompson, as the Ranking Member of our full Committee, would you like to make any closing comments?

Mr. THOMPSON. No, I know, votes are coming up here soon, so I just want to say thank you for your leadership and the Ranking Member's leadership on this incredibly important work. Farming, as I said before, agriculture is a business. And at the end of the day, it is a margin. And these are some challenging times based on the testimony we have heard and the things that we are hearing at home, too. And it is just great to have these four economists as a part of our farm team to be able to lean on and to get your input. And we will continue to lean on all four of you, so thank you so much for being here and participating today.

The CHAIR. Thank you, Mr. Thompson. And I want to thank our Members for participating today and also our witnesses. We are grateful to you. You shed some light on what is going on out in the countryside, and that is very helpful to us as we gear up to figure out what is going to go into the 2023 Farm Bill, so we are really grateful to you for your time.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions posed by a Member. This hearing the Subcommittee on General Farm Commodities and Risk Management is adjourned.

[Whereupon, at 10:31 a.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

Farmers Feel the Squeeze of Inflation

Higher costs for seeds, fertilizer, weedkillers and labor could push up grocery bills this year, researchers say

Even as crop prices remain high, supply costs are expected to outpace the price of agricultural goods in 2022.

By PATRICK THOMAS¹

Photos by Veasey Conway for *The Wall Street Journal* Feb. 15, 2022 5:33 a.m. ET

Inflation is growing on the farm.

American farmers are paying significantly higher prices for their weed-killing chemicals, crop seeds, fertilizer, equipment repairs and seasonal labor, *eroding some of 2021's windfall*² from rising crop prices. *Higher farm costs*³ could help push up

¹ <https://www.wsj.com/news/author/patrick-thomas>.

² <https://www.wsj.com/articles/surging-grain-prices-fuel-surprise-farm-recovery-11611322634>.

³ <https://www.wsj.com/articles/surging-fertilizer-costs-push-farmers-to-shift-planting-plans-raise-prices-11639580768>.

grocery bills further in 2022, analysts say, following a year in which *global food prices rose*⁴ to decade highs.

Brooks Barnes, a second-generation farmer in Wilson County, N.C., says he plans to reduce acres dedicated to fertilizer-intensive crops.

“I just don’t see how I’m going to get paid this year,” said Brooks Barnes, a second-generation farmer in Wilson County, N.C.

Mr. Barnes said he spent more than he ever had to operate his farm last year. Higher commodity prices at the time covered most of those cost increases. Facing even higher prices now, he doesn’t expect that to be the case for 2022.

On his farm where he grows tobacco, corn, soybeans, wheat and sweet potatoes, Mr. Barnes in the spring of 2021 said he paid \$16 a gallon for *Bayer*⁵ AG’s Roundup, the world’s most commonly used weedkiller, for his crops. By September he bought it for about \$40 a gallon and in February, his Nutrien Ltd. retailer told him it was \$60 a gallon, he said. One of the fertilizers he buys, 24s, cost him \$500 a ton from \$175 last spring, he said. Float bed plastic, which holds water for his tobacco plant trays to float on in his greenhouses, cost him \$82 a roll, compared with \$70 a year ago.

⁴ <https://www.wsj.com/articles/where-inflation-is-hitting-hardest-prices-of-groceries-utilities-rent-jump-11644519819>.

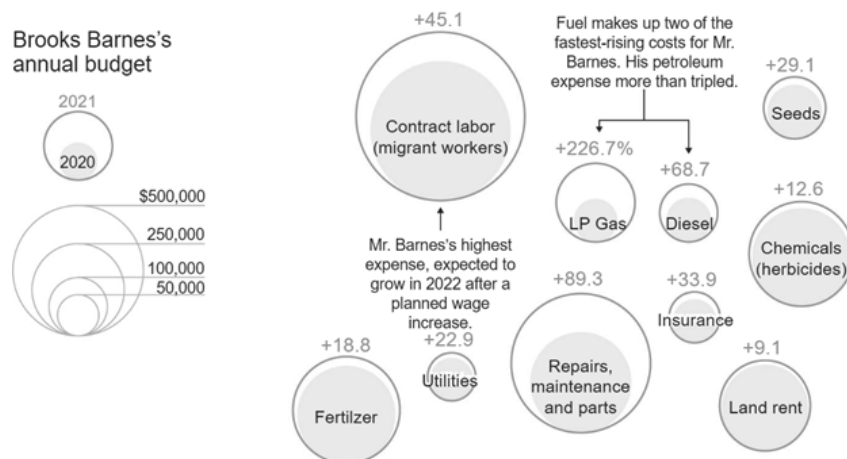

⁵ <https://www.wsj.com/market-data/quotes/BAYRY>.

"I've always been excited to start a new crop but I'm not excited at all for this one," said Mr. Barnes, who has been farming full-time since 2004.

Supply-chain constraints and staffing problems are leading to higher prices for products and supplies across a variety of industries, especially food. U.S. inflation *hit its fastest pace in nearly 4 decades*⁶ last year. Food prices surged 7% in January, the sharpest rise since 1981, the Labor Department on Thursday said, as meat and egg prices continued to climb at double-digit rates.

A rally in prices for agricultural commodities such as corn and soybeans, which kicked off in mid-2020, pushed up incomes for U.S. farmers and led them to *spend more freely on farmland and machinery*.⁷ In 2021, U.S. farms' net income was estimated to be about \$117 billion, up 23% from 2020, according to the U.S. Department of Agriculture.

Even as crop prices remain high, supply costs are expected to outpace the price of agricultural goods in 2022, according to a January report from the Federal Reserve Board. Net income for farmers in Kansas is estimated to fall 65% from a year ago, according to a January study from Kansas State University.

The Wall Street Journal.

Growers' biggest expenses each year, including fertilizer and crop chemicals, such as glyphosate, used to kill weeds and other pests are soaring in price. Glyphosate, Roundup's active ingredient, is up about 250% from what it was 12 months ago, said Dean Hendrickson, vice president of marketing and business development at *CHS*⁸ Inc., a farm cooperative and major retailer of seeds and chemicals.

Bayer attributed the recent increases in glyphosate prices to a global shortage caused by weather events, energy restrictions, high demand for transportation and global supply-chain challenges, a spokeswoman said.

"We expect challenges to the global ag industry to remain in 2022 and beyond," the company's spokeswoman said.

⁶ <https://www.wsj.com/articles/us-inflation-consumer-price-index-january-2022-11644452274>.

⁷ <https://www.wsj.com/articles/u-s-farm-belt-revival-prompts-mad-dash-for-dirt-and-iron-11632657604>.

⁸ <https://www.wsj.com/market-data/quotes/CHSCP>.

Mr. Barnes says his goal is to break even this year.

Bayer said Monday that a supplier of an ingredient for glyphosate ran into mechanical problems that may hamper production of the herbicide. The company said the supplier is on track to restore production, and Bayer said it expects any impact to be marginal in terms of its annual glyphosate production.

The Federal Reserve has signaled it plans to raise interest rates in 2022 in response to stubbornly high inflation. WSJ's J.J. McCorvey explains what higher rates could mean for your finances. Photo illustration: Todd Johnson.

Editor's note: the video is retained in Committee file.

Seed prices are also up. Crop-seed and pesticide supplier *Corteva*⁹ Inc. said prices that it charges farmers for seeds rose 10% in its most recent quarter and its crop-protection products were up 6% compared with the prior year to offset inflation.

⁹<https://www.wsj.com/market-data/quotes/CTVA>.

“We’ve demonstrated that we can move prices to cover costs and grow margins,” said CEO Chuck Magro.

The price of anhydrous ammonia fertilizer is up more than 200% from a year ago at \$1,492 per ton, an all-time high, according to agricultural research firm DTN. Fertilizer price increases partly stem from elevated natural-gas prices, a key ingredient for nitrogen-based fertilizers, as well as severe storms in the U.S. that disrupted production plants earlier this year. Major fertilizer producers including China, Turkey, Egypt and Russia also curbed exports in the second half of 2021, further pushing up global prices, analysts and retailers said.

Some farmers also blame fertilizer companies for the rising prices. A recent study from Texas A&M, commissioned by state corn growers associations, suggested that fertilizer costs tend to go up when corn revenues increase, even after accounting for natural-gas prices and higher demand.

Boxes of sweet potatoes are moved inside a climate-controlled barn on Mr. Barnes’s farm in Lucama, N.C.

“Our cost to buy products from our suppliers went up and therefore our prices for customers have increased,” said Jeff Tarsi, head of global retail operations at Nutrien, a major fertilizer supplier.

The potential for higher farming costs to cut into production of corn and other crops could fuel continued food-price inflation, analysts said. Higher corn and soybean prices, for example, raise the cost of animal feed for meat companies, *which pass along the increase to consumers*.¹⁰

“I don’t think there is any reprieve for food prices to come down,” said Kevin McNew, chief economist for the Farmers Business Network, an online marketplace for agricultural supplies. “It’s not just a logistics issue, or supply-chain issue to grocery stores, it’s deeper rooted than that.”

Because of the higher costs, Mr. Barnes said he is holding back on many of the purchases he had hoped to make this year, including a new combine. He put his annual hunting trip to Saskatchewan, Canada, on hold this year, for fear his budget might be too tight.

Like many other U.S. farmers, Mr. Barnes also plans to adjust this year by reducing acres dedicated to fertilizer-intensive crops, and planting more soybeans and wheat, which tend to require less nutrients. Planted U.S. acreage of soybeans this year is projected to be up about 6% from last year and exceed corn for the third

¹⁰ <https://www.wsj.com/articles/tyson-posts-higher-quarterly-profit-on-price-increases-strong-demand-11644241426>.

time in history, according to Farm Progress, a division of research firm *Informa*.¹¹ The only other times were in 1983 and 2018.

“My goal for the year is just to break even,” Mr. Barnes said.

Greenhouses on Mr. Barnes's farm.

Corrections & Amplifications

If planted soybean acreage in the U.S. were to exceed corn this year, it would mark only the third time for that to happen, the prior years being 2018 and 1983. An earlier version of this article, failing to cite 1983, incorrectly said it would be the second time and that the only other time was 2018. (Corrected on Feb. 16.)

'Farms Are Failing' as Fertilizer Prices Drive Up Cost of Food

Farmers in the developing world say they are curtailing production, which means global hunger could worsen

¹¹<https://www.wsj.com/market-data/quotes/UK/XLON/INF>.

Fertilizer prices and shortages are hurting farmers; phosphate fertilizer being moved at a warehouse in Russia last month. Andrey Rudakov/*Bloomberg News*.

By JON EMONT,¹ in Singapore and JENNY CAROLINA GONZALEZ in Bogotá, Colombia

From South America's avocado, corn and coffee farms to Southeast Asia's plantations of coconuts and oil palms, high fertilizer prices are weighing on farmers across the developing world, making it much costlier to cultivate and forcing many to cut back on production.

That means grocery bills could go up even more in 2022, following a year in which *global food prices rose to decade highs*.² An uptick would exacerbate hunger—already acute in some parts of the world because of pandemic-linked job losses—and thwart efforts by politicians and central bankers *to subdue inflation*.³

“Farms are failing and many people are not growing,” said 61 year old Rodrigo Fierro, who produces avocados, tangerines and oranges on his 10 acre farm in central Colombia. He has seen fertilizer prices double in recent months, he said.

A woman harvesting in a field in Ivory Coast. Fertilizer demand in sub-Saharan Africa could fall 30% this year, which nonprofit International Fertilizer Development Center says would translate to a loss in food production equivalent to the needs of 100 million people. Photo: Legnan Koula/Shutterstock.

Christina Ribeiro do Valle, who comes from a long line of coffee growers in Brazil, is this year paying three times what she paid last year for the fertilizer she needs. Coupled with a recent drought that hit her crop hard, it means Ms. do Valle, 75, will produce a fraction of her Ribeiro do Valle brand of coffee, some of which is exported.

There is also a shortage of fertilizer. “This year, you pay, then put your name on a waiting list, and the supplier delivers it when he has it,” she said.

The coffee beans won’t develop as they should for lack of fertilizer, she said—not just this year but also in 2023. “It’s like a child that’s malnourished,” she said.

*Farmers in the U.S. are also feeling the pinch,*⁴ with some shifting their planting plans. But the impact is expected to be worse in developing countries where smallholders have limited access to bank loans and can’t pay up front for expensive fertilizer.

Fertilizer demand in sub-Saharan Africa could fall 30% in 2022, according to the International Fertilizer Development Center, a global nonprofit organization. That would translate to 30 million metric tons less food produced, which the center says is equivalent to the food needs of 100 million people.

Global food prices rose to decade highs last year. A customer shopping at a London supermarket earlier this month. Photo: Daniel Leal/Agence France-Presse/Getty Images.

“Lower fertilizer use will inevitably weigh on food production and quality, affecting food availability, rural incomes and the livelihoods of the poor,” said Josef Schmidhuber, deputy director of the United Nations Food and Agriculture Organization’s trade and markets division.

As the pandemic enters year 3, more households are having to cut down on the quantity and quality of food they consume, the World Bank said in a note last month, noting that high fertilizer prices were adding to costs. Around 2.4 billion people lacked access to adequate food in 2020, up 320 million from the year before, it said. Inflation rose in about 80% of emerging-market economies last year, with roughly a third seeing double-digit food inflation, according to the World Bank.

Diammonium phosphate, or DAP, a commonly used phosphate fertilizer, cost \$745 per metric ton in December—more than double its 2020 average price. December prices for Eastern European urea, a widely exported nitrogen fertilizer, were nearly four times the 2020 average.

The price-increases stem partly from global energy costs, with the average natural-gas price in Europe for the October–December quarter ten times as much as that for the year of 2020, according to World Bank data. Nitrogen production facilities rely heavily on natural gas to convert chemical raw materials into finished products, so rises in the natural-gas price often flow through into fertilizer costs. Major fertilizer producers including China, Turkey, Egypt and Russia also curbed exports in the second half of 2021, further pushing up global prices.

A more recent factor is European Union and U.S. sanctions on Belarus, a major exporter of potash, which is a key ingredient of mineral fertilizers. Norway-based *Yara International ASA*,⁵ one of the world’s largest fertilizer makers, said this month it would wind down its sourcing of Belarusian potash by April.

“Belarus represents 20% of the global production of potash so clearly they are a significant supplier,” said Chief Executive Svein Tore Holsether in an interview. “If that part doesn’t make it out of Belarus then I don’t see anyone ready to turn up the volumes,” he said.

The trucking industry has long been dealing with a shortage of drivers and high job turnover, but supply-chain bottlenecks have underscored the need for new recruits. Here's how some companies are trying to get them behind the wheel. Photo: Robyn Beck/AFP via Getty Images (Originally published in November).

Editor's note: video retained in Committee file.

Tony Will, chief executive of CF Industries Holdings Inc., a leading nitrogen fertilizer manufacturer based in Deerfield, Ill., said he expected lower fertilization levels this year to result in reduced agricultural yields. The company has only re-opened one of the two UK plants it closed in September, citing high natural-gas prices and low availability of truck drivers. Plants in North America, where gas prices are lower, are running at maximum capacity, Mr. Will said.

Industry experts say European production is likely to be constrained as long as natural-gas prices remain high there, with shortages in parts of the developing world amplified by trade restrictions in other major fertilizer exporters.

On Indonesia's Sumatra island, coconut grower Burhanuddin Rafik is seeking out alternatives to fertilizer. He says farmers in his area have resorted to using monosodium glutamate, or MSG, a flavor enhancer that contains high levels of nitrogen and is used in local dishes. He and others are also trying organic methods, like spreading ash and plant debris on their crops.

"When I tell them the price of seeds is \$3 per kilogram, they start to cry."

FAUSTIN LOHOURI BI TRA, who grows corn, rice and soy seeds for other farmers in Ivory Coast

Faustin Lohouri Bi Tra, who grows corn, rice and soy seeds for other farmers on a 500 acre plantation in Ivory Coast, said if fertilizer prices remain high into April, he might have to slash his own planting by half or more. He can only raise prices so much before his seeds become too expensive for local farmers. "When I tell them the price of seeds is \$3 per kilogram, they start to cry," he said.

In an oven-hot, largely flat corner of southern Colombia, Marcos Baquero, 48, said high fertilizer costs were prompting him to try to figure out how to coax a bigger yield from his small farm.

"Farmers need to produce 50% more than they produced before," said Mr. Baquero, though he said he believed that many would simply give up on farming.

While he usually gets 35 tons of watermelon a hectare, he now wants to see if he can produce 40 tons. As for corn, he would like to increase the yield from the 6 tons to 10 tons he now produces to as much as 20 tons a hectare.

"This is very painful for us farmers," he said, "and it's getting very difficult to work."

Farmers Are Racing Against Poor Weather to Plant Crops

Delays in getting crops started could cut into harvests amid already high grain prices

A farmer at work last month in Heyworth, Ill. The planting of corn, soybeans and wheat are well behind their usual pace. Photo: Alan Look/Zuma Press.

By PATRICK THOMAS,¹ and KIRK MALTAIS²
May 11, 2022 1:29 p.m. ET

Farmers are in a race against the clock to get their crops in the ground this week, with planting of corn, soybeans and wheat well behind their usual pace.

Wet and cool temperatures in key parts of the Midwest have delayed farmers' planting plans, leaving them days to get crops in the ground before they start to lose out on a bigger harvest. If they don't, some grain traders say that already high prices for agricultural commodities could rise even more, with supplies thinning as farmers world-wide grapple with tough weather.

On Monday, the U.S. Department of Agriculture said 22% of corn was planted, compared with 50% for the previous 5 year average. For soybeans, 12% was planted, compared with the previous 5 year average of 24%, and 27% of spring wheat was in the ground compared with a typical 47%, according to the USDA.

For corn the situation is particularly tenuous because corn planted after this week runs an increased risk of yielding less, agronomists say. With global grain markets already tight due to poor weather in *key growing areas*³ and Russia's war in Ukraine, further disruptions to U.S. crops could push crop prices beyond current *near-record levels*,⁴ they said.

Jeff Ryan, a corn and soybean farmer in Cresco, Iowa, said under 10% of his crop is planted, and more rain Monday night further delayed his progress. In a typical year, he said, he finishes planting by May 10, but windy and overcast weather conditions this spring have left his soil too wet. With rain expected later this week, Mr. Ryan said he expects his yields to fall by between 10% and 20% if the weather doesn't improve.

"It's not looking real promising," Mr. Ryan said, adding that it will take him about 10 days to plant. "It all depends on the weather. If it's just rainy enough and overcast, there's not much you can do."

Corn crops usually produce less grain when planted in middle to late May, said Jeffrey Coulter, a University of Minnesota Extension corn agronomist, who advises

¹ <https://www.wsj.com/news/author/patrick-thomas>.

² <https://www.wsj.com/news/author/kirk-maltais>.

³ <https://www.wsj.com/articles/ukraine-war-wheat-shortfalls-high-prices-11651503940>.

⁴ <https://www.wsj.com/articles/corn-and-soybeans-near-record-prices-push-food-costs-higher-11651092056>.

regional farmers. When corn is planted after May 12, yields start to slip, but can stay high until around May 20, he said.

Some corn-producing states—such as Illinois, Indiana, Minnesota and North Dakota—have seen above-average precipitation over the past 3 months, according to data from the U.S. National Oceanic and Atmospheric Administration. Wet soils in Corn Belt states have prevented farmers from getting their machinery into their fields.

Sean Elliot, a sixth-generation farmer in Iroquois County, Ill., planted his crop until midnight on Monday and got back out to the fields at 5:30 a.m. the next day to resume planting. Some of his land is still wet, but with more rain expected this weekend, Mr. Elliot said he is racing to get as much corn and soybean planted as he can this week. He has a drainage system installed that will help dry out his soil, but his neighbors that don't will probably lose out on some of their yields, he said.

"We're pushing as hard as we can," he said.

Farmers faced a *similar situation*⁵ in 2019, when record rainfall delayed planting and many either planted diminished crops or made insurance claims for unplanted acres. Corn production declined by about 5% that year, according to the USDA.

Further west, drought conditions are lingering in parts of major grain-producing states like Kansas and Nebraska, where dry soils make it difficult for farmers to successfully plant seeds.

Over 68% of the winter-wheat crop in the U.S. is in a severe drought, while spring-wheat states are stuck with excessive moisture, said Chandler Goule, chief executive of the National Association of Wheat Growers. In Minnesota, one of the largest spring-wheat growing states, 2% of the spring wheat is planted compared with 93% last year.

"The lack of moisture in the winter wheat and excessive moisture in the spring will affect yields and quality if we don't see an immediate change in the weather," he said.

Seed and pesticide maker *Corteva*⁶ Inc. said the planting delays cut into some of the company's first-quarter seed sales. While Corteva ships seeds to local sales representatives, it doesn't recognize revenue until after the seeds make it to the farmer. Challenging weather conditions that began at the end of March pushed back purchases, the company said.

A tight crop supply globally has boosted grains prices. Year-to-date, corn futures are up 31% while soybeans have risen 19% and wheat has increased nearly 42%. The USDA on Thursday is expected to release its monthly world supply-and-demand report. If the report shows demand for grains in the coming year rising as inventories and new U.S. production shrinks, futures may rise further, according to analysts.

Chuck Read, a fifth-generation farmer in Princeton, Ill., said he thinks he can get his 1,150 acres of corn and soybeans planted by the end of the week if the weather holds. "It's important we have a good crop for food prices," he said. "We need to have a good crop especially with what's happening in Ukraine."

Appeared in the May 12, 2022, print edition as 'Poor Weather Delays Midwest Crop Planting'.

SUBMITTED REPORT BY HON. GLENN THOMPSON, A REPRESENTATIVE IN CONGRESS
FROM PENNSYLVANIA

CONGRESSIONAL BUDGET OFFICE

Baseline Projections

May 2022

The Commodity Credit Corporation (CCC) accounts for a significant portion of mandatory Federal spending for agriculture through a wide range of programs shown in the general summary tables. CCC provides commodity price and income supports mainly through four programs:

- The **Price Loss Coverage** program makes payments to producers when the annual average market price per unit of a covered commodity falls below the reference price set in law. Beginning with the 2019 crop year, the Price Loss Coverage program makes payments when the annual average market price per

⁵ <https://www.wsj.com/articles/farmers-on-drenched-land-confront-tough-choice-on-planting-11559727000>.

⁶ <https://www.wsj.com/market-data/quotes/CTVA>.

unit of a covered commodity falls below the effective reference price, as defined in the 2018 Farm Bill (Public Law 115–334, the Agriculture Improvement Act of 2018).

- The **Agriculture Risk Coverage-County** program makes payments to producers when the actual average revenue for a crop (price times production) within the producer’s county falls below the local guaranteed amount, which is based on an average for recent years.
- The **Marketing Loan** program makes short-term loans to farmers at specified commodity loan rates using current production as collateral. Non-recourse loans may be repaid at less than principle plus interest if the market price estimated by the Department of Agriculture drops below the loan rate. The commodity also may be forfeited to CCC *in lieu of* loan repayment. Once a loan is repaid, producers are free to sell their crops.
- The **Dairy Support** program makes payments to producers to account for the difference between the monthly milk price and the cost of feed. Participants may choose the size of the margin they wish to cover and may be required to pay a premium to the government for such protection.

Participants in the Price Loss Coverage Program and in the Agriculture Risk Coverage program may receive payments from only one such program in any given year. The loan program is available to qualified producers in any year. The dairy supports program operates continuously.

Crop Insurance

Through the Federal Crop Insurance Corporation, producers may purchase insurance against major losses in yield or revenues for their crops. On average, the Federal Government pays 60 percent of a producer’s insurance premiums. The government also reimburses private-sector insurance companies for administrative expenses and underwriting gains (a company’s share of total gains and losses for insurance policies).

Conservation Programs

The Federal Government has programs to encourage producers to take fragile land out of production or to make improvements that promote land conservation by preventing erosion or improving productivity, for example.

Disaster Assistance

The Federal Government offers producers assistance when natural disasters reduce feed available for livestock, cause above-average death rates among livestock, or damage trees.

Commodity Background Tables

Total costs of commodity programs are derived from estimates for individual eligible commodities. Critical factors used to estimate program costs depend on projections of the price, yield, and program acres for each commodity. Historically, prices for a given commodity have been related to, among other things, the ratio of ending stocks to total use. A relatively high ratio implies an excess supply, which usually is associated with a lower price. Estimating prices according to historical relationships helps to keep price projections consistent with other market variables.

To help the agency consider changes to its baseline estimates, CBO convenes a meeting of agricultural economists each fall to discuss supply, demand, and price forecasts for major agricultural commodities like corn, soybeans, wheat, and cotton. In addition, crop insurance analysts are invited to review past performance of the crop insurance program and to discuss program changes. Attendees include economists from the Department of Agriculture’s Office of the Chief Economist, World Agricultural Outlook Board, Economic Research Service, Farm Service Agency, Foreign Agricultural Service, and Risk Management Agency, as well as agricultural economists from various universities and private enterprises.

CBO’s May 2022 Baseline for Farm Programs

Adjusted for Sequestration from FY 2021 to FY 2031

Abbreviations Used in Farm Programs Baseline Tables

ARC	Agriculture Risk Coverage
AWP	Adjusted World Price
CCC	Commodity Credit Corporation
CO	County Coverage

Abbreviations Used in Farm Programs Baseline Tables—Continued

CRP	Conservation Reserve Program
ELS	Extra-Long Staple Cotton
FCIC	Federal Crop Insurance Corporation
FSI	Food, Seed, and Industrial
FY	Fiscal Year
IC	Individual Coverage
MLG	Marketing Loan Gain
NRCS	Natural Resources Conservation Service
OMB	Office of Management and Budget
PLC	Price Loss Coverage
USDA	U.S. Department of Agriculture

Components may not sum to totals because of rounding.
 In some cases, 2021 spending is indicated as estimated because actual spending by program component is incomplete.

Congressional Budget Office
 May 2022

On May 27, 2020, CBO reposted this table to correct a typographical error on page 9.

^aThis is the account for Commodity Credit Corporation price support programs in budget function 350 (agriculture). It includes those activities listed on the following page.
 It does not include conservation programs. CRP and several conservation programs were added to CCC in 1996, but remain under budget function 300 (natural resources and environment).
^bThese amounts reflect projected direct spending for conservation programs shown by OMB under the CCC account total.
^cThis total is consistent with categories included in USDA's CCC total for budget functions 350 and 300; includes some minor loan program accounts.

Mr. THOMPSON. Yes, now, I am going to tee this one up and would love to follow up individually with you just because all the time remaining. I have been hearing a lot about—and I want to kind of look at the economic impact on commodity prices, but it is a total curveball. It has to do with solar fields being on fertile farmlands. And I think some of our other Members of the Committee are hearing about this as well. That is putting out policies that—policies have impact, right? I am recently hearing a lot of discussion and concern that government policy is incentivizing placement of solar farms on fertile farm, not marginal, but fertile farm land driving up the competition for leasing acreage, and that is really important for our young and beginning farmers. And so I would love to follow up with you, any thoughts you might have in writing or in person, if this is or could be a significant input cost variable going forward, just cost of acreage.

There is no currently available estimate of the impact of existing or proposed utility-scale solar installations on the price of agricultural land. Similarly, the degree to which government policies have incentivized utility-scale solar installations is not known with precision. Both effects are likely to vary considerably across states since policy incentives, farmland values, the availability of non-agricultural land, and solar power output vary considerably across space. Many of these parameters also vary across time. For instance, a recent study^{1*} from the Lawrence Berkeley Laboratory suggests the land requirements per unit of power generated have fallen con-

¹M. Bolinger and G. Bolinger, "Land Requirements for Utility-Scale PV: An Empirical Update on Power and Energy Density," † in *IEEE Journal of Photovoltaics*, vol. 12, no. 2, pp. 589–594, March 2022, doi: 10.1109/JPHOTOV.2021.3136805.

* **Editor's note:** footnotes annotated with † are retained in Committee file.

siderably over time. Finally, policy incentives are numerous and complex² so estimating their impact on land values is difficult.

Even assuming government incentives are responsible for all solar installations and that all solar installations occur on farmland, the impact of existing and proposed solar installations on farmland values is likely to be small because the number of agricultural land acres possibly impacted by conversion is small. By one estimate,³ the proportion of land in existing and proposed solar projects in the average county in the U.S. Midwest is 0.005% of the quantity of agricultural land.

That said, more research is needed to answer the specific question proposed by the Representative. The impact of farmland conversion to alternative commercial and residential uses more generally is thought to be significant,⁴ although the impact of any one specific type of conversion (*e.g.*, for utility-scale solar) is likely to be smaller.

Congressman Thompson,

Thanks for the question regarding “solar farms.” We don’t have any data in our FINBIN database that directly address your question. My observation in MN and surrounding states is that the development of solar farms has been on relatively marginal farm land. I do not expect solar farms to have an impact on the availability or price of quality farm land.

ROBERT H. CRAVEN,
University of Minnesota.

love to follow up with you, any thoughts you might have in writing or in person, if this is or could be a significant input cost variable going forward, just cost of acreage.

This confirms what I have witnessed and what I am hearing from colleagues in the South. Wind farm operators are targeting cropland so they will not have to undertake the cost of clearing and leveling the land for solar installation. Specifically as it relates to policy, a lot of agricultural policy has unintended consequences and this is another example. Incentivizing solar production in the suite of all renewable energy policy has the effect of reducing the cost of installation/operation of solar farms. This in turn makes it profitable to pay more for land for solar farms. Many solar farms are being located on productive farmland which reduces the available supply of farmland and increases costs.

Insert 2

Mr. ALLEN. Farmers in my district have signed on to a petition which requests that a lack of agronomic inputs be included as covered peril under the 2022 MPCl policy.* Can you comment on that?

Dr. OUTLAW. I would say that—

The standard MPCl policy covers a large array of causes of loss. The unavailability of necessary production inputs (at the time they are needed) would also cause losses for producers. While it may be difficult to prove loss, this is definitely an area that RMA should look into as the agriculture supply chains continue to prove unreliable.

ATTACHMENT

April 14, 2022

Congressman Rick W. Allen,
Statesboro Office,
Statesboro, GA.

Dear Congressman Allen:

We would like to take this opportunity to point out an operational and economic issue farmers are facing in 2022. Regardless of the fact that there are multiple contributors to the problem, 2022 poses a significant financial threat to the farm community due to major supply chain issues. Farmers are anticipating difficulties sourcing Herbicides, Fungicides, and Fertilizer needed to successfully make their crop yields. Why, you may ask, is this such an important issue for the upcoming year? To date, “lack of agronomics inputs” is a *non-insured* peril under current Multi-Peril Crop Insurance policies (MPCl). This means that the inability to produce a favorable yield due to the *inability to secure necessary supplies* will lead to farmers being denied claims on the basis of policy exclusions.

We believe, and hope, that you will support any effort to **require** USDA/FCIC/RMA to include “lack of agronomics inputs” as a covered peril in the 2022 MPCl policy. USDA made a favorable effort to extend deadlines as a result of [COVID], so we are certain that something can be done to cover the above mentioned peril, on a temporary basis at minimum, in an effort to prevent farmers from financial ruin.

We would like to thank you, in advance, for your continued support! A petition in support of this request is attached and signed for your review.

Best regards,

Georgia Farmers.

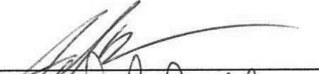

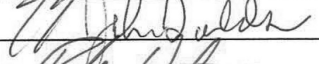

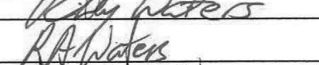

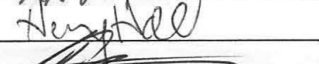

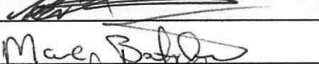

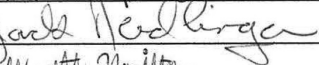

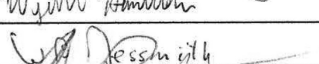

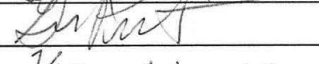

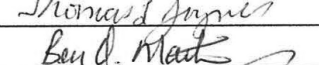

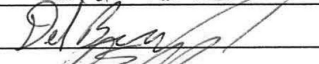

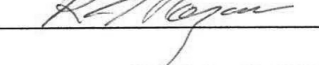

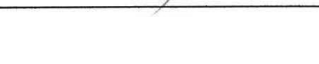

SID NEWTON.

Petition Request To Include “Lack of Agronomics Inputs” on 2022 MPCl Policies as a Covered Peril for Crop Insurance

**A 2022 REVIEW OF THE FARM BILL
(STAKEHOLDER PERSPECTIVES ON NON-SNAP USDA
NUTRITION PROGRAMS)**

TUESDAY, JUNE 14, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:06 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, Costa, McGovern, Adams, Spanberger, Hayes, Brown, Pingree, Sablan, Kuster, Plaskett, Carbajal, Lawson, Craig, Harder, Axne, Schrier, Panetta, Kaptur, Thompson, Austin Scott of Georgia, Crawford, Hartzler, LaMalfa, Allen, Rouzer, Kelly, Bacon, Johnson, Baird, Cloud, Mann, Feenstra, Moore, Cammack, and Fischbach.

Staff present: Caitlin Balagula, Lyron Blum-Evitts, Prescott Martin III, Amar Nair, Ashley Smith, Katherine Stewart, Caleb Crosswhite, Jennifer Tiller, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. All right. Welcome, everyone. The Committee will now come to order. And I want to thank everyone for joining us here today for *A 2022 Review of the Farm Bill: Stakeholder Perspectives on Non-SNAP USDA Nutrition Programs*, a very important hearing. After our brief opening remarks, Members will receive the testimony from our witnesses today, and then the hearing will be open for questions.

And so, let me just start by again saying welcome to all of you. I really appreciate you all coming in and sharing this vital information on *A 2022 Review of the Farm Bill: Stakeholder Perspectives on Non-SNAP USDA Nutrition Programs*. This hearing is another in an ongoing series of hearings that we are hosting to review the 2018 Farm Bill and prepare for the 2023 Farm Bill. We will receive stakeholder input on USDA's nutrition programs included in the farm bill other than SNAP, which includes the following food distribution programs: One, The Emergency Food Assistance Program, better known as TEFAP; two, the Commodity Supplemental Food Program; and three, the Food Distribution Program on Indian Reservations. And our nutrition incentives and food access programs, including the Gus Schumacher Nutrition Incentive Program, the Seniors Farmers' Market Nutrition Program, the Healthy Food Fi-

nancing Initiative, and Community Food Projects Competitive Grants Program. So, as you can see, we have a lot of ground to cover.

These critical anti-hunger nutrition programs work together alongside SNAP to tackle food insecurity from different angles and provide support to millions of Americans, with each also providing positive impacts for both farmers and ranchers, as well as our broader food system. For example, in Fiscal Year 2020, The Emergency Food Assistance Program, or TEFAP, provided 2.2 billion pounds of USDA foods to emergency food providers like food banks, who use that support to serve more than 60 million Americans, according to Feeding America, an excellent, excellent helping hand for our nation to feed America. The Seniors Farmers' Market Nutrition Program, which provides over 800,000 low-income seniors with coupons each year that they can exchange for fresh fruits, vegetables, herbs, and honey at our farmers' markets. And our newest Member, Ms. Kaptur, a fine Representative from Ohio, has been a strong proponent of this program for many years. Thank you, Ms. Kaptur.

And just last week, the Healthy Food Financing Initiative announced its latest round of grants and loans to entities that will offer healthy foods in communities without access to nearby grocery stores and food retailers. These awards will support 134 projects in rural areas, urban areas, and Tribal communities in 46 states and Territories, including several right in my own home State of Georgia. Because it is in Ellenwood, Georgia, which is now completely in my district thanks to the redrawing—I had it before, and now they are bringing it back to me, Ellenwood.

And the name of this organization is Atlanta Harvest, an urban farm that provides food to seven counties in the greater Atlanta region. They just received Healthy Food Financing Initiative funding, and I am very glad about that. This funding will expand their market square footage to increase their inventory and variety of foods sold, and they will be able to purchase a hybrid delivery food truck. And Atlanta Harvest is a great example of how our nutrition programs work in concert. And since 2018, they have partnered with Wholesome Wave Georgia, who happens to be a 2021 GusNIP grantee, and provides SNAP recipients a 100 percent match for fresh produce.

And that was a little bit of just some of the many fantastic programs that we will discuss today. I also have to acknowledge the incredible work that these programs and their grantees and administrators have done during this terrible COVID-19 pandemic. Despite incredible challenges faced, they responded quickly and with great flexibility to be able to continue serving those in need during a particularly difficult time, and we want to say thank you very much. I look forward to discussing these programs and reviewing their relevant provisions in the 2018 Farm Bill so that we can maintain and improve upon them as necessary for our 2023 Farm Bill.

So, thank you again to the Members and witnesses who are joining us today, as well as those who have tuned in and are listening or watching. And I look forward to hearing more today about how we can improve these important programs.

[The prepared statement of David Scott of Georgia follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning and welcome to today's hearing, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on Non-SNAP USDA Nutrition Programs*. This hearing is another in the ongoing series of hearings we are hosting to review the 2018 Farm Bill and prepare for the 2023 Farm Bill.

We will receive stakeholder input on USDA nutrition programs included in the farm bill—*other than* SNAP—which includes our food distribution programs: The Emergency Food Assistance Program (TEFAP), The Commodity Supplemental Food Program, and the Food Distribution Program on Indian Reservations.

And our *nutrition incentive* and *food access programs*, including: The Gus Schumacher Nutrition Incentive Program, The Seniors Farmers' Market Nutrition Program, The Healthy Food Financing Initiative, and Community Food Projects Competitive Grants Program.

So, as you can see, we have a lot of ground to cover!

These critical anti-hunger and nutrition incentive programs work together, alongside SNAP, to tackle food insecurity from different angles and provide support to millions of Americans, with each also providing positive impacts for farmers and ranchers and our broader food system.

For example, in Fiscal Year 2020, The Emergency Food Assistance Program—or TEFAP—provided 2.2 billion pounds of USDA Foods to emergency food providers, like food banks, who used that support to serve more than 60 million Americans, according to Feeding America.

The Seniors Farmers' Market Nutrition Program provides over 800,000 low-income seniors with coupons each year that they can exchange for fresh fruits, vegetables, herbs, and honey at farmers' markets. Our newest Member, Ms. Kaptur has been a strong proponent of this program.

And, just last week, the Healthy Food Financing Initiative announced its latest round of grants and loans to entities that will offer healthy foods in communities without access to nearby grocery stores and food retailers. These awards will support 134 projects in rural, urban, and Tribal communities in 46 states and Territories, including several in my own home state of Georgia.

In Ellenwood, Georgia—which is inside of my new Congressional District—Atlanta Harvest, an urban farm that provides food to seven counties in the greater-Atlanta region, just received Healthy Food Financing Initiative funding to expand their market's square footage, to increase their inventory and variety of food sold, and to purchase a hybrid delivery food truck.

And Atlanta Harvest is a great example of how our nutrition programs work in concert. Since 2018, they have partnered with Wholesome Wave Georgia, who happens to be a 2021 GusNIP grantee, to provide SNAP recipients 50 percent off fresh produce.

And that was a little bit on just *some* of the *many* fantastic programs we will discuss today.

I also have to acknowledge the incredible work that these programs and their grantees and administrators have done during the COVID-19 pandemic. Despite the incredible challenges faced, they responded quickly and with great flexibility to continue serving those in need during a particularly difficult time. Thank you.

I look forward to discussing these programs and reviewing their relevant provisions in the 2018 Farm Bill so we can maintain and improve upon them as necessary for the 2023 Farm Bill.

Thank you again to the Members and witnesses joining us today as well as those who have tuned in and are listening. I look forward to hearing more today about how we can improve these important programs.

With that, I'd now like to welcome the distinguished Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for any opening remarks he would like to give.

The CHAIRMAN. And so, with that, now, I would like to welcome our distinguished Ranking Member, my friend, the gentleman from Pennsylvania, Mr. Thompson, for any opening remarks that you would like to give.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Thank you, Mr. Chairman. Thank you, Mr. Chairman, and good morning to our witnesses, and thank you for sharing your time and expertise with us today.

First, I want to remind the Committee we are again battling record levels of inflation. Consumer prices rose 8.6 percent in the 12 months ending in May, climbing at the quickest pace since the Carter Administration. This Administration and my colleagues must rethink regulatory actions and spending proposals because to say our communities are suffering is an understatement. And obviously, we see that in the area that we are discussing today, which is the affordability of food when you look at the cost of groceries and individual food products have increased and escalated as a part of that.

The harsh reality makes today's hearing important but also a cautionary tale. Each of the programs being discussed today, including the Commodity Supplemental Food Program, The Emergency Food Assistance Program, and the Food Distribution Program on Indian Reservations, round out the nutrition safety net for individuals and communities in need. But it is no wonder participation rates are through the roof. Nutrition distribution incentive programs are costing billions to operate, and inflated prices are making it harder for providers to provide and recipients to receive. So, I do hope today delivers a realistic discussion on how to combat these excessive costs and ensure those in need have access.

But more spending and expanded eligibility are not necessarily the answer. Infusing the economy with newly printed money is a reckless plan. Instead, we need to evaluate how to grow our economy naturally through increased labor force participation, addressing our fractured supply chain, and boosting our domestic production, welcomed steps towards less need and reliance on Federal aid.

Today also presents the opportunity to discuss what is working and what is not in the statutes guiding each of these programs. And I remain troubled that our recent nutrition farm bill-related hearings that focus solely on the 2018 Farm Bill and more on where we can increase spending and expanding eligibility and programming. We know for a fact some of the bipartisan ideas that came to fruition in 2018 have cost too much, yielded too few results, or barely made a difference in people's lives. I think also it is imperative that we hear more about nutrition and health today.

The recently announced White House Conference on Food, Nutrition, Hunger, and Health advertises itself as an event to accelerate progress and drive significant change to end hunger, improve nutrition and physical activity, reduce diet-related disease, and close the disparities around them. On its face that mission appears praiseworthy. However, the hearsay surrounding the conference is leaving much to be desired.

And last, in areas like nutrition centers, what is being studied and learned related to health outcomes? Are we asking the right questions about their impact? And are the beneficiaries receiving the bulk of the funding or are we seeing funds tied up by organizations under the guise of, quote, "administration," end quote.

Thank you, Mr. Chairman, for calling this hearing. I look forward to the discussion. And again, I thank our witnesses for their testimony today. And with that, I yield back.

The CHAIRMAN. Thank you, Ranking Member.

And now the chair would request that other Members submit their opening statements for the record so that witnesses will be able to begin their testimony and to ensure that there is ample time for questions.

And right now, I would like to give a warm welcome to our first witness today, Mr. Kyle Waide, who is the President and Chief Executive Officer of the Atlanta Community Food Bank in our great State of Georgia. And let me just say, I have had a great relationship with this gentleman. We have worked together on many projects through feeding our wonderful people in Georgia and across the nation. And I want to also add that we have done a great project at Mundy's Mill High School, where we were able to provide COVID-19 vaccinations.

Our next witness today is Mr. Gary Besaw, who is the Director of the Menominee Tribal Department of Agriculture and Food Systems and also the Director of the Menominee Tribal Food Distribution Program from Keshena, Wisconsin. Thank you for coming.

Our third witness today is Dr. Jessie Gruner, the Director of Community Innovations at Pinnacle Prevention in Chandler, Arizona.

And our fourth witness today is Ms. Spencer Moss, who is the Executive Director of the West Virginia Food and Farm Coalition in Charleston, West Virginia.

And our fifth and final witness today is Mr. William Smittcamp, the President and Chief Executive Officer of the Wawona Frozen Foods in Clovis, California, who is testifying on behalf of the American Frozen Foods Institute.

I want to welcome all of you to our hearing today. And now we will proceed with your testimony. Mr. Waide, please begin when you are ready.

STATEMENT OF KYLE WAIDE, PRESIDENT AND CHIEF EXECUTIVE OFFICER, ATLANTA COMMUNITY FOOD BANK, ATLANTA GA

Mr. WAIDE. Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee, thank you for your invitation to testify today. My name is Kyle Waide. I am the CEO of the Atlanta Community Food Bank. We are a member of Feeding America, the national network of 200 member food banks that serve every county in the United States, distributing 7.5 billion pounds of food annually through a grassroots network of community-based feeding programs. Last year, my food bank in north Georgia provided 100 million pounds of food to 700,000 neighbors across 29 counties. Together, Feeding America food banks are uniquely capable of distributing emergency food safely, efficiently, equitably, and reliably to food-insecure families when and where they need it.

As we discuss the next farm bill, I want to deliver a simple message. Demand for food assistance is growing, and food banks need more Federal support to meet rising demand. We all know how the

pandemic dramatically increased food insecurity across the country. We met this crisis with an unprecedented Federal response, combined with an extraordinary expansion of food banks and other nonprofit feeding programs. Over time, more and more food-insecure families got back on their feet, and demand for food assistance declined. In recent months, however, rising prices for food, gas, and other basic needs, combined with the unwinding of many COVID recovery supports have increased pressure on families. Lines at food banks are growing again. And in my food bank, our distribution volume over the last few months has now risen again to 35 percent higher than where we were before COVID.

Meeting this demand is getting harder. Like every business in the country, our operating costs are skyrocketing due to rising wages, gas prices, and costs for maintaining and replacing equipment. Our costs for food acquisition have increased by 40 percent as we purchase more food at inflated prices to offset large declines in food commodities provided through Federal nutrition programs.

The Emergency Food Assistance Program, TEFAP, has provided critical support for food banks, especially during the pandemic. We would not have met the need for food assistance during the pandemic were it not for the massive investments in additional TEFAP spending authorized by Congress. This is particularly true in less populated areas of the country, where Federal commodities account for a much larger percentage of the food distributed by food banks.

But, looking ahead, we are concerned that reverting back to pre-pandemic levels of TEFAP spending in the next farm bill will leave us ill-prepared to meet the needs in our local communities. Food banks are anticipating a decline in Federal commodities next year of 40 percent or more. In addition, many TEFAP shipments right now are being canceled due to supply chain challenges and price increases.

To offset these reductions, food banks are purchasing more food. In Atlanta, we will spend more than \$15 million next year just to purchase food, which will account for more food than we expect to receive in TEFAP commodities. That is not a sustainable pattern for the vast majority of food banks.

We need your help to continue to meet the need for food assistance over the long-term. And specifically, we need more TEFAP. I encourage you to consider increasing the level of mandatory funding for TEFAP to \$450 million annually while increasing funding for TEFAP storage and distribution costs.

Alongside an increased investment in TEFAP, I also encourage you to consider expanding access to the Commodity Supplemental Food Program and to support enhancements to the SNAP program. I refer you to my written testimony for more detail on enhancements to CSFP and SNAP.

As you consider increasing funding for these programs, I also encourage you to consider what it takes to ensure this food is distributed safely and equitably in the communities that need it the most. Food insecurity continues to disproportionately impact communities of color and rural communities, both of which experience food insecurity rates that are twice as high as the national average. Getting food to these communities is often more challenging and more expensive. Here again, the nation's food banks are uniquely capable

of ensuring federally funded food resources reach the people in communities that need it the most.

We have developed the infrastructure and systems to store and move food safely and accountably, and, more importantly, we have built relationships and trust in our country's most vulnerable communities. In Atlanta, $\frac{2}{3}$ of the partners who work with us to distribute food are faith-based organizations, representing a wide variety of faiths and denominations across urban, suburban, and rural communities. Sixty percent of our partners serve majority minority communities, and half are led by BIPOC leaders. This is why our community turns to us in a crisis and it is why Congress and the USDA can trust us to ensure the food you provide us is reaching the people who need it the most.

I want to thank Chairman Scott for inviting me to testify. I look forward to working with the Committee to advance our next farm bill, and I am happy to answer your questions.

[The prepared statement of Mr. Waide follows:]

PREPARED STATEMENT OF KYLE WAIDE, PRESIDENT AND CHIEF EXECUTIVE OFFICER,
ATLANTA COMMUNITY FOOD BANK, ATLANTA GA

Dear Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee:

Thank you for the invitation to testify at today's hearing on the *2022 Review of the Farm Bill: Stakeholder Perspectives on Non-SNAP USDA Nutrition Programs*. My name is Kyle Waide, and I am the President and CEO of the Atlanta Community Food Bank, one of the largest food banks in the country. I am excited to share my perspective today on how to protect and improve Federal nutrition programs, specifically The Emergency Food Assistance Program (TEFAP) and the Commodity Supplemental Food Program (CSFP) to ensure individuals and families facing hunger can continue to put food on the table.

The Atlanta Community Food Bank is a member of the Feeding America food bank network. Feeding America is the largest hunger-relief organization in the United States with a network of more than 200 food banks, 21 statewide food bank associations, and more than 60,000 partner agencies, food pantries, and meal programs. Like our sister food banks across the country, the Atlanta Community Food Bank works to end hunger with the food, people, and big ideas required to ensure our neighbors have the nourishment they need to lead healthy and productive lives.

We work with a wide variety of retailers, farmers, restaurants, manufacturers, distributors, and Federal programs to secure donated and purchased essential groceries for people facing hunger in our service area. We distribute this food across 29 counties in metro Atlanta and north Georgia through a large, decentralized grassroots network of close to 700 community-based nonprofit partners, the majority of which are faith-based organizations. In our Fiscal Year 2021, we served more than 715,000 of our Georgia neighbors in need of food assistance, distributing more than 116 million pounds of food, the equivalent of nearly 100 million meals. In addition to managing a food supply chain, we offer other services that connect individuals and families to local providers offering services such as affordable housing options, shelters, rent and utility assistance, free to low-cost health services, job skills, nutrition education and food and clothing pantries.

The Atlanta Community Food Bank and the Feeding America food bank network are uniquely capable of working to reduce food insecurity as part of a robust combined government and community response. Through years of growing our infrastructure, building public-private partnerships, responding to crises, and driving innovation, we have built the capacity and the accountability systems to support ongoing large-scale food distribution, providing high-quality nutritious food safely, efficiently, equitably, and reliably to food-insecure families when and where they need it.

Current State of Food Insecurity

Prior to the pandemic, national food insecurity rates had reached their lowest levels in 20 years. After reaching a peak following the Great Recession, the food insecurity rate fell steadily as the economic recovery accelerated and we reached histori-

cally low levels of unemployment. Despite that progress, 38 million people, including nearly 12 million children are food-insecure in the United States in 2022. In Georgia, the food insecurity rate within the Atlanta Community Food Bank's 29 county service area is currently 12%.

The COVID-19 pandemic may be receding, but demand for food assistance is on the rise again. As we all know, the Federal response to the pandemic was unprecedented in scale and scope. Investments in nutrition assistance programs made an enormous difference in preventing much larger increases in hunger. Now, however, some of those expansions in program capacity and flexibility have already ended, and others, such as Supplemental Nutrition Assistance Program (SNAP) emergency allotments, will go away nationwide when the Public Health Emergency (PHE) declaration ends. Some states, including Georgia, have already chosen to end SNAP emergency allotments, leading to a projected average loss of \$82 a month in benefits for those enrolled. Many families are struggling to adjust to these changes, and rising costs are only increasing the challenges they face. These families are facing grocery prices that are ten percent higher this year, alongside the rising costs they face for other basic needs like gas, housing, and childcare. Nationally, the cost of meat, poultry, fish, and eggs has increased by 13%. Households that are low-income already spend about $\frac{1}{3}$ of their income on food. Even relatively small increases in food prices can destabilize budgets and force families to make impossible choices between food and other necessities. Increased food prices also mean that nutrition program benefits, like those received through SNAP, don't buy as much. To survive rising costs at the supermarket and reduced government assistance program benefits and access, many families are turning to food banks.

During the peak of the pandemic our food distribution volumes were 70 percent higher than pre-pandemic levels. An improving economic environment and critical public supports such as the investments in nutrition programs and the Child Tax Credit helped reduce demand for food assistance during the latter half of 2021, and our distribution volume declined as well. In recent months, however, the rising prices for food and other basic needs, combined with the cessation of COVID recovery supports, have put increasing pressure on low- and moderate-income families. Our distribution volumes are rising again, and over the past 2 months we distributed essentially the same volume of food as we did during April and May of 2020, nearly 35% higher than pre-COVID levels.

Alongside the increase in demand, our operating costs are increasing significantly. Fifty-five percent of Feeding America food banks have recently reported that food donations are down, and 57% report that United States Department of Agriculture (USDA) commodities including The Emergency Food Assistance Program (TEFAP) have declined significantly this year. To replace these sources of food, food banks have dramatically grown how much food they purchase. With food prices soaring, our costs for food acquisition have increased by nearly 40% to source the food we need to meet current levels of demand. Outside of food acquisition costs, food banks are also paying more for everything else from fuel to vehicle maintenance. And like everyone else, we are paying more in wages and benefits to keep up with the highly competitive labor market. In Atlanta, this means our costs per meal distributed have risen by 22%.

Food insecurity continues to disproportionately impact Black, Latino, and Native American/Alaskan communities, which experience rates of food insecurity that are more than double the rates of food insecurity among their white counterparts. Similarly, many rural communities continue to experience higher levels of hunger, with food insecurity rates exceeding 20% in many rural Census tracts across Georgia. At the Atlanta Community Food Bank, more than 70% of the people receiving food through our network identify as Black or Latino, with demand growing significantly in a number of counties and communities with highly concentrated BIPOC populations. And we distributed close to 30 million pounds of food in the ex-urban and rural counties outside metro Atlanta over the past twelve months.

The resiliency, diversity and breadth of our partner network makes our work possible and enables us to continue adapting to the rapidly changing environment in which we operate. Food banks are not stand-alone organizations, working in isolation from a single location to deliver services. We are truly defined by and best understood as a widely distributed network of hyper-local community-based organizations, supported by a high-capacity centralized engine for acquiring and distributing food and other resources. We are the churches, soup kitchens, social-service programs, shelters, and community centers where food-insecure families access the food we source through our central warehouses. In Atlanta, $\frac{2}{3}$ of these partners are faith-based organizations, representing a wide array of faiths and denominations across urban, suburban, and rural communities. Approximately 60% serve majority BIPOC communities, and half are led by BIPOC leaders. Two-thirds of our staff,

more than 60% of our leadership team, and 44% of our board of directors identify as racially diverse. We represent, include, and engage all aspects of our community, which has helped us build a unique level of trust and connectivity in all kinds of local communities across our region, including and especially in our most vulnerable populations. It is also why the community turns to us during crisis, enabling us to work closely with schools, government leaders, business groups and others to support a variety of emergency food distributions across our region, including the events we supported with Chairman Scott and a variety of community partners over the past several years.

In addition to our community-based distribution network, our work also depends on broad community support and deep relationships across food and agriculture industries. We are supported by 20,000 volunteers and 60,000 financial donors, who help our team of 180 food bankers pack food boxes, pull orders, manage food distributions, and address other client needs. We source donated food from a long list of local, regional, and national food manufacturers and distributors, which includes collecting donated perishable food items from more than 500 retail grocery store locations in north Georgia. We work closely with farmers to collect and distribute millions of pounds of surplus produce, dairy and other agricultural products that otherwise would go to waste. These relationships include large, multi-generational farms, as well as smaller, local farms, including socially disadvantaged BIPOC growers and urban farmers.

This deep connectivity across our community, with grassroots organizations, large corporations, and everything in between, enables us to get food and other resources to the people and communities who need it, when and where they need it. And against the backdrop of growing demand, a tightening food supply and increasing costs, food banks are working as hard as ever with our partners to feed families in need. We are committed to continue growing our capacity to acquire and distribute more food to respond to the growing need for food assistance. But we cannot do our work alone. We need help, and in particular we need access to more of the high-quality food commodities provided by USDA through programs authorized by the farm bill. The people and communities we serve need more food. The 2023 Farm Bill provides an opportunity for Congress to help continue to reduce food insecurity and address racial equity in food insecurity by increasing investments in Federal nutrition programs including The Supplemental Nutrition Assistance Program (SNAP), The Emergency Food Assistance Program (TEFAP) and Commodity Supplemental Food Program (CSFP).

Role of Federal Support in Addressing Food Insecurity

The support provided by and through a variety of Federal nutrition programs has been critical to helping food banks do our work, starting with two programs that provide the backbone of nutritious food we distribute. The Emergency Food Assistance Program (TEFAP) is a means tested Federal program that provides nutritious food to low-income individuals through food banks and other charitable organizations nationwide, while supporting U.S. grown commodities. The program provides critical support, helping us ensure a nutritious balance of food is distributed to families in need by allowing us to combine TEFAP with our other sources of food. As the Committee already knows, Congress authorized more than \$1 billion in additional TEFAP spending through a number of COVID recovery bills in 2020, dramatically increasing our access to food resources during the crisis. USDA also provided short term assistance through an additional allocation of food purchases in 2020 and 2021, including support for states to partner with food banks and local growers to connect local food with people in need.

This made a critical difference for us in north Georgia. In our fiscal 2021 year, we distributed approximately 40 million pounds of food commodities provided through TEFAP and other special USDA programs (*e.g.*, the Coronavirus Food Assistance Program, commonly known as the “Farmers to Families Food Box Program”). This represents more than $\frac{1}{3}$ of our total volume during that critical year. For food banks serving less populated areas of the country, Federal commodities accounted for an even larger percentage of their food distribution volume. To state the obvious, we would not have met the need in our community were it not for these extraordinary investments in TEFAP spending during the pandemic.

But looking ahead, we are concerned that simply reverting back to pre-pandemic levels of TEFAP funding will be insufficient to respond to the needs of our communities. Food banks across the country are anticipating a decline in Federal commodities of 40% or more. At my food bank, we are planning to receive 14 million pounds of TEFAP food in fiscal 2023, representing only $\frac{1}{3}$ of the food we received through TEFAP and CFAP during 2021 *and* a reduction of approximately 1 million pounds in food compared to what we received pre-COVID. And this does not account for the

growing number of TEFAP shipments that are being canceled due to complications in the food supply chain—for us in Atlanta, approximately 13% of the TEFAP shipments we ordered this year have been canceled and we believe this number is higher in many other parts of the country. We expect to spend nearly \$15 million next year on purchasing food to offset this reduction, and we will source 25% more food next year through purchasing (17.5 million pounds) than we expect to receive through TEFAP (14 million pounds). We are concerned that this pattern will not be sustainable over the long-term.

Food banks and other charitable feeding organizations have demonstrated the critical role they play in providing immediate food assistance as well as in augmenting gaps in broader food assistance programs. Congress should include additional mandatory funding for TEFAP food in the next farm bill in recognition of the sustained high need for food assistance nationwide. Specifically, TEFAP mandatory funding should be authorized to \$450 million per year in the next farm bill and TEFAP Storage and Distribution Funds should increase to reflect the actual distribution costs needed to \$200 million per year. TEFAP Infrastructure Grants should remain at \$15 million per year.

There are 5.2 million seniors facing hunger in the United States. The Commodity Supplemental Food Program (CSFP) works to improve the health of low-income persons at least 60 years of age by supplementing their diets with nutritious USDA Foods. The program itself serves 619,000 seniors with incomes at or below 130% of the Federal Poverty Line (approximately \$15,301 for a senior living alone) and the Feeding America network serves more than ½ million seniors (age 60 and older) through the CSFP program. More than half of Feeding America network food banks participate in CSFP, the most extensive hunger-relief program for seniors operated across our network. In Atlanta, we distribute roughly 5,000 CSFP boxes each month to low-income seniors, connecting them with high-quality nutritious food they would not otherwise be able to access.

While CSFP serves more than ½ million seniors across the Feeding America network, the population of food-insecure seniors is growing and will continue to grow over the next decade. To expand access to this program, Congress should increase the Federal Poverty Level for eligibility determination above 130% to reduce the burden of reporting requirements as part of the program. We also recommend increasing the length of time between recertification periods to ensure more seniors are able to participate in this important Federal program, instituting a self-declaration of needs to determine CSFP eligibility, and tailoring CSFP food packaging to assist with meeting dietary and medical needs of seniors. Furthermore, Congress should help us more effectively meet the food needs of seniors across the nation by adding culturally appropriate nutritious food options.

In addition to the food provided to food banks and other nonprofits by USDA, support for food assistance through other nutrition programs has played a critical role in response to this crisis. Our food-insecure neighbors rely heavily on an array of Federal programs—SNAP, school lunches, Pandemic-EBT, WIC, senior meals—to meet their families' needs. Millions of Americans would not have the food they need to survive without the continued strong support of Federal nutrition programs.

Conclusion

Recovering from COVID will continue to be a challenge for all of us. Ongoing Federal investment and support will be necessary to accelerate and sustain our recovery. This is even more true for food-insecure families, whose recovery will be disproportionately harder. I urge the Committee, Congress, and the Administration to take the lessons learned from COVID and use that insight to create a strong farm bill that puts people facing hunger at the center. Purchase more food through TEFAP and other USDA programs. Leverage high-capacity partners like the nation's food banks to move this food safely, efficiently, and equitably to the people and communities who need it. Flood the zone with access to food. Doing so will help our families, communities and our country recover faster.

I want to again thank Chairman Scott for inviting me to testify. We celebrate the Committee's interest in ensuring all our neighbors have the food they need. I look forward to working with you on that important goal and to answering your questions.

Sincerely,

KYLE WAIDE,
President and CEO,
Atlanta Community Food Bank.

The CHAIRMAN. Thank you, Mr. Waide.

And now, Mr. Besaw, please begin when you are ready. Mr. Besaw, you may want to come a little closer to your microphone. We are not hearing you clearly.

Mr. BESAW. Can you hear me now?

The CHAIRMAN. Yes. It is a little muffled. Just get as close as you can, and we will make do. Go right ahead.

STATEMENT OF GARY J. BESAW, DIRECTOR, MENOMINEE TRIBAL DEPARTMENT OF AGRICULTURE AND FOOD SYSTEMS AND MENOMINEE TRIBAL FOOD DISTRIBUTION PROGRAM, KESHENA, WI

Mr. BESAW. *Anāmāhkatowak, na netānawemākanak wāwānen, etōwak* (Greetings my Relatives, Thank you I say) for allowing me to be here today to speak regarding the Food Distribution Program on Indian Reservations. Part of the comments I have heard here today about the increased funding and costs are important to Menominee and important to the Tribes. And part of that response can be that much of what is in the farm bill or would be in the farm bill can be redirected to allow Tribes to have that ability to take that same funding that may be going to them, or that may be through the farm bill and administered by AMS, to now have Tribes have that authority to have control through self-governance processes.

There are several things within the farm bill that Tribes have been working through a Tribal leaders consultation work group, and these are some of the concerns. One I will speak to is the 638 self-determination contracting.* Another is working and having more assistance from the Agricultural Marketing Service in working to develop that point of contact and really work to allow Tribes to walk through the process to become an eligible producer in the system.

We have concerns on indigenous representation in the FNS positions. Where that is available, Tribes ask that we have positions filled by Tribal members or by others who have received the training and education that they would need to be able to support Tribes.

I will talk about one of the programs that we are in; using the FDPPIR's Self-Determination Demonstration Project, Menominee has been able to use self-determination to replace and supplant some of the 100 products that are available as commodities or products for our food distribution clients. What this does is allows Tribes that want to participate in the 638 contracting process to now be able to come in to contract with indigenous producers to use that same funding that AMS may have used to purchase product from wherever across the country and bring that to our food distribution—to our stores, our warehouses on reservation. We want to be able to shorten that food chain to build a more resilient food system. We want to look at providing jobs for our economy, for our Tribal economies.

* **Editor's note:** 638 refers to Pub. L. 93-638, Indian Self-Determination and Education Assistance Act.

So, the 638 contracting allows Tribes—this was put into the 2018 Farm Bill as a pilot project—it allows us to be that purchaser for certain foods grown indigenously, grown by Tribes to be able to purchase that food and to supplant or replace those certain foods. And we have done that by replacing and purchasing, through that 638 process wild rice. We have replaced ground beef, ground bison, and beef roasts. We have also replaced apples with apples we have bought from indigenous producers and smoked fish, lake trout filets, white fish filets, and walleye from indigenous producers.

So, we are trying to grow our economies. And this is a good way, as we have heard before, where we are not necessarily trying to ask for money, too much additional money, but we would be replacing that authority where we do the actual ask, and we actually purchase. We know what is best for our Tribal members.

[The prepared statement of Mr. Besaw follows:]

PREPARED STATEMENT OF GARY J. BESAW, DIRECTOR, MENOMINEE TRIBAL DEPARTMENT OF AGRICULTURE AND FOOD SYSTEMS AND MENOMINEE TRIBAL FOOD DISTRIBUTION PROGRAM, KESHENA, WI

Introduction—About Menominee & Oneida

Beginning in 2021, the Menominee Indian Tribe of Wisconsin and the Oneida Nation partnered together to participate in the FDPIR Self-Determination Demonstration Project. Through this project, we are replacing USDA buffalo, ground beef, beef roast, and apples with Oneida Nation buffalo, ground beef, beef roast, and apples. We are also replacing USDA wild rice with wild rice from Spirit Lake and replacing USDA fish with fish from Red Cliff.

By participating in this demonstration project, we are:

- Expanding Tribal sovereignty
- Providing better, more nutritious foods to our community
- Expanding cultural and historical knowledge through the use of traditional foods
- Building capacity amongst our Tribal staff, farmers, indigenous vendors, food producers, and our government as well as educate the USDA on our food systems and the challenges our communities face with access to nutritious, locally-grown, and traditional foods.
- Providing a source of economic benefits to the Tribes and Tribal vendors
- Expanding Self Determination and hopefully Self Governance into the USDA.

How we want to see this Demonstration Project evolve

While we are happy to participate in this Demonstration Project, we believe more can be done to enhance Tribal flexibility in FDPIR and USDA:

- We would like to see this Demonstration Project become permanent and expanded to include Self Governance authority. Although we appreciate the opportunity to determine what foods to buy and incorporate into the FDPIR food packages, we think Tribal authority should go beyond this by providing Tribes with recurring, base funding and the authority to redesign the program in a way that meets each Tribe's unique needs and Tribal priorities.
- This flexibility is especially important for FDPIR, because our local food products are so impacted by seasonality and weather. This demonstration project required us to predict specific food quantities months or years ahead of the actual growing season, which is challenging. For example, In May 2021, Wisconsin suffered unusual weather and experienced three hard frosts. This ended up damaging much of the apples in our region and the Orchard lost over half of their apple production in 2021. If we had Self-Governance authority, we would be able to handle unforeseen issues without having to obtain Federal approval and all the administrative work that goes along with it to substitute products or make budget modifications.
 - Increased flexibility would also allow us to respond to the unique needs and demands of our community. So far, we have received a lot of positive feedback from our clientele. Many of our customers have said how they are enjoying

the quality of the foods being provided, especially the black Angus beef that comes from the Oneida Nation Farm. One Elder customer said that she does not have to use much seasoning when preparing the meat because the quality is so much better. The beef and buffalo are in high demand and efforts are being made to provide more beef roasts for next year. Under Self-Governance, we would have been able to reallocate funds from other products, such as fish products, to the beef and buffalo products without further approval from the USDA. Under the current demonstration project, we had to make a modification of our food list in order to reallocate funds to meet the needs of our communities.

Closing

Thank you for the opportunity to provide our perspective on the FDPIR Demonstration Project. We are eager to work with you to make this demonstration project permanent and expand Self-Governance in FDPIR and the USDA.

The CHAIRMAN. Well, thank you very much, Mr. Besaw.
And now, Dr. Gruner, please begin when you are ready.

STATEMENT OF JESSIE G. GRUNER, PH.D., RDN, DIRECTOR OF COMMUNITY INNOVATIONS, PINNACLE PREVENTION, CHANDLER, AZ

Dr. GRUNER. Thank you, Chairman Scott and Members of the Committee. I am honored to have the opportunity to provide testimony today. My name is Jessie Gruner. I am the Director of Community Innovations at Pinnacle Prevention, an Arizona-based nonprofit. We have been administering USDA nutrition programs statewide in Arizona for over 5 years. Today, I want to share with you our experiences and recommendations around GusNIP, the Senior Farmers' Market Nutrition Program, and the Community Food Projects Competitive Grants Program.

I would like to start off with GusNIP first, or the SNAP incentive program. In Arizona, we offer our Double Food Bucks Program at multiple outlets, including farmers' markets, CSAs, mobile markets, corner stores, as well as grocery stores. We started this program with FINI funding in 2016, with only six farmers' market sites. Six years later, we are now on our third round of GusNIP funding from USDA, and we have grown our Double Up Program to over 75 locations.

From our experience, we want to share the value and importance of being able to have an adaptable program model that we can tailor based on the needs of our diverse communities, including urban, rural, and indigenous. The ability to tailor the incentive program has allowed us to spread across the state, particularly in areas that don't have access to a farmers' market.

In our model, we prioritize locally grown produce. This prioritization has had a tremendous economic impact with small producers and as increased local spending on these products by more than ten-fold at our Double Up sites. Not only are families taking home more healthy, seasonal, local food, this program has become a consistent, reliable source of revenue for local farmers.

We did not get to where we are today alone. Thanks to collaborations with other states and strong technical assistance, we were able to find new and innovative solutions and had an abundance of resources available for us to use. The 2018 Farm Bill created a national Nutrition Incentive Program Training Technical Assistance Evaluation and Information Center, known as the Nutrition Incentive Hub. Today, we would like to voice our support for ensur-

ing current farm bill efforts continue to include technical support and assistance, which is critical for implementing and evaluating nutrition incentive programs.

The program is currently designed with a dollar-for-dollar match requirement. While in Arizona we were successful in securing state-match funding, the current match structure inhibits our ability to expand our program, particularly in the grocery sector, which has a much higher SNAP volume and utilization rate. An alternative match structure would allow us to truly meet the needs of our communities.

Next, I would like to talk about the Senior Farmers' Market Nutrition Program, which provides low-income seniors with coupons that can be exchanged for locally grown produce at farmers' markets, roadside stands, and CSA programs. This is a tiny but mighty program. It is so much more than just food and can be part of the solution for reducing senior isolation. In some of our senior housing centers, our program was the only source of fresh food during the pandemic. In one of our rural mountain communities, a low-income housing site had a bus that would typically bring the seniors to the farmers' market to spend their coupons.

And during the pandemic, in order to protect their safety, they weren't able to bring seniors to the market, and this was really challenging for our seniors. Luckily, the Senior Farmers' Market Nutrition Program allows up to 50 percent of the funds to be used on bulk food purchases. This flexibility allowed us to have local produce delivered to their housing centers. We also had kids send in pictures that they drew to be included in their produce bags. And it was really a beautiful way to bring connection to seniors during a really isolating time.

We know that isolation was exacerbated by the COVID-19 pandemic, but isolation both preceded the pandemic and will continue to be a challenge seniors face. Because this program is something that seniors look forward to, a one-time benefit is not enough to meet the need and maximize the program's potential benefits. Increasing the maximum amount seniors receive annually would allow more flexibility in the program's structure and provide seniors more touch-points with their communities.

We also desperately need an investment in the administrative allocation for this program. Administrative costs are capped at ten percent, which means the amount of dollars that can be used for personnel time is really limited, making it hard to reach the communities that need the support and assistance the most, especially in our rural areas.

Finally, I would like to briefly mention the Community Food Projects Competitive Grants Program. We see this program as the low-hanging fruit that helps to build capacity for our community organization and helps producers to be able to scale up for larger programs and projects. It helps organizations test innovation at a small regional level. If we want to be able to meet the challenges that are facing the future of our local, regional, and national food systems, we have to provide space and resources for idea incubation and continue to center our small community food projects and socially disadvantaged producers. In many cases, this program is

farmers' first introduction to USDA programs. As one of the lowest entry points we see an opportunity to make this—

[The prepared statement of Dr. Gruner follows:]

PREPARED STATEMENT OF JESSIE G. GRUNER, PH.D., RDN, DIRECTOR OF COMMUNITY INNOVATIONS, PINNACLE PREVENTION, CHANDLER, AZ

Introduction

Thank you, Chairman Scott and Members of the Committee. I am honored to have the opportunity to provide testimony on non-SNAP USDA Nutrition Programs. My name is Jessie Gruner, I am the Director of Community Innovations at Pinnacle Prevention, an Arizona-based nonprofit dedicated to cultivating a just food system and opportunities for joyful movement.

We have been administering USDA nutrition programs statewide in Arizona for over 5 years. Today, I want to share with you our experiences and recommendations around GusNIP, the Senior Farmers Market Nutrition Program, and the Community Food Projects Competitive Grants Program.

GusNIP

I would like to start off with GusNIP, or the SNAP incentive program. Here in Arizona, we offer our nutrition incentive program, or as we brand it Double Up Food Bucks Arizona, at multiple outlets, including farmers['] markets, Community Supported Agriculture (CSA) programs, mobile markets, corner stores, as well as grocery stores. We started this program with FINI funding in 2016 with only six farmers['] market sites. Six years later, we are now in our third round of GusNIP funding from USDA and we have grown our Double Up program to over 75 locations.

From our experience we want to share the value and importance of being able to have an adaptable program model that we can tailor based on the needs of our diverse communities, including urban, rural, and indigenous. The ability to tailor the incentive program has allowed us to spread across the state, particularly in areas that do not have access to a farmers' market.

Because of the success of the program, we were able to achieve a state-wide policy win securing recurring program investment from the state's general fund with strong bipartisan support, which shows how much people love and believe in this program.

In our model, we prioritize locally-grown produce. This prioritization has had a tremendous economic impact with small producers and has increased local spending on these products by more than ten-fold at our Double Up sites. Not only are families taking home more healthy, seasonal, local food, this program has become a consistent, reliable source of revenue for local farmers, some of whom take home half of their daily market sales from Double Up Food Bucks.

We did not get to where we are today alone. Thanks to collaborations with other states and strong technical assistance, we were able to find new and innovative solutions and had an abundance of resources available for us to use. The 2018 Farm Bill created a national Nutrition Incentive Program Training, Technical Assistance, Evaluation, and Information center, known as the Nutrition Incentive Hub. Today we would like to voice our support for ensuring current farm bill efforts continue to include technical support and assistance, which is critical for implementing and evaluating nutrition incentive programs.

The program is currently designed with a dollar-for-dollar match requirement. While in Arizona we were successful in securing state match funding, the current match structure inhibits our ability to expand our program, particularly in the grocery sector which has a much higher SNAP volume and utilization rate. An alternative match structure would allow us to truly meet the needs of our communities, especially in places where individuals must travel between 50 and 100 miles to access a grocery store. We ask the Committee to consider a lower or percentage-based approach to match or removing this component.

Finally, we know that USDA is making tremendous strides to increase access to online SNAP for small vendors. We want to ensure that these efforts continue. The pandemic has resulted in new innovations in online and grocer delivery models, and we would like nutrition incentive models to be competitive in this space. We need more investment and flexibility to make this happen, especially for farmers and small business operations. To keep pace with efforts in modernization, we need to be thinking 10–20 years down the road with funding and support provided for the integration of GusNIP programs into SNAP EBT processing technologies.

Senior Farmers['] Market Nutrition Program

Next, I would like to talk about the Senior Farmers['] Market Nutrition Program, which provides low-income seniors with coupons that can be exchanged for locally-grown produce at farmers' markets, roadside stands, and CSA programs. The Senior Farmers['] Market Nutrition Program is a tiny, but mighty program. It is so much more than just food and can be part of the solution for reducing senior isolation. While the program provides nourishment for seniors and an additional source of revenue for small food producers, it is also a connection point for seniors. Food is the way that seniors are connecting with each other. Through this program they get to connect with the farmers, they get to see their neighbors, and they get to interact with their communities.

In some of our senior housing centers, our program was the only source for fresh food during the pandemic. In one of our rural mountain communities, a low-income housing site had a bus that would typically bring the seniors to the farmers['] market to spend their coupons. During the pandemic, in order to protect their safety, they weren't able to bring the seniors to the market. And seniors were really mourning that loss. Luckily, the Senior Farmers['] Market Program allows up to 50% of the funds to be used on CSAs or bulk food purchases. This flexibility allowed us to take produce from producers at the farmers['] market to the seniors when they couldn't leave their homes. We also had kids send in pictures they drew to include in the produce bags, and it was a beautiful way to bring connection to seniors during a really isolating time. We know that isolation was exacerbated by COVID-19, but isolation both preceded the pandemic and will continue to be a challenge seniors face.

Because this program is something that seniors look forward to, a one-time benefit is not enough to meet the need and maximize the program's potential benefits. Increasing the maximum amount seniors receive annually would allow more flexibility in program structure, such as a monthly benefit during the market season. For example, seniors could receive a \$100 benefit broken down over a monthly period across the market season. More touch-points can help build relationships between seniors and farmers, and strong customer relationships often lead to increased food literacy, understanding of local availability, and better access to community resources.

We also desperately need an investment in the administrative allocation for this program. Administrative costs are capped at ten percent, which means the amount of dollars that can be used for personnel time is really limited, making it hard to reach the communities that need the most support and assistance, especially in rural areas. Additional flexibility and investment in administrative dollars would help meet seniors where they are at and would result in a greater ability to provide equitable access to the program.

One final point, we recognize that WIC FMNP is the sister program to SFMNP and falls under Child Nutrition Reauthorization. We would like to see the same flexibility offered under farm bill to be offered for WIC FMNP, including bulk purchasing and CSA purchasing

Community Food Projects Competitive Grants Program

Finally, I would like to briefly mention the Community Food Projects Competitive Grants Program. While we have not been the direct recipients of a Community Food Project, we work with smaller food producers to help them submit proposals for CFPs. We see community food projects as the low-hanging fruit that helps to build capacity for the really small community organizations and producers to be able to apply for larger programs and projects, such as building their capacity to scale up to apply for GusNIP programs. It helps organizations test innovation at a smaller regional level. If we want to be able to meet the challenges that are facing the future of our local, regional, and national food systems, we have to provide space and resources for idea incubation and continue to center small community food projects and socially disadvantaged producers.

In many cases, the Community Food Projects Competitive Grants Program is farmer's and organization's first introduction to USDA programs. As one of the lowest entry points, we see an opportunity to make this program as easy as possible for applicants. Providing strong technical assistance, simplifying the application process and reporting requirements, and removing or reducing the match requirement would help streamline entry for farmers and organizations and make it easier for them to equitably participate.

Closing

I would like to conclude my statement by saying that our participation in these incredibly important programs has allowed us to be responsive to food system needs

in unprecedented ways and times here in Arizona. It's allowed us to be more adaptive in linking and leveraging multiple efforts across USDA as a whole to benefit farmers and provide nutrition security to families. Thank you for the time to share our experiences with you today.

The CHAIRMAN. Yes, thank you, Dr. Gruner. If you could wrap up for a moment there, your time has expired. But thank you.

Ms. Moss, please begin where you are ready.

**STATEMENT OF SPENCER C. MOSS, EXECUTIVE DIRECTOR,
WEST VIRGINIA FOOD AND FARM COALITION, INC.,
CHARLESTON, WV**

Ms. MOSS. Thank you. Good morning and thank you for having me here today. My name is Spencer Moss. I am the Executive Director of the West Virginia Food and Farm Coalition. We are a non-profit organization. And since we work at the intersection of farm viability and food access, we take advantage of Federal grant programs that allow us to pull resources into our rural communities.

Today, I will briefly discuss two programs that we have utilized, even though I could also speak to Senior Farmers' Market Nutrition Program, Community Food Projects, Farmers' Market and Local Food Promotion Programs as well. I am speaking to two programs that are nutrition-based but also have fantastic economic development outcomes. And finally, I will make three brief recommendations to make Federal grant programs more accessible.

So first, the Healthy Food Financing Initiative—the goal of this program is to improve food security in low-access communities through the establishment of new retail facilities, aggregation distribution hubs, and programming such as delivery programs. In 2019, we received one of these grants for \$215,400. And, with this grant, we helped establish two brick-and-mortar stores in downtown areas, and five corner store kiosks in existing businesses in rural Pocahontas County, West Virginia.

Now this is a story of improved nutrition, but it is also a story of economic development. On average, these brick-and-mortars have grossed \$609,000 annually, and employ 4.5 full-time and 5.5 part-time staff. And our work did not stop with the end of that grant. As a direct result of that grant, we established the West Virginia Rural Grocer Network where we provide valuable access to technical assistance and training to nascent or rural grocers. Most are just people who are stepping up to feed their communities and are leaving careers in the trades or in education. We also provide access to capital to purchase things like refrigeration equipment.

The second program I am going to talk about briefly was that Gus Schumacher Nutrition Incentive Program, or GusNIP. We received FINI funds in 2018 to pilot a program that we would eventually call SNAP Stretch. And in 2020 and 2021, we received the GusNIP award and a COVID response supplemental award.

So, SNAP Stretch doubles and triples SNAP EBT dollars—aka, formerly food stamps—at farmers' markets, on-farm stands, mobile markets, CSAs, and a growing number of local retailers. Can you tell I have said that a few times? So if a SNAP user comes to the market and they say I want to spend \$10 of my SNAP, they are going to get \$10 in market scrip to spend on any SNAP-eligible item. They are also going to get \$10 in SNAP Stretch scrip to

spend on fruits and vegetables. If they are a senior or if they have a child with them, they are going to get an extra \$10.

This is another program that certainly improves nutrition as it stretches the food budgets of low-income SNAP recipients, but it is also a major economic benefit to our communities, capturing both Federal food assistance dollars, Federal grant funds, and philanthropic funds. This program has grown each year since 2018 and in 2021, with the help of the folks behind me, we helped 35,000 West Virginians access this program, putting \$1 million into the hands of our farmers and local businesses.

Now, with my remaining time, I want to briefly talk on some recommendations. Matching requirements: In theory, grant-matching requirements show that there is some community investment in the program. In reality, matching requirements disadvantage rural communities, low-income communities, communities of color, and small nonprofit organizations. Ninety-one out of 100 of the most disadvantaged communities in this country are rural, and only five to seven percent of philanthropic funds come into rural communities. So, thereby, there is less money available for rural communities to access which is needed to access these Federal funds.

Number two, requiring grants to be reimbursable: The practice of reimbursable grants disadvantages smaller organizations and smaller communities that do not have the cash flow. To run a grant, you spend the money first, wait 4 weeks to 4 months to receive a reimbursement. It can oftentimes completely lock out communities from accessing these Federal funds.

And last, programs need more funding. Many of these Federal programs have not received the caps in what community groups can apply for in many years. So what I could do with \$500,000 in 2016, when I received my first Farmers' Market Promotion Program grant, *versus* what I can do today are very different, given the conversation we have already had about inflation. And yet, as grantees, we are increasingly expected to be more innovative, dig deeper in communities, have more partners, have more stakeholders, and affect more community change. But those dollars don't go as far, even though we are very happy to meet all of those expectations.

And with that, I am open for questions as well.

[The prepared statement of Ms. Moss follows:]

PREPARED STATEMENT OF SPENCER C. MOSS, EXECUTIVE DIRECTOR, WEST VIRGINIA FOOD AND FARM COALITION, INC., CHARLESTON, WV

The West Virginia Food and Farm Coalition was founded in 2010 and its mission is to build the West Virginia food and agriculture system in a way that provides viable incomes for farmers and local food businesses and ensures all residents have access to locally produced food. With this in mind, the Coalition is always trying to marry economic development and advancement of the agricultural sector with food access/food security for West Virginia's communities.

The following testimony will detail the Coalition's successes in implementation of several USDA grant programs that are either designed to increase nutrition and food security or increase economic development in the agricultural sectors. Through the Coalition's execution, we have been able to excel in both areas, further proving that nutrition programs are good for both the economy and the future of food access and security. Additionally, this testimony will explain how these grant programs have given wings to further programing at the community-organization level and allowed for the programs to layer together for maxim efficacy.

Last, this testimony will make recommendations regarding these grant programs for ways that they can be more efficient and more equitable in low-income, low-resources, rural, and/or communities of color.

About Non-SNAP Nutrition Incentive Programs

- USDA/NIFA Gus Schumacher Nutrition Incentive Program (GusNIP) (formally the Food Insecurity Nutrition Incentive FINI program)—provides incentives to income-eligible consumers to increase the purchase of fruits and vegetables and prescriptions for fresh fruits and vegetables (Prescription Produce program).
- USDA/RD Healthy Food Financing Initiative (HFFI)—aims to improve access to healthy foods in underserved areas, to create and preserve quality jobs, and to revitalize low-income communities. The program aims to build a more equitable food system that supports the health and economic vibrancy of all Americans.
- USDA/AMS Farmers^['] Market/Local Food Promotion Program (FMLFPP)—are two grant programs under the same heading. The Farmers^['] Market Promotional Program funds projects that develop, coordinate and expand direct producer-to-consumer markets to help increase access to and availability of locally and regionally produced agricultural products by developing, coordinating, expanding, and providing outreach, training, and technical assistance to domestic farmers^['] markets, roadside stands, community-supported agriculture programs, agritourism activities, online sales or other direct producer-to-consumer. The Local Foods Promotional Program funds projects that develop, coordinate and expand local and regional food business enterprises that engage as intermediaries in indirect producer to consumer marketing to help increase access to and availability of locally and regionally produced agricultural products.
- USDA/FNS Farm-To-School (F2S)—Farm-to-School programming can take on many forms including introducing garden education to youth, developing youth entrepreneurs, building youth farms, conducting educational youth-focused marketing, and developing pathways to get more locally sourced produce in local schools.

Gus Schumacher Nutrition Incentive Program (GusNIP) Became SNAP Stretch: How it Was Implemented in West Virginia

First funded by a USDA/NIFA FINI grant in 2018 then a 2020 USDA/NIFA GusNIP grant, and a supplemental USDA/NIFA GusNIP COVID Response and Recovery award in 2021, the SNAP Stretch program is a triple-bottom-line win for communities! SNAP Stretch benefits low-income West Virginia residents and farmers by *doubling and tripling SNAP/EBT purchases* for fruits and vegetables at farmers' markets, on-farm stands, mobile markets, Community Supported Agriculture Programs (CSAs), and local food retailers. SNAP Stretch incentivizes purchases of fruits and vegetables from local markets/farmers and helps overcome three key food access issues seen in rural communities:

1. *Many rural communities lack access to grocery stores where fresh produce is available.* "Dollar stores" litter rural landscapes and these stores often do not offer fresh produce. However, mobile and farmers^['] markets offer an endless supply of fresh fruits and vegetables during 6 months of the year providing valuable access to rural community members
2. *Many low-income folks, especially seniors, lack transportation to grocery stores that are outside of the community.* There are dozens of West Virginian communities that require residents to travel 45 minutes or more to access grocery stores. Mobile markets and farmers^['] markets are typically located in the middle of communities, helping residents overcome transportation barriers. In addition, as a result of big box grocery stores exiting rural communities, there has been an influx of locally-owned small grocery retailers beginning to establish in West Virginia. These retailers are located in the center of rural communities and are willing to participate in programs like SNAP Stretch in order to boost their sales, benefit local farmers, and fully engage their community.
3. *Often it is not financially feasible for families to purchase fruits and vegetables as they are not shelf stable.* However, double and tripling SNAP dollars makes market shopping thrifty and more financially feasible for cash-strapped families. There are countless anecdotal stories of the SNAP Stretch program helping families, however, there is one story of a family with four-children and they were weekly market shoppers. The mother said on multiple occasions that SNAP Stretch "financially enabled her to feed her children fresh fruits and vegetables."

How it Works

At participating farmers' markets a SNAP/EBT user will bring their card to a market staff representative or volunteer and ask to use any portion of their SNAP/EBT balance on purchases. Typically, the market will issue market scrip, such as tokens. Then, they will also issue "SNAP Stretch dollars" in the form of a similar but distinct scrip. For example, if the user asks to use \$20 from their SNAP/EBT card, they will receive \$20 in SNAP tokens and \$20 in SNAP Stretch tokens. If the user has children or they are a senior citizen, they will receive an additional \$20. So, a family with seniors and/or children would have \$40 to spend at the farmers' market on fruits and vegetables in addition to their \$20 that could be spent on anything that is SNAP-eligible. Similarly, participating local food retailers offer a discount at the register for allowable items before charging the SNAP/EBT card. Detailed documentation is kept and the Coalition reimburses the market/retailer for the SNAP Stretch redeemed.

One of the innovations in the SNAP Stretch program, as compared to national programs, such as Double Dollars and Double Up Bucks, is that there is an additional match (1:2) for families with children. This innovation came from an idea tested by the West Virginia University Family Nutrition Program (WVUFNP). WVUFNP began hosting a series of pop-up farmers' markets at schools and child-care centers. These children were given \$4 in market bucks to spend on fruits and vegetables of their choosing. Over 600 parent surveys revealed that 91% of participating youth ate all of the produce that they purchased because they had the agency to choose. It is with this in mind that SNAP Stretch has continued this practice that not only supports families, it develops youths pallets for fruits and vegetables, and further supports West Virginia Farmers.

*Program Success!*

Prior to the inception of the SNAP Stretch Program, SNAP/EBT purchases at West Virginia farmers' markets were nearly nonexistent. In fact, many farmers' markets paid the necessary internet and point of sale terminal fees for ideological reasons and not because there was a return on investment in SNAP/EBT sales. In a few short years, SNAP Stretch has quickly expanded the use of SNAP/EBT dollars for fruits and vegetables at local markets:

Food Access Dollars in West Virginia Farmers['] Markets

Farmers’ market vendors and small businesses have seen the benefit of the program as SNAP Stretch dollars are reimbursed directly to them. Because of this program, farmers have invested in additional acres of land for an increased output of products to be sold at markets. One of the participating markets normally closes their business for the winter in September, however their SNAP Stretch sales allowed them to remain open for an additional 3 months through the end of the year. “We paid \$165,171 to [our county’s] businesses and fellow farmers in 2021 for their goods and services,” the market owner told the Coalition. “We have also teamed together with several farmers in the area and are working to open our own meat processing facility in [our county]. Our added income with SNAP Stretch has made all of this possible.”

Finally, many SNAP Stretch recipients speak highly of the program's positive impact on their overall health. One participant shared the impact of the program on his life with a video testimonial, saying "if we didn't have the EBT [SNAP Stretch] program where it doubled and tripled the dollars, I would never be able to afford to eat healthy because health food costs more". Market managers regularly share stories like these with the Coalition as it becomes clear what a strong impact SNAP Stretch incentives are having.

Healthy Food Financing Initiative (HFFI) Became WV Rural Grocer Network: How it Was Implemented in West Virginia

The USDA Healthy Food Financing Initiative (HFFI) aims to improve access to healthy foods in underserved areas, create and preserve quality jobs, and revitalize low-income communities. The program aims to build a more equitable food system that supports the health and economic vibrancy of all Americans. In 2019–2020, the Coalition received an HFFI grant to help establish two brick-and-mortar grocery stores (Blue Ridge Bee Company in Princeton, WV and The Public Market in Wheeling, WV) and five corner kiosks in existing businesses along Route 219 in Pocahontas County to address barriers to food access and support a more equitable food system. This funding allowed the Coalition to (1) *develop a grocery store toolkit* (2) provide technical assistance to participating nascent grocers (3) provide access to necessary supplies and equipment to open the groceries, and (4) strengthen a network of grocers throughout West Virginia.

Program Success!

Each year in compliance with HFFI reporting, the Coalition collects end-of-the-year data from these participating grocers. While the HFFI investment was \$215,400, and the projects all had additional private investment, just 2 years worth of data indicate that there was a significant return on investment in these grocers:

Average Annual Sales between Brick and Mortar Stores and Decentralized Kiosks in 2020-21

Through the HFFI project, the Coalition identified two of the biggest barriers in achieving sustainability in an ever-changing landscape amongst grocers: (1) reliable equipment and (2) the skills to understand their finances in order to make appropriate business decisions. Assessment, expert technical assistance, coaching, and access to capital are required to support these businesses, thus, the WV Rural Grocer Network (WVRGN) was born. In addition to providing access to technical assistance, coaching, and capital, the [WVRGN] also creates a market for locally grown produce and value-added products.

In addition to HFFI reporting, the Coalition collects end-of-the-year data from all of its WVRGN participants, the 2020-2021 results include:

Average Annual Sales of WV Rural Grocer Network Participants 2020-21

Blue Ridge Bee Company is one of the grocers that got their start as part of the HFFI project. The owners, Will and Emily, began harvesting honey in 2014 and noticed a need for a cost-effective way to mitigate varroa mites in their hives that didn't include harsh chemicals and after much research, engineered their own BRBC Oxalic Acid Vaporizer. After success through online sales, Will and Emily en-

visioned a storefront to sell their vaporizer, beekeeping supplies, and honey. Their plan was to use the sales of beekeeping equipment to offset the overhead costs of running a grocery that would benefit their main street community. With support from HFFI and the Coalition, they opened their store in 2019 in Princeton, WV. Once open, the vision expanded and today the store includes value-added products such as jams and jellies, fresh produce, meat, eggs, dairy products, hand-dipped ice cream, and much more!

How do USDA-Funded Nutrition Programs Work Together?

The Coalition views its work as the intersection between economic development and food access. Through programming such as the WV Rural Grocer Network or SNAP Stretch, the Coalition seeks to increase farmers' and food-based entrepreneurs' bottom line while increasing West Virginians' access to fresh local fruits and vegetables. These efforts are combined to support a more equitable food system in the state. Nottingham's Store is a prime example of how this work intersects. Located in Clay County, West Virginia, Nottingham's Store is a family-owned and operated business that offers groceries, hardware, plumbing supplies, livestock feed, night crawlers/chicken livers for fishing, knives, ammunition, and numerous country sundries. In the businesses' 100+ years in operation, it has seen economic declines in their county. Clay County is ranked as the second lowest county in the state in per capita and household income. 27.30% live in poverty including 37.40% children. 29.8% of the population receive SNAP/EBT benefits. With transportation being a large barrier to fresh produce, it is difficult for the population of Clay County to travel out-of-the-county to a full-service grocery store.

Nottingham's Store, however, can see the need its community has for food assistance and more fresh produce options. Nottingham's has also started making business decisions with the changing of the time to meet the needs of their community while also being a viable business. In the fall of 2021, Nottingham's Store began to participate in the WV Rural Grocer Network and SNAP Stretch with the Coalition. After only a few months of participation this small, family-owned business distributed \$9,000 in SNAP Stretch incentives, while capturing \$9,000 in Federal assistance dollars that will remain in Clay County to spur economic growth and help the Nottingham's adapt their business model to the changing landscape around them.

"We want to help our community and customers and hopefully (with SNAP Stretch) can support our local farmers more instead of big box stores," said Bryan Nottingham.

The business is situated between the Elk River water trail and a newly developed rail trail which is attracting visitors and new customers to the area—kayakers, hikers, mountain bikers, and nature enthusiasts. Currently, there are few restaurant options in Clay County so the owners of Nottingham's saw an opportunity to add a to-go kitchen that offers pizza, sandwiches, and daily specials.

As participants of the WV Rural Grocer Network, the Coalition is supporting the Nottingham's through technical assistance and access to the Revolving Equipment Fund. Additionally, the extra income generated from SNAP Stretch allowed the Nottingham's to build out their kitchen ahead of schedule. "This business has been around for over 100 years, we want to see it last another 100 with future generations of Nottingham's," said Pauline Nottingham, when asked about the motivation for changes and updates to the store.

Economic Development Programs Can Develop Nutrition

The Coalition has received a 2016 Farmers' Market Promotional Program and is currently a subcontractor on a Local Foods Promotional Program. These two programs are aimed at economic development within the local agricultural sector. However, these programs easily enhance nutrition in communities. For example, currently, the Coalition helps operate the Go Growcery Market. This mobile cold-storage trailer aggregates produce from local farmers and takes it into rural communities that lack access to grocery stores and sets up a weekly farmers' market. This program is especially successful with seniors!

Farm-to-School grants are aimed at education, economic development, and nutrition. Depending on the implementation plan, all three outcomes can be achieved! In the Coalition's current Farm-to-School grant activities, we're installing gardens at elementary schools in partnership with teachers to both teach about agriculture and develop the pallet for the taste of vegetables with young children. We're also able to engage farmers and develop systems for farmers to sell their fresh produce into the school system that will increase children's access to more nutritious fresh foods. Also in development is a youth-ran business that sells fresh produce and value-added products to communities!

Future Program Recommendations

Match Requirements

It is understood that most grant programs have matching requirements—in theory, it shows that the community is invested in the project. In reality, matching requirements disadvantages rural communities, low-resource communities, communities of color, and smaller nonprofit organizations. These communities inherently have far less access to funds than affluent communities and urban communities. According to a study commissioned by the Bill and Melinda Gates foundation 91 of out 100 of the most disadvantaged communities are rural and 20% of the country's population reside in rural areas (Carlson and Cook 2021).^{*} However, according to multiple sources, only 5–7% of philanthropic dollars are invested in rural communities.

Concessions in matching requirements for rural communities, low-resource communities, communities of color, and smaller nonprofit organizations should be made in order to encourage projects that benefit these communities.

Requiring Grants to be Reimbursable

Currently, the vast majority of Federal grants are considered to be “reimbursable.” This means that organizations or communities must first spend the funds first and then receive reimbursement. While some grant programs do allow for pre-approved “advances” on known expenses, the practice of reimbursable grants creates two challenges: (1) it disadvantages smaller organizations who do not have the cash flow to manage a grant and wait a minimum of 4 weeks to 4 months for reimbursement. It often requires these organizations to take out lines of credit and pay interest fees instead of investing funds into communities, and (2) it locks smaller communities or community organizations out of applying for funds completely, simply because they are unable to operate on a reimbursement basis.

Requiring that grants are reimbursable locks smaller community groups out of the ability to apply—or it requires that groups take out a line of credit and then pay interest rates. Some grants allow reimbursement within 24 hours and some take 4–8 weeks.

Use of Intermediaries Organizations

The use of intermediary organizations can be helpful. Organizations such as the Gretchen Swanson Center and Fair Food Network provide useful technical assistance and data collection support to organizations.

However, using an intermediary to administer the grant makes community groups essentially a “sub-awardee,” which significantly increases the administrative paperwork in order to receive reimbursements, ultimately increasing overhead costs. While it is sometimes helpful to have the support an intermediary can provide, it is usually easier and less time consuming to operate the grant, dealing directly with staff at the USDA.

Length of Time Between the Program Announcement and Submission Deadlines

Annually, the GusNIP Request for Applications (RFA) is made available to the public only 60 days in advance of the submission deadline. Significant changes were made between 2019–2020 in the program funding requirements. Most noticeably, priority areas in program design and preferred firm types along with the allowable options for issuing nutrition incentive dollars. Following the 2020 RFA, every annual request has continued in this pattern. While it is helpful that program operators are listening and responding to feedback, more than 60 days would help community-based organizations submit more thoughtful informed applications as preference is given to those grantees who demonstrate coordination with multiple stakeholders, such as farm organizations, nutrition education programs, cooperative extension services, public health departments, private and public health insurance agencies, cooperative grocers, grocery associations, and community-based and non-governmental organizations. It can be challenging to coordinate all of these stakeholders on a short schedule.

Programs Need More Funding

In 2016, the Coalition received a Farmers['] Market Promotional Program grant for \$500,000 and applied for another in 2022. The difference in what can be achieved with \$500,000 in 2016 vs. 2022 is astoundingly different. Many of the aforementioned programs have not experienced an increase in the amount of fund-

^{*}**Editor's note:** there is neither a link, nor an end note citation, for this in-text citation. It has been reproduced herein as submitted.

ing that can be applied for in many years. With higher costs associated with travel, having staff, supplies, construction, *etc.*, these programs need higher funding caps.

To illustrate this point even further, GusNIP has increased emphasis on recruiting brick-and-mortar retailers over farmers' markets to participate in the program, with the rationale being that brick-and-mortar stores are open longer hours. However, without a sufficient increase in funds to enable this expansion, there often isn't enough of an incentive for grocery stores to join the program, given the additional administrative oversight that they incur.

Brick and mortar retailers operate longer hours and often have more registers and employees. This creates an increased paperwork and reporting burden for these firms, as well as increased incentive money required to operate SNAP Stretch. Brick and mortar firms often require additional onboarding effort and training, accounting for the increased time commitment and travel per market for program staff. When the GusCRR grant was introduced with an increased emphasis on brick-and-mortar retailers, the grant funds were not increased to account for these considerations.

Concluding Thoughts

The Coalition has continued these programs launched with USDA FINI and HFFI funding and is always finding new and exciting partnerships to work with. One such partnership is Keep Your Faith Corporation, Inc (KYFC) located on the West Side of Charleston, WV. KYFC is a community-based organization working to grow and cultivate opportunity and support community through programs centered around behavioral health, food insecurity, and workforce development.

In partnership with the Coalition, and with American Rescue Plan Funding, KYFC is developing Miss Ruby's Corner Market, a community-owned grocery store, that will provide healthy food access and will employ youth from within the community to help grow food, stock, manage, and conduct community engagement. This store will also accept SNAP Stretch and engage in a number of community-based programs that other NGO and University Extension Services have to offer—all the economic development, food security, and better nutrition for the community.

West Virginia Rural Grocer Network by the numbers

The West Virginia Food and Farm Coalition collects year end data from all of its WVRGN participants.
The 2020-2021 results include...

Downtown Brick and Mortar	Rural Brick and Mortar	Decentralized Kiosks
		
average annual sales \$609,749.92	average annual sales \$45,568.50	average annual sales \$13,642.26
average weekly sales \$12,120.49	average weekly sales \$1,446.93	average weekly sales \$635.51
average basket size \$30.03	average basket size \$19.05	average basket size \$27.23
SNAP/EBT sales 8.09%	SNAP/EBT sales 11.24%	SNAP/EBT sales 20.33%
Full-time jobs created 4.5	Full-time jobs created 0.5	Full-time jobs created 1.17
Part-time jobs created 5.5	Part-time jobs created 4	Part-time jobs created 1.33

WHAT IS SNAP STRETCH?

SNAP Stretch increases the buying power of EBT/SNAP recipients, increases the consumption of locally grown fruits and vegetables, and decreases food insecurity in West Virginia.

The SNAP Stretch program matches EBT/SNAP benefits spent at participating farmers markets, farm stands, mobile markets, Community Supported Agriculture programs (CSA) and local independent grocers at a 1:1 ratio. Seniors and families with children are matched at a 1:2 ratio for the purchase of fruits and vegetables. SNAP Stretch also captures federal food assistance dollars, EBT/SNAP, in the local food economy which profits West Virginia farmers. In 2021, \$483,371 in federal food assistance dollars were captured in West Virginia's agriculture economy as a result of SNAP Stretch.

Miss Ruby's Corner Market

Reclaiming community

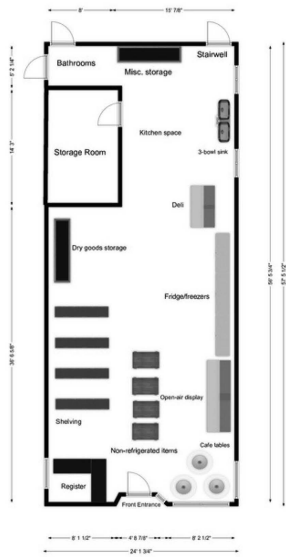

739 Central Avenue was once Abraham Grocery, providing food to the neighborhood and a local gathering place for a soda at the traditional soda fountain. It later became Park Place Bar and was relegated to a location where criminal activity occurred. The community has expressed a real interest in returning this building into a positive location in the neighborhood for years.

The location is situated on the bus line, as well as within walking distance from Jarrett Terrace, a senior high rise living facility, seen above

The view from the front door helps to paint a picture of what could be- a vibrant, positive gathering space for neighbors to gather essentials and connect with each other.

Keep Your Faith Corporation

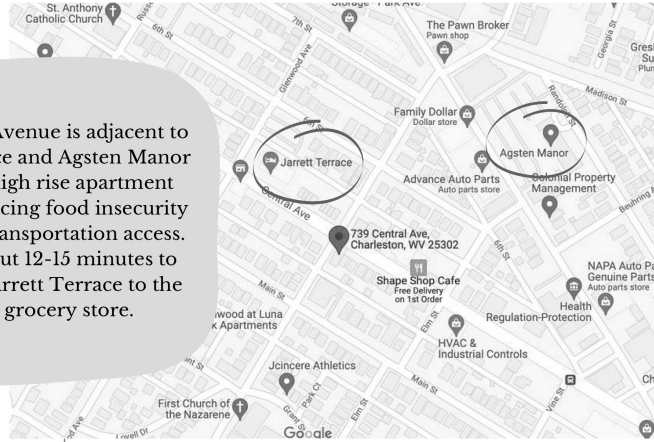

Keep Your Faith Corporation, Inc. (KYFC) began as a literacy-focused volunteer group meeting the needs of local children and adults struggling with the ability to read and write. KYFC has expanded program initiatives in response to community and statewide social and health determinants to include a focus on behavioral health, food insecurity, and workforce development. KYFC operates West Side Grown, a project that is striving to eliminate food insecurity by increasing access to fresh fruits and vegetables while promoting agricultural and nutrition literacy and economic growth.

The second level of the building will provide a mixed use work space in the heart of the community allowing KYFC to expand their youth workforce development.

739 Central Avenue is adjacent to Jarrett Terrace and Agsten Manor which are high rise apartment complexes facing food insecurity and lack of transportation access. It takes about 12-15 minutes to walk from Jarrett Terrace to the nearest grocery store.

With the WV Rural Grocer Network, the Food and Farm Coalition is able to connect with community grocery stores, like Miss Ruby's Corner Market, and provide technical assistance, coaching, and support.

Cafe tables and chairs will help to encourage a sense of community and gathering in the restored building.

The CHAIRMAN. Thank you, Ms. Moss. And now Mr. Smittcamp.

STATEMENT OF WILLIAM S. "BILL" SMITTCAMP, PRESIDENT AND CHIEF EXECUTIVE OFFICER, WAWONA FROZEN FOODS, INC., CLOVIS, CA; ON BEHALF OF AMERICAN FROZEN FOODS INSTITUTE

Mr. SMITTCAMP. Thank you, Chairman Scott, Ranking Member Thompson, and distinguished Members of this Committee. I thank you for the opportunity to speak with you today about USDA feeding programs and how they can best serve the consumers, especially the most vulnerable and underserved populations. I am Bill Smittcamp, President and CEO of Wawona Frozen Foods in Clovis, California, and I am representing the American Frozen Foods Insti-

tute. At Wawona, we grow and process over 125 million pounds of fresh and frozen fruits and nutritious produce and products that we supply worldwide to sectors such as the school lunch program, the foodservice industry, retail, and we are also an ingredient supplier. We have been in business since 1963, and we are honored to have been partners with the USDA for over 35 years, serving families who participate in the national school lunch program and as well as food stamps.

Personally, I am passionate about feeding communities not just in my hometown, but among populations around the community. Family businesses and community are a way of life for me and my family. And I think this is very important that we are here today.

We believe households are best served when they have access to all forms of nutritious foods, just as my family does. We know that USDA nutrition programs have been successful in bringing fresh foods to recipients. However, there is an opportunity to include and promote frozen foods to enhance these programs and help ensure families have access to high-quality nutrition throughout the year, regardless of their geographic location. This is especially true in programs such as GusNIP—in the Produce Prescription Program, FDPIR, and consumer education through programs such as SNAP-Ed.

When we think about strengthening these programs in the 2023 Farm Bill, there are three main components I would encourage you to consider. Americans fall far short of meeting recommended intakes of produce and therefore feeding programs intended to increase produce consumption should promote all forms of produce. The U.S. *Dietary Guidelines for Americans* recommend consumers eat all forms of fruits and vegetables, including frozen, fresh, canned, and dried, to meet the recommended daily intakes. Frozen foods offer a cost-effective and pragmatic way for people to meet these intakes.

Second, the frozen food advantage. The frozen food promotes a sustainable food system, especially one that minimizes food waste. Frozen foods are critical to fighting food waste due to the extended shelf life and proportional serving that help consumers prepare just the right amount of food that they need to eat. For example, families currently throw away over \$2,200 a year in food waste, but frozen foods are pre-measured, ready to serve, their longer shelf life than refrigerated or fresh foods, so households can avoid their financial waste by utilizing frozen products.

And then third, the supply chain stability. We should consider that freezing is like nature's pause. It allows us all to enjoy just-baked, just-harvested, just-crafted food at our convenience without losing any of the freshness or its nutritional benefit. For example, Mother's Day, we just celebrated all of our mothers and the strawberry season was ramping up. And then, that Sunday, we celebrated with strawberry shortcakes. But then what happened on Monday? There was no market after that. That is where the frozen food industry steps in as a safety net and takes those strawberries on, freezes them, puts them in 4 ounce fruit cups for the USDA School Lunch Program or for the TEFAP program. And this is where I believe that we need to improve the ability to get frozen into these programs.

Unfortunately, we often hear that, due to lack of funding, there is lack of freezer capacities for schools, food banks, pantries, retail locations, and that these outlets cannot or will not accept frozen product. The real point here I am trying to make is that our peach season is 4 months, all during when school is out. We can have frozen peaches all year round. You can have them in November, December, January when it is done. I thank you for your time.

[The prepared statement of Mr. Smittcamp follows:]

PREPARED STATEMENT OF WILLIAM S. "BILL" SMITTCAMP, PRESIDENT AND CHIEF EXECUTIVE OFFICER, WAWONA FROZEN FOODS, INC., CLOVIS, CA; ON BEHALF OF AMERICAN FROZEN FOODS INSTITUTE

Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee, thank you for the opportunity to speak with you today about USDA feeding programs and how they can best serve all consumers, especially the most vulnerable and underserved populations. I am Bill Smittcamp, President and CEO of Wawona Frozen Foods located in the San Joaquin Valley in Clovis, CA, and representing the American Frozen Foods Institute. At Wawona, we grow and process over 125 million pounds of fresh fruit into nutritious frozen fruit products that we supply worldwide to sectors such as schools, foodservice, retail and as an ingredient supplier.

We have been in business since 1963, and we are honored to have been partners with USDA for over 35 years to serve families who participate in the National School Meals Program, as well as TEFAP. Personally, I am passionate about feeding communities, not just in my hometown but among populations around the country. Family, business, and community are a way of life for me and my family . . . not to mention peaches.

We believe households are best served when they have access to all forms of nutritious foods, just as my family does. We know USDA nutrition programs have been successful in bringing fresh foods to recipients. However, there is an opportunity to include and promote frozen foods to enhance these programs, and help ensure families have access to high quality nutrition throughout the year, regardless of their geographic location, available time to prepare meals, and cooking skills. This is especially true in programs such as [GusNIP], in both incentive and produce prescription programs, [FDPIR], and consumer education through programs such as SNAP-Ed. When we think about strengthening these programs in the 2023 Farm Bill, there are three main components I'd encourage you to consider.

1. Americans fall far short of meeting recommended intake levels of produce and therefore, Federal feeding programs should promote greater consumption of these important foods. Feeding programs intended to increase produce consumption should promote all forms of produce.

The U.S. *Dietary Guidelines for Americans* recommends consumers eat all forms of fruits and vegetables, including frozen, fresh, canned, and dried, to meet the recommended daily intake. Frozen foods offer a cost-effective and pragmatic way to help people meet these nutritional needs.

USDA's Thrifty Food Plan recognizes the value of frozen food in helping consumers eat a diet that meets Federal nutrition guidelines. This is thanks to the benefits that frozen food offers in meeting value, time, and preparation needs. Frozen food is delicious, nutritious and helps families meet their food and nutrition goals while ensuring they spend less money over time.

Additionally, *results from menu modeling** show that realistic, balanced and affordable menus featuring mostly frozen foods can meet energy, nutrient and cost goals based on recommendations from the *Dietary Guidelines for Americans*, MyPlate and the USDA Thrifty Food Plan.

When studying produce consumption in the United States, data indicates that many consumers do not eat more produce because they do not know how to prepare it.¹ Frozen vegetables are peeled and trimmed, ready to cook with easy-to-follow cooking instructions on package. In addition, research shows that the nutritional

* <https://frozenadvantag.wpengine.com/achieve-the-dietary-guidelines-for-americans-with-frozen-foods/>.

¹ <https://fns-prod.azureedge.us/sites/default/files/resource-files/SNAP-Barriers-Summary.pdf>.

value of frozen fruits and vegetables is equal to, and in some cases better than, fresh produce.²⁻³ We need to ensure consumers are encouraged and able to purchase the form of produce that is right for their family and meets their ease of preparation and cost needs.

2. The Frozen Advantage: frozen foods promote a sustainable food system, especially one that minimizes food waste.

Frozen foods are critical to fighting food waste due to their extended shelf-life and pre-portioned servings that help consumers prepare just the amount of food they plan to eat. For example, families currently throw out up to \$2,275 worth of food each year,⁴ but frozen foods are often lower in cost-per-serving and have a longer shelf-life than refrigerated or fresh foods, so households can avoid this financial waste by utilizing frozen products.

This translates to consumers saving money and benefits to the environment by reducing Greenhouse Gas (GHG) emissions in landfills from food waste. This reduced waste can also help lessen the environmental impact across the entire food production chain, including at the distribution and retail level.

3. Supply chain stability: We should consider that freezing is like nature's pause button. It allows all of us to enjoy just-baked, just-harvested, and just-crafted food at our convenience without losing any of the freshness or nutritional benefits.

For example, the day after Mother's Day, suddenly there is a sharp decrease in demand for fresh strawberries. So, we in the frozen industry are the safety net for the strawberry growers for the fresh market that could [plummet]. Therefore, we now freeze those strawberries, so that the nutritious strawberry could be eaten any time of the year and not wasted. Access to food year-round is one reason why USDA's feeding programs are extremely important, and why we should work together to strengthen them.

Unfortunately, we oftentimes hear that, due to a lack of freezer capacity at schools, food banks, pantries, and retail locations, that these outlets cannot or will not accept frozen foods. How can we work together to solve these *infrastructure challenges* and ensure that consumers can access multiple forms of produce for their nutritional needs at any time? The real point that I am trying to make here, is that our peach season in the U.S. is 4 months long. With frozen peaches in particular, the recipients and school kids can have a delicious, healthy fresh-frozen peach during any season.

In conclusion, as you craft the 2023 Farm Bill, please ensure that frozen foods are allowed and encouraged as a solution to increasing nutrition access and ending hunger. In any program that is specifically geared to increase produce consumption, we would like to see families have the option and incentive to purchase *all forms of nutritious* foods: fresh, frozen, dried, and canned.

In the U.S. in 2022, I am saddened we are still talking about how to help hungry people, yet we are. But the frozen industry stands ready to offer innovative solutions and work with you to make sure that all Americans have access to the bounty of products, the fruits of our labor, if you will, we food producers can offer. I thank you and "Think Peaches."

The CHAIRMAN. And thank you so much, and thank all of you. You have all given wonderful, informative testimony.

And now we will move to our questions at this time. Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us to get in as many questions as possible. And as always, please do keep your microphones muted until you are recognized so we can eliminate any background noise.

And now let me start off. I recognize myself for 5 minutes.

Mr. Waide, you have delivered some very troublesome news to this Committee, and it is news that is daily on all the newscasts.

²Bouzari, A., D. Holstege and D.M. Barrett. 2015. *Vitamin Retention in Eight Fruits and Vegetables: A Comparison of Refrigerated and Frozen Storage*. JOURNAL OF AGRICULTURAL AND FOOD CHEMISTRY, 63(3): 957-962.

³Li, L., et al., 2017. *Selected analyses of fresh, fresh-stored, and frozen fruits and vegetables*. JOURNAL OF FOOD COMPOSITION AND ANALYSIS, 59: 8-17.

⁴<https://www.nrdc.org/media/2012/120821>.

People are not just suffering from the lack of food but the lack of ability to get the food with the high prices. What I want you to do, if you can, is share with us and the nation how serious this problem is. We have veterans not getting—tell us how serious this is. And you are in a position to best tell us Members of Congress what do we need to do right now to help with this food crisis, with Feeding America and your fellow community food banks? We are determined to make sure that nobody goes hungry in our nation. Everything almost you can do without, but food you can't, so it is critical. Tell us what we need to do here in Congress to help you and to address this food accessibility crisis.

Mr. WAIDE. Well, thank you for the question, Mr. Chairman. And, as I said in my testimony, lines at food banks are now increasing again. We went through a period over the latter half of last calendar year where we were really seeing a reduction in demand as people were getting back on their feet. But the impact of rising gas prices, food prices, and other basic needs is having a serious impact.

I just had a conversation at the end of last week with a couple of our feeding program partners in a couple of counties, historically known as affluent suburban counties north of Atlanta, in Cobb County and in north Fulton County. And those partners are telling us how the client base that they serve is growing. And more troubling is that in that client base there are people who are showing up who, just like in the early days of the pandemic, have never needed help getting food before in their lives.

The CHAIRMAN. Yes.

Mr. WAIDE. These are new clients. They had found a way to survive the pandemic, and now they are facing trouble.

What we need help with in the Feeding America network, and for my food bank in particular, is, as we look forward to the farm bill, that we need increased mandatory funding for TEFAP commodities. TEFAP commodities are really high-quality, nutritious food products that offer a lot of variety. They offer high nutritional content, and they help us ensure that our client base has access to the food.

The CHAIRMAN. So, you have given us one, that TEFAP funding. What is it now, and how much additional do you need, and how—so we can address—

Mr. WAIDE. Well, we have enjoyed tremendous TEFAP access and other nutrition program access during the pandemic, and that provided us with a huge influx of food during that critical time. We are in the process right now of those supplemental forms of funding having been exhausted, of reverting back to the baseline of TEFAP. And what that means is that our access to TEFAP in the next 18 months is going to decline significantly. We are asking for an increase to \$450 million in annual TEFAP funding.

The CHAIRMAN. That \$450 million increase into the farm bill, is that—

Mr. WAIDE. In total TEFAP funding of—

The CHAIRMAN. Okay. We want to work with you on that. Our staff will follow up on that because I agree with you. I wanted to get to you also. But in the spirit of what I say, my time has expired. Ranking Member, maybe you will—

Mr. THOMPSON. Mr. Chairman, you are a man of your word.

The CHAIRMAN. Yes, sir, thank you.

Mr. THOMPSON. Thanks once again to all the witnesses.

The recently announced White House Conference on Food, Nutrition, Hunger, and Health, which is really kind of interesting, no outreach from the White House on this. You would think you would want to engage the authorizing Committee when it comes to nutrition. But they advertise it as an event to accelerate progress and drive significant changes to end hunger, improve nutrition and physical activity, reduce diet-related disease, and close disparities around them. And while that mission is laudable, as I have said before, the listening sessions to date have left a lot to be desired, including a strong focus on just SNAP-specific policy and not much else, including the programs that you all are here to discuss. So for any of the witnesses, what has been your participation thus far in that process? Do any of the organizations represented here have a role—I assume Feeding America.

Mr. WAIDE. So, I know Feeding America, the national organization, is in conversation with the various organizers of the conference. And in particular, what our network is working to do is to help identify folks who are receiving—the food-insecure families, people with lived experience, who can talk about the challenges they experience day to day, and have those folks participate in a variety of listening sessions to inform the content of the conference. And then I think there are other conversations going on among Feeding America folks that I haven't been privy to personally, but I know that we are engaged in the planning around the conference.

Mr. THOMPSON. Okay. Any other organizations represented here today have received an invitation to be engaged in this conference? Not seeing it? Okay. When Feeding America has been—and if you were invited—which I am really surprised by the fact that you weren't. So if you weren't, say, and you were king for a day, what would you like to see? What would this conference look like if you were able to plan it, organize it, implement it? What kind of conversations? What would it look like?

Mr. SMITTCAMP. Thank you, Ranking Member. We have been.

Mr. THOMPSON. Okay.

Mr. SMITTCAMP. As I said, we have been invited, and I think what we would be looking for from the conference would be just equal access, fresh, frozen, canned, so that there was, again, parity in everything that we do. And that would be really what we are looking for. We don't want the big side of it. But our products are better transported than some of the fresh side of things.

Mr. THOMPSON. Very good. Any other thoughts which you would like to see this conference turn out to be? Please, Ms. Moss.

Ms. MOSS. Certainly. I think it would be really interesting to see an emphasis on rural communities, and particularly the farmers that support feeding people in this country. I think there is a lot of emphasis placed on commodities and whatnot, but given the mobility issues of food that we have seen throughout the pandemic, I think an emphasis on our local agriculture and our local farmers would be significant and really looking at rural communities. So that is what I would love to see an emphasis on.

Mr. THOMPSON. Very good. Thank you. Mr. Waide, any thoughts of, you are obviously—your organization is going to be a part of the process. If you had the ability to help shape this agenda, those discussions, anything particularly you really want to make sure this would look like?

Mr. WAIDE. Yes, I would just offer three thoughts. I think, first, as I said, it is really important that we listen to food-insecure families and understand what life looks like on the ground for them firsthand as the first sort of data point in understanding what solutions we need to develop to help them have food access. Let's listen to them first.

I think, second, we have to think about the hunger issue, the food insecurity issue more broadly as an economic insecurity issue and think about what it takes comprehensively to help people have access to financial opportunity that would prevent food insecurity.

And then I think, third, I would want to see us in that conversation with alignment on the goals and metrics of what success looks like. I think sometimes we don't have alignment on metrics and goals, and that leads to a lot of disagreement about inputs. If we can get aligned on goals and metrics that would help us develop better solutions.

Mr. THOMPSON. Very good. Well, Mr. Chairman, thank you so much. My time has expired.

The CHAIRMAN. The gentleman from California, Mr. Costa, who is also the Chairman of the Subcommittee on Livestock and Foreign Agriculture, is now recognized for 5 minutes.

Mr. COSTA. Thank you very much, Mr. Chairman, for this hearing. It is important as we set the table, literally and figuratively, for next year's farm bill. And I want to thank the witnesses. I think you have all underlined in various ways what I like to say, and that is that food, food that we grow in America is a national security issue.

And when we talk about the SNAP program, otherwise referred to as food stamps, but the other programs that ought to be touched upon in one fashion or another, what we are talking about is America's safety net, America's safety net to ensure that in fact all Americans have quality and affordable food. But in some cases, we know we have real challenges. And certainly, this pandemic pointed out the challenges we have, especially among those who live in food deserts, those who have other difficult challenges in terms of their economic income and being able to have a decent meal on their dinner table. So many of the children today we know in nutrition programs get their best meal of the day in the school lunch or breakfast program. And of course, when we don't have school going on, that is more difficult for those children.

Obviously, not time to cover all of the areas; but, Mr. Bill Smittcamp, Wawona Foods in Clovis, California, I have worked with you and your family now for three generations. And I want to commend you not only for your efforts and being a pioneer in terms of the frozen food production and the many fruits that you are able to provide over an entire year, as you noted in your testimony, but also the importance of the nutritional value of that program and the challenges faced in making that available. Obviously, freezer capacity and other factors and supply chain are critical.

But you and I have discussed this in the past, Bill, as to what the USDA qualifies that should be included or not included in the school lunch programs in terms of what is nutritious. And we grow so many products out in California, and around the country. What are your thoughts in terms of how we do a better job?

Mr. SMITTCAMP. Well, I think the USDA currently is doing an excellent job reaching out. We just had a meeting with them yesterday in regards to innovation, how we can get more products into them. But during the pandemic, for example, we were very instrumental with fruit cups and individual servings rather than the #10 can or a way where fresh fruit was not quite available during the winter months. There were innovative serving sizes that the frozen industry could apply to all these things.

We just think that, with what we are doing, that we continue to move forward with *frozen* in the language. I think this is part of what—

Mr. COSTA. Is freezer capacity an issue, especially in our schools?

Mr. SMITTCAMP. No, I think we have the capacity to supply more frozen foods to the world—

Mr. COSTA. How about food banks?

Mr. SMITTCAMP. Pardon me?

Mr. COSTA. How about our food banks?

Mr. SMITTCAMP. And the food banks. I think there again, we are the safety net, the frozen food side, whether it is freezers of fruits or vegetables.

Mr. COSTA. When the height of the pandemic and having people that had never been—Mr. Waide, as you indicated—to a food bank in their lives, put more pressure and demand on the services of food banks. I found some of the food banks in our area having challenges in terms of being able to make that supply. The point you made to the chair in your closing testimony talked about increasing funding. And I think one of the debates we are going to have here in Committee next year is baseline funding. If we are going to be able to expand capacity here in a host of areas, we are going to have to deal with the baseline funding. Have the food banks in the country come up with any suggestions on how we tackle that issue?

Mr. WAIDE. In terms of expanding baseline funding?

Mr. COSTA. Right.

Mr. WAIDE. Well, I mean, I don't know how to solve the budgetary—

Mr. COSTA. No, I am not expecting you to do that.

Mr. WAIDE. But I—

Mr. COSTA. Do you have recommendations in terms of anticipating what the need may be?

Mr. WAIDE. Yes, so our recommendation is \$450 million in baseline funding.

Mr. COSTA. Nationwide?

Mr. WAIDE. Nationwide, yes.

Mr. COSTA. All right. You talk about waste in our food supply chain, and you noted \$2,100. How do we get at the waste that we need to cut at all ends of the food supply chain? My time is obviously almost over. But I would like you to submit that to the Committee for future reference.

The information referred to is located on p. 1101.]

The CHAIRMAN. Thank you. And now the Chairman recognizes the gentleman from Georgia, Mr. Austin Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. And I want to focus on the domestic food issue. But I do want to make just a brief statement that I hope that America is watching what is happening with the food supply around the world. Ukraine exported 50 million metric tons of corn and wheat. They were the largest supplier of the UN World Food Programme. And while we have challenges in America, I am afraid that we are about to see people literally starving to death throughout Africa, Asia, and other lower-income parts of the world.

And we need to be cognizant that the nitrogen and the potash that was coming through the Black Sea region, which are two of the key elements we use to achieve the yields inside the United States, that supply of fertilizer may not be there next year, and we need to be cognizant of that. And we need to be making sure that we are doing everything we can as a Committee to replace the supply from Russia and Belarus and others so that we are not dependent on them for our yields.

That said, Mr. Waide, I am from Georgia. And before the Family Food Box Program was put in, I literally know farmers who were sharing hundreds of hundreds of thousands of dollars' worth of vegetables. It was done, admittedly hastily, but I will tell you, those crops would have been left to rot in the field. And I watched my National Guard pass out boxes of food that I think any of us would have been proud to serve on the most special of days in our homes.

I am disappointed in the criticism of that program from President Biden and Secretary Vilsack. I think it was a program that was extremely effective and served America well, especially based on the speed with which it was put in.

We have moved now to the TEFAP program since Farmers to Families was canceled. And just I understand that your food bank, that you have received some of these boxes already, is that correct?

Mr. WAIDE. Yes, we received boxes through both programs. The Farmers to Families Food Box Program provided a lot of support for our community, helped us meet the need in our community. And in the new program, we have benefited from that as well.

Mr. AUSTIN SCOTT of Georgia. And how many commodities are available through that program?

Mr. WAIDE. I don't know the specific number of commodities. We can follow up with that specific answer.

[The information referred to is located on p. 1101.]

Mr. AUSTIN SCOTT of Georgia. Okay. All right. Do you think it is meeting your demand for fresh produce?

Mr. WAIDE. Well, I would say that the demand for fresh produce in our community currently exceeds what we are doing. I think we are trying to grow our capacity to move produce effectively. Some of the challenges relate to what Mr. Smittcamp was talking about, an opportunity to invest in processing capacity to preserve more fresh products so that it can be utilized by the families that we serve. I think investments in agile programs that can operate quickly at scale to capture surplus produce will help us move more produce to the families who need it. So again, the Farmers to Fam-

ilies Food Box Program was an attempt to do that, and I think we benefited a lot from it.

Mr. AUSTIN SCOTT of Georgia. Okay. Mr. Smittcamp, for the most part, each of the programs under discussion include all forms of produce, as well as a variety of other frozen products. What specific programs need a stronger focus on all of these forms?

Mr. SMITTCAMP. Well, I think when it really comes down to it, it is the access, but it is also the ability to distribute and warehouse in these rural communities that do not have the capacity to handle fresh and frozen products across the country. And that is where I believe the focus really needs to be is on capacity of storage. When Congressman Costa asked me about availability, I was thinking about it from a production side rather than from the recipient side. But it really is needed on the recipient side because we have the capacity to produce it, but then there is no capacity to store it and move it.

Mr. AUSTIN SCOTT of Georgia. I want to thank all of you for being here and helping us solve these challenges as we push ahead. And I just want to again, advocate for those who are working to solve the problems throughout the world with the issues and the new challenges from Russia. Thank you.

The CHAIRMAN. The gentleman from Massachusetts, Mr. McGovern, who is also the Chairman of the House Committee on Rules, is now recognized for 5 minutes.

Mr. MCGOVERN. Well, thank you, Mr. Chairman. And let me start off by thanking all our witnesses for their comprehensive testimonies about these incredibly important programs that I am determined to see strengthened in the next farm bill.

I want to bring up a few points on GusNIP, which has continued to show us that incentives actually work. When I was on a farm tour last year throughout Massachusetts, I heard from farmers that the Double Up Bucks Program has made an incredible difference in their lives and for the lives of their customers. They mentioned to me that during the pandemic when many of us were worried about going to the grocery store, that the Double Up Program helped support people looking to make healthier choices without limiting what consumers could and could not buy.

What I care about is making it easier for people to access fruits and vegetables, and that is exactly what programs through GusNIP do. And, that to me is better than having—as some of my colleagues have advocated—having government dictate what people can and cannot eat or what they can or cannot purchase with their SNAP dollars. Quite frankly, I think that is offensive. It robs people of choice, and it robs people of dignity.

And so, my goal is to find ways to expand these incentive programs in the next farm bill, and I look forward to working with my colleagues who also get that these incentives actually help people make healthier choices that make sense for them, and also enables them to buy culturally appropriate foods for their families.

So next, while we have Mr. Besaw here, I want to take a minute to talk about the Food Distribution Program on Indian Reservations, especially how we can expand regional purchasing. Through the Rules Committee's push for a White House Conference on Hunger, Nutrition, and Health, I have had the opportunity to speak

with Tribal leaders all across this country. And while I am amazed by the work that this program has done, I heard over and over that Tribes are looking for more diversity of food options available to them, and they are looking for more—and the Tribal leaders will tell me that what Tribes eat in the Pacific Northwest is not the same of what Tribes in the Southeast want in their eating, and yet there is not currently a structure in place to fully support this. So, this is something I started working on in the last farm bill and something that I fully intend to continue working with USDA on.

So, Mr. Besaw, I would like to ask, in your opinion, what do we need to make regional purchasing a reality? What are the things that you in your role think that we would need to make regional purchasing feasible?

Mr. BESAW. One of the things—and thank you for that. One of the things that we looked at, again, is using the 638 funding, the Indian Self-Determination Act. So, if we took that—if we were allowed—and we are not talking additional funding, we are talking about funding AMS currently uses to purchase. And now we have that ability to contract so we can make the determinations on purchasing. We can help grow the local producers and ranchers. Many times, on Tribal reservations, we do not have that in place right now enough for the farm, the bigger industry on there. If we had that ability to be able to decide who we purchase from using an expanded and permanent 638 funding, which really is not so much additional funding, but is replacing what AMS currently does, by us deciding who those local producers are, we can grow them. If they have the capital to build their infrastructure, put in more pack wash, more fencing, and really grow what they do, then there is a greater chance that they can expand. And that is what we want. We don't want to be fed a fish. We want to be able to learn how to fish. So, we want to build those economies. And that is a strong answer towards some of the other inputs and some of the other international and national systems problems we have.

Mr. MCGOVERN. Right.

Mr. BESAW. We want to have a resilient, smaller system in place.

Mr. MCGOVERN. Yes, and I appreciate that. I have heard that over and over from other leaders. Let me just say one thing. That is why we need a White House Conference on Nutrition, Health, and Hunger. We need to connect the dots better, and I think we need to listen to people on the ground and people with lived experiences. And again, I would hope that everybody on this Committee, Democrats and Republican alike, rather than try to diminish the importance of a White House Conference would embrace it and use this opportunity for us to look at these issues holistically and actually help people get access to the food that they want. But thank you very much.

The CHAIRMAN. Thank you. And now the gentleman from Arkansas, Mr. Crawford, is recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman.

I want to direct this question to Dr. Gruner. Recent evaluations of GusNIP have reported about 85 percent of retailers are in urban areas despite there being roughly the same SNAP density across different geographies and demographics. Additionally, about 70 percent of projects are in farmers' markets. While supporting

smaller local farmers is vitally important, less than one percent of SNAP benefits are redeemed at farmers' markets. What more can be done to ensure that retail SNAP customers have access to incentive programs like GusNIP in rural areas and in the retailers where they most often redeem benefits? And go ahead and give me your thoughts on that.

Dr. GRUNER. Thanks, Representative Crawford. I think, as I mentioned, a stronger investment in GusNIP—in particular for grocery expansion—is desperately needed. We know that farmers' markets are limited usually once a week, sometimes twice a week for a couple of hours. Grocery stores are open every single day, all hours, except for evenings, usually, so they have a much higher SNAP volume and also utilization rate.

So, just in our experience, when we have tried to expand into some of our grocery outlets, in corner stores in smaller rural areas, we have gone through funding a lot more quickly. Our funding formula was kind of blown out of the water. We tried our best to use some of the resources available to estimate what the funds would be so we could properly supply and bring on those partners. And then what we don't want to do is go into communities for only a limited time, and then we run out of funding and have to pull out because that is harmful for growers, it is harmful for retailers that participate, and it is especially harmful for community members that start to use that resource. So really having additional investment is really important if we want to think about how to expand into grocery and corner stores and thinking about the utilization rate that is much higher than farmers' markets. And so we just have to have that additional investment in order to do that.

Second, I would say that we also need help and more investment in the POS technology. Sometimes getting the incentive built into POS systems, which are vastly different across our retailers, especially in rural areas, they need additional technical support and resources for getting that POS to kind of talk to that incentive model. So, I would say those are the kind of two investments I would recommend is a higher incentive and also investment in POS technology that can help to distribute the incentive.

Mr. CRAWFORD. Ms. Moss, do you have any thoughts on that?

Ms. MOSS. Yes, certainly. And I would echo what Dr. Gruner said. We have encountered—

Mr. CRAWFORD. [inaudible]—

Ms. MOSS. I am sorry?

Mr. CRAWFORD. I am sorry. Go ahead, Ms. Moss.

Ms. MOSS. Oh, okay. I would echo what she said. We have experienced—so last year looking at our numbers, we were in 21 farmers' markets and ten brick-and-mortar stores. And so, when we looked at our allocations this year, we have less money because we have less philanthropic investment this year. And so, some of our grocery stores sort of pulled out because it just wasn't enough money to incentivize the additional work on their part, even though ideologically they agree with the program and they want to be a part of that. So, I certainly could almost see an additional program that was aimed at GusNIP in grocery stores instead of having grocery stores, corner markets, brick-and-mortar, mobiles, farmers'

markets, things along those lines. That would be my initial thought on it.

Mr. CRAWFORD. Ms. Moss, we know that nine in ten Americans aren't meeting *Dietary Guidelines for Americans'* fruit and vegetable consumption recommendations. We also know most fruits and vegetables purchased by USDA for distribution and nutrition programs aren't fresh. We see in programs like WIC where clients can select the produce of their choice, for example, consumers typically choose to spend most of their benefit on the fresh option. Appreciating that all forms of fruit and vegetables can help meet *Dietary Guidelines* recommendations, are you able to speak to why ensuring the families you serve have access to fresh fruits and vegetables through Federal nutrition programs is equally important?

Ms. MOSS. I am sorry, and just double-checking. Why is it equally important that families have access to fresh fruits and vegetables?

Mr. CRAWFORD. Right.

Ms. MOSS. Yes, certainly. For us, one of the things we look at is, again, I represent a lot of local agriculture, so when things are picked at the peak of freshness, it is a higher degree of nutrition. And I think there is also an amazing sort of connection to your local farmer, your local community. We don't move as much product—or product doesn't get trucked nearly as far, so that can also help reduce the prices. So, what we see in our local communities is our farmers drive, not as far of a distance, and can sort of lower the prices of these fresh fruits and vegetable items.

Mr. CRAWFORD. Thank you. I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Chairman Scott and Ranking Member Thompson, for hosting today's hearing. To our witnesses, your expert testimony clearly paints the stark reality that we were facing as a nation.

Before the COVID-19 pandemic, food insecurity was at its lowest since the 2008 recession. And although COVID-19 is receding, the demand for food aid has not receded. We can point to a perfect storm of factors, whether worker shortages or global supply chains caused by the war in Ukraine, families and households are struggling today. And Congress must rise to meet these demands.

Last week, along with Representatives McGovern and Lee, I sent a letter to the House and Senate leadership urging immediate action to prevent the hunger cliff that looms ahead when the Federal COVID-19 public health emergency expires. The non-SNAP nutrition programs we are discussing today are currently weathering the storm through the COVID-19 recovery bill passed in 2020, and I am worried about the capacity that these programs currently have.

Mr. Waide, your testimony states that over five million seniors face hunger in the U.S. One effective program discussed, the Commodity Supplemental Food Program, works to mitigate food insecurity for this population. So, what are some of your recommendations for Congress to further invest in CSFP in the upcoming farm bill?

Mr. WAIDE. Thank you, Congresswoman, for the question. The CSFP program is a really important resource for low-income seniors who face food insecurity. Many food banks around the country help operate the CSFP program, delivering really high-quality food boxes to these seniors to round out their need for nutrition. And, in the next farm bill, we recommend a number of different enhancements to the CSFP program. Number one, we think expanding access to the program would be very beneficial by increasing the eligibility determination above the current level of 130 percent of the Federal poverty line. We also recommend increasing the length of time between recertification periods to ensure that more seniors are able to participate. We recommend instituting a self-declaration of needs for determining CSFP eligibility. And we recommend tailoring CSFP food packaging to assist with meeting dietary and medical needs of seniors.

Ms. ADAMS. Well, thank you. Thank you. It is quite a list. Great. Great.

Ms. MOSS, you spoke of the successes saying that the implementation of GusNIP and the Healthy Food Financing Initiative in rural communities, of course, your testimony speaks to how hunger issues are cross-cutting across all demographics. So, although you are an expert concerning rural food security, can you speak to the overall need for increased funding for all communities that utilize these programs?

Ms. MOSS. Yes, certainly. So, these programs are competitive grant programs, which means that, as an organization or as a community, you have to apply, you have to write an amazing grant with amazing evaluation metrics, you have to have all the right partners, you have to have all the right match funding. And then, if your grant reviewer is really feeling you that day, you might get lucky and get put into a pot that might get funding. So, inherently, it is a very competitive process. And so, if there were either additional funding or the process was not competitive, I think we could see these programs really affect more communities.

Ms. ADAMS. Okay. So, can you share just a little bit more about what your participants are saying about their ability to buy and eat more produce?

Ms. MOSS. Oh, my goodness. Okay. I will share with you a story. I had a mom call me just Friday. She called me and she said, "Hey, do you know of any voucher programs for families with a type 1 diabetic child?" I said, "No, it is not really what we do," although I could point her in the direction of a few resources. And I said, "Let me tell you about SNAP Stretch." So, this mother tells me the story of the fact that they were a middle-income family, Dad got COVID, was in the hospital on a ventilator for 4 months. Now he has long COVID. He is not even the same person. His accent has changed. He is now disabled. Mom was working in a nursing home, lost her job. The child is 14 years old, and she is a type 1 diabetic, and they cannot keep her blood sugar under control, so she is consistently in the hospital. And Mom says, "I don't know what I am doing. I need to change her diet. I get \$134 a month in food stamps. What do I do?" So, I was able to talk to her about really stretching her SNAP budget.

Ms. ADAMS. Well, thank you so much. I am out of time, I think. Is that correct? I think I am out of time.

The CHAIRMAN. Yes. Thank you very much.

Ms. ADAMS. Thank you so much for the responses. I appreciate it.

The CHAIRMAN. Ms. Adams, thank you. And thank you, Ms. Moss.

And now the gentleman from California, Mr. LaMalfa.

Mr. LAMALFA. Thank you, Mr. Chairman.

To our witnesses here, thank you for being here and participating. As we contemplate the next farm bill and reflecting upon the elements that were in the 2018 Farm Bill, what would you look at would be some improvements on modifying the feeding programs, *et cetera*? Coordination, is there something that could be done on improving coordination between the agencies and such? What should we be looking at really that would get a more streamlined, better approach towards more success?

Mr. WAIDE. Well, from our perspective in the network of food banks, the farm bill has provided tremendous support to our work over the last 5 years, 4 years. We think that, again, expanding mandatory TEFAP funding levels would be a critical part of ensuring that we meet the needs in our local communities. We think there are opportunities to continue to invest in capacity. We heard from Mr. Smittcamp about the availability of frozen products and continuing to invest in capacity at the local level for freezer and cooler capacity, can help us move more high-quality produce, both fresh and frozen, in communities that need it the most.

We certainly think that there are always opportunities in terms of working with producers to have better coordination in the way that purchasing is planned out. Smaller producers in particular need to know well in advance what kind of opportunities exist so that they can get crops in the ground in time to participate in some of these contract opportunities with TEFAP.

Mr. LAMALFA. Let's go back to the refrigeration and freezing aspect of frozen foods, *et cetera*. Is that going to be a huge challenge on just the ongoing cost of electricity is no bargain these days, as well as the space required to keep such at food banks or, the others on the panel, with your way of handling business? Is that something that is really being clamored for or is it duplicative—

Mr. WAIDE. Well, the food banks around the country are investing in or trying to invest in capacity, freezer cooler capacity. My food bank completed a capital campaign and moved into a new building that is 345,000² large with 75,000² of freezer cooler space in March of 2020. The other seven food banks that are serving the State of Georgia are all engaged right now in capital projects to expand freezer cooler capacity and other kind of warehousing capacity—

Mr. LAMALFA. Well, let me narrow it down then. So, is that seen as a top priority or number one priority? Or what is really the most important thing we can be looking at as we contemplate the farm bill for those needs overall needs?

Mr. WAIDE. Yes, outside of protecting and preserving the SNAP program, the number one priority for us within food banks is mandatory TEFAP funding and expanding that. We need food. I think

certainly being able to invest, particularly for smaller food banks, being able to invest in freezer cooler capacity, and having funding sources at the Federal level can help with that. But TEFAP funding is at the top of the list.

Mr. LAMALFA. Okay. The others, what should we prioritize?

Mr. SMITTCAMP. I am sorry?

Mr. LAMALFA. What should we prioritize coming into the next farm bill?

Mr. SMITTCAMP. Well, it certainly would be—in the produce prescription side and the GusNIP would be to let in all forms so that way—because right now it is dedicated to fresh. And by having all forms, we can complement, we can complement what is going on. So, when the food producer, if we are going to go to the regional side, doesn't quite have enough crop or has an overcrop, so we can balance it with the frozen food or canned or all forms. So, I think that is the key that we are here at the table just asking for the appropriate thing for the recipient to get the healthy, nutritious food.

Mr. LAMALFA. That would be in domestic production. Would that be a priority rather than import?

Mr. SMITTCAMP. I am sorry?

Mr. LAMALFA. Domestic production instead of imported, would that be a priority, too?

Mr. SMITTCAMP. Domestic?

Mr. LAMALFA. Yes. Okay. Thank you.

Mr. SMITTCAMP. Yes, I am sorry.

Mr. LAMALFA. I yield back, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. LaMalfa.

And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is now recognized for 5 minutes.

Ms. SPANBERGER. Thank you, Chairman Scott.

And before I turn to questions, I would like to call attention to an impending deadline that is of critical importance to the well-being of our children across the country and certainly the planning for our school districts across the country. On June 30, less than 3 weeks from today, the child nutrition waivers that provide schools with flexibilities to feed children will expire. And I have heard from communities, counties across central Virginia imploring us to extend these waivers because they are valuable to schools' ability to plan for and provide those in-school programs. These waivers have been a lifeline for schools, for students, for parents, especially amid ongoing pandemic-related supply chain challenges. And a survey from the School Nutrition Association found that 97 percent of respondents were impacted by higher food and packaging prices.

With the current waivers, most schools receive \$4.56 in reimbursement for each school lunch received, and without them, most only received \$3.75. To prepare for these waivers expiring, school districts are raising prices for students for the first time in years to make up for the increase in costs. And for hardworking parents across the country, every cent counts. We can address these rising costs, including by passing my Lower Food and Fuel Cost Act (H.R. 7606) on the House floor this week. But, as we do so, we must en-

sure that children have access to healthy, nutritious food. Failure to act and extend these waivers will mean more hungry kids, higher costs for parents, and a lot of confusion and lack of planning for school districts across the country.

As we get closer to the June 30 expiration date, I urge my colleagues in the House and the Senate to heed the pleas from our local school districts, take up the bipartisan legislation, Keeping School Meals Flexible Act (H.R. 6613), to extend these waivers.

And another program, switching gears to this hearing, that I hear consistently about from food banks and pantries across our district is the TEFAP program. Now more than ever, food banks rely on this program. And the Federation of Virginia Food Banks, comprised of seven food banks across the Commonwealth, purchased 30 percent more food in 2021 compared to 2019 to keep pace with the growing need.

Mr. Waide, thank you so much for your testimony. And you mentioned that approximately $\frac{1}{3}$ of the food commodities your food bank distributed last year were provided through TEFAP. Could you talk a little bit about some of the logistical barriers or challenges that you might face with the administration of TEFAP? And as we are looking to strengthen the program, speak to some of those challenges.

Mr. WAIDE. Well, in terms of logistical challenges around TEFAP, I think the biggest challenge we are facing right now is that a number of TEFAP orders for us. Thirteen percent—for the nation-wide number it is closer to 16 or 17 percent of these TEFAP shipments—are being canceled. And obviously, that creates lots of challenges. Number one, we don't have the food coming. But, number two, we have also been planning around those shipments coming and basing other kind of purchasing or sourcing decisions on the expectation that that food would be arriving.

And so, the reason why those orders are being canceled are complex.

Ms. SPANBERGER. Yes.

Mr. WAIDE. They relate to the complexity in the broader supply chain. But that is obviously a challenge that we are facing right now.

More importantly, TEFAP is a great program. We support it 100 percent. We want to see additional funding because that food is a lifeline, in particular for smaller food banks serving smaller communities.

Ms. SPANBERGER. And, speaking of which—and I do appreciate that you had included in your comments the recommendation related to increasing funding for TEFAP storage and distribution. Pivoting to some of the smaller communities, certainly I hear from Virginia food banks about how rural distribution allows them to reach more households. Mobile distribution allows them to reach more households, particularly in rural communities. Could you comment on the impact that this flexibility for mobile distribution has had on the communities that you serve?

Mr. WAIDE. Sure. So, we have a tremendous network of community-based partners who get food from us and distribute it in their local community. We have invested in a lot of their capacity, but in times of great crisis, or in more rural communities where the

distance between pantries is larger, being able to operate mobile distribution sites allows us to get the food closer to where people are at a time when they need it. And so, it has had a huge impact for us in a variety of communities, particularly in rural communities.

Ms. SPANBERGER. Thank you very much. Mr. Chairman, I yield back. Thank you.

The CHAIRMAN. And now the gentleman from South Dakota, Mr. Johnson, is now recognized for 5 minutes.

Mr. JOHNSON. Thank you, Mr. Chairman.

I want to go back to the days of COVID, to the Farmers to Families Food Box Program. And given all of the constraints and the Herculean efforts that needed to be accomplished, I always felt like that program answered the bell in a most impressive way—not perfectly, but quite impressive. I just want to ask the panelists for their reactions to that. And part of the reason I ask is it seemed like some of the reputation for that program has been more modest than what I think the impressive delivery and execution was. And so how did the program work? What can we learn from that? And what are the potential uses of that kind of delivery mechanism in the future?

Ms. MOSS. If I could speak to that, so the Food and Farm Coalition works with the two food banks in the State of West Virginia. And, what we saw from that program, especially initially, is that food was not—first of all, was not coming from any farmers in West Virginia. And second, they weren't bringing food that we would consider to be culturally appropriate in West Virginia, and it was not coming in a timely manner. So, that program didn't really do well for us in our very rural state in our very rural communities.

Mr. JOHNSON. So, Ms. Moss, just to follow up because I think that is a little different than what I heard from South Dakota. But obviously, when you roll out a national program, you are going to have some high points and some low areas. And I did hear some of those complaints in South Dakota. They diminished pretty rapidly as the program got a little more mature. Did you see any improvement in West Virginia?

Ms. MOSS. I think in the second round when new contracts came out, our food banks did have somewhat better contracts for food groups coming from Pittsburgh and Philadelphia that were delivering those products. But our two food bank directors were very glad to see that program end.

Mr. JOHNSON. Yes, I mean, that is good feedback. Well, what about anybody else, other experiences?

Dr. GRUNER. You can conclude that as well in Arizona. That was our experience. The second round we did have one local dairy producer that was able to participate, but we weren't able to have a lot of our local food producers, so I think we are really welcoming the opportunity for the Local Food Purchasing Cooperative Agreement Program, which we are calling LFPA, as another opportunity to kind of take the good things that came from CFAP and invite our local producers to be part of that solution. So, I am really looking forward to the opportunities that are going to come this year, building on that program and just creating more opportunities for local product to go to families that need it the most.

Mr. JOHNSON. Okay.

Mr. BESAW. If I may pitch in, one of the things that we found in Wisconsin—and I am going to speak to Wisconsin to what we found—is that, sadly, we lead in a lot of the health indicators in a bad way with diabetes, hypertension, lactose intolerance, heart disease, reduced life expectancy. And a lot of the foods that were in the boxes were incompatible with many of our elders and some other individuals on the reservations. And it is not that we were not appreciative. I mean, we got food. So, what we had done was said this needs to push us to really look at trying to look at our sovereign food system to really look at how can we get the foods that we know are culturally appropriate that our elders can use almost in that food-as-medicine type approach? And that is where we went with that. And we have received all types of accolades from individuals. For instance, even getting—we buy from the Oneida Nation in Wisconsin. We replace—there are over 100 food items on the food distribution category. And with the 638, you can replace or supplant existing—those foods with comparable.

Mr. JOHNSON. So, sir, I have one more follow-up for you in just 30 seconds. I mean, you talk about them not being a good fit for your elders. Of course, we have nine reservations in South Dakota. Diabetes is a big concern there. The food boxes in South Dakota weren't overly high on sugar near as I could tell. Maybe your experience in Wisconsin was different.

Mr. BESAW. Yes, I think just systemically, with all of the foods, the processed foods within that, I think that caused the concern more than anything.

Mr. JOHNSON. Very good. Thank you. Mr. Chairman, I know I am out of time and so—or, Madam Chair, I yield back.

The CHAIRMAN. Thank you.

Mr. JOHNSON. Or Mr. Chairman.

The CHAIRMAN. And now, the gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations, is now recognized for 5 minutes.

Mrs. HAYES. Thank you, Mr. Chairman, and thank you for having this very important hearing.

I am trying to figure out now how I am going to get through all of my questions. And also, Ms. Spencer Moss, I am very interested in hearing the end of the story you were telling about how you responded to this parent with her questions about expanding the diet of her diabetic child.

Ms. MOSS. Yes, so fortunately, I got close to the end of the story, but essentially, it was, okay, your farm is quote/unquote, "Up a holler in a county where we don't actually have a SNAP Stretch program," but let me point you to two SNAP Stretch sites in one county over and one more in another county over that is open 7 days a week. A very, very ecstatic mama to have the opportunity to triple her SNAP—her \$134 in SNAP to try to get her daughter's diet under control.

Mrs. HAYES. Thank you. I appreciate that. And I think it ties in very nicely with the questions that my colleague Mr. Johnson was just asking. People with very specific and unique dietary needs, we really have to have programs that are malleable and flexible so

that we are not just providing food that is unusable to people who have very hyper-specific dietary restrictions, so that is very helpful. I am happy that that mother was able to connect with you.

We have heard in the hearing today that matching requirements often disadvantage rural communities, and I am talking about the GusNIP program, low-resource communities, communities of color, and smaller nonprofit organizations because they have less access to food. My question is for Dr. Gruner. How can a shift in matching requirements help these communities gain access to more fruits and vegetables? And what else can we do to ensure that these hard-to-reach or especially vulnerable communities are better served by these programs? And I will just add that one of the things that the experience in my State of Connecticut with many of the Farmers to Families Food Box, we had one Connecticut farm that was involved in the program. Much of what was brought in was shipped, packaged somewhere else. By the time it got to us, it was expired, outdated, bruised. So how do we really utilize local farmers in these programs?

Dr. GRUNER. Thanks, Representative Hayes. I think from that, first speaking to the match requirement, the one-to-one match requirement means that we have to find capital in our communities, which we work really hard to do. But I will say in some of our more urban communities, it is easier to find partners that are willing to give that match requirement. Sometimes that comes with a stipulation that it can only be used in a certain area. They want to invest in a specific site, a specific location, a farmers' market or store. So that really makes it difficult to expand to those rural communities, especially if we don't have a match partner in rural communities. So, I will say that that is one challenge that we see.

In terms of, again, just wanting to echo my previous comments on some of our rural communities don't have a farmers' market. And so, while GusNIP and the Double Up Food Bucks Program, when we originally rolled it out, it was designed for farmers' markets. To have to think about how to shift to different models that will fit our rural communities, which, again, don't have a farmers' market, but there is a really great corner store that might be a good fit. And the thing that we see with our corner stores in our rural communities is, again, just getting some of the EBT technology up and running for them is one challenge so that they can even accept SNAP benefits, and then also getting a POS system that can read the benefits and also distribute an incentive. I think that is an area that definitely needs more investment.

And then I think our model in particular, we do work on prioritizing local produce. And so, with that, we do work with our corner stores on scaling up. So, whenever they start their baseline, we try to find ways that we can connect them with local growers in the region so that we see over time they have a percentage shift in the local—

Mrs. HAYES. Thank you. I am sorry to cut you off, but I want to hear from Mr. Smittcamp before my time ran out.

Mr. SMITTCAMP. Thank you very much. Just broaden the language. That is where we are. We want to complement—frozen foods wants to complement all other sources. And so, we are there. We can get it to the small rural if they have the infrastructure to han-

dle frozen. It is all about getting the language opened up to handle all forms and then allowing us to do what we do best and get the product to the particular recipient.

Mrs. HAYES. Thank you. I appreciate that. I really need more than 5 minutes to have this conversation. Mr. Chairman, I yield back.

The CHAIRMAN. I agree with you, gentlelady. There is so much we want to do to help solve this food disparity problem.

And now the gentleman from Indiana, Mr. Baird is recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman. I appreciate the opportunity to sit in on this important hearing. I really appreciate the witnesses being here. I think the expertise that you share with us really makes us better informed to try to improve these programs. And as we look at the 2023 Farm Bill, that is a real asset to us.

I want to look at another little area. I think in many cases, food preparation can be just as important as the type of foods. So, we have these air fryers and so on now. So, I am interested in two things. Is there equipment that we could use that would be beneficial to people? And how many people have access to those sort of things? And then how much has education played a role in trying to help families identify a good nutrition program?

Mr. SMITTCAMP. I don't know anything about air fryers. My wife has one, but I don't know.

Mr. BAIRD. I don't either. But I would like to——

Mr. SMITTCAMP. But I will tell you that education is the key. There are so many things about the leafy green vegetables that we are talking about, right? And people just don't accept them. I think when I serve in some of the nonprofits back home, they just don't take the leafy greens or some of those things because they don't know how to prepare them. So, there again, we have access to a product that is already prepared for them and frozen. And so, I think that is all we are trying to do; open that language up, get the availability of the infrastructure, and then naturally educate the recipients of how to do that. And I think, more and more, agencies are doing that and seeing that need, where they are in my community.

Mr. BESAW. If I may also speak to that. The SNAP educational funding goes to states, and there is no real compulsory coordination with Tribal governments if there was a \$4 million allocation for FDPIR Tribes in the nutrition field. So, if we have those fresh products, then we want to be able to provide that type of educational training. And I think there needs to be an increase or a proportion of what goes to SNAP should come a higher proportion to the Tribes, or there should be mandatory coordination between the states and SNAP recipients and the FDPIR programs because, by all means, we provide that type of cooking and coursework. And, by the way, several of my children have the air fryer.

Mr. BAIRD. Thank you. Ms. Moss, did you have a——

Ms. MOSS. Yes, so just to follow up to my co-panelists here. So, USDA does have several programs that I think are really interesting. So, one he mentioned is SNAP-Education. We work very closely with our SNAP-Education folks that come out of West Virginia University very closely. They do amazing education in schools

with both children and also adults. And I think there are other really great USDA-funded grant programs to help out with this. So, Farm to School, for example, does farming education, but it is also nutrition education with youth, and it really helps to develop their palates.

Mr. BAIRD. Thank you. Anyone else? I would like to ask one more question in that regard. What are we doing in the schools, do you think, for these families? Are the children being exposed to better ways to eat and so on?

Dr. GRUNER. I can speak to the Farm to School Program. I think the beauty of all of these programs is that there is a lot of collaboration that happens, and Farm to School is a great area where local farmers and nutrition, the SNAP-Ed program can come in and teach kids about where their food is coming from. We know that we can only do so much to create local food. We also have to do work on both ends to increase education so that the demand for local food is also there. And that is where the Farm to School Program is just a great way that that teaches kids about where their food comes from to increase their palates.

Mr. BAIRD. Thank you very much. Anyone else?

Mr. SMITTCAMP. Well, a fun fact on that, I mean, the USDA has asked us as manufacturers to do a much more retail label so they can go on and get our website and look at education on that. We are feeding 30 million children in a day, so there is a lot of access out there.

Mr. BAIRD. Thank you. My time is out, and so I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from Ohio, Ms. Brown, is now recognized for 5 minutes.

Ms. BROWN. Thank you, Chairman Scott and Ranking Member Thompson, for holding this hearing today. And thank you to our expert panel for being here. Your perspectives are helpful as we look ahead to the next farm bill.

The COVID-19 pandemic put tremendous strain on our nation's food system. We saw our nation's hunger crisis expand our food supply chain challenge. And this is why I worked with my colleagues to introduce the FIND Food Act of 2022 (H.R. 7317, Further Incentivizing Nutritious Donations of Food Act of 2022) to meet the demand in the face of declining food donations.

So, Mr. Waide, as you mentioned in your testimony, food banks are paying almost 40 percent more to purchase nearly the same amount of food as last year, and prices continue to rise. How would additional TEFAP investments help your food bank and others across the country in the 2023 Farm Bill?

Mr. WAIDE. So, thank you for the question, Congresswoman. Expanded TEFAP funding would make a critical difference, particularly for food banks serving smaller communities where TEFAP commodities make up a much higher percentage of the total volume of food that they distribute in those local communities. Today, food banks are experiencing a decline in the volume of Federal commodities that are flowing into food banks as we revert back to baseline spending. And to offset those declines, along with declines in donated food, food banks are purchasing more in patterns that are just unsustainable. As I mentioned, my food bank next year will spend more than \$15 million to buy food for the first time in

our history. We will source more food through our purchasing activity than we will source through Federal commodities. And, again, that is just not a pattern that most food banks will be able to support long-term. So, increased TEFAP funding will help ensure that food banks have the food sourcing capacity they need to meet the demand in their local community.

Ms. BROWN. Thank you. The pandemic also shed light on many of the existing barriers to access when it comes to putting food on the table. So, Mr. Waide, communities of color and rural communities often have higher rates of food insecurity, lack adequate grocery store retailers, and are often harder to reach for food distribution. What are some of the innovative distribution models your food bank uses to help serve our neighbors in need? And how can the Committee better address hunger in communities of color and rural communities in the 2023 Farm Bill?

Mr. WAIDE. Well, I think the most important thing that we have done in my food bank to increase access is really about building partnerships with organizations on the ground level in those local communities. And that includes organizations with which we have longstanding partnerships, who really understand those local communities, and who have built capacity to serve those communities more effectively.

It also includes organizations where we built relationships kind of on the fly in the midst of crisis during the pandemic, so we worked with a lot of schools, a lot of governmental organizations, city council leaders to host mobile distributions in urban communities, in rural communities, and everywhere in between so that we could target parts of the region where we did not have existing food partners to get food there ordinarily. And that really helped us fill those gaps in a way that was critically important during that crisis. So mobile distribution, partnerships, and investments in capacity are really the keys to ensuring that every part of our region has access.

Ms. BROWN. Well, thank you very much. I know that in my community we have begun to partner with an organization such as DoorDash to help some of our seniors get access. And so those are innovative ideas that I hope we are doing research that could potentially have a greater impact.

So, an important point in closing that you touched on in your testimony, that often gets lost, is that TEFAP is not only an important program for families but for farmers as well. And so, I just look forward to working with my colleagues on both sides of the aisle to address this issue.

And with that, Mr. Chairman, I thank you, and I yield back.

The CHAIRMAN. Thank you, Ms. Brown.

And now the gentleman from Iowa, Mr. Feenstra, is recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Scott and Ranking Member Thompson, and thank you for having this hearing. And I appreciate all your testimony. It is very useful as we look at the 2023 Farm Bill as we move forward.

The Fourth District in Iowa, which is where I am from—my district, is made up of many small rural communities. Ms. Moss, you mentioned in your testimony that requiring some Federal grants to

be reimbursable has a negative impact on smaller communities. Can you speak on this more, what your thoughts are when you noted that?

Ms. MOSS. Certainly. So, almost all Federal grants are reimbursable, you have to spend the money, wait 4 weeks to 4 months to get reimbursed.

Mr. FEENSTRA. Yes.

Ms. MOSS. And this can be \$20,000, it could be \$200,000. I was actually just on the phone with one of our food bank directors who had to spend \$600,000 and is still waiting on reimbursement 6 months later. It is really challenging to maintain that kind of a cash flow if you are a small organization.

Mr. FEENSTRA. I fully agree with you. So, what is your solution? Especially, we have all these small locations in my communities and stuff. So, what could we do to create a better system when it comes to reimbursement or getting away from reimbursement?

Ms. MOSS. Certainly, there are in my mind two options. And some grant programs do allow this. They allow you to apply for an advance. But those are only very known expenses, and you have to supply a very detailed list of what those expenses are. The lady behind me nodding her head is about to tell you how much of a pain that is and how much human capital it takes to make that happen.

The other option is do what a lot of philanthropic organizations do, and they will cut a check annually or every 6 months for what you said you would need for that period.

Mr. FEENSTRA. So that would be like a grant application?

Ms. MOSS. Yes, essentially. And a lot of the programs we are talking about are grants, GusNIP, HFFI.

Mr. FEENSTRA. Yes. So with that, Ms. Moss, which programs that you discussed in your testimony are most beneficial to rural America? Again, my district, I am just thinking about it. Are there programs that are better serving rural communities and small communities than others? And how can we maximize that intent? We just started talking about the intent of reimbursements. But I am looking at things being equitable and the impact. What are your thoughts?

Ms. MOSS. Certainly. So Healthy Food Financing Initiative is fantastic in rural communities because rural communities are experiencing the big box stores pulling out, so that program really helps to have retail close by. GusNIP, of course, is a fantastic program. And this is not part of the discussion today; but, AMS has the farmers' market, local food Farmers' Market and Local Foods Promotion Programs, also fantastic farm bill programs to really maximize that local agriculture.

I think one of the biggest things is match. Rural communities just don't have the funding that cities have. Philanthropy doesn't invest in rural communities.

Mr. FEENSTRA. Exactly. I tend to agree with that. Do you look at a private-public partnership, meaning that, would there be a way that we should incentivize—I think of my larger grocery chains, things like that, where we can give them some incentivization to help our local food banks and things like that?

Ms. MOSS. I think my colleague to the left would probably be better suited to speak to that. And I think there are a lot of partnerships with food banks.

Mr. WAIDE. Well, certainly the majority of food banks in the country are located in smaller communities. And in the State of Iowa there are several outstanding food banks serving that state that are doing a lot of innovative things to grow capacity in the state. I think we have a lot of incentives in place to encourage large grocery store chains to donate and to support food banks and other charitable feeding programs. And certainly, just enhancing those incentives can continue to grow our partnerships.

I think probably the biggest thing to contemplate in increasing access in local communities that are in the food banks serving the smaller communities is, one, to beat a dead horse, TEFAP funding is really critical. So, my food bank, large metro area, 30 percent maybe of our food comes from Federal commodities. In a smaller community like those serving in Iowa, it will be over 50 percent Federal commodities.

Mr. FEENSTRA. And I appreciate you saying that. I just look at—I mean, my in-laws, we have a large cattle operation, a hog operation, and stuff like that, and I think there is always, to me, opportunities not only with grocery but also the agricultural producers on how we could partner up and help food banks and stuff like that.

Thank you. I am out of time. I yield back.

The CHAIRMAN. And now we recognize the gentlewoman from Maine, Ms. Pingree for 5 minutes.

Ms. PINGREE. Thank you so much, Mr. Chairman. Thank you for holding this important hearing and thank you to all of our panelists. You do wonderful work, all of you, and I really appreciate it. And you are really helping to inform our Committee as we look into the future of the farm bill and other funding issues that we have to deal with.

So, let me just start with Mr. Waide. Thank you for the great work you do at the food bank. And I think in the last answer you said you hate to keep beating a dead horse on the TEFAP program, but as far as I am concerned, you can keep beating that drum as long as you want because I am particularly concerned about what is going to happen when we revert to pre-pandemic levels. And you have talked about that quite a bit, so thank you for emphasizing that.

I just want to ask a somewhat more obscure question, but it is something we have heard about. We are served by the Good Shepherd Food Bank here in Maine, and they do an incredible job. But they brought up to us some challenges with The Emergency Food Assistance Program, where the implementation guidelines limit participating agencies to 501(c)(3) nonprofits when their partner networks now includes schools, hospitals, and municipalities. I am just wondering if you have had similar experiences and if you have any suggestions about that challenge?

Mr. WAIDE. Well, we certainly work a lot with schools in our community, and we work with a variety of other entities. As I mentioned, during the pandemic, we worked with a number of municipal governmental leaders to host food distributions. And doing

that did create some complexity in how we distributed TEFAP products and other federally funded types of products. And so increasing flexibilities is something we would always support. It just helps us move faster to get food to where it is needed.

Obviously, we have to balance that against the need for accountability and the need for organizations that have good operating practices, know what they are doing to handle food safely, and that can adhere to other kinds of standards. But we think we can accomplish that while still maintaining greater flexibility that allows the whole system to move faster.

Ms. PINGREE. Well, thank you for that. Maybe that is something we could look into the future in terms of that flexibility. So that is an important point, I think.

Dr. Gruner, you, again, are also doing great work. And thank you for all of your testimony today. I am really interested in the locally sourced side of this. I think, particularly now with the supply chain issues that we have worried about and are working on, the more we can do to expand those local networks is really important. And in previous farm bills, I have worked on the language that allowed SNAP beneficiaries to shop at farmers' markets like everyone else, so that is very important to me.

I know there have been some concerns raised about insufficient access in rural communities, which is kind of ironic, since it is in the rural communities that we are producing so much of the food. I come from a very rural state. And I know you have already talked about this a little bit, but do you have anything else to add about the challenges that we could address or successes that we can build on when we are prioritizing locally grown food through GusNIP?

Dr. GRUNER. Yes, I think in addition, GusNIP, having the model that prioritizes local food I think is really important, but I also think that when looking at all the different programs that are in the farm bill, I think there is a really untapped resource with our small local producers, especially in our rural areas. So smaller programs like the Senior Farmers' Market Nutrition Program, which utilizes local produce, is another great complementary program that, again, I think just having an additional investment in that program and additional admin dollars could really help to expand and purchase that product from local producers. Especially sometimes in our smaller farms, it is really hard to get larger distribution trucks in those areas, so being able to have smaller programs that can navigate and source from our farms and our rural communities can be really helpful. So, I see all of these programs as really being complementary. And, I know it was already mentioned, but, LAMP is a great way that can help with that coordination of all the programs because I think all of these programs play a role. So, I am really looking at ways to invest in our small local producers as a solution.

Ms. PINGREE. Thank you for that. And thank you for always mentioning LAMP. That has been a really important part of the work that we have been doing in enhancing that. And so, we appreciate hearing that it is working.

I am going to run out of time, but, Ms. Moss, thank you too, for your work. And I was really grateful to hear your story about helping the family with the diabetic child. And that is another reason

to work on the Produce Prescription Program as a way to tailor making sure that people get the food and nutrition that they need for their families. So I am out of time, but I will yield back. Thank you so much, Mr. Chairman.

The CHAIRMAN. And thank you.

And now the gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. Thank you, Chairman Scott, and thank you to all our witnesses for appearing before the Committee today, definitely an important topic, and so I am just going to jump right in.

Mr. Waide, your testimony alludes to Feeding America working to quote, "End hunger with the food, people, and big ideas required to ensure our neighbors have the nourishment they need to lead healthy and productive lives," end quote. Feeding America has been around for more than 40 years and has seen increased participation in programming, receives billions, with a B, from the Federal Government, and spends millions of dollars on advertising. What started as a clearinghouse has really become a monopoly in the distribution space. Can you walk me through the big ideas the organization is currently thinking through to reduce reliance on food assistance and indeed help families lead healthy and productive lives?

Mr. WAIDE. Sure, I would be happy to answer that question, Congresswoman. I think it is really important to start with really understanding what food insecurity is and looks like. The vast majority of folks who identify as food-insecure, who get food through our network, who participate in Federal programs like SNAP, they aren't a part of these programs permanently. And in fact, whether you look at SNAP or you look at participation in feeding programs like those operated by Feeding America, the duration that people spend in these programs is generally less than a year's worth of time. And then they get back on their feet after they have navigated a crisis and are able to provide for themselves.

So, we have been around for 40 years. We have expanded food distribution over those 40 years. And I think we have done that to great end to help ensure that people get out of crisis faster and that our response to crisis is more effective and durable.

So, the innovations that I think you are asking about relate to our ability to enhance the quality of the food that we are distributing compared to what we were doing 40 years ago. More than half of the food that we distributed during the pandemic was either fresh or frozen. We have increased access to nutrition education during that time. We have increased partnerships with workforce development programs to help people get access to better careers over time. And we have increased partnerships with other kinds of service providers in the healthcare space to improve health outcomes over time. So, I think what we have seen through the investment that we have been privileged to enjoy from both Federal sources and the private-sector is that, as pressure has increased over the last 40 years on low- to moderate-income families, that we have helped those families have better life outcomes than they certainly would have otherwise.

Mrs. CAMMACK. Well, and Dr. Gruner, I will submit a follow-up question for the record, but I am running out of time, so I am just going to jump into my second question.

Feeding America states that for every one meal provided, SNAP provides nine. Does it make more sense to shift the hundreds of millions spent on TEFAP to SNAP or incentive programming, each of which provide choice, flexibility, and more immediate solutions for families in need?

Mr. WAIDE. So, we think the safety net that is provided by the combination of these nutrition programs are complementary and important to be taken together. SNAP is a much larger program, and the spending on SNAP is about 20 times what it is on TEFAP. So certainly, SNAP is a critical part of the response. That said, TEFAP is a unique program that really helps respond to opportunities in the agricultural market to take advantage of surplus food and get it to people who need it, while also supporting America's farmers. So, we don't think canceling that program out would continue to support our farmers in the way that TEFAP does today. And we also think it would be a net loss to the families that we serve collectively in the hunger relief space.

I would also say, you mentioned a monopoly in the feeding programs. It is important to remember that Feeding America works with 60,000 community-based programs across the country, $\frac{2}{3}$ of which are faith-based organizations, probably a significant percentage of which are led by BIPOC leaders and a significant number of which serve majority minority communities.

Mrs. CAMMACK. So, Mr. Waide, my time has expired, and so I want to be sensitive to the Chairman's time. I would just like to follow up with I do believe there is a licensing fee that many of those entities have to use in order to use the Feeding America name. But with that, I yield back. Thank you.

The CHAIRMAN. Thank you. And now the gentlewoman from New Hampshire, Ms. Kuster, is now recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman. And thank you, Mr. Waide, for bringing up the health benefits. I think Ms. Schrier and I both serve on both the Health Subcommittee on Energy and Commerce and on Agriculture. And I would love to have a joint hearing at some point about the health benefits of these important issues and programs in the Nutrition Title of the farm bill, not just SNAP, but these nutrition programs that take a holistic approach to food security and the safety net, but also to helping families address health issues, the most expensive health issues, diabetes, heart disease, obesity. All of that can benefit from the work that you are doing not just to mitigate hunger but help stabilize families and help them address their health and well-being, eating more fruits and vegetables, eating those leafy greens that we have talked about this morning.

That safety net is more critical than ever as we recover our supply chains from the height of the pandemic and navigate the food and fuel shortages stemming from Russia's unconscionable invasion of Ukraine. We know that the results of the pandemic and the war are higher prices at the grocery store and leading to greater reliance on food banks and community resources at a time when they are already stretched thin. And so, it is so important today that we

talk about how we reduce costs, but also how do we provide that important safety net.

And for me, a big part of this, as Representative Pingree brought up, is having food grown closer to where it is consumed because we can bring down those high transportation costs, the trucking, the shipping, *et cetera*.

Mr. Waide, you noted in your testimony that Congress helped fill the gap during the pandemic by authorizing \$1 billion in additional funding for the TEFAP, The Emergency Food Assistance Program, but we are far from out of the woods. Just like the experience in Georgia, I have heard from the Community Action Program in New Hampshire that handles our TEFAP contract about the challenges of acquiring the items they need to feed families as food and transportation prices rise.

Mr. Waide, could you elaborate on how the additional TEFAP allocation helped sustain your operations during the peak of COVID, and why the mandatory funding level needs to be increased in the next farm bill?

Mr. WAIDE. So, simply put, we would not have been able to meet the need in our local community were it not for the extraordinary Federal response in expanding access to commodities. The demand would have just far exceeded the supply available from donated sources of food. And we certainly could not have closed the gap with our own purchasing resources.

What we know, going forward, is that demand right now is growing again due to the pressures that families are facing with higher costs for food and gas and other basic needs. We do not think that is a challenge that will last only a few months. We think it will be with us for a longer period. And, for food banks and other organizations to continue to respond to their community and meet the needs in their community, we need more food. Being able to provide all that food with our own purchasing resources is not a sustainable solution. It might be something we can do over the course of a year or two, but having a higher level of mandatory funding for TEFAP in the next farm bill will help ensure a predictable, robust supply of food for emergency food providers over the long-term as we continue to work to meet the need for increased levels of demand for food assistance.

Ms. KUSTER. Thank you. Now, let me turn to the Senior Farmers' Market Nutrition Program, which I believe is an incredible win-win program for vulnerable seniors and for our local farmers. Dr. Gruner, I appreciate in your testimony you called this program tiny but mighty. The connections this program allows seniors to make with fresh, local food, as well as other community resources, are invaluable, and it also supports our small farm economics, just like the farmers in my district in New Hampshire.

Dr. Gruner, we have heard the program is drastically oversubscribed nationally. Can you tell us roughly how many more seniors you could be serving with more funding in the program?

Dr. GRUNER. Representative, I realize your time has expired. I am happy to follow up in written comments if that would be helpful.

[The information referred to is located on p. 1104.]

Ms. KUSTER. I apologize.

The CHAIRMAN. We appreciate that so much.

Ms. KUSTER. I wasn't tending the clock.

I yield back.

The CHAIRMAN. No problem. And the gentleman from Georgia, Mr. Allen, is now recognized for 5 minutes.

Mr. ALLEN. Well, thank you, Mr. Chairman. And, Mr. Waide, you have mentioned the partnerships with farmers to minimize waste products. Do you have any ideas for how a similar partnership could be created for any of the USDA programs in order to create more access to fresh, local products while utilizing the excess products of farmers, how that could be integrated?

Mr. WAIDE. Well, I think—and, Congressman, good to see you again, and thank you for the question. I think TEFAP is already engaging a wide variety of producers as suppliers to the TEFAP program. I think work can certainly be done to broaden participation of producers in the existing TEFAP program. And we certainly encourage AMS to do that as part of their ongoing activity. We also think that there are opportunities to invest in the capacity of smaller local producers, including socially disadvantaged producers, so that they can participate on an ongoing basis in TEFAP contracts more effectively.

And then there are always opportunities to take lessons learned from programs like the Farmers to Families Food Box Program to find ways to respond with greater agility and speed to market opportunities to get that high-quality product where it is needed, when it is needed.

Mr. ALLEN. Well, your comments are important here and your input is important, because we will be working on a new farm bill in the next Congress, and we want to see how these non-SNAP USDA nutrition programs are working and the improvements that we need to make to those programs to make sure that we are doing everything we can do to make sure folks get good and nutritious food.

This is a question for all of our folks who are here testifying today. Much of the testimony we have received thus far in the 117th Congress, including today's, includes calls to strengthen programs. And, of course, when I hear calls for strengthening, I immediately think of we need additional funding. And for our witnesses today, seeing Title IV alone will cost taxpayers more than \$1.1 trillion over the next 10 years, how do you reconcile that with your programmatic recommendations? And we will start off with you, Mr. Smittcamp, I believe, if I am reading that correct.

Mr. SMITTCAMP. Well, I guess if I understand the question, how do we recognize when the cost of fuel is going up, how we can supply all the things that we need to do? But I think in the frozen food world, we are probably the most efficient folks to be able to produce a pound a serving that needs to go to these communities. So, with that, I believe the frozen food industry is doing their job to continue to eliminate waste, give a value and complement what fresh is when they run out or when they have oversupply. So, I think in the frozen food industry we are trying to do—and with regard to the TEFAP money, when we are a lot of a bonus buy, when there is an excessive crop, wherever it might be, whether it is peaches, strawberries, or berries, it comes in and it definitely shows on the

farmer side, which were all very important, that the farmer's side, it raises the fresh market up to a nice parity. So, the TEFAP program is good.

Mr. ALLEN. Good. And so, it sounds like that your threats are external things you can't control and so that is going to be part of your ask. Ms. Moss, what do you have for us as far as what you can do to—

Ms. MOSS. In terms of a rationale for the line item?

Mr. ALLEN. Right.

Ms. MOSS. In my lifetime I have seen a consolidation of agriculture. There are a lot of big corporate farms in America, and we don't see nearly as many small farmers as we did when I was a kid. I am not that old. And so I think that is for a couple of reasons. One of it is farming is hard work. Farmers don't get a fair shake. There has not been a lot of investment in our local farmers, particularly those that are producing food.

Mr. ALLEN. Right.

Ms. MOSS. And so, I would say that this is really an investment in your local agriculture, which is really a homeland security issue as well.

Mr. ALLEN. Sorry, I am out of time. And, Mr. Waide, if you will provide us something to that question to us in writing, I would appreciate it. Mr. Chairman, I yield back. Thank you.

[The information referred to is located on p. 1102.]

The CHAIRMAN. Thank you very much. And now the gentleman from California, Mr. Carbajal, is now recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman. And thank you to all the witnesses testifying today. The work you all do in administering these very important programs is essential to providing people across the country with nutritious food and preventing millions from going hungry.

As we prepare for work on the next farm bill, hearing from you all is extremely important to these programs so that we can best serve the people who most need them in our planning.

Mr. WAIDE, USDA recently launched the TEFAP Fresh Produce Box Program to help address a lack of fresh produce available through the TEFAP food list. This serves to complement the fresh produce food banks are purchasing privately. Can you talk about the importance of ensuring clients have options to access a wide variety of produce when they visit a food bank?

Mr. WAIDE. Thank you for the question, Congressman. And it is a really important consideration. The families that we serve, in particular, lack access to fresh produce. It is harder for them to access because it is not as available in the grocery store serving their communities, or because it is just not something they can afford and certainly can't afford to see go to waste. So, having good variety is critical to our meeting their nutrition needs.

We in the nation's food banks have dramatically grown our distribution of fresh produce over the last decade. And we still have a lot of opportunity to increase the volume and variety of produce that we are distributing. Having more options for where we source that produce, for the format and packaging of what that produce shows up to our food banks looking like so that we can give clients options, allows them to have more choices, to find products that

meet the needs of their families, the preferences of their families, which is what any of us want when we go to the grocery store. And so that variety is really critical to increase access and utilization of produce for food-insecure families.

Mr. CARBAJAL. Thank you.

Dr. Gruner, it is great to hear about the success Arizona has had in implementing the GusNIP program. I am very supportive of helping SNAP recipients get more bang for their buck. Can you walk me through some of the challenges you faced when implementing this program and how Congress can best support the Nutrition Incentive Hub to make sure that the needed resources are available to other organizations?

Dr. GRUNER. Yes, I would be happy to. I think the first thing is just when we have any site that is available, is getting them onboarded with EBT equipment. Not all of our farmers' markets are eligible sites that are receiving local produce are able to receive SNAP benefits. So, I think that is where we see the biggest amount of our technical support right now is just making sure that they have EBT processing equipment and are part of that registration. And then, I think ultimately it's just outreach and making sure that participants know that they are eligible and that they can find a location, so I think we see a significant effort in our outreach and finding creative solutions for reaching lots of different families across our state. So, I think those are the two areas where we see significant challenges.

We are really lucky that the evaluation component, again, is with that Nutrition Incentive Hub. That has really helped to streamline and create a really comprehensive evaluation. So, I think in the next couple of years we are going to have some really great data from all of our states across the nation to pull together. So, I think having that uplifted to a broader approach is going to be really helpful as well, so we are not having to do all of the evaluation from scratch. So, I think those are just a couple of the ways that we see some challenges that we faced.

Mr. CARBAJAL. Thank you very much. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from Washington, Ms. Schrier, is recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman, and welcome to all of our witnesses. Today, I would like to focus on The Emergency Food Assistance Program, or TEFAP. Over the past few years, we have all had many discussions about the issues at food banks, huge increases in demand like you pointed to in your testimonies, long lines, distribution challenges, sometimes more donations than food banks can even handle because of storage limitations, refrigeration space. And I think that this has all really ignited an important and urgent conversation about what our food systems, writ large, should look like.

I want to first just highlight the incredible work of two organizations in my district. First, the Bonney Lake Food Bank is charting a new path forward for the operation of food banks and food pantries. They saw a 700 percent increase in customers due to the COVID-19 pandemic. And because of that, they began developing a new food insecurity project that focuses on increasing access for

the surrounding area by building in consideration of convenience for customers and transportation and help with language barriers. And they are also supplementing the TEFAP foods that they receive with weekly purchases of fresh produce from nearby farms to create a food bank that really looks and feels more like a market.

The second that I would like to really highlight is Cascadia Produce, a food aggregator and distributor in Auburn, Washington. In response to some of the systemic barriers preventing small and underserved farmers from accessing market opportunities, Cascadia Produce is championing a new model of coordinated collaboration to act as an incubator and create a path for underserved food businesses to bid and execute future contracts on their own. And this work is ensuring that communities throughout Washington are fed by local farmers in a way that creates jobs, sustains local farms, and strengthens the entire food network.

I wanted to share these examples because I think this is the kind of work that TEFAP can and should help to support. And Federal investment through TEFAP and other feeding programs we are discussing today, it really has the potential to act as a catalyst for creating circular local food systems that support our family farms while also feeding our communities. So, that is why I am working on legislation that would improve our food and agricultural supply chain by modifying the procurement side of TEFAP to provide emergency feeding organizations with better access to healthy, locally grown food.

Mr. Waide, I have a question for you. In meeting with stakeholders throughout my district in Washington State, one thing I have heard time and again is the need for work to be really locally led. People have told me that the pandemic food box program for example, however well-intended—and it was really well-intended—demonstrated that the Federal agencies just don't have the on-the-ground local knowledge and connections to adapt to the need of every different community and different food banks with different capabilities. So, I wanted to ask you, Mr. Waide, about your view here. How did the Atlanta Community Food Bank work to get food, as you said in your testimony, to the people who need it, when and where they need it during the pandemic?

Mr. WAIDE. Well, I think—and thank you for the question. The key to our success in being responsive to the needs of the community is that we have built, over more than 40 years of practice, really deep relationships on the ground in communities across our region. And so, we are there to engage, educate, and empower the community to fight hunger, which means we are providing resources and platforms including food, including investments and transportation capacity, refrigeration capacity so the folks who really understand what need looks like in their local neighborhoods have what they need to really take care of their neighbors. Those grassroots relationships we were able to really lean on and activate to an even greater degree during the crisis so that we could stand up mobile distributions in places that weren't being served as well as they needed to be so that we could change operating models on the fly, to respond to needs in those local communities.

Ms. SCHRIER. Thank you.

Mr. WAIDE. Yes.

Ms. SCHRIER. I really appreciate those relationships. That is why the legislation I am working on now is really going to get funding hopefully to the states to get down to the most local communities to do exactly what you have done and be able to purchase local food farmed locally to food banks and solve hunger. Thanks very much. I yield back.

The CHAIRMAN. The gentleman from California, Mr. Panetta, is recognized for 5 minutes.

Mr. PANETTA. Thank you, Mr. Chairman, and thanks to all our witnesses for participating in this very important hearing, especially on the evening before the farm bill coming up in 2023. So, I appreciate you discussing something that is going to be and is very important to my district on the Central Coast of California.

Recently, I led a bipartisan letter with my colleague Shontel Brown and the late Congressman Don Young, requesting an additional \$900 million to support The Emergency Food Assistance Program, TEFAP, as we have been discussing, obviously identifying the urgent need to resource this vital program.

I am continuing, though, to hear from food banks in my district about how critical TEFAP is so that they can meet their demand for food. And I think we all know that food banks, as well as families, are being squeezed by the cost of food, fuel, and other basic needs, especially at this time.

Mr. Waide, I am going to hit you up again. I know you have been busy in this hearing, as I have been seeing, but I am going to rely on your expertise to answer this next question. Go ahead and describe what the Federal drop in commodities has meant to food banks, and what can be done in the upcoming farm bill to ensure food banks who literally are the final backstop in the Federal Government's safety net? What can be done to ensure that they are adequately resourced?

Mr. WAIDE. Well, thank you, Congressman, for the question. As I have indicated throughout this hearing, food banks right now are responding to the decline in Federal commodities by buying more food with private resources. We are expecting a 40 percent decline in the volume of TEFAP food in the coming year collectively. And in response to that, we are trying to fill the gap with purchased food because we are also seeing challenges in terms of donated food due to other issues in the supply chain.

For my food bank, as an example, prior to COVID, we were spending approximately \$6 million a year in total food purchasing activity. In the coming year, we will spend more than \$15 million on buying food. So that is 2½ times what we were buying prior to the pandemic. And, my food bank compared to most food banks in the network is very well-resourced. And, even for us, if we were to do that indefinitely, it would become very challenging to sustain our operations.

So expanded TEFAP funding—and we are recommending \$450 million in annual mandatory TEFAP funding in the next farm bill—would help reduce that dependency on buying food and give us more resources to invest in programming, to invest in trucking, to invest in grant-making to our partners so that we can really build our distribution capacity to get food where it is needed.

Mr. PANETTA. Great. Great. Thank you. I appreciate that.

Dr. Gruner, I got two for you. Obviously, you understand the importance of using SNAP, especially, to buy fresh fruits and vegetables, but also at farmers' markets. And unfortunately, there are some barriers there that SNAP beneficiaries have in using their benefits at farmers' markets. What are some of those barriers, and how can we make it a little bit easier for people to use their SNAP benefits at farmers' markets?

Dr. GRUNER. I will take a perspective from our rural areas. Just having EBT equipment that connects and that can read cards, so connectivity broadband is where we definitely need investment for our rural communities so that they can have SNAP equipment that can read EBT cards so that beneficiaries can even participate in the program or even use SNAP benefits at farmers' markets. So, I would say that is one of the primary things that we see, just an additional investment and a need for technology support in our rural communities.

I am sorry, you had one more, so I want to just give you an opportunity—

Mr. PANETTA. Thank you. Real quickly on the GusNIP, how can we utilize online SNAP to improve user experience and increase access to fresh fruits and vegetables through the use of GusNIP?

Dr. GRUNER. I would love to submit some more—it is a complex answer, but I will just say I am thinking about online SNAP has to be part of a solution for how we think about modernization, and using the farm bill to really lay that groundwork work is really important, so it has to be part of how we think about it.

Mr. PANETTA. Outstanding. Thank you. Thanks to the witnesses. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. And now the gentlelady from Ohio, Ms. Kaptur, is now recognized for 5 minutes.

Ms. KAPTUR. Thank you, Mr. Chairman. What an outstanding set of witnesses you have gathered today. And I want to thank you all on behalf of the people of Ohio that I represent for the tremendous job that you do in representing all of America. Your experience will influence us in drafting this farm bill.

And I wanted to just mention that in another bill Congress passed, which is the Infrastructure Investment and Jobs Act (Pub. L. 117-58), there is funding there for energy systems, new energy systems. Many of the food banks and even farmers' markets that we operate around the country could be much more efficiently run if they had modern power and even some generator backups for some of our freezers and some of our food banks. I would urge you to look at that bill and put together a—you would have to give it a name, a food network plan for the regions that you represent, whether it is West Virginia, California, Georgia, wherever it might be, and take a look at that bill. And also, on broadband, which Dr. Gruner just mentioned, there is funding in that bill that could really help you do the work that you are attempting to do. And I thank you on behalf of the country.

I will be real quick and say my goal in participating in the farm bill drafting will be to strengthen local agriculture in this country. And I have heard that from many of you. And another goal of mine is to improve nutrition and the elements of that so the younger generation understands what it is to grow food and harvest a crop.

We are far from that in our country, and it is hurting us. It is hurting us as a country.

So, I am very interested in that, Mr. Besaw, I listened to you use the term *shorten the food chain*. I know he is up there on the computer somewhere. But I am somebody that wants to do that. And Ms. Schrier, Representative Schrier used the term *circular food system*, and I just am sitting here applauding. So, I believe that what American farmers grow, grows America. And when they get harmed, boy, we are in trouble. And too much of our food is imported. I grew up in a family market. We used to go over to Indiana, pick up the best melons in the world. The other day, I went to shop at a produce market and the melon came from Honduras. There are climate refugees from Honduras. I look at that and I say to myself, "Am I taking food from someone in Honduras?" I don't really know. But I want to support local agriculture in this country.

I am asking myself the following questions. Mr. Waide, do food banks in your network have the ability to contract with local farmers in order to move product to your food bank? I don't know if you are authorized to do that. I would like to know that. I will ask these questions very quickly.

Dr. Gruner, I would like to ask you, in terms of the Senior Farmers' Market Nutrition Program, the coupon program, it is so popular. Why does it only function in maybe one Congressional district per state in this country?

And number three, how do we encourage local schools to get food from local farmers? How do we move into those school nutrition contracts? What can we do in the farm bill in that regard? So, anybody that wants to address any one of those three, I am really interested in your answers. Thank you.

Mr. WAIDE. Well, I can quickly answer the first question you asked me. We do source purchased produce from local farmers. The point I would emphasize, though, for you all to consider is the local producers, including socially disadvantaged producers in our region, what they really want is access to markets and customers, right? And so, working with food banks is great for them, but, more importantly, they need customers. And the key enabler for them is going to be access to capital and investment in their capacity. And so, in addition to helping folks participate more regularly in the TEFAP program as suppliers, the more we can do through a variety of programs, with the farm bill, with FSA programs, is help these smaller producers get access to capital to invest in their capacity so that they can build customer relationships.

Ms. KAPTUR. I agree with you, Mr. Waide. I don't want to cut you off, but in terms of what we can do through the farm bill, we can empower our local food banks to buy from local farmers because our local farmers are the major donors to our food banks, at least where I come from. And I am going, hey, how come they can't get a contract to grow cucumbers and tomatoes and so forth and move those into the food banks? But it is my understanding that that isn't so easily done in current programs. I don't know if anyone else wishes to comment on that.

But I did ask two other questions, one about how we can improve the ability for local schools to buy local from farmers and producers. And then in terms of the Senior Farmers' Market Nutrition

Program, how can we make it a national program rather than diddle around in one Congressional district and half the states?

The CHAIRMAN. If you don't mind, your time has expired. But that was a very important question, and we would appreciate it if each of you could respond to Ms. Kaptur in writing.* And I thank you for that, Ms. Kaptur, and for your wonderful—oh, okay. Mr. Lawson?

Mr. LAWSON. Thank you, Mr. Chairman. Thank you. I am having some difficulty on the computer, but now, I think—first, I want to thank you—

The CHAIRMAN. Yes—

Mr. LAWSON.—Mr. Chairman and Mr. Thompson, for holding such a great hearing. And, hunger is a serious issue among seniors. According to the recent data from Feeding America, nearly 5.2 million seniors were food-insecure during 2020, which is incredible. Dr. Gruner, you had heard that the Senior Farmers' Market Nutrition Program is drastically oversubscribed nationally. Can you tell us roughly how many more seniors you could serve with more funding? Dr. Gruner?

The CHAIRMAN. Yes, Mr. Lawson, can you repeat the question and who you directed it to?

Mr. LAWSON. Yes. Mr. Chairman, I don't know whether you can hear me, but it was directed to Dr. Gruner. I was talking about the 5.2 million seniors that were food-insecure in 2020. And my question was, we have heard that Seniors Farmers' Market Nutrition Program is drastically oversubscribed nationally. And I was asking, Doctor, can you tell us roughly how many more seniors you could serve with more funding?

Dr. GRUNER. Thank you, Representative. I think where we see opportunity is we also need an additional investment in admin. When we talk to some of our neighboring states, I think where we see commonality is a lot of us are limited in how much outreach we can do. And so, speaking of the program only being in a couple of Congressional districts, that is really because the personnel time is so strapped, especially in a state like Arizona. We are the sixth-largest state, and so getting to all of our rural communities and getting out and transportation there and getting programs up and running there, technical support there, and then also just distributing coupons or whatever the incentive model there is, is quite challenging. And so I think additional admin would really help us to expand our capacity.

In Arizona, we served just over almost 1,400 seniors last year, but we are also capped at whatever our CFAP program is, a that is like one of the entry points. We have created an additional way that we can do an eligibility waiver. But essentially, it is really tied closely with our CFAP. So, I think these programs work really closely together. But, ultimately, we have farmers that are available and willing to offer product. We just need personnel and resources to be able to expand into other communities and reach more seniors. So, I would say that we don't necessarily have a number I can say, but I would say just additional admin time would help not just Arizona, but some of our neighboring states as

* **Editor's note:** the response from Dr. Gruner is located on p. 1103.

well to really expand to reach some of those hard-to-reach areas of all of our states.

Mr. LAWSON. Okay, thank you very much. And, Mr. Waide, thank you for all the work that you are doing in Georgia distributing food during these difficult times. I am very interested in Atlanta Community Food Bank's work and with housing, health services, job training, and other critical support. The kind of wrap-around service that you provide can change the lives during this time. So, are there any restrictions on TEFAP that prevents you from offering more support services?

Mr. WAIDE. There are no restrictions in TEFAP that prevent us from offering more services. The way we typically do that is by partnering with other organizations that are experts in those areas. We are really good at moving food. We are really good at building partnerships on the grassroots level and investing the capacity of other organizations. Those other organizations are really good at job training or other kinds of healthcare type of provision of services, and we really leverage their expertise.

I think the key thing that could always make a difference is expanding eligibility for TEFAP. Right now, about 57 percent of the people we serve earn too much money to be eligible for TEFAP, and so we could serve more of those people more food and do more work for them if that eligibility threshold were lifted to a higher number.

Mr. LAWSON. Thank you very much. Mr. Chairman, my time is running out, and I yield back.

The CHAIRMAN. All right, thank you very much. And now we have reached the end of our hearing. And we want to first of all thank you. And then we are going to have some comments from the Ranking Member and then my closing statement as well.

So first, Mr. Kyle Waide, President and CEO of Atlanta's Community Food Bank, we want to say thank you. And we are committed to helping secure this additional \$450 million. I believe this Committee—and I think you have heard from them—share this goal as well. And with the help of my good friend, the Ranking Member, I believe we will be able to do it.

And now, Mr. Gary Besaw, Director of the Menominee Tribal Department of Agriculture and Food Systems, we want to say thank you to your excellent testimony.

And to Dr. Jessie Gruner, Director of Community Innovations, Clinical Prevention, thank you very much.

And for Ms. Spencer Moss, Executive Director of the West Virginia Food and Farm Coalition, thank you for your very informative testimony.

And Mr. William Smittcamp, President and CEO of the Wawona Frozen Foods, testifying on behalf of the American Frozen Foods Institute, thank you for your excellent testimony and presenting that very important perspective from our frozen foods. They play a very important role.

And now with that before I give my closing statement, Mr. Ranking Member, I recognize you.

Mr. THOMPSON. All right, Mr. Chairman, thank you so much. Each of the witnesses, thank you for bringing your experience, your expertise, and obviously your passion in this realm. Nutrition is incredibly—Title IV of the farm bill, the Nutrition Title is a very im-

portant title, as important as any other title in the farm bill. And quite frankly, this is about—I think Title IV for me summarizes what I have come to identify as a rural value, maybe an urban value, too. I have never lived in urban America, so I am not sure. But a rural value is neighbors help neighbors in need. And part of that is making sure that we look at it from a broad perspective.

Certainly, as was pointed out, in a lot of the testimony I heard today, it is recognized that financial distress, poverty, whatever we want to call it, financial challenge is transitory. People enter in and they are either in or out. I don't think we will ever end poverty, but the goal is to help people stay there for a short period of time when they find themselves in difficult financial situations, whether it is because of nothing that they did, or quite frankly, bad decisions, whatever would put them in that.

And so, I think that that is why, not only making sure that folks are getting access to nutrition, I think nutrition comes in many different ways. Frozen, fresh, I don't get too hung up on how things are packaged. But, in addition to that, I think we have an obligation here to make sure that we are helping people effectively move out of poverty, out of financial distress to the point that they don't need these programs. And that is why we have the SNAP-Education programs. That is why we have the education, call it training, although I will say, the Ranking Member in the Education Workforce Committee would take argument with that because she says we train dogs and we educate people. And I don't argue with her, so I am okay with that.

And we have great programs to do that. We reauthorized the Perkins Act (Pub. L. 115-224) for education, laborers, career and technical education. We have great opportunities. We expanded apprenticeships, so we have different ways to move people out of poverty. And we need our partners who are there to help people land softly, let's say, when they find themselves in financial distress, get the proper nutrition they need. They help us be partners to move these folks so that they can realize the American dream because the American dream is not being stuck in financially difficult circumstances, obviously. This country offers more than that.

I think we also have to be looking—and I know it was part of my opening remarks—of what puts people into poverty, these inflation prices, which I think are self-inflicted at this point when you look at energy policy, when you look at regulatory policy. It is just incredible where inflation has come to over eight percent, a new record just this past week. And so, we need to—we in terms of us, Members of Congress—we need to be looking at what can we do in order to correct the course of the policies we have seen over the past couple of years that lead people into those poverty circumstances.

So, we have a stunning statistic, and I am going to round off numbers, I apologize if I get it wrong by a decimal point. But there is somewhere in the neighborhood of 11.2 jobs open and available in this country today. That is more than maybe any time in our lifetime. And unless I am incorrect, I believe there are about 11 million people that have been on the SNAP program, and that is the able-bodied adults that do not have dependent children or,

quite frankly, parents that need care at home because those folks need to be dedicated to doing that. And these are able-bodied folks.

And so, we got a lot of work ahead of us actually. And I really appreciate the role that you all play primarily in the nutrition space. But quite frankly, those who participate in the programs where we also put an emphasis into the education component to helping people move out of those financially distressed circumstances to greater opportunity, which that is basically the only thing this country promises each and every one of us.

So, Mr. Chairman, thanks so much for this hearing and your leadership.

The CHAIRMAN. And thank you, Ranking Member, for your leadership as well. You are my partner on this Committee. You and I have worked together on many things, and I appreciate that, and certainly none greater than making sure that we feed the American people. That is the number one objective of our Agriculture Committee. And I appreciate our partnership.

And I just want to say again, and echo a few of the things that the Ranking Member mentioned as well; our first priority is what we have been in here talking about. But we are also faced with numerous challenges. And then, more than that, statistical evidence that Mr. Kyle Waide presented in terms of the 40 percent increase in terms of need. That is almost half of what we are doing. We have to increase. We have been hit with COVID-19. We have been hit with challenges all the way through.

Many of our veterans are going hungry, and that just breaks my heart for any of our American citizens going hungry. But Lord knows those that have put their lives on the line for us are reaching pinnacles of homelessness and food deserts. Sometimes the chill in this room, this gives me an aggravated cough, so I appreciate you all working with me on that during this session.

But I can't tell you how grateful we are. And you have reinforced—I think you have heard from the feedback from the Members of this Committee, both on the Republican side and on the Democratic side. This is one thing, one issue that has bipartisan support, feeding our nation.

And so, I mean that sincerely, Mr. Waide, we are going to get you and this nation that \$450 million that is needed in this farm bill. We are committed to doing that. And I think then that I feel confident that we have the collective power to get it done.

And all of the other recommendations that each of you have mentioned, we can get it done. All we have to do is work together in a bipartisan way. That is the way you get things done. In my whole career people say I have done great work, but I have done great bipartisan work. And we Democrats and Republicans are going to work together to make this the absolute best farm bill we have ever had. And we have had a bunch of, many of them, but we want to keep improving.

And so, I just want to thank you. And before I close out, I want to thank my wonderful staff. They have put together a wonderful hearing here. Would you mind giving my staff a good round of applause? These are the people that do the work. And so I thank you for that. And I believe I have to do a little homework here before I adjourn.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any question posed by a Member.

With that, this hearing of the Committee on Agriculture of the House of Representatives is adjourned.

[Whereupon, at 1:09 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. ALMA S. ADAMS, A REPRESENTATIVE IN CONGRESS FROM
NORTH CAROLINA

June 9, 2022

Hon. NANCY PELOSI,
Speaker of the House,
U.S. House of Representatives,
Washington, D.C.;

Hon. KEVIN MCCARTHY,
Minority Leader,
U.S. House of Representatives,
Washington, D.C.;

Hon. CHUCK SCHUMER,
Majority Leader,
United States Senate,
Washington, D.C.;

Hon. MITCH MCCONNELL,
Minority Leader,
United States Senate,
Washington, D.C.

Dear Speaker Pelosi, Minority Leader McCarthy, Majority Leader Schumer, Minority Leader McConnell,

We urge you to take steps now to prevent a “hunger cliff” that otherwise looms ahead when the Federal COVID–19 Public Health Emergency Declaration (PHE) expires.

Food insecurity in 2020 affected an estimated one in ten U.S. households overall. Food insecurity also had disparate impacts, with food insecurity affecting nearly one in eight Hispanic-headed households and more than one in five Black-headed households.¹ Recent supply chain issues, the Russian invasion of Ukraine, and other factors pushing food price rises are exacerbating the challenges many Americans have in affording an adequate diet.

Federal relief enacted at the outset of the pandemic has helped to mitigate the depth of hunger. Specifically, the Families First Coronavirus Response Act of 2020 authorized the issuance of SNAP Emergency Allotments (EAs) while Federal and state PHEs are in place. That Act also temporarily suspended time limits on SNAP eligibility for certain unemployed and underemployed workers and provided USDA with enhanced authority to allow changes to SNAP operations. The Consolidated Appropriations Act, 2021 increased SNAP access for college students during COVID–19.

In addition to positive impacts on the food budgets of millions of households and the streamlining of administrative operations, the temporary SNAP relief has had positive impacts on the economy. Each \$1 in SNAP benefits during a downturn generates between \$1.50 and \$1.80 in economic activity. That has benefited the entire food chain—from farmers, ranchers and food manufacturers, to truckers, grocers and store clerks.

Moreover, SNAP has had positive impacts on all communities, rural as well as urban. In 2020, SNAP reduced poverty in metro areas by 0.8 percent and in rural areas by nearly double that (1.4 percent).²

Once the HHS PHE sunsets, however, most of these SNAP relief measures also will end. Due to the end to EAs alone, most SNAP participants, on average, are expected to *lose \$82 per person a month* in SNAP benefits. The average SNAP benefit will fall to about a mere \$5.40 per person per day.

Action is needed to avert the looming “hunger cliff” and to strengthen SNAP permanently. First, Congress should both extend the authority for issuing SNAP EAs beyond the PHE to provide a more gradual path to regular benefits as well as instruct USDA to require states to notify and robustly screen all households for all allowable shelter, childcare, and medical expense deductions in order to ensure the correct amount of SNAP benefits.

Second, Congress should include in any upcoming legislation three key strengthen SNAP bills:

Closing the Meal Gap Act of 2021 (H.R. 4077/S. 2192) to address SNAP benefit adequacy and equity by: (1) substituting the Low Cost Food Plan for the Thrifty Food Plan as the market basket on which to calculate SNAP benefits; (2) increasing the \$20 minimum monthly benefit; (3) removing the cap on the shelter costs that households with children can take into account for SNAP; (4) streamlining the SNAP standard medical deduction for SNAP participants who are elderly or have a disability; and (5) providing equitable access to residents

¹ <https://www.ers.usda.gov/publications/pub-details/?pubid=102075>.

² <https://www.aei.org/wp-content/uploads/2022/03/SNAP-Supports-Rural-Families.pdf?x91208>.

of Puerto Rico, American Samoa, and the Commonwealth of the Northern Mariana Islands.

Two additional bills to improve equitable access to SNAP: one, ending a time limit on benefits for certain unemployed and underemployed adults (Improving Access to Nutrition Act of 2021 (H.R. 1753)); the other, eliminating long-standing rules that require many college students to work 20 hours a week for their food benefits, effectively undermining their educational success. (Enhance Access To SNAP Act of 2021 (H.R. 1919/S. 2515)).

Hungry people can't wait. Taking these actions now can help avert a severe "hunger cliff" and promote food security and economic equity during COVID-19 and beyond.

SUBMITTED LETTER BY HON. JIMMY PANETTA, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

February 28, 2022

Hon. TAMMY BALDWIN,
Chair,
Senate Appropriations Agriculture,
Rural Development, Food and Drug
Administration, and Related Agencies
Subcommittee,
Washington, D.C.;

Hon. JOHN HOEVEN
Ranking Minority Member,
Senate Appropriations Agriculture,
Rural Development, Food and Drug
Administration, and Related Agencies
Subcommittee,
Washington, D.C.;

Hon. SANFORD D. BISHOP, JR.,
Chair,
House Appropriations Agriculture, Rural
Development, Food and Drug Adminis-
tration, and Related Agencies Sub-
committee,
Washington, D.C.;

Hon. ANDY HARRIS
Ranking Minority Member,
House Appropriations Agriculture, Rural
Development, Food and Drug Adminis-
tration, and Related Agencies Sub-
committee,
Washington, D.C.

Dear Chairs Baldwin and Bishop and Ranking Members Hoeven and Harris:

We write to respectfully request that you include additional funding beyond what has already been provided in FY 2022 appropriations legislation for The Emergency Food Assistance Program (TEFAP) in omnibus spending legislation or any additional COVID relief supplemental spending legislation.

The charitable food system continues to experience an on-average 40 percent increase in demand for local emergency hunger relief, with over 60 million people turning to food banks in 2020.¹ This rise comes at a time when past emergency food support provided by Congress has ended. As we continue to observe a high demand for food assistance, food banks will need additional support to ensure they can meet the demand from community members, families, and children facing hunger.

United States Department of Agriculture (USDA) foods including TEFAP are the cornerstone of the food supply for our nation's food banks. According to Feeding America, USDA commodities provide approximately 39 percent of the food distributed by their network of 200 food banks and 60,000 local faith-based and charitable partner organizations. Last year, USDA foods provided 2.4 billion meals distributed to their network food banks. Many food banks could struggle to meet the demand for food assistance without the fresh fruits, vegetables, protein, and more provided through the program.

¹ *State-By-State Resource: The Coming Food Bank Crisis—Your Community May Face a Food Crisis in 2021—Feeding America Action* (<https://feedingamericaaction.org/resources/state-by-state-resource-the-coming-food-bank-crisis-your-community-may-face-a-food-crisis-in-2021/>).

Further, TEFAP is essential to rural communities. Rural communities make up 63 percent of all counties in the United States, but account for 87 percent of counties with the highest rates of food insecurity in the nation.² Last year, through USDA commodities, food banks distributed 1.2 billion pounds of food to rural America,³ with TEFAP providing nearly 40 percent of this assistance. For years, farmers, agriculture partners, and food banks have maintained a deep working relationship to provide U.S. grown commodities to families and children facing hunger.

We can help address the need for emergency food bank support by providing an additional \$900 million for food purchases through TEFAP. We ask that you include this additional critical funding to ensure food-insecure families can put food on the table.

Sincerely,

Hon. JIMMY PANETTA,

SUPPLEMENTARY MATERIAL SUBMITTED BY KYLE WAIDE, PRESIDENT AND CHIEF
EXECUTIVE OFFICER, ATLANTA COMMUNITY FOOD BANK

Insert 1

Mr. COSTA. All right. You talk about waste in our food supply chain, and you noted \$2,100. How do we get at the waste that we need to cut at all ends of the food supply chain? My time is obviously almost over. But I would like you to submit that to the Committee for future reference.

Feeding America is the nation's largest food rescue organization and partners with food manufacturers, retailers, restaurants, and growers to recover surplus nutritious food and distribute it to people in need. An estimated 72 billion pounds of edible food goes to waste each year in the United States. Last year, the Feeding America food bank network and partners rescued 4.7 billion pounds of groceries to help provide additional food assistance to our neighbors facing hunger. In Georgia, we continue to work with agriculture partners to ensure agriculture products that would otherwise go to waste can be used to help Georgians facing hunger. However, Congress and the United States Department of Agriculture (USDA) can take additional actions to reduce food waste and increase food assistance. The Feeding America food bank network urges Congress and the USDA to consider the following policy suggestions:

- Increase technical support and education about the Bill Emerson Good Samaritan Food Donation Act, to reduce donor concern about potential liability.
- Increase storage and distribution funding for food rescue efforts. The 2018 Farm Bill funded food waste pilots that USDA has implemented to focus on composting at the municipal level; this should be expanded to include food rescue support by food banks and others.
- Standardize food donation guidelines to allow the donation of safe, nutritious food beyond the "sell-by" date. Currently, 20 states do not allow the donation of food if it is beyond a "sell-by" date, even when the food is known to be safe and nutritious.
- Simplify food labels by providing a uniform national standard to reduce confusion around what terms like "sell-by," "best-by," "use-by," and "best before" dates mean.
- Provide resources to innovative food rescue programs, including offsetting the cost to harvest, pack, and transport donated food.
- Increase tax incentives for food donation and provide tax incentives for donations of transportation to 501(c)(3) nonprofit organizations or grant dollars to support transportation and distribution of recovered food.
- Increase access to donated foods for Native American communities by allowing Tribal organizations to receive donated food, along with 501(c)(3) organizations, under Internal Revenue Code Section 170(e)(3).

Insert 2

Mr. AUSTIN SCOTT of Georgia. . . .

We have moved now to the TEFAP program since Farmers to Families was canceled. And just I understand that your food bank, that you have received some of these boxes already, is that correct?

Mr. WAIDE. Yes, we received boxes through both programs. The Farmers to Families Food Box Program provided a lot of support for our community, helped

us meet the need in our community. And in the new program, we have benefited from that as well.

Mr. AUSTIN SCOTT of Georgia. And how many commodities are available through that program?

Mr. WAIDE. I don't know the specific number of commodities. We can follow up with that specific answer.

According to the United States Department of Agriculture (USDA), from May to December 2020, the Farmers to Families Food Box Program provided 132 million food boxes nationwide to people in need of food assistance. The Feeding America food bank network distributed 20–29% of the food throughout this timeframe. While the program provided critical additional food assistance during an unprecedented time, the Administration and Congress should consider a few recommendations before potentially implementing similar programs. These recommendations include:

- Provide increased accountability for the Farmers to Families Food Box Program by requiring distributors to distribute the food in an equitable manner nationwide through USDA Food Distributions Programs like The Emergency Food Assistance Program (TEFAP) to emergency hunger relief organizations.
- Provide support for emergency hunger relief organizations for distribution costs by providing storage and distribution grants directly to the organizations per truckload of food received.
- Provide a steady supply of ready-to-load commodities to food banks to help meet demand. Both growers and food banks would benefit from knowing how long additional food purchase support from USDA could last so that they can plan accordingly and understand the impact of the program. This would allow food banks to plan with other partners to source additional food as needed. The Farmers to Families Food Box Program provided food quickly but was not as efficient or effective as it could be in distributing food to people in need. We recommend a program that provides food quickly during this crisis, but that operates through existing distribution channels to ensure equitable distribution across the country, predictable deliveries, and safe food handling.

Insert 3

Mr. ALLEN. . . .

. . . And for our witnesses today, seeing Title IV alone will cost taxpayers more than \$1.1 trillion over the next 10 years, how do you reconcile that with your programmatic recommendations? And we will start off with you, Mr. Smittcamp, I believe, if I am reading that correct.

* * * * *

Mr. ALLEN. Sorry, I am out of time. And, Mr. Waide, if you will provide us something to that question to us in writing, I would appreciate it. Mr. Chairman, I yield back. Thank you.

Currently, 38 million people, including 12 million children, continue to face hunger in the United States, which is still higher than pre-pandemic levels. Last year, one in six people in the United States—53 million people—sought help from the charitable food sector. In Georgia, the food insecurity rate within the Atlanta Community Food Bank's 29 county service area is currently 12%. In addition, hunger continues to disproportionately impact communities of color and rural communities, which often have higher rates of food insecurity. While food banks have worked tirelessly to ensure our neighbors in need have access to emergency food assistance, we know hunger cannot be solved without continued strong partnerships between the private- and public-sectors. For example, United States Department of Agriculture (USDA) commodities like The Emergency Food Assistance Program (TEFAP) provide 39% of all the food distributed through the Feeding America food bank network. This critical program would not exist without the strong partnerships between our nation's farmers, food banks, and the USDA. Federal nutrition programs have been proven to help reduce hunger across the United States, and Congress should continue to invest in these programs. In the 2023 Farm Bill, the Feeding America food bank network is urging Congress for a modest increase in increase TEFAP baseline funding by \$250 million a year, providing \$500 million total for TEFAP food purchases before adjusting for inflation. TEFAP is currently funded at \$250 million per year, adjusted annually by the Thrifty Food Plan, with an additional \$35 million per year added by the 2018 Farm Bill. Increased funding for TEFAP will help ensure food banks can continue to meet the demand for food assistance from neighbors in need. In addition, Feeding America is planning for a nearly 40% decrease in Federal commodity food pounds in FY2023. Food banks will not be able

to make up for the decrease in food without additional increases in TEFAP and other USDA commodity programs.

Ms. KAPTUR. . . .

* * * * *

Dr. Gruner, I would like to ask you, in terms of the Senior Farmers' Market Nutrition Program, the coupon program, it is so popular. Why does it only function in maybe one Congressional district per state in this country?

And number three, how do we encourage local schools to get food from local farmers? How do we move into those school nutrition contracts? What can we do in the farm bill in that regard? So, anybody that wants to address any one of those three, I am really interested in your answers. Thank you.

* * * * *

The CHAIRMAN. If you don't mind, your time has expired. But that was a very important question, and we would appreciate it if each of you could respond to Ms. Kaptur in writing.

Thank you for your questions, Representative Kaptur. We typically see the greatest utilization of the Senior Farmers' Market Nutrition Program (SFMNP) in places and regions where seniors have greater access to farmers' markets and limited transportation barriers. Due to the limited funding of the program, we believe that some states are strategic in channeling their funding to areas where they will have the highest utilization of the program with the lowest human capacity for implementation. Ultimately this results in the program operating only in one or two Congressional districts per state. Our experience with the SFMNP has led us to recognize that innovative transportation solutions and additional technical assistance are needed to increase access to the program, especially in geographically hard-to-reach communities, including rural and Tribal areas. Additional resources to meet the needs of these communities in the form of administrative funds would help to ensure that more seniors and growers can participate in this program and further shore up our regional food system. Even a small amount of increased investment can greatly increase reach, program utilization, and ultimately consumption of nutritionally-dense food among our senior population. For example, in Colorado, the addition of a nominal \$5 per share empowered a CSA program to deliver weekly produce directly to isolated households. Increasing the administrative cost cap from 10% to 15% would allow states more flexibility and innovation to reach underserved communities and further advance equity in the program.

In terms of encouraging schools to get food from local farmers, there are a couple of pieces of legislation that will help to move more local food into our school system that will hopefully be adopted through Child Nutrition Reauthorization (CNR). This includes:

- The Kids Eat Local Act (H.R. 3220, S. 1817), which will bring more local food into school meal and child nutrition programs by making it easier for schools to source local food through procurement processes, providing more market opportunities for farmers, ranchers and fishermen.
- the Farm to School Act (H.R. 1768, S. 1328), which will increase annual funding for the highly demanded Farm to School Program from \$5 million to \$15 million and increase the grant award maximum to \$250,000, which will help support more grantees and grantees from large school districts and state agencies in launching and establishing long-term, sustainable programs.
- The Scratch Cooked Meals for Students Act (H.R. 6608), which will provide funding for culinary training, kitchen equipment, infrastructure, and technical assistance for schools and districts. Greater access to equipment and training will ultimately help to expand the types of products schools are able to procure and cook for students, including more whole and minimally processed products.
- The School Food Modernization Act (H.R. 4379 and S. 876), which will help provide grant assistance and seed funding for schools to upgrade kitchen infrastructure and high-quality equipment, which will expand the type of foods that schools are able to source and menu.

These policy efforts through CNR will help to build the capacity of schools to procure more local food. We also recognize a need to build the capacity of local farmers, ranchers, and fishermen to help navigate the unique school marketplace. Building off of experiences and lessons learned from USDA's recently launched Local Foods for Schools (LFS) Cooperative Agreement Program, we have identified a need to help farmers build capacity to navigate school procurement systems and a need to improve access to equipment and technology to help producers source product to their local school districts. This could include increased and improved accessibility of funds farmers, ranchers, and fishermen could specifically apply for to:

- increase food safety training and certification, such as the Food Safety Certification for Specialty Crop Program;
- improve on-farm cold food storage and transportation, including Coolbots and refrigerated trucks and vans; and
- gain greater access to packing and processing equipment, and third-party processors to better meet the unique serving size and product needs of schools.

Continued investment in equipment, infrastructure and technical support will help increase the capacity of local farmers which will ultimately make it easier for schools to source food from local producers. Improving access and creating low-burden application processes of existing funding will help to ensure a greater number of producers have access to programs, especially historically underserved producers. In summary, to evade duplication of efforts, we recommend that farm bill efforts emphasize building farmer capacity and CNR efforts continue to support building the capacity of schools.

Insert 2

Ms. KUSTER. . . .

Dr. Gruner, we have heard the program is drastically oversubscribed nationally. Can you tell us roughly how many more seniors you could be serving with more funding in the program?

Dr. GRUNER. Representative, I realize your time has expired. I am happy to follow up in written comments if that would be helpful.

Thank you for your question, Representative Kuster. It is not our experience that the Senior Farmers' Market Nutrition Program is oversubscribed. For context, in Arizona, we have nearly 250,000 seniors who are eligible for the SFMNP and our current funding allocation can serve roughly 2,600 individuals, meaning we only have enough funding to meet about 1% of the need.

We recognize that there could be improvements made to the funding allocation to ensure that there is an equitable distribution of funds based on current poverty rates across states. For example, in FY 2021, Texas received less than 0.50% of the current SFMNP allocation despite being home to 10% of the nation's adults over the age of 65 living in poverty. In June of this year, the USDA released a framework for shoring up the food supply chain and transforming the food system to be more fair, competitive, and resilient. This included an additional \$50 million allocated for the SFMNP. We have submitted a letter to Undersecretary Vilsack advocating that this funding be used to help resolve the significant inequity in the current allocation of funds to be more in line with state poverty rates. We suggest that in order to have a distribution of funds that more accurately reflects need, the additional \$50 million be used to ensure that all states receive an allocation that (at a minimum) reflects a standard equation based on poverty rates, without penalizing states that are meeting and exceeding their current caseloads. While this one-time funding is a welcomed investment that will ultimately help to serve more seniors and improve equity in the program, what is ultimately needed long-term is an increase in the base funding for the program through farm bill to create a more sustainable solution. Reexamining the current appropriation of funds in the absence of increased base funding will continue to perpetuate the disparities in the funding allocation and would fail to address the true need of serving more seniors and optimize the full capacity and potential for this program.

In terms of how many more seniors we could we could serve in Arizona, approximately 23,000 seniors participate in the Commodity Supplemental Food Program (CSFP), making them eligible for the SFMNP (in Arizona, our SFMNP is tied to CSFP participation). We are currently serving 2,600 seniors and with additional funding we would have the capacity to serve all seniors participating in CSFP.

SUBMITTED QUESTIONS

Response from Kyle Waide, President and Chief Executive Officer, Atlanta Community Food Bank

Question Submitted by Hon. Salud O. Carbajal, a Representative in Congress from California

Question. As a supporter of additional funding for TEFAP, I know how vital the program continues to be to ensure food banks can continue to meet the increased demand for food. During the pandemic, I heard from food banks in my district about the flexibilities that allowed them to improve program operations. Allowing things as simple as a streamlined signature process was critical as food banks had to shift to scale up and quickly modify their programs. I'm also glad to see California raise the income threshold so that families facing higher costs of living can access the program.

Mr. Waide, can you describe ideas to strengthen TEFAP in the 2023 Farm Bill by building on program improvements while maintaining the critical civil rights protections in Federal nutrition programs?

Answer. The Emergency Food Assistance Program (TEFAP) and United States Department of Agriculture (USDA) foods are the backbones of the Feeding America food bank food supply, providing 39 percent of the food we distribute to people in need of emergency food assistance. The Atlanta Community Food Bank distributed approximately 40 million pounds of food commodities provided through TEFAP and other special USDA programs in our FY 2021. In addition, TEFAP and USDA foods continue to be a critical source of nutrition for unserved and rural communities. Last year, Feeding America distributed 1.2 billion pounds of food in rural communities, and 465 million pounds distributed in rural counties were through USDA commodities like TEFAP. As our nation's food banks continue to experience an increase in demand for food assistance and a decline in retail donations, food banks will need additional support to help meet the demand. Unfortunately, Feeding America is planning for a nearly 40% decrease in Federal commodity food pounds in FY 2023, which cannot be made up without additional investments in TEFAP. In the 2023 Farm Bill, Congress should increase TEFAP baseline funding by \$250 million a year, providing \$500 million total for TEFAP food purchases before adjusting for inflation. TEFAP is currently funded at \$250 million per year, adjusted annually by the Thrifty Food Plan, with an additional \$35 million per year added by the 2018 Farm Bill. Congress must also authorize \$200 million per year for TEFAP Storage and Distribution funds and \$15 million per year for TEFAP Infrastructure Grants. This funding will help ensure that TEFAP food levels remain steady throughout the food assistance network, continue to help households facing hunger, and support the U.S. agricultural economy. In addition, programmatic improvements can be made to increase access to the program. TEFAP state agencies should work with distributors of TEFAP foods, like food banks, to use policy options that optimize distribution. The USDA should strongly encourage states to reduce program administrative barriers and reduce barriers to eligibility. Federal law specifies four key requirements for TEFAP eligibility: Local organizations must collect an individual's name, income eligibility, address, and the number of people in their household. However, numerous states require additional paperwork that reduces individual dignity and creates burdensome processes for food banks and state agencies.

Response from Gary J. Besaw, Director, Menominee Tribal Department of Agriculture and Menominee Tribal Food Systems and Food Distribution Program

Questions Submitted by Hon. Tom O'Halleran, a Representative in Congress from Arizona

Question 1. Mr. Besaw, how do you expect the 638 Self-Determination Demonstration Project for FDPPIR—or the 638 contracts—to impact local farmers and ranchers and the broader food systems in and around participating Tribes?

Answer. This is a new market opportunity for local farmers and ranchers that can increase farm income and open doors to other institutional markets for our producers. That helps producers grow their businesses and scale up, which in turn creates new job opportunities. Those new jobs are not only on farm, but also in the surrounding food system: when producers scale up and add value-added opportunities to their operations, this creates a need for processing facilities, packing, transportation and shipping for those value-added products. This also keeps food dollars circulating within our communities, stabilizing economies. That doesn't just benefit Tribal citizens, but everyone in and around the Tribe.

Importantly—this is also a market opportunity that continues even during emergencies. When the coronavirus pandemic started in spring 2020, almost overnight local farmers and ranchers across the country lost market access as restaurants, schools, and even farmers['] markets closed. But our food assistance programs like FDPIR continued because they had to provide food during that crisis.

Question 2. Mr. Besaw, of the eight Tribes participating in the Self-Determination Demonstration Projects, Menominee is unique in that it has joined together with Oneida Nation to establish a joint 638 Demonstration Project. Can you elaborate on why it was important to Menominee collaborate on this project?

Answer. There were several reasons. Some of the bigger goals of the joint 638 Demonstration Project collaboration were to (1). Model a cooperative agreement process between two Tribal sovereigns in order to demonstrate and educate the USDA/FNS on our unique needs and joint processes, (2). Model to other regional Tribal sovereigns that Tribal sovereigns can create culturally and legally informed agreements and set the stage for future agriculturally related agreements, (3). By joining together, we could increase the volume of produce and proteins needed to order from each vendor, thus increasing the positive impact to indigenous producers and economically justifying their respective involvement as suppliers. (4). Since our reservations are approximately 40 miles apart, by shortening the delivery radius and coordinating deliveries, we could decrease the transportation and storage needs, thus reducing the carbon footprint, a goal of the USDA as well.

Question 3. Mr. Besaw, I understand the Self-Determination Projects currently last up to 3 years. Does the time-limited nature of the Self-Determination Projects impact your ability to secure contracts with more Native farmers?

Answer. Yes, absolutely. Timing has certainly been an issue. Farmers and ranchers are excited about working with us but they need to know about contract availability much earlier in the year to be able to plan and commit to that. Also, many of the producers we are working with are small- or midsize farmers and ranchers who may be able to scale up their operations because of the market opportunity they have with these contracts, but that requires additional capital investment, which is challenging for them to receive without a guarantee of stable contracts. We can provide that stability for our farmers and ranchers when we can offer a longer termed, more permanent contract for producers to plan out and finance infrastructure improvements needed. The longer termed contracts can also serve to provide the justification for start-up farmers and producers to develop feasibility models and more realistic business plans needed to obtain financing for infrastructure and capital needed to get started in the Tribal agricultural economy.

As long as this is a limited pilot project that relies on discretionary appropriations, USDA will be unable to extend the kind of long-term contracts we need to see the most benefit to our producers, people, and food systems from this authority. The next farm bill offers an opportunity for Congress to make this authority permanent, which would remove that time-limited barrier. That type of change would benefit Tribal and non-Tribal producers and ranchers across untold communities by creating regional food systems, while also reducing carbon emissions by reducing travel and storage needs.

Question 4. Mr. Besaw, in your testimony, you mention the administrative hurdles you ran into last year when Wisconsin suffered unusual weather and experienced three hard frosts, damaging many of the apples in your region. How would self-governance authority help you handle unforeseen issues like this?

Answer. Expanded self-governance authority for this program would help us be as flexible as possible in sourcing food for our people and supporting our producers. When those kinds of weather events happen and we have limited apples to source, we would have the immediate ability to shift and purchase different products for the program, or immediately pivot to other available orchards or fruit providers.

Broader self-governance authority for all USDA programs would be even more helpful in situations like this, because Tribes would have the ability to offer more immediate disaster relief to our producers.

The current demonstration project is limited in scope and only allows Tribes or Tribal organizations to enter into short-term contracts to replace USDA food with locally grown, traditional foods. By expanding into self-governance, Tribes would have greater authority and flexibility to revise what foods are being provided in the program and adapt to the unpredictability of food production. If we had Self-Governance authority, we would be able to handle unforeseen issues like this without having to obtain Federal approval and all the administrative work that goes along with it.

**A 2022 REVIEW OF THE FARM BILL
(DAIRY PROVISIONS)**

WEDNESDAY, JUNE 22, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:00 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, Costa, McGovern, Adams, Brown, Kuster, O'Halleran, Carbajal, Khanna, Craig, Harder, Axne, Schrier, Bishop, Davids, Thompson, LaMalfa, Allen, Johnson, Baird, Balderson, Cloud, Mann, Feenstra, Moore, Cammack, and Fischbach.

Staff present: Lyron Blum-Evitts, Daniel Feingold, Emily Pliscott, Kelcy Schaunaman, Ashley Smith, Patricia Straughn, Trevor White, Erin Wilson, John Konya, and Dana Sandman.

**STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN
CONGRESS FROM THE STATE OF GEORGIA**

The CHAIRMAN. The hearing will now come to order, and I would like to welcome everyone, and thank you each for joining us today. Today's hearing is entitled, *A 2022 Review of the Farm Bill: Dairy Provisions*. After brief opening remarks, Members will receive testimony from our witnesses, and then the hearing will be open for questions. And let me begin with my statement first.

Good morning again, and I appreciate our wonderful witnesses for joining us today. Before we discuss the topics of today's hearing, I certainly want to welcome Congresswoman Sharice Davids to our House Committee on Agriculture. Ms. Davids represents the Third District in Kansas and joins Mr. Mann as our second Member from the great State of Kansas. So we want to extend a welcome to Ms. Davids, and I understand she will be joining us in person very soon.

Today's hearing continues our review of the 2018 Farm Bill as we analyze the dairy provisions, and the impact that they have had on dairy farmers, and how appropriate it is that we hold this hearing in the month of June, as we celebrate Dairy Month. I am very pleased to welcome two panels today, a panel first of USDA witnesses, and an industry panel. These two panels provide us with a depth of expertise to evaluate the dairy provisions of the farm bill. A significant portion of today's hearing will cover the dairy

safety net for family farmers, which is an integral part of ensuring the consistent production and availability of dairy products.

And, contained within that safety net, is Dairy Margin Coverage. Very, very important, DMC. This program provides more comprehensive coverage to small- and medium-sized farms than any other program before it. The Dairy Margin Coverage is extraordinarily important to our dairy farmers. The creation of DMC was an important part of the 2018 Farm Bill, and it is vital that we understand if there are ways to further improve this valuable tool so that it is working for our farmers and the American people. That is our chore today. And I look forward to a productive conversation about programs, such as DMC, designed to give our farmers a safety net that works.

And nothing made the importance of this safety net more apparent than the COVID-19 pandemic that we saw, and we saw during the early stages of the pandemic how shocks to labor, and our supply chain—some of which still persist today—how they impacted the ability of farmers to get their products to market. However, as market balances were disrupted, we were able to provide Pandemic Market Volatility Assistance Program funds through USDA to help our dairy farmers. However, COVID also raised a question of whether the Federal Milk Marketing Order system, which governs the pricing of milk, is the best fit for today's world. And we must listen to our farmers, and we must continue a dialogue with industry and USDA, as we navigate that issue to identify the best approach to any changes as we move forward.

And even as we have seen dairy prices rebound in 2022, there are several trends that are extremely troubling to me, and to our Committee. The number of licensed U.S. dairy herds fell by more than half between 2002 and 2019, and with an accelerating rate of decline in 2018 and 2019, even as milk production continued to grow, and we are losing dairy farms every single day. And this is something that is pressing on my heart, and the heart of this Committee. Folks, we are losing at a record pace our small farmers in many areas of our agriculture industry, and this is why I am writing a bill, and some legislation, with our Committee to see if we can help to stem this loss. This loss is devastating. Many of these smaller farmers—and while we have room for all sizes in the dairy industry, the loss of the smaller farms is having an impact across our rural communities. Human loss, as well as drastic economic loss. And in that same vein, we must also pay attention to the needs of small farmers around the country.

We were intentional in selecting our witnesses for our stakeholder panel today from multiple regions across the country, because this will provide us with the diversity of views, and can provide insight into recent developments, such as in the Northeast, where organic farmers have struggled to identify alternative markets after a major plant closed, and faced debilitating transportation issues in trying to find new markets for their milk. And as I have said many times, I have tremendous admiration for our farmers, and dairy faces a unique set of challenges, which is why the farm bill dairy provisions are so vitally important to each and every one of the Members on this Committee. And I look forward to hearing from our distinguished panels today about these pro-

grams, as well as opportunities where this Committee can move to improve them.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning, and thank you to our Committee Members and witnesses for joining us today. Before we discuss the topic of today's hearing, I would like to welcome Congresswoman Sharice Davids to the House Committee on Agriculture. Ms. Davids represents the Third District in Kansas and joins Mr. Mann as our second Member from the great State of Kansas. Welcome Ms. Davids.

Today's hearing continues our review of the 2018 Farm Bill, as we analyze the dairy provisions and the impact they have had on dairy farmers. How appropriate it is that we hold this hearing in June, as we celebrate Dairy Month. I am pleased to welcome two panels today, a panel of USDA witnesses, and an industry panel. These two panels provide us with a depth of expertise to evaluate the dairy provisions of the farm bill.

A significant portion of today's hearing will cover the dairy safety net for family farmers, which is an integral part of ensuring the consistent production and availability of dairy products. Contained within that safety net is Dairy Margin Coverage (DMC), a program that provides more comprehensive coverage to small- and medium-sized farms than any program before it.

The creation of DMC was an important part of the 2018 Farm Bill, and it is vital that we understand if there are ways to further improve this tool so that it is working for farmers and the American people. I look forward to a productive conversation about programs, such as DMC, designed to give these farmers a safety net that works.

Nothing made the importance of this safety net more apparent than the COVID-19 pandemic. We saw during the early stages of the pandemic how shocks to labor and the supply chain—some of which persist today—impacted the ability of farmers to get their products to market. As market balances were disrupted, we were able to provide Pandemic Market Volatility Assistance Program funds through USDA to our farmers.

However, COVID also raised the question of whether the Federal Milk Marketing Order System, which governs the pricing of milk, is the best fit for today's world. We must listen to farmers and continue a dialogue with industry and USDA as we navigate that issue to identify the best approach to any changes moving forward.

Even as we've seen dairy prices rebound in 2022, there are several trends that are extremely troubling. The number of licensed U.S. dairy herds fell by more than half between 2002 and 2019, with an accelerating rate of decline in 2018 and 2019, even as milk production continued to grow. We are losing dairy farms every single day. Many of these are smaller farms, and while we have room for all sizes in the dairy industry, the loss of these smaller farms is having impacts across rural communities.

In that same vein, we must also pay attention to the needs of small farmers around the country. We were intentional in selecting witnesses for our stakeholder panel from multiple regions across the country. This will provide us with a diversity of views and can provide insight into recent developments, such as in the Northeast, where organic farmers have struggled to identify alternative markets after a major plant closed and faced debilitating transportation issues in trying to find new markets for their milk.

As I have said many times, I have a tremendous admiration for our farmers. And dairy faces a unique set of challenges, which is why the farm bill dairy provisions are so important. I look forward to hearing from our distinguished panels today about these programs, as well as opportunities to improve them.

With that, I'd now like to welcome the distinguished Ranking Member, the gentleman from Pennsylvania, Mr. Thompson, for any opening remarks he would like to give.

The CHAIRMAN. And with that, I would like to turn it over to my good friend, the Ranking Member from Pennsylvania, Ranking Member Thompson.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Chairman Scott, thank you so much for convening this important hearing to discuss farm bill dairy provisions. Agriculture is the number one industry in Pennsylvania, and dairy is our most valuable commodity. Our dairy producers have a huge impact on the economy in our Commonwealth, especially in the rural communities and townships that I am honored to represent. I am a descendant of many generations of dairymen and -women who produced the milk, processed the milk, and actually delivered the milk. Unfortunately, our family farm sits at the bottom of a lake today, thanks to eminent domain.

But dairy will always remain a key interest of mine—I am proud to say I have milk flowing through my veins. I am concerned with the number of farms that we have lost in my state, and—dairy farms that we have lost, and those across the country as well. From 2020 to 2021, Pennsylvania lost more than 200 dairy farms, and nearly 1,800 nationwide in that same period. In order to stem this decline, we must have strong dairy policies in place that provides a safety net to help farmers withstand the tough years, and programs that help facilitate the movement of milk from the herd to the household.

Now, I am glad that we have witnesses from the Department of Agriculture to update us on current policy and program implementation, as well as from our dairy stakeholder community to give their perspective on what is, and, quite frankly, what isn't working well. With the trends that we have seen year in, year out, in terms of number of cows, number of dairy farms, we can't keep doing what we have been doing and expect different results. The dairy policy we have in place now is the result of an alliterative process. To be frank, Congress missed the mark in the 2014 Farm Bill with regards to the dairy safety net. I will say our Committee didn't miss the mark. Unfortunately, once the dairy coverage in 2014 Farm Bill went to the larger body changes were made that did not work well, make it affordable, nor make it useful for our dairy farmers. Since then, via the omnibus spending bills, and the 2018 Farm Bill, we have made key improvements, and now our producers have access to the Dairy Margin Coverage Program, as you have made reference to, Mr. Chairman, which is proven to be an effective risk management tool for dairies.

In terms of the agriculture industry, I would argue no sector was as acutely affected by the COVID-19 pandemic as dairy producers and processors. Unlike many other commodities, that can be stored or easily re-routed from food service to retail shelves, dairy doesn't have that luxury. Unfortunately, in the early days of the pandemic, there were some tragic examples of farmers being forced to dump milk, but I credit the resiliency of the industry in limiting those occurrences. Everyone, from the producer to the processor, stepped up, and they worked overtime to find new markets or retool their production lines to keep up with the rapidly changing demands of the shuttered economy.

Now, I am proud of our dairy industry for rising to the unprecedented challenges, and continuing to provide households here at home and abroad with safe, abundant, and affordable supplies of

nutritious milk and dairy products. Unfortunately, these market disruptions had a negative impact on producers' income due to the changes made in the 2018 Farm Bill to the Class I Mover. While USDA has provided some assistance to compensate producers for those losses, the 5 million pound limitation on assistance under the Pandemic Market Volatility Assistance Program left large operations with significant uncovered losses. In the past, dairy policy was regularly one of the most contentious debates during farm bill reauthorizations. However, in the 2018 Farm Bill, the dairy industry worked together to achieve consensus, rather than having Congress fight its battles for them. Now, I want to commend the National Milk Producers Federation and the International Dairy Foods Association for their work to foster those conversations, and present a united front on critical policy debates, particularly as it relates to further modifications to the Class I Mover.

Before I close, I would be remiss if I didn't point out that dairy not only needs producers and manufacturers, it needs consumers. Dairy is a nutrition powerhouse, but we lost a generation of milk drinkers when the milk fat was taken out of our schools in 2010, not by this Committee, but by the Education and Labor Committee, and we badly need to turn that around, and make sure that our kids have access to the nutrition that they need, and milk fat, we know, is where that nutrition is centered. I will continue to push for my bipartisan Whole Milk For Healthy Kids Act of 2021 (H.R. 1861). Many Members of this Committee are cosponsors of that bill, which has strong support across the Committee, and Congress, and hope that we can make some progress there.

Thank you, Mr. Chairman, for working with me on this hearing, and I look forward to hearing from the witnesses on both panels, and I yield back.

The CHAIRMAN. And thank you, Ranking Member, for your opening statement. The chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony to ensure that there is ample time for questions. And now let me introduce our distinguished panel. And, again, as I mentioned earlier, we are going to have two panels today.

On our first panel, we have our first witness for our first panel, is Mr. Scott Marlow. Mr. Marlow is the distinguished Deputy Administrator for Farm Programs at the Farm Service Agency at the United States Department of Agriculture. Welcome, Mr. Marlow. Good to have you. And now our second witness today is Ms. Dana Coale, the Deputy Administrator for the Agricultural Marketing Service Dairy Program at the Department of Agriculture. Good to have you too.

And—so now we are going to start, and, again, I want everyone to please keep your microphones muted until you are ready to speak. And, Mr. Marlow, please begin when you are ready.

**STATEMENT OF SCOTT MARLOW, DEPUTY ADMINISTRATOR
FOR FARM PROGRAMS, FARM SERVICE AGENCY, U.S.
DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.**

Mr. MARLOW. Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee, for this opportunity to appear before you and discuss the Farm Service Agency's efforts to

support the American dairy sector. My name is Scott Marlow, and since January of this year I have had the honor of serving as the Deputy Administrator for Farm Programs at the USDA's Farm Service Agency. In this capacity, I oversee the management of FSA's disaster assistance, conservation, safety net, and price support programs, including the focus of today's hearing, our dairy programs. I come to this job after decades of work supporting farmers and ranchers as they navigate the impacts of financial crises and disasters, and work to rebuild. I have seen firsthand the importance of timely, targeted, and accessible assistance from USDA, and I am humbled to now have the opportunity to help shape and improve the very programs I have helped producers access. Since the start of the Biden-Harris Administration, USDA has been focused on helping all producers recover from the continued impacts of the bruising COVID-19 pandemic, and in particular this Administration has been dedicated to filling gaps in previous pandemic programs and keeping farmers and ranchers in business.

At FSA our staff have worked tirelessly to find flexibilities in our existing dairy programs to be more responsive to the realities of dairy farming today, and we have made key improvements to both our Dairy Margin Coverage Program and our Dairy Indemnity Payment Program to meet the needs of our producers. I will let Deputy Administrator Coale delve into the details of the AMS Pandemic Market Volatility Assistance Program, the Dairy Donation Program, the Dairy Business Innovation Initiatives, but I will reference those programs as additional clear examples of this Administration's commitment to filling gaps and helping the dairy industry recover and rebuild with resilience.

As we look ahead to the upcoming farm bill process, and opportunities to update and improve our programs, I look forward to providing technical assistance and working together to continue finding the best path forward to support American dairy producers. In the remainder of my testimony, I will provide additional details on FSA's key dairy programs, and improvements that we have made.

The Dairy Margin Coverage Program is a voluntary risk management program established in the 2018 Farm Bill that offers reasonably priced risk protection to dairy producers when the difference between the all-milk price and the average cost of feed falls below a certain level selected by the producer. In 2021 DMC payments triggered for 11 months, for a total of \$1.2 billion paid to producers who enrolled in DMC for the 2021 program year. Ahead of the 2022 DMC signup, FSA made key improvements to DMC. Specifically, FSA rolled out Supplemental DMC, allowing dairy producers to better protect their operations by enrolling supplemental production, and providing an additional \$450 million in benefits. FSA also updated the DMC and Supplemental DMC formula to better reflect the actual cost dairy farmers pay for high quality alfalfa hay. We are now calculating those payments using 100 percent premium alfalfa hay, rather than 50 percent. This change is retroactive to January 2020 and provided additional payments of \$42.8 million for 2020 and 2021.

In addition to DMC, FSA administers the Dairy Indemnity Payment Program, which has historically provided indemnities to dairy producers for contaminated milk and milk products, and in Decem-

ber of 2021, FSA updated its DIPP regulations to better address the tragic crisis of PFAS contamination. Specifically, dairy producers are now eligible to receive payments for the loss of contaminated dairy cows. While I know that our updates to DIPP will provide critical assistance to impacted dairy operations, I also want to take a moment to recognize the reality that DIPP does not capture the scope of the problem when it comes to PFAS contamination on agricultural lands.

Moreover, while New Mexico and Maine have been at the forefront of this crisis, PFAS contamination extends far beyond these states. Unfortunately, the resources FSA has at the ready are not designed to comprehensively respond to these concerns, and as we look ahead to the upcoming farm bill, USDA will continue to provide technical assistance in response to any requests from Congress, and we are eager to engage on questions that will help USDA better support the range of agricultural producers grappling with chemical contaminants, including PFAS.

I also want to highlight forthcoming disaster assistance for dairy producers. On September 30, 2021, President Biden signed into law the Extending Government Funding and Delivering Emergency Assistance Act (Pub. L. 117-43), which includes \$10 billion in assistance to agricultural producers impacted by natural disasters in 2020 and 2021. FSA has implemented the first phase of assistance for livestock and crop producers, and, thus far, using a streamlined application process, has provided \$590 million through the Emergency Livestock Relief Program, and \$3 billion through the Emergency Relief Program. My team and I are actively working on designing phase two of both programs and will also be implementing assistance to specifically address milk loss, and I look forward to sharing additional details later this summer.

As I close my testimony, I also want to take the opportunity to express my gratitude and admiration for the entire FSA workforce, who are committed to keeping our nation's dairy producers, and all farmers and ranchers, in business for generations to come. Since my first day on the job, I have seen our staff work hard to develop and implement many new pandemic relief and disaster programs authorized by Congress, while administering our conventional farm programs, and I am grateful for the opportunity to work with them. I look forward to answering your questions and working with each of you.

[The prepared statement of Mr. Marlow follows:]

PREPARED STATEMENT OF SCOTT MARLOW, DEPUTY ADMINISTRATOR FOR FARM PROGRAMS, FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Thank you, Chairman Scott, Ranking Member Thompson, and Members of the Committee, for the opportunity to appear before you and discuss the Farm Service Agency's (FSA's) administration of programs that benefit our nation's dairy farmers.

My name is Scott Marlow, and since January of this year, I have had the honor of serving as the FSA Deputy Administrator for Farm Programs at the U.S. Department of Agriculture (USDA). In this capacity, I oversee the management of FSA's disaster assistance, conservation, safety net, and price support programs, which play a critical role in our farm and ranch economy. I am grateful for the opportunity to share and discuss FSA's efforts to support the American dairy sector.

Thanks to the work of many in this room, the 2018 Farm Bill established a much stronger dairy safety net. Over the past 2 years, pandemic relief and appropriations

laws provided additional support to address new challenges and stressors facing the dairy sector. Since the start of the Biden-Harris Administration, FSA has engaged with stakeholders and worked to implement provisions to support dairy farmers hard hit by the dual crises of the pandemic and devastating natural disasters.

Specifically, over the past year, FSA staff have worked tirelessly to find flexibilities in our existing dairy programs to be more responsive to the realities of dairy farming today. We have made key improvements to both our Dairy Margin Coverage (DMC) Program and our Dairy Indemnity Payment Program (DIPP) to meet the needs of our producers. We have also collaborated with our partners at the Risk Management Agency (RMA) and the Natural Resources Conservation Service (NRCS) to ensure we are working effectively across the Farm Production and Conservation (FPAC) mission area to best serve these producers. As we look ahead to the upcoming farm bill process, we look forward to providing technical assistance and working together to continue finding the best path forward to support American dairy producers. Additionally, just last week USDA Deputy Secretary Bronaugh signed a key Memorandum of Understanding (MOU) with the Innovation Center for U.S. Dairy, to continue our collaborative work on sustainability and reducing methane emissions with this important industry. The Innovation Center for U.S. Dairy was established in 2008 through the dairy check-off program. The MOU, which extends and builds upon a 2009 agreement, will facilitate cooperation to encourage the adoption of technologies and practices that improve sustainability and assist in addressing environmental needs of U.S. dairy farmers. We feel this MOU will further position the domestic dairy industry as a leader in sustainability.

In the remainder of my testimony, I will provide additional details on FSA's key dairy programs.

Dairy Margin Coverage

The DMC Program is a voluntary risk management program established in the 2018 Farm Bill that replaced the Margin Protection Program for Dairy (MPP-Dairy). DMC offers reasonably priced protection to dairy producers when the difference between the all-milk price and the average cost of feed falls below a certain level selected by the program participants. By providing flexible coverage options, DMC was crafted to better target small- and mid-sized dairy producers.

The last couple years have proven to be incredibly volatile for dairy producers. The monthly all-milk price for 2021 ranged from \$17.10 per hundredweight to \$21.80 per hundredweight, and the dairy margins varied from \$5.03 per hundredweight to \$9.53 per hundredweight. So far in 2022, the monthly all-milk price has ranged from \$24.20 per hundredweight to \$27.10 per hundredweight, with dairy margins ranging from \$10.98 per hundredweight to \$12.29 per hundredweight.¹ This swing in dairy prices and margins caused the 2022 forecast for net cash farm income for dairy businesses to increase by 58% relative to the previous year to \$382,100 per farm business. Still, we must interpret this data with an important caveat—that these incomes are not representative of the experience of all dairy farms, especially since “farm businesses” only include farms with annual gross cash farm income (GCFI) of at least \$350,000 or operations with less than \$350,000 in annual gross cash farm income but in which farming is reported as the operator's primary occupation.

Numbers for 2021

In 2021, DMC payments were triggered for 11 months for a total of \$1.2 billion paid to producers who enrolled in DMC for the 2021 program year, with an average payment of \$60,275 per operation. At 15¢ per hundredweight at the \$9.50 level of coverage, DMC is a very cost-effective risk management tool for dairy producers.

Performance for 2022

Ahead of the 2022 DMC signup which opened in December 2021, FSA made key improvements to DMC. Specifically, the program was expanded to allow dairy producers to better protect their operations by enrolling supplemental production, as authorized by the Consolidated Appropriations Act of 2021. Supplemental DMC provides \$580 million to better help our small- and mid-sized dairy operations that have increased production over the years but were not able to enroll that additional production. Specifically, eligible dairy operations with fewer than 5 million pounds of established production history can now enroll supplemental pounds based on a formula using 2019 actual milk marketings, which are resulting in additional payments. Supplemental DMC coverage is applicable to calendar years 2021, 2022, and

¹ <https://www.fsa.usda.gov/programs-and-services/dairy-margin-coverage-program/index#accordion-col-8>.

2023, which means that participating dairy operations with supplemental production history have been able to receive retroactive supplemental payments for 2021 in addition to payments based on their established production history.

In addition to rolling out Supplemental DMC, FSA updated the DMC and Supplemental DMC feed cost formula to better reflect the actual cost dairy farmers pay for high-quality alfalfa hay. FSA now calculates payments using 100 percent premium alfalfa hay rather than 50 percent of the premium alfalfa hay price and 50 percent of the conventional alfalfa hay price. This change is retroactive to January 2020 and provided additional payments of \$42.8 million for 2020 and 2021.

After rolling out these updates, FSA heard from stakeholders about the need for additional outreach and time for producers to make an enrollment decision. In addition to hosting a widely attended webinar, FSA conducted specific outreach with FSA cooperators, Tribal governments, State Outreach Coordinators, State Beginning Farmer and Rancher Coordinators, and other USDA Outreach Coordinators. FSA also extended the original DMC deadline to enroll in DMC and Supplemental DMC from February 8, 2022, to March 25, 2022. Continued interest in DMC is reflected in the increase in both 2021 and 2022 DMC enrollment numbers.

Dairy Indemnity Payment Program (DIPP)

In addition to DMC, FSA administers the Dairy Indemnity Payment Program (DIPP), which has historically provided indemnities to dairy producers for contaminated milk and milk products. In December 2021, FSA updated its DIPP regulation to better address the crisis of perfluoroalkyl and polyfluoroalkyl substances (PFAS) contamination. Specifically, dairy producers are now eligible to receive payments for the depopulation, or losses above normal mortality, of contaminated dairy cows. Applications are already available for cow indemnification under DIPP, and the program will now be able to provide much-needed compensation to dairy producers who must depopulate or lose their cows due to chemical contamination through no fault of their own. Here at FSA, we are also working closely with USDA's NRCS to target assistance through the Environmental Quality Incentives Program and other conservation programs to help producers safely dispose of and address resource concerns created by affected cows.

While I know that our updates to DIPP will provide critical assistance to impacted dairy operations in New Mexico and Maine, I also want to take a moment to recognize the reality that DIPP does not capture the scope of the problem when it comes to PFAS contamination on agricultural lands. Moreover, while New Mexico and Maine have been at the forefront of this crisis, the tragic reality of PFAS contamination extends far beyond these states. Unfortunately, the resources FSA has at the ready are not designed to comprehensively respond to these concerns. As we look ahead to the upcoming farm bill, USDA will continue to provide technical assistance in response to any requests from Congress, and the Administration looks forward to working this year with the Congress, partners, stakeholders, and the public to identify shared priorities for the 2023 Farm Bill.

Emergency Relief for Dairy Loss

I also want to touch on forthcoming disaster assistance for dairy producers. Over the past 2 years, dairy producers across the country have been hard-hit by more frequent and intense natural disasters. On September 30, 2021, President Biden signed into law the Extending Government Funding and Delivering Emergency Assistance Act (P.L. 117-43), which includes \$10 billion for necessary expenses related to losses of crops, including milk, due to wildfires, droughts, hurricanes, winter storms, and other eligible disasters experienced during calendar years 2020 and 2021. In addition to disaster assistance provided by farm bill programs, Congress designated \$750 million of this funding to assist livestock producers for losses in 2021 due to drought or wildfires. USDA is implementing this assistance using a two-phase process for both livestock and crop disaster assistance. The first phase of the Emergency Livestock Relief Program, which provides payments related to forage losses, was announced on March 31, and \$597 million in payments have been disbursed for the Emergency Livestock Relief Program as of June 2. I look forward to sharing additional details this summer regarding assistance to address milk loss.

Risk Management Agency (RMA)

Last, while it is outside the scope of my work at the FSA, I want to highlight the great work the Risk Management Agency (RMA) is doing to proactively help dairy farmers through the Dairy Revenue Protection (DRP) and the Pasture, Rangeland, and Forage (PRF) program.

Dairy Revenue Protection (DRP)

Dairy producers have seen significant expansion of Federal crop insurance offering the last several years. Through the Dairy Revenue Protection (DRP), dairy producers can protect against unexpected declines in their quarterly revenue from milk sales relative to a guaranteed coverage level.

While this product has only been offered for a few years, it covers approximately a quarter of the milk production in the United States. Livestock Gross Margin for Dairy Cattle is also available and provides protection when feed costs rise, or milk prices drop and can be tailored to any size farm. Modifications were made last year to allow dairy producers to purchase coverage on a weekly basis.

Pasture, Rangeland, and Forage Program (PRF)

RMA also offers the Pasture, Rangeland, and Forage (PRF) program, which is designed to provide insurance coverage on pasture, rangeland, or forage acres grown for the intended use of livestock grazing or haying. The PRF program allows producers to insure specific 2 month time periods, called index intervals, that are important to their operation. In doing so, the program is designed to help protect a producer's operation from the risks of forage loss due to a lack of precipitation.

Conclusion

In closing, I would like to emphasize FSA's commitment to keeping our nation's dairy producers in business for generations to come. I want to thank you for the opportunity to testify and for the support you have provided to USDA so that we can implement strong, inclusive programs. I look forward to continuing to work with this Committee to empower our producers to address new challenges, and I am happy to take any questions from the Committee.

The CHAIRMAN. Thank you very much, I appreciate that. And now, Ms. Coale, you are recognized. Begin when you are ready.

**STATEMENT OF DANA H. COALE, DEPUTY ADMINISTRATOR,
DAIRY PROGRAM, AGRICULTURAL MARKETING SERVICE,
U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.**

Ms. COALE. Good morning, Chairman Scott, Ranking Member Thompson, and Members of the Committee. Thank you for the opportunity to appear before you today to discuss USDA's implementation of select provisions of the 2018 Farm Bill, as well as the numerous other activities undertaken by the Agricultural Marketing Service, where the primary role is to facilitate the efficient marketing of milk and dairy products for the benefit of our nation's dairy farmers through increasing transparency in the marketplace. I am Dana Coale, Deputy Administrator of AMS Dairy Programs.

As someone who has worked with the dairy industry for more than 32 years, I have witnessed the turbulent landscapes that producers have faced over several decades. Most recently we have seen prices oscillate from near record lows to now record highs, while the margins vary widely across the country. Through all of this, I have seen America's dairy farmers continue to innovate, persevere, and put top quality dairy products on tables here and around the world. At USDA, we are committed to being a strong partner for dairy farmers, providing vital market information and programs to spur the development of more and better markets for America's dairy farmers both here and abroad. While my written testimony provides more detail on the wide range of activities conducted by AMS, I would like to briefly highlight some of our current activities that help our nation's dairy farmers.

The 2018 Farm Bill directed USDA to develop a program to reduce food waste and provide nutrition assistance to low-income individuals. The Milk Donation Reimbursement Program was established in 2019. Under the program, eligible dairy organizations

may apply for, and receive, limited reimbursements to cover donations of fluid milk products. Congress authorized \$9 million for the program in Fiscal Year 2019, and \$5 million for each fiscal year thereafter. In the Consolidated Appropriations Act of 2021 (Pub. L. 116–260), Congress expanded USDA’s authority to reimburse processors for donated dairy products and provide additional resources for the new Dairy Donation Program. An interim final rule implementing this program was published on September 1, 2021. To lessen the burden on participating entities, and gain administrative efficiencies, the programs are administered jointly, while still maintaining separate funds from which payments are made, according to the separate program rules.

The 2018 Farm Bill also authorized the establishment of at least three Dairy Business Innovation Initiatives, which was expanded to four in 2021, to support dairy businesses in the development, production, marketing, and distribution of dairy products. The DBI initiatives provide technical assistance to dairy businesses and provide sub-awards to dairy businesses as well. The DBI businesses approach of providing both technical assistance and sub-awards serves as a unique and very effective model. In order to improve regional dairy supply chain resiliency, support processing capacity expansion, and increase technical assistance service to local and regional dairy businesses, USDA invested, just this week, an additional \$80 million in DBI funding from the American Rescue Plan (Pub. L. 117–2). The four DBI partners are now able to reach dairy producers and processors in nearly 40 states.

The Pandemic Market Volatility Assistance Program was authorized and funded under the CARES Act of 2021 (P.L. 116–136), and provided much needed pandemic assistance payments to dairy farmers, who received a lower value for their milk due to market abnormalities occurring during the pandemic. Under the program, payments reimbursed qualified dairy farmers for 80 percent of revenue losses for fluid milk sales from July to December of 2020 on an annual production of up to 5 million pounds. USDA distributed the funds to producers through their handlers and implemented a robust oversight system to ensure accurate payments were distributed to producers within the 30 days of a handler receiving the money. A key part of the program was a required producer educational component on the PMVAP Program, and other dairy topics.

Finally, the origin of livestock final rule was published in the *Federal Register* on April 5, 2022. This rule provides clear and uniform standards about how and when livestock may be transitioned to organic dairy production, and how transitioned animals are managed.

Thank you for the opportunity to be here today, and we look forward to working with the Committee as you draft the next farm bill. I would be happy to address any questions you have. Thank you.

[The prepared statement of Ms. Coale follows:]

PREPARED STATEMENT OF DANA H. COALE, DEPUTY ADMINISTRATOR, DAIRY PROGRAM, AGRICULTURAL MARKETING SERVICE, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to appear before you today to discuss the U.S. Department of Agriculture's (USDA) implementation of select provisions of the Agriculture Improvement Act of 2018 (2018 Farm Bill) as well as the numerous other activities undertaken by the Agricultural Marketing Service (AMS) to facilitate the efficient marketing of milk and dairy products for the benefit of our nation's dairy farmers.

I am Dana Coale, Deputy Administrator of AMS' Dairy Program, and as someone who has worked with the dairy industry for 32 years, I've witnessed the turbulent landscapes that producers have faced over the last several decades. More recently, we've seen milk prices oscillate from near-record lows to now record highs. Through all of this, I've seen America's dairy farmers continue to innovate, persevere, and continue to put top quality dairy products on tables here and around the world. At USDA, we are committed to being a strong partner for dairy farmers, providing vital market information and programs to spur the development of more and better markets for America's dairy farmers at home and abroad.

We appreciate the tools that Congress has provided to the agency through the 2018 Farm Bill and subsequent legislation. In addition to a summary of those farm bill provisions, my testimony today will discuss other key AMS dairy programs and activities.

Milk Donation Reimbursement Program and Dairy Donation Program

The 2018 Farm Bill directed USDA to develop a program to reduce food waste and provide nutrition assistance to low-income individuals. The Milk Donation Reimbursement Program was established in a Final Rule published on September 5, 2019. Under the program, eligible dairy organizations that account to a Federal Milk Marketing Order market-wide pool and incur qualified expenses related to certain fluid milk product donations may apply for and receive limited reimbursements to cover those expenses. The program is intended to reduce food waste and provide nutrition assistance to low-income individuals. Congress authorized \$9 million for the program in Fiscal Year 2019, and \$5 million per fiscal year thereafter.

In the Consolidated Appropriations Act, 2021, Congress expanded USDA's authority to reimburse processors for donated dairy products, including those in addition to fluid milk, and provided additional resources for the new Dairy Donation Program (DDP). An Interim final rule implementing this program was published on September 1, 2021. To lessen the burden on participating entities and gain administrative efficiencies, the programs are administered jointly, while still maintaining separate funds from which payments are made according to the separate program rules. The program began making reimbursement payments this spring.

Dairy Business Innovation Initiatives

The 2018 Farm Bill authorized the establishment of at least three Dairy Business Innovation (DBI) Initiatives to support dairy businesses in the development, production, marketing, and distribution of dairy products. The DBI Initiatives provide technical assistance to dairy businesses and use at least 50% of the award for subawards to dairy businesses, including makers of niche dairy products, such as specialty cheese, or producers of dairy products derived from the milk of a dairy animal, including cow, sheep, and goat milk. For example, the University of Wisconsin's Center for Dairy Research partners with the Wisconsin Cheese Makers Association to test new ingredients and conduct trials of new cheeses. The DBI Initiatives' approach of providing both technical assistance and subawards to dairy businesses serves as a unique and effective model by facilitating the development of critical relationships with local dairy producers and processors to support their on-the-ground needs. For example, the Vermont Agency of Agriculture, Food, and Markets made marketing and branding consultants available to help dairy businesses pivot their business strategies in response to the pandemic.

In Fiscal Year 2019, which was the DBI Initiative's first year with funding, AMS competitively awarded \$1.36 million to three initiatives to fulfill the purpose of the program: the University of Tennessee, the Vermont Agency of Agriculture, Food & Markets, and the University of Wisconsin. In Fiscal Year 2020, AMS awarded \$18.4 million in additional funds to the current Initiatives to continue the work started under their previous awards. On November 8, 2021, AMS announced \$18.4 million, to be evenly split among the three current initiatives and an additional \$1.8 million for a new initiative at California State University Fresno Foundation. Each of these centers serve a multi-state region, such as the northeast, to reach stakeholders across broad geographic regions.

In order to improve regional dairy supply chain resiliency, support processing capacity expansion, and increasing technical assistance services to local and regional dairy businesses, USDA announced on March 2, 2022, an additional \$80 million in funding to support long-term resilience in the dairy industry. This American Rescue Plan funding provided the four DBI partners the opportunity to submit an additional proposal to further dairy processing capacity expansion, on-farm improvements, and technical assistance to producers. On June 20, 2022, USDA awarded this \$80 million in additional funding and announced a new DBI Request for Applications for \$22.9 million in appropriated funding for Fiscal Year 2023. It's important to note that with this supplemental \$80 million in funding, the reach of the DBIs was extended from 30 to 39 states.

Extension of Dairy Forward Pricing Program

The 2018 Farm Bill extended the Dairy Forward Pricing Program until September 30, 2023. This program allows farmers to voluntarily enter into forward price contracts with handlers for pooled milk used for Class II, III, or IV products under the Federal Milk Marketing Orders. The program allows regulated handlers to pay farmers in accordance with the terms of a forward contract instead of paying the minimum Federal Order blend price for pooled milk. The final rule extending the program was published on March 1, 2019.

Class I Skim Milk Price

The 2018 Farm Bill amended the Class I skim milk price formula for milk pooled under Federal Milk Marketing Orders. Per Congress's direction, the Class I skim milk price became the simple average of the monthly advanced pricing factors for Class III and Class IV skim milk, plus \$0.74 per cwt, plus the applicable adjusted Class I differential. Prior to this amendment, the Class I skim milk price was the higher of the two advanced pricing factors, plus the applicable adjusted Class I differential. The final rule amending the formula was published on March 11, 2019.

Pandemic Market Volatility Assistance Program

The Pandemic Market Volatility Assistance Program (PMVAP) was authorized and funded under the Coronavirus Aid, Relief, and Economic Security (CARES) Act of 2021 and provided much-needed pandemic assistance payments to dairy farmers who received a lower value due to market abnormalities occurring during the pandemic. Under the PMVAP, payments reimburse qualified dairy farmers on an annual production of up to 5 million pounds of milk, for 80 percent of revenue losses for fluid milk sales from July 2020 through December 2020. The payment rate varies by region based on the actual losses on pooled milk related to price volatility.

USDA disbursed funds to handlers to provide to their eligible dairy farmer suppliers. After receiving the payments, handlers had 30 days to make payments to their eligible dairy farmer suppliers. Handlers began payments to farmers in January 2022. USDA has implemented a robust oversight system to ensure accurate and verified payments are distributed by handlers to qualifying dairy farmers within 30 days of a handler's receipt of the money.

As part of the program, handlers provided virtual or in-person education to dairy farmers on the program and other dairy topics, selecting from educational information available from USDA or other sources. Handlers were paid a limited reimbursement for administrative costs and the dairy policy education they provided.

Market News

One of AMS' most important functions is *Market News* which collects, analyzes, and disseminates current market information to assist producers and marketers of farm products and those in related industries in making critical daily decisions. *Market News* information covers local, regional, national, and international markets and includes data on supply, movement, contractual agreements, inventories, and prices for numerous agricultural commodities, both conventionally and organically produced. Reported commodities include cotton, cottonseed, and tobacco; dairy products; fruits, vegetables, and ornamentals; and livestock, meat, grains, poultry, and eggs. There are over 470 unique market reports disseminated from over 45 *Market News* offices across the country.

Market News continues to expand its organic market price reporting services, increasing the products and markets covered by boosting outreach to reporters and industry contacts in the organic sector. *Market News* has added new organic products and expanded overall organic coverage at each of the market levels reported—shipping point, wholesale/terminal markets, and retail. The AMS *Market News* organic webpage focuses on market reports detailing over 300 different grains, feedstuffs, eggs, specialty crops, and dairy products. The AMS Weekly Retail Organic Price Comparison report shows price differences between organic and conven-

tional products to assist stakeholders in analyzing commodity sales and consumers' willingness to pay for organic products.

Federal Milk Marketing Orders

Federal Milk Marketing Orders (FMMOs) establish certain provisions under which dairy processors purchase fresh milk from dairy farmers supplying a marketing area. In Federal Order provisions, dairy processors are referred to as handlers and dairy farmers are known as producers. A marketing area is generally defined as a geographic area where handlers compete for packaged fluid milk sales, although other factors may be taken into account when determining the boundaries of a marketing area. Federal Orders serve to maintain stable marketing relationships for all handlers and producers supplying marketing areas. Federal Milk Marketing Orders were established in the 1930s by Congress and have been continually modified, at industry request (most recently in 2019), to evolve into the system we have today. The program carries out its objectives by establishing minimum milk prices participating handlers must pay to producers, ensuring timely and accurate payments to producers, and providing robust market information. The provisions work together to facilitate the complex process of marketing fresh milk.

Research and Promotion Programs

Since 1966, Congress has authorized industry-funded research and promotion boards, also known as check-offs, to provide a framework for agricultural industries to pool their resources and combine efforts to develop new markets, strengthen existing markets and conduct important research and promotion activities. AMS oversees 22 research and promotion programs, which generate more than \$900 million in assessments annually. The strategic direction for activities conducted by research and promotion programs is determined by a board of directors appointed by the Secretary of Agriculture. AMS ensures that those boards properly account for all program funds and administer the programs in accordance with their authorizing statutes and Orders. Boards are required to post their bylaws; annual budget summaries; annual reports containing information about board activities, projects, and administrative expenses; annual Certified Public Accountant financial audit report; and most recent independent economic evaluation to their website.

AMS oversees two research and promotion dairy programs. The Dairy Research and Promotion Program is a national producer and importer program for dairy product promotion, research, and nutrition education. It is the largest of all commodity check off programs generating \$346.7 million annually. To fund the program, U.S. dairy farmers pay a 15¢ per hundredweight assessment on their milk and importers pay 7.5¢ per hundredweight on dairy products imported into the U.S.

The Fluid Milk Processor Promotion Program develops and finances a generic advertising program designed to maintain and expand markets and uses for fluid milk products produced in the U.S. Processors marketing more than 3 million pounds of fluid milk per month pay a 20¢ per-hundredweight assessment on fluid milk processed and marketed in consumer type packages in the U.S. This program generates \$85.7 million annually. The Dairy and Fluid Milk boards fund a variety of programs and activities including consumer marketing and education, product innovation and partnerships, nutrition research, exports, and childhood health and wellness, and climate change solutions.

The provisions contained in the authorizing statutes, the Dairy Production Stabilization Act of 1983 and the Fluid Milk Promotion Act of 1990, may be amended by Congress. The National Dairy Promotion and Research Board and the Fluid Milk Processor Promotion Board may recommend to the Secretary of Agriculture amendments to the Dairy Production and Research Order and the Fluid Milk Order. Amendments to the programs are conducted through the rulemaking process in the Federal Register.

Origin of Livestock

The Origin of Livestock final rule was published in the *Federal Register* on April 5, 2022. This rule provides clear and uniform standards about how and when livestock may be transitioned to organic dairy production, and how transitioned animals are managed within the organic dairy system. Now, all organic dairy livestock producers will have the confidence and certainty they are operating in a fair and competitive market.

Some organic certifiers and dairies had not been consistently implementing these requirements. Therefore, the organic industry sought further rulemaking to eliminate the inconsistencies and what they viewed as some producers avoiding the significant costs and time investments required under statute.

AMS-accredited certifiers visit every certified organic dairy yearly. AMS is working with them to ensure the inspectors understand and apply the new regulation

consistently, to ensure all organic dairies are held to the same standard. In addition to the inspections by certifiers, the ongoing organic livestock compliance project targets Federal surveillance and unannounced inspections based on risk factors that include operation size, complexity, and compliance history to better enforce uniform compliance with the organic standards.

Conclusion

Thank you for the opportunity to be here today and we look forward to working with the Committee as you work to draft the 2023 Farm Bill. I would be happy to address any questions you may have.

The CHAIRMAN. Thank you and thank you to the both of you. At this time Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members, and you will be recognized for 5 minutes each in order to allow us to get in as much time, and as many questions, as possible. And as always, please keep your microphones muted until you are recognized so that we can minimize noise. I recognize now myself for my 5 minutes of questions.

Let me start with you, Mr. Marlow. I have been hearing a lot about Dairy Margin Coverage from our producers. Tell us, how has Dairy Margin Coverage enrollment changed since it replaced the Margin Production Program after the 2018 Farm Bill? Tell us, what type of feedback has the Department received from dairy farmers since DMC was first implemented?

Mr. MARLOW. Thank you very much, Chairman Scott. The Margin Protection Program, which you recognized, was a transition in dairy programs to a risk management-based—essentially a risk management-based program. DMC then expanded on that program. What we have seen as we have moved into DMC, and we have made a series of improvements to the program, DMC, in the transition from MPP Dairy, lowered the cost of the protection, increased the level of protection that producers could get, and a series of other improvements.

Since the start of the Administration, we have made a series of improvements again to DMC. These include changing the calculation of the cost of feed to include 100 percent high quality alfalfa hay instead of just 50 percent so that it more accurately represents the cost that producers are facing. Also, with Congress' authority, we created Supplemental DMC, which allowed producers who had increased production from the time that they set their production history back in 2011, 2012, 2013, who had increased their production, to increase their coverage under DMC. And that—the introduction of Supplemental DMC, it put an extra \$580 million into the program.

The CHAIRMAN. And so where do you see, or what do you see, we could do in this farm bill to improve this program?

Mr. MARLOW. The changes that we have made so far are very much in response to the input that we have gotten from farmers. Supplemental DMC was an important step. Both DMC and Supplemental DMC are equivalent, so it would be very easy to combine the two, or to make that a permanent change.

The CHAIRMAN. So, you are saying sort of steady as we go, we are okay right now, you don't see us making any changes?

Mr. MARLOW. Well, we are happy to provide technical assistance, and look at any suggested reforms, but we made extensive changes and improvements to the program over the last couple of years,

and believe that it is, in concert with the Risk Management Agency programs, a strong safety net.

The CHAIRMAN. Okay. That is fine. Deputy Administrator Coale, when discussing any potential changes to our Federal Milk Marketing Orders, what are your thoughts regarding the procedure for implementation?

Ms. COALE. Thank you for the question, Chairman Scott. I believe that the process that we utilize to make amendments within the Federal Milk Marketing Order system is one that provides for clear transparency, and, most importantly, it stimulates and encourages industry participation. USDA must respond to the industry, rather than USDA leading, so it is an opportunity for the industry to present issues before the Department, and then we can work with them to determine if we need to go through rulemaking proceeding, but it is a very collaborative process.

The CHAIRMAN. Well, we on the Committee, we have seen—shall I say a reluctance to initiate this process within the industry. Is that your impression?

Ms. COALE. That is not my—

The CHAIRMAN. Within USDA.

Ms. COALE. Within USDA, that is not my impression. We spend a considerable amount of time, and I personally have traveled throughout the United States, talking with dairy producers, with cooperatives, with processors, regarding what kind of changes might be made to the Federal Order system.

The CHAIRMAN. And let me ask you also, what have you heard from industry on changes to structure, and do we in Congress need to act?

Ms. COALE. With regard to structure, I am not exactly certain what you are referring to with that. Is it the structure of the Federal Order system, or is it the structure within the industry?

The CHAIRMAN. Well, what we are trying to find out is—I will say within the industry.

Ms. COALE. Okay. I think that the Federal Order system is a program that is designed to work in the current structure, as well as in any future structure of the industry. The Order system adapts and changes on a regular basis to reflect what is happening within the industry itself, and that is based on proposals that the industry brings forward to the Department.

The CHAIRMAN. Okay. Thank you very much. Ranking Member, I now recognize you for your questions.

Mr. THOMPSON. All right. Well, thank you to both our witnesses from the USDA for your service and leadership. Ms. Coale, I appreciate the Department's work implementing the Dairy Donation Program we created to provide needed dairy products for families in need, while also minimizing food waste. This is a great win-win, in my opinion. As you have implemented the program, can you talk about the successes you have seen so far, as well as any areas for improvement that we could help to refine in order to make sure the program is used to the fullest potential?

Ms. COALE. Thank you, Ranking Member Thompson. I would agree with you, the Dairy Donation Program is a fantastic program, and it was really designed to take a situation where dairy farmers were dumping milk and put that into consumers who real-

ly needed to have that nutritional product, so the premise on which the program has been established is wonderful.

At this particular time, we are in the infancy, as far as implementing the Dairy Donation Program. As you know, we implemented the Milk Donation Reimbursement Program as part of the last farm bill. That program did not receive enough publicity, and enough participation, I think partially because of the reimbursement level, and that has been corrected through the Dairy Donation Program, where reimbursements are more reflective of what the costs are being incurred for those donations. So, I think at this particular time we need to see how the program further develops. Any assistance in encouraging processors and feeding networks to participate in the program is always welcome, and we are working on increasing the awareness of the program.

Mr. THOMPSON. Well, thank you. And we are certainly open to, as implementation proceeds, any suggested refinements as we prepare for the next farm bill. Mr. Marlow, I was glad USDA incorporated the dairy quality alfalfa price point, you mentioned that, into the Dairy Margin Coverage formula. We included language in the 2018 Farm Bill directing NASS to include that price point in their monthly surveys, enabling you all to make this change, and I am pleased with this improvement, as it makes our dairy safety net more reflective of actual farmer feed costs. Can you talk about how this change has impacted producer payments under the program?

Mr. MARLOW. Prior to that change, the feed costs were calculated based on 50 percent high value alfalfa. The change made a significant increase in payments. There are two factors to this. One is that we made it retroactive to 2020, so that farmers were able to receive payments for both 2020 and 2021. Also, this is a permanent change to the program. Having this change in the program will affect the baseline, and our conversations as we go into the new farm bill. So it has provided a series of benefits.

Mr. THOMPSON. Well, I am so thankful that, when we set the Dairy Margin Coverage, we based it on margin. I think it was *Southern Ag* that had a blog on Monday this week that talked about hundredweight prices topping \$27 per hundredweight. I didn't think we were going to see that. Unfortunately, agriculture is a business, right? And at the end of the day, it is the margin that matters, so I am, again, very thankful that we based our safety net for dairy on margin. That is probably something we need to look at for other commodities.

So, Mr. Marlow, the escalating cost of inputs that is making that high commodity price is not really beneficial, do we have a mechanism, or additional mechanisms to consider any of those input costs for further adjustment within the Dairy Margin Coverage?

Mr. MARLOW. We are very concerned about the margins, and, as you just said, I think it is very important that the DMC focused on the margin, and not just the price in the marketplace. We know that producers are facing inflation on costs far beyond just the feed costs that are part of the calculation. This is part of a much broader strategy on inflation that the Administration is taking on, which includes looking at a series of issues, including labor, and also freeing up trade, freeing up trade and the movement and transpor-

tation, and a series of issues that we are taking on. But at this point, and I agree with you and the Chairman, that this margin-based coverage has proven to be extremely important in terms of addressing the costs that you are talking about, and is something that we need to look at in terms of other commodities.

Mr. THOMPSON. All right. Thank you so much. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you. And now the gentleman from California, Mr. Costa, who is also the Chairman of the Subcommittee on Livestock and Foreign Agriculture, is recognized for 5 minutes.

Mr. COSTA. Thank you very much, Mr. Chairman, for this important informational hearing as we set the table for the reauthorization of next year's farm bill. Clearly, we understand that the dairy industry is such an important component of American agriculture, and it has variations on a regional basis, as we are already discussing. As a third-generation dairy—son of three generations of dairy family in Fresno, California—from the time I was a young man until I was in my early 20s I worked on our family's dairy—I understand the trials and the challenges that we face, a business that is 365 days a year in which the cows must be milked, the volatility that we have seen not only in recent years, but it is part of the history of dairy in America. So this hearing is near and dear to my heart, as California is the leading dairy state in the nation. We are producing 20 percent of the milk products for the entire country, a total milk production of over 41 billion pounds last year.

My district is one of the top ranking dairy producing districts in the nation, so as we talk about how we make changes, and how we adjust, in light of the pandemic and other factors, I think it is very important, for the 2023 reauthorization bill, that we examine the safety net provisions, whether we are talking about the Dairy Margin Coverage Program, or other issues in terms of the Dairy Forward Pricing Program that involve risk management. Clearly we are fortunate to have a situation where organizations that work closely with Members of the Committee, and I think there is a consensus—a bipartisan consensus here, whether we are talking about National Milk Producers Federation, International Dairy Foods Association, Dairy Farmers of America, or California Dairy, Inc., that I work very closely with.

What we have seen is extreme volatility during this pandemic, with price per hundredweight dropping down below \$10 per hundredweight, now we see it at \$27 per hundredweight. That volatility, and those input costs, I think demonstrates the risky nature of this business. And so I want to—and commend the USDA for their efforts, going back to 2020, making it retroactive, and including the alfalfa pricing, as a number of Members have mentioned, I think was the appropriate thing to do, because these are part of the input costs. But I think the \$5 million cap, frankly—and, again, one size doesn't fit all, but it is really discriminatory to California, where our 1,200+ dairy producers exceed that amount, and so that is something that I would like to bring to the Committee's attention.

My first question is to Ms. Coale. As you are aware, the State of California conducted statewide processing under the old system before we joined the Federal Milk Marketing Order to ensure that

we understood the data, as a vital resource, would be included in cost allowance. Can't we do better on the Federal Marketing System to update that data collection services, and what would you need to ensure that to occur?

Ms. COALE. Thank you, Congressman Costa. You are correct in that the California Department of Food and Ag had a robust manufacturing cost survey that they conducted when there was a California State Order. When California became part of the Federal Order System, that manufacturing cost survey was no longer continued by CDFA. Currently at USDA, we do not have the authority to conduct a mandatory manufacturing cost survey so that—

Mr. COSTA. Could that be something we consider under the reauthorization of the new farm bill?

Ms. COALE. That would certainly be something that would need to be authorized under the upcoming farm bill.

Mr. COSTA. And what level of funding would you need to do that?

Ms. COALE. That is a great question.

Mr. COSTA. Get back to us, because I want to pursue that.

Ms. COALE. Okay. We can get back to you with the information on how much we will need for that funding. Thank you.

Mr. COSTA. And when we talk about—and maybe both of you might want to respond, I have limited time here, but the Federal Milk Marketing Order for Class II, III, and IV purposes, reauthorized in the 2018 Farm Bill, is set to expire. You think—it is a very valuable risk management tool. Do you think we ought to permanently include that? You can say yes or no because of limited time.

Ms. COALE. Yes.

Mr. COSTA. Okay. My time has expired. Thank you very much, Mr. Chairman.

The CHAIRMAN. The gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. Thank you, Mr. Chairman. I appreciate this discussion today, and the key element that dairy is for my home state, and district, and following up with Mr. Costa on that, we do see California as a major, major producer, and the challenges they have faced from state regulations and market conditions—let me launch right into a couple thoughts here for Deputy Administrator Coale. On Dairy Forward Pricing Program, as far as how producers take this, what do you think the great benefit will be from permanent authorization of the program?

Ms. COALE. I think if that—forwarding contracting on Class II, Class III, and Class IV were made permanent, the industry would have a good understanding and appreciation to use the program more robustly than they currently do, because there is always the concern that, at the end of a farm bill, it may not be reauthorized in the next one.

Mr. LAMALFA. Farm bills aren't easy to pass around here. It is tougher every 5 years, it seems, to get it done, with a lot of misinformation put out about them and such, but on the farmer's side of it, which represents about 20 percent of the spending is more critical than ever that we have it, no real downside on permanency that you would see, as far as having to change it with further legislation? Would it be pretty linear over time?

Ms. COALE. Absolutely, as long as it continued for Class II, Class III, and Class IV.

Mr. LAMALFA. Okay, thank you. And, Administrator Marlow, the Emergency Livestock Relief Program related to forage losses for the last couple years, of course, bringing it back home to my home state, and the western states, where we have had such drought problems and lack of availability of forage, of feed, at good pricing, and it is going to be that way in 2022 with that crop as well, what further work can we do to streamline an emergency program like this to make sure that the producers are getting relief as soon as possible, since they are not as likely to be able to float this cash-wise with other increased expenses, *et cetera*?

Mr. MARLOW. That time lag, in terms of the time between disaster and payment, is something that we are very focused on, and administering this program would leverage the applications that farmers had already filled out to streamline that application process and build on information that we already have.

Mr. LAMALFA. So you don't have to reinvent the wheel with a new application? Just change the dates, pretty much, and it will be much quicker?

Mr. MARLOW. We were able to use the information from farmers' Livestock Forage Program applications to essentially be the application for this program. We have now disbursed \$590 million into farmers' pockets without them ever having to fill out an application, or go into their local offices.

Mr. LAMALFA. But there is still accountability the taxpayers would demand and expect, right?

Mr. MARLOW. Absolutely.

Mr. LAMALFA. Yes. Okay. So, as we have seen, that Congress did pass the funding in September of 2021, but the program didn't come into place until end of March in 2022, so you don't see further delays like that coming forward, like—happening for what is in the pipeline, or maybe possible 2022 claims next year?

Mr. MARLOW. Well—

Mr. LAMALFA. A 6 month gap?

Mr. MARLOW. What I would encourage us to look at is not just the time until the program is announced, but the time to actual cash in farmers' pockets. On ELRP alone, we had money going into farmers' pockets within just a couple of weeks of the program being announced.

Mr. LAMALFA. Beautiful.

Mr. MARLOW. We are now on Emergency Relief Program-Phase One. That program was announced approximately a month ago. We now have over \$3 billion that has been disbursed. Those checks are out, and in farmers' pockets. We are now in the process of looking for Phase Two. What we are charged with on phase two is filling in the gaps and addressing those who have not received those benefits. We are moving forward as quickly as we can to finish out the disaster programs.

Mr. LAMALFA. Okay. Good, good. I appreciate—that is a good report. Thank you for that. So, Mr. Chairman, I will yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from Ohio, Ms. Brown, is recognized for 5 minutes.

Ms. BROWN. Thank you, Chairman Scott, and Ranking Member Thompson, for holding this hearing today, and thank you to both of our panels for being here today. Dairy products of all kinds are an important component of USDA's food distribution programs. Programs such as The Emergency Food Assistance Program, the Commodity Supplemental Food Program, and the Food Distribution Program on Indian reservations are unique in that they utilize only U.S. grown and produced products. These programs are critical to our nation's farmers, farm economy, and food security. CFAP bonus commodity purchases are particularly unique, as they are driven by the need for agriculture commodity support when the market price of commodities falls, and those purchases are made by Agricultural Marketing Service and Farm Service Agency.

So my question is, Deputy Administrator Marlow and Deputy Administrator Coale, can you speak about how our USDA food distribution programs, including CFAP bonus purchases, serve these important dual purposes of supporting food-insecure families, as well as our nation's farmers, in particular dairy farmers? Thank you.

Ms. COALE. Thank you for the question, Congresswoman Brown. The food programs that we have at USDA are vital to both the agricultural producers who grow the food that is purchased through the Commodity Procurement Program at the Agricultural Marketing Service, and then distributed through the various programs offered and developed through the Food and Nutrition Service. This is not our particular area of expertise, and I would encourage you to contact us to give you the individuals at the Food and Nutrition Service who would be happy to go into detail on the specific programs that you are asking about. But anytime that USDA can deliver food to individuals who need nutrition assistance, it is a benefit to everyone in the agricultural sector, so thank you so much for that question.

Ms. BROWN. Thank you. Along similar lines, can you speak to how the Supplemental Nutrition Assistance Program supports dairy farmers by ensuring that low-income Americans can afford to purchase their products?

Ms. COALE. Once again, this would be a question that I would defer to my colleagues in the Food and Nutrition Service, and what I can say is that we are actively, and have recently, increased the amount of fluid milk that is available through feeding networks, which is something that USDA implemented recently. We also are working on developing, through various programs, the opportunities for food banks to have refrigeration systems so that the nutritious dairy products are available to them as well. Again, specifics could be answered best by our colleagues at the Food and Nutrition Service regarding the specific SNAP program.

I might indicate as well that the Dairy Donation Program, which is administered within the Agricultural Marketing Service, is one program that is truly designed to connect the consumer with products that are donated, and it is to provide a direct benefit to the dairy farmer in that milk that might have been dumped on the farm can be manufactured and put into the feeding networks for those low-income individuals to have the nutritious product.

Ms. BROWN. All right, excellent. Well, thank you for sharing that information, I appreciate it. And with that, Mr. Chairman, I yield back.

The CHAIRMAN. The gentleman from Indiana, Mr. Baird, is recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman, Ranking Member, for holding this session. Mr. Marlow, my question deals with the 2022 DMC signup. In other words, that was expanded or opened in December of 2021, and it has key provisions for helping small- and mid-sized producers to sign up for a supplemental production. Could you elaborate on that?

Mr. MARLOW. Thank you, Congressman, for the question. When DMC was established, farmers were able to establish their history of production based on either the 2011, 2012, or 2013 years. Many farmers had not reached the 5 million pound cap yet. So what Supplemental DMC did was allowed farmers to essentially enroll that supplemental production, that was between what they had established in 2011 or 2012, and the 5 million pound cap in the program, increasing their risk management for their operations.

Mr. BAIRD. So can you elaborate on—are there any issues that we need to tweak in that program, that you are aware of, or has it been working well enough to leave it alone?

Mr. MARLOW. With the changes that we have made over the last year, we have gotten very positive feedback from dairy producers on the current status of the program. We look at the opportunity possibly to combine Supplemental DMC with DMC, and make that a more permanent part of the program. This would allow farmers to update their production history, and the amount that they can enroll in the program. We continue to seek and receive feedback from producers in terms of the types of changes that we have already made, and we will continue to be aggressive about communicating with the producers, and responding to that feedback, and look forward to providing technical assistance on any suggestions that come from this hearing, or other conversations in preparation for the farm bill. Thank you.

Mr. BAIRD. Thank you. Thank you very much. I am going to turn now to Deputy Administrator Coale. The 2018 Farm Bill is probably going to serve as the base, certainly for what we do in the 2023, but I am interested in the Dairy Forward Pricing Program that is extended until September of 2023. I want to know what classes of milk, and I think it is II, III, and IV, that are covered in that extension, and how that has been working.

Ms. COALE. Thank you, Congressman, for the question. The Dairy Forward Pricing Program is working very well, as it was authorized within the last farm bill and previous farm bills. The application of forward contracting does apply to Class II, Class III, and Class IV uses of milk, and I think that is the appropriate continuation of the program. At the current time we see the program probably utilized most in the upper Midwest region of the U.S., and potentially the program would be utilized a bit more if there were permanent authorization for the program, although that is something that we don't have any information on. But the individuals who do utilize the program, the feedback that I get from the dairy

sector is that it works very positively, and is a valuable risk management tool for the producers who do use it. Thank you.

Mr. BAIRD. Thank you, and thank you, both witnesses, for your responses, and I yield back.

The CHAIRMAN. The gentlewoman now from North Carolina, Ms. Adams, who is also the Vice Chair of the House Agriculture Committee, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Chairman Scott, and Ranking Member Thompson, for having this hearing, and to our witnesses, thank you for testimonies that continue to help Members of the Committee prepare for the farm bill. We can see that the subsidy policies discussed today are effective for producers and consumers across the board. I would like to see similar farm bill subsidies and programs improve conditions for fresh produce growers as they continue to face barriers to expanding their production, advocating for subsidies that support dietary guidelines for all Americans, meaning that we need to remove these barriers.

So, Deputy Administrator Coale, I would like to discuss the dairy safety net programs, and their ability to withstand market disruptions. So, if these programs are working well, why were additional payments, including \$350 million in Pandemic Market Volatility Assistance payments necessary?

Ms. COALE. Thank you for the question, Congresswoman. The payments that were distributed and are currently still under distribution for the Pandemic Market Volatility Assistance Program, resulted from market abnormalities that occurred during the pandemic. In the 2018 Farm Bill, Congress authorized a change to the Class I price mover, and we implemented that in the Department in 2019. As was mentioned earlier this morning, this change in Class I mover was a consensus agreement reached by the National Milk Producers Federation and the International Dairy Foods Association to benefit the entire industry, and implementation in the farm bill was designed to be revenue neutral.

However, at the time it was implemented, nobody foresaw a pandemic occurring, and, more importantly, nobody even could have projected the implications that that pandemic would have on all agricultural market prices, and particularly within the dairy sector. So, a provision that was intended to be revenue neutral, what we saw occur between a period of mid-2020 through mid-2021 was a result in a significant change in that revenue neutrality. If you look at the Class I mover prior to the pandemic, and the Class I mover as we are moving out of the pandemic, it is maintaining pretty much a revenue neutral position, compared to the prior mover. However, during that pandemic period, due to the price inversions that occurred, we had some major losses that were incurred by the dairy sector, and hence USDA stepped up to help provide assistance that was needed to those dairy producers during that period of time. Thank you.

Ms. ADAMS. Thank you. Mr. Bozic, you mentioned long-term trends in the U.S. dairy industry, and the continued decrease in demand, so can you explain or speak to how farm bill programs can aid milk prices, and stabilize a volatile market?

The CHAIRMAN. I believe that was—who did you direct that to?

Ms. ADAMS. Well, any of the panelists can answer that.

The CHAIRMAN. Okay. Would any of you—

Ms. COALE. All right, I will go ahead and answer that question. I believe it was directed towards my colleague, but I will be happy to try and step in.

The CHAIRMAN. Go right ahead.

Ms. COALE. USDA has several programs to help assist dairy producers, and I think it is important that all of these programs are a package that work together, and many of them are dependent upon the producer actually taking the initiative to participate. So if a producer wants to participate in a forward contracting program to lock in a particular price, they need to invest, and take the time to understand the program, and sign up for the program. Likewise, the programs that Deputy Administrator Marlow administers in the Farm Service Agency also require signup by those producers.

Working collectively, USDA tries to assure that there are various opportunities for producers to ensure that they have viability going forward in the future because, of course, American agriculture is the essence of USDA.

Ms. ADAMS. Well, thank you very much. Mr. Chairman, I am going to yield back.

The CHAIRMAN. All right, thank you. And now the gentleman from Ohio, Mr. Balderson, is recognized for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman. Panel, thank you for taking time to be here today. My first question is for Deputy Administrator Coale, Federal Milk—

The CHAIRMAN. Excuse me a moment. Members, remember, check your microphones. Let us keep them muted until you are recognized. Thank you. You may continue.

Mr. BALDERSON. Thank you, Mr. Chairman. Again, this is for Deputy Administrator Coale. Federal Milk Marketing Order price formulas use the average cost of manufacturing a pound of four specific dairy products. AMS released a cost processing study earlier this year which accounted for data from October 2017 to December of 2020. Prior to this data collected from a 2006 and 2007 cost of processing study was being used. This was touched on earlier by Mr. Costa, but can you elaborate further on the benefits of conducting cost of processing studies more often?

Ms. COALE. Thank you for that question, Congressman. I do believe that, in the Federal Milk Marketing Order price formulas, we are using make allowances, and there were benchmarks that we could utilize to determine if those make allowances were staying in touch with reality, as far as what was happening in the manufacturing sector. And, without the California Department of Food and Ag, without their make allowance study, there really is no information, so USDA progressively has worked with Dr. Mark Stevenson to have a manufacturing cost study. It is a voluntary study, and the information, obviously, was not as robust as what the industry was hoping for, nor was it as robust as what USDA was hoping. However, the information is purely voluntary.

In order to continue to have an effective make allowance within the Federal Milk Marketing Order price formulas, I think that it would be beneficial to have authorization for USDA to conduct a mandatory price survey, as far as the manufacturing costs are concerned. The timing, and the robustness of that survey would be

things that could be determined by the industry, as to who should participate, if it should be the same participants that are already required to report under the Dairy Mandatory Price Reporting System, or if it should be something else, as well as the industry determining how often that make allowance study should be conducted, and how the results of that study should be implemented within the Federal Milk Marketing Order System.

So, I think this is a conversation that is applicable to the upcoming farm bill and is something that needs to incorporate a robust discussion with the industry as well. Thank you.

Mr. BALDERSON. Ms. Coale, thank you. That was a great response. I appreciate that. My next question is for Mr. Marlow. Thank you for being here also, sir. You discussed the changes your agency has made to the DMC Program earlier. Did you reach out to get feedback from small- and medium-sized producers when deciding what changes would be made to DMC, and what kind of outreach was conducted?

Mr. MARLOW. Thank you very much for the question. Yes, since the start of the Administration, dairy producers, and especially small- and mid-scale dairy producers, have been one of the areas we have focused our attention, in terms of the gaps within the programs that have needed increased assistance. Over that time, based on input that we have received from producers, we have made changes specifically because of the input of producers, and the input of those who work with small- and mid-scale producers. We continue to seek that input through our county and our state officers, and also through meetings with industry that we hold on a regular basis.

Mr. BALDERSON. Okay. Thank you very much. Mr. Chairman, I yield back my remaining time. Thank you very much, sir.

The CHAIRMAN. The gentleman from Arizona, Mr. O'Halleran, is now recognized for 5 minutes.

Mr. O'HALLERAN. I want to thank Chairman Scott and Ranking Member Thompson for organizing this important hearing. I also want to thank the witnesses for their participation today in preparation for the upcoming farm bill. Last year, Arizona's dairy industry created more than 44,000 jobs. Dairy is an essential part of Arizona's economy, and among the top commodities in Arizona's First Congressional District. Over 98 percent of Arizona dairies are family owned and operated, and these families depend on our work to stabilize prices and incentivize domestic production.

I know a little bit about dairy farming. It is in my family's background. My grandfather, my father, were dairy farmers, along with seven brothers of my father's, and some of those uncles took on the role of dairy farming even after my grandfather's farm was lost during the Great Depression. During the previous farm bill reauthorization I worked to strengthen the dairy farm safety net. This included creating the Dairy Margin Coverage Program, which serves as an important risk management tool for producers in my district.

Mr. Marlow, you have significant expertise in risk management. In your view, how successful has the DMC program in aiding farmers through the recent volatile years?

Mr. MARLOW. Congressman, thank you very much for the question. I think it is important for us to look at the safety net as a system between both DMC and also the Risk Management Agency programs that also work with it to provide a more comprehensive coverage. I would highlight that in 2021, the DMC Program put out \$1.1 billion in payments to dairy farmers across the country, having a very significant impact on farm viability across the country. I am very proud of the changes that we have made in DMC over the last couple of years. I think it is a much more robust safety net, along with our programs from our partners over at RMA, but I also would be remiss if I didn't note that between 2013 and 2021 we lost approximately 17,000 dairy farms in the United States.

That is a loss, and over time I have spent time sitting at the kitchen tables of families going through that process, I know that that is a continued weight on the land, a weight in our communities, but we are very proud of the safety net that we have created, and the safety net that we have built through the changes that we have made over the last couple of years.

Mr. O'HALLERAN. And a follow up on that, what are the most important updates we can make to the DMC Program, or other programs, to make sure the dairy safety net is as strong as it needs to be, to make sure that we don't lose 17,000 farms, like you had just mentioned?

Mr. MARLOW. Thank you very much, Congressman. I would say that the opportunity was provided through Supplemental DMC for farmers to update their coverage levels, and their production history has been a very important part of the process, and a very important part of it being an effective safety net over the last couple of years. We can look at how that becomes more of a part of the program over time. I would also say that, by focusing on the margin, and by focusing on the gap between the price and the cost, in this case feed cost, as we have talked about inflationary pressures and other issues, this is a very important model for assistance programs as we go forward, and should serve as an important touchpoint in the conversation going to the farm bill. And we look forward to providing technical assistance on any other proposals that come either through your offices, or through the remaining panels who are yet to speak today.

Mr. O'HALLERAN. Thank you very much, Mr. Marlow. Ms. Coale, despite the safety net provisions, the dairy industry was hit hard during the beginning of the COVID-19 pandemic. At one point Arizona dairy farmers were dumping hundreds of thousands of gallons of milk a day. Milk pricing became volatile, and farmers in Arizona have had to contend with economic ups and downs ever since. I am going to be sending you, due to time, some questions on that, but I find it that we have to continually adapt to these changing environments at a much faster pace so that there is reality placed in the system of the timeliness and the impacts to family farms. Thank you, and I yield back.

The CHAIRMAN. The gentleman from Iowa, Mr. Feenstra, is now recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Scott, and Ranking Member Thompson. Thank you for the testimony from both of you. The dairy industry is extremely vital to Iowa, in my Fourth District. I

mean, we are home to Agropur, Wells, Blue Bunny, Dean Foods, AMPI. They are all in my back yard, literally in my back yard, and I talk to my dairy producers virtually every week, so I am just thankful for you taking the time out to discuss these topics.

However, the number one topic that I am hearing from my producers is the fear moving forward, granted, we are at \$25 per hundredweight right now, but their input costs are just very significant. So from either one of you, I am just wondering, as we move forward—and I know we have the Dairy Margin Coverage and stuff like that, but a lot of the smaller producers are saying that they are going to go under if this changes, or if the commodity price changes at all, the costs of feeding and everything else going up, that they are setting up for a huge cliff. Can either of you talk about what we can do in the farm bill, or what we should be doing moving forward so we don't lose these producers?

Mr. MARLOW. Thank you, Congressman, this is an extremely important question at this point. We share the concern about the volatility of the price, and the pressures of inflation. Inflation and input costs has been a major concern within USDA, and a major cause of action, and it is taking essentially a two-prong approach. One is looking at what we can do to improve the situation in the short-term, and address some of the specific situations in terms of shipping, in terms of transportation, in terms of supply chain issues, and those types of things. We are also looking at longer-term structural issues, in terms of competition.

So, I would point at both the work that is being done on the investments, on increasing fertilizer production, and increasing and addressing fertilizer costs, but then also, longer-term, the very significant investment that the Administration is making in supply chain diversification, and the opportunities to access and increase processing. I would also suggest that, for the smaller-scale and mid-scale farmers that you are referring to, access to higher value markets is often a very critical component of their strategy for financial viability and as we invest in these supply chains, invest in higher value markets, and invest in bringing a greater portion of the food dollar back to the farm. One of the issues that our division is working on is to look at how we need to adjust our safety net programs to make sure that we are recognizing those markets that are so critically important to the scale of farmers that you are talking about and how, in our disaster programs, we are able to recognize those prices, recognize those markets, and make sure that that safety net extends into the higher value shorter chain operations that farmers of the scale that you are referring to need to be viable, and not just stay in, but thrive over time.

Mr. FEENSTRA. Yes. Right. I mean, I agree 100 percent. I mean, you have to find value added. They have to figure out a way to make sure that—and sustainability. I mean, long-term, this is always a challenge. The other thing that sort of goes along with this, when it comes to inputs, is the cost of finding workers, and, especially in the Midwest right now, we have such a shortage of workers, both from the production side, all right, from the producer, and then also from the side that is making the dairy products, whether—the ice cream, or cheese, or whatever—proteins, or whatever it might be.

Actually, yesterday we had a situation that one of the locations I noted was dumping milk. Well, we sure don't ever want that, and so I look at that, and I have 35 seconds here. Any direction there? I know we talked to the H-2A—H-1A program, but any direction that you look at and say, "Hey, this is something that we need to address"?

Mr. MARLOW. This is an issue that the Secretary has taken a personal interest. We have supported the Farm Workforce Modernization Act of 2021 (H.R. 1603), and we are happy to continue conversations about specific needs within specific industries, but, in my last 3 seconds, it is an issue that has very much taken the attention of the Department.

Mr. FEENSTRA. Yes. Thank you, and I yield back.

The CHAIRMAN. The gentlewoman from Washington, Ms. Schrier, is now recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman, and thank you to our witnesses. I thought I would first focus today on just keeping costs down for our producers. As everyone here knows, import costs are extremely high for farmers and agricultural producers right now. I first became aware of supply chain dysfunction made worse by the pandemic from hay growers in Ellensburg, Washington, in my district, and, of course, issues impacting the hay and feed supply are going to directly impact dairy producers, so right now I am seeing the storm brewing that will impact all feed for cattle. Part of that is weather, part of it is port congestion, and supply chain issues. Part is the high cost of inputs, like fertilizer, and then another is that right now the price of wheat is so high that there is more incentive to grow wheat, and less incentive to grow hay, and so this is all potentially contributing to skyrocketing prices for feed.

So, Mr. Marlow, first I want to thank you—especially on behalf of the producers in my district. Thank you for the change in the DMC feed cost formula to better reflect the cost of high-quality alfalfa hay. And I want to ask you a couple of things. One is, in light of this change, is there more that can be done to address or offset high feed costs, and kind of part two of that question is—I do have dairy producers in my district who have their cows at least part time just feed off the grass, just feed—and—on the range, and was wondering if—how you think about costs of feeding those cattle?

Mr. MARLOW. Thank you very much Congresswoman for the question. This is an extremely important issue. The inflation of costs for producers is something that we have been looking at and working on quite intensively. You mentioned several pieces. One is opening up movement through the ports to allow a greater flow of goods. We have recently created a program with the ports of Seattle and Oakland to basically provide an opportunity for containers to be filled with agricultural commodities, and to increase that flow of goods. We have also had increased funding for the expansion of fertilizer production in the United States.

And there are a series of steps that we are taking to address the specific issues that you named. One is the extent to which we have been able to open up some of the CRP land for supplemental grazing and supplemental haying based on the extensive droughts across the country. For land that is being taken out of CRP at the end of the season, we have opened up the ability for farmers to get

out of CRP early in order to prepare land for fall production if that land was coming out of CRP anyway.

These issues of inflation, and we have had a whole series of issues, the extensive disasters, the war in the Ukraine, coming out of the pandemic, these issues are going to require a comprehensive approach in terms of addressing each of the different pieces. We are really looking at that comprehensive approach in terms of increasing the ability for the financing of infrastructure, the development of supply chain diversification, and a series of other steps to be taken.

Ms. SCHRIER. Thank you for the answer. We may have to have a further discussion about undoing conservation programs for this, but that can be another day. I just want to close by mentioning that there is a big problem, as Mr. Feenstra just said, with labor issues for our dairy producers. In Washington State, folks point to immigration policy as one of the primary barriers here, and so I just want to mention the need to make progress here with the passage of the Farm Workforce Modernization Act of 2021 that passed in a bipartisan manner in the House, but we need to get through the Senate. It would allow for more worker visas, which would help the dairy producers in my district, and across this country. Thank you, I yield back.

The CHAIRMAN. The gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. All right. Well, thank you, Mr. Chairman. I will jump right into it. So, Ms. Coale—am I saying that right?

Ms. COALE. You are.

Mrs. CAMMACK. All right, wonderful. I always have to ask, because people always get my name wrong. But, Ms. Coale, as you know, my dairy farmers in the great State of Florida were especially hard hit by the price inversions that occurred during the pandemic 2 years ago. Now, I appreciate that the Department has reimbursed farmers for some of the losses under the Pandemic Market Volatility Assistance Program, but I am continuing to work on rectifying that program's 5 million pound limitation.

I know that we see eye to eye on how important it is that we work towards real reforms for the dairy sector that avoid a repeat of what happened amid the pandemic, and that we consider the impact of such reforms, and what they can do on dairy farmers of all sizes, including our family dairy farms in my state, where the average dairy has more than 1,300 cows, and keep in mind these are all family operations. These are not massive corporate entities, but they are family operations. So can you give me your assessment on some of these pricing dynamics, and how they impacted producers in different areas?

Ms. COALE. Thank you, Congresswoman. I have been on many of your family-owned dairy farms in Florida, and I completely understand how they are operating, and the unique marketing conditions that they face in the State of Florida that are different than from other areas across the country. And what we did see through the pandemic was that there was a real increase in price volatility, and typically we see cheese prices that are lower than what the price for fluid milk is, or Class I milk, as we refer to it, but during the pandemic there were some market abnormalities that occurred,

and cheese was suddenly valued much higher than Class I milk. And that continued for a period of time, and the Department recognized that this was creating great hardship for the dairy sector and dairy producers, so the Pandemic Market Volatility Assistance Program was developed and implemented.

And I recognize that the program had different effects across the country, and there were different payouts across the country. That was a result of several things, including the 5 million pound cap, which obviously impacted every producer in the State of Florida, and it may not have impacted all other producers in different regions. When we are looking at how the Pandemic Market Volatility Assistance Program paid out, what it looked at was the difference between the prior Class I mover and the current Class I mover. It looked at the volumes of milk that were pooled. It looked at how the cooperative or the processor was paying the individual dairy producers, and took all of this collective information to determine how to pay out the monies. And I recognize that we were limited in the resources that we had available to us, and therefore we looked across to determine how other support programs were administered that USDA had been given authority to, and that is how the 5 million pound cap came into existence.

So it is a program that we would look at. If Congress were able to provide additional resources for that, we could explore what other opportunities might be to help the dairy producers in your region, as well as across the country.

Mrs. CAMMACK. I appreciate your insight there, and I would like to insert into the record an article from the *Tampa Bay Times* from one of my dairy farmers, Ms. Brittany Nickerson-Thurlow.

The CHAIRMAN. Without objection.

[The article referred to is located on p. 1191.]

Mrs. CAMMACK. Thank you, Mr. Chairman. Now, as you know, and you talk about this, my state, Florida, our dairy farmers have been working for generations, but, as we know, their livelihood and their survival are threatened. Now, I want to reiterate something that has already been spoken about in this hearing here today, which is that 95 percent of the U.S. dairies, even those larger dairies like those in my State of Florida, with more than 1,300 cows, are family owned and operated. We keep reiterating this. Now, these farms are part of the fabric of my state—we like to call ourselves the Dairy Belt—and they are vital to our economy and our food security. And, yes, these farms have grown in size, but they are still family farms, and they grow in size because they have to meet margins just to stay viable.

One of the dairy farms in my state recently spelled out a reality that I hope we can all remember as we move forward. In the 1960s, a dairy with 27 cows was enough to support one family and three kids. To be successful today, many of our dairy farmers, particularly those in my State of Florida, must operate on a larger scale, with hundreds, thousands, even, of cows in order to make a living and survive this challenging time. With any of the programs moving forward, I think that the Pandemic Market Volatility Assistance Program being one of them, we need to take into the—reality this—the account. Many farms are not that small. They have many operations, and I look forward to working with my colleagues here

on the Committee, but also with USDA to ensure that our family-owned dairy farms are able to be provided equitable relief and support, regardless of the size of their operation. And with that, Mr. Chairman, I yield back.

The CHAIRMAN. The gentleman from California, Mr. Harder, is now recognized for 5 minutes.
