Mr. HARDER. Thank you, Chairman Scott, and thank you also to our witnesses for joining us today. California's dairy producers are key to the ag economy of the Central Valley. In both Stanislaus and San Joaquin Counties, milk is the second top commodity, valuing over \$700 million and over \$400 million respectively. But despite the staggering economic contributions that we have seen from dairy, dairy has to face some real challengers, many of them exacerbated by the COVID pandemic. Just in my district we have seen hundreds of dairies close in recent years, and I know we are working to try to address that in the 2023 Farm Bill.

I know that USDA and this Committee have partnered to roll out programs that assist dairy farmers to combat price fluctuations, unforeseen natural disasters, but I hear from many of our dairy producers that those programs don't quite meet the scope of our California dairies. And, of course, top of mind is the Dairy Margin Coverage Program, which I know came from the 2018 Farm Bill. It has been helpful to some dairy farmers, but most of our producers find that the 5 million pound cap either gives them minimal support, or deters them from the program entirely. And, given the vast amount of dairy production in the State of California, you would think that we would have a pretty high level of participation within DMC, but that is, of course, not the case. California has much lower participation than other states.

Mr. Marlow, given your role managing the safety net programs like DMC, can you discuss any regional differences you have seen in DMC participation, in particular why California participation is so much lower compared to other states?

Mr. MARLOW. Thank you very much, Congressman. Thank you for the question. I do think, as we look at our safety net programs, that a one-size-fits-all approach does not fit. The scale of production definitely has an impact on participation, but in answering your question, I really want to look at our dairy safety net programs more comprehensively, including our Risk Management Agency programs.

It is true that DMC has the 5 million pound cap. Coverage up to that cap is available to all dairy farmers, regardless of scale. They can also obtain the same coverage above that cap, just at a higher price. We also look at the RMA crop insurance policies based on dairy as part of that safety net, especially for some of our larger operations as they move past that 5 million pound point. So I think we have to look at it in a comprehensive way, and look at all of those programs together as providing a safety net, whereas the 5 million pound cap really focuses in on providing a basic safety net across all scales, rather than just a subset. As you said, it may not cover the full range for a large scale producer.

Mr. HARDER. Yes, I hear what you are saying. I also think the DMC Program is incredibly important for dairy producers, and I am curious if you have any suggestions around what can be done

to include California producers who may be on the fence about participating in DMC.

Mr. MARLOW. Well, I think it is important to recognize that the margin factor of the DMC is one of the major factors that makes it effective for dairy producers, that it is focused on the margin. We also have an RMA program that is also focused on margin for dairy producers as well. We are happy to engage in a conversation on how it can be extended more effectively to producers across the scale. I am happy to engage in technical assistance as we look at additional proposals.

Mr. HARDER. Thank you. I appreciate your comments, and I do think it is important to make sure that, as we look at the 2023 Farm Bill process, that we are making sure that our California dairy farmers are well represented. I look across this Committee, I see a lot of folks that represent California dairies, more so than in the 2018 Farm Bill process, and I think that should be a chief goal of this Committee as we go forward. So, I look forward to working with the Committee, and our Chairman, and Ranking Member, and our stakeholders to hopefully get this right. So thank you guys so much for coming, and, Mr. Chairman, I yield back the remainder of my time.

The CHAIRMAN. The gentlewoman from New Hampshire, Ms. Kuster, is now recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman, and I want to thank our panel for being with us today. Dairy is an important pillar of New Hampshire's diverse agricultural economy, so I am glad we are having this discussion as we look ahead to the 2023 Farm Bill. In the last farm bill, 2018, we successfully retooled what is now known as the Dairy Margin Coverage Program that we are discussing today. The narrow margins between high feed costs and low milk prices strain dairy farms across the country, and that was especially true for small family farms in New England, and in my district in New Hampshire, where transportation costs trend much higher. Farmers have been burned so badly by the previous iteration of margin coverage that not one dairy farmer I talked to in my district thought they would re-enroll.

Thankfully, the DMC Program won over many converts, and has made a tangible difference in ensuring that farmers can access reliable margin coverage, and choose between options that best fit their needs. And it was a tremendous testament to the type of work we can get done when we write the farm bill in a bipartisan way. Nevertheless, New England dairies continue to face significant challenges to their long-term viability, and we are still losing small dairy farms in New Hampshire who have a tough time remaining viable as the industry consolidates nationwide.

Consolidation runs the clear risk of making our dairy supply chains less flexible, especially in moments that call for maximum agility. We saw this discrepancy play out in the early days of COVID, when farmers were forced to dump milk, even though families were going hungry. The supply chain dots just weren't being connected. I believe there is much more we can do in the next farm bill to shore up family dairy operations, so with that, let us dive into the Milk Marketing Orders. In 2020, we saw the Federal dairy pricing thrown off as a result of the increased demand for cheese

in the Farmers to Families Food Box Program, which then negatively impacted the fluid milk price. Deputy Administrator Coale, given this type of uncertainty, I am curious if USDA is making any moves regarding Federal Milk Marketing Orders, and if you had been in touch and heard from small dairy producers about how best to ensure fairness for setting dairy prices.

Ms. COALE. Thank you, Congresswoman. I appreciate the question about what we are doing within the Federal Order System, and right now USDA's primary role is to have conversations with our stakeholders, and those conversations include both large and, in particular, small dairy producers to find out and educate them as to what the Federal Order System provides, and how it enables them to have a market for their milk production. The Federal Order System is one that is designed to establish minimum prices, and, in essence, this assures a dairy producer as to what the value is of the milk that they are marketing, based on how it is used. So it is vital that we have those conversations, and continue to educate the industry as a whole as to what it is that we offer within the system.

We have had multiple, and I personally have had multiple conversations with producers from the northeastern part of the United States just discussing the unique marketing challenges that they face, and how best they can position themselves. One of the programs that USDA does have that has been providing a benefit, and adding a value to dairy producers and operations, is through the Dairy Business Innovation Initiatives. And these are opportunities for dairy producers to receive technical assistance and also to get some grants and some awards if they want to put in any kind of value-added production, or improve their efficiencies, whether it be for climate change, or just general marketing practices, *et cetera*. So, the DBIs are one very effective model that we have been using within AMS to assist all dairy producers, but with real focus on small- to medium-sized producers. Thank you.

Ms. KUSTER. Great. That is good to hear. I just want to quickly go back to the margin coverage. Do you see opportunities for better incorporating regional feed cost calculations into the program formulas?

Mr. MARLOW. We would be happy to engage in technical assistance with you on any proposed changes made to regional feed costs. We are happy to look at those issues as we move into the farm bill conversation.

Ms. KUSTER. Great.

The CHAIRMAN. The gentlelady's time—

Ms. KUSTER. Thank you very much. With that I yield back.

The CHAIRMAN. Yes, ma'am, thank you. And now the gentleman from Texas, Mr. Cloud, is recognized for 5 minutes.

Mr. CLOUD. Thank you very much, Mr. Chairman, and thank you all for being here to help us as we prep for the farm bill. Mr. Marlow, I wanted to ask you about the Dairy Margin Coverage Program. I talked to some dairy producers back in Texas, and Texas maybe tends to have some of the larger producers. Could you give me a rough estimate of how many farms are enrolled in Tier One, as opposed to Tier Two?

Mr. MARLOW. Approximately 60 percent of the farmers who enroll in DMC are in Tier One only, so about 40 percent are in Tier One and Tier Two.

Mr. CLOUD. Forty percent are in both? Or are in Tier Two?

Mr. MARLOW. Well—were you—you can—

Mr. CLOUD. Sixty percent are in Tier One?

Mr. MARLOW. You can enroll in Tier One for the first 5 million pounds, and then Tier Two for the additional. So about 40 percent of the producers who are in the program go beyond that 5 million pound limit.

Mr. CLOUD. Right. I have talked to some in Texas, and, even though they produce that much, some say they can hit that 5 million mark in a matter of a couple weeks, but they don't enroll in Tier Two just because of the cost discrepancy. Can you speak to how that 5 million benchmark came into place, and whether that is a good figure or not?

Mr. MARLOW. I believe that that was in the original legislation that was provided to us, and so we work with that \$5 million—I am sorry, 5—

Mr. CLOUD. Five million pound.

Mr. MARLOW.—million pound number.

Mr. CLOUD. Right.

Mr. MARLOW. We are happy to engage in a conversation about where that lands. It is approximately a 250 cow dairy for the 5 million pound mark. That is really an approximate point.

Mr. CLOUD. Okay. I guess is it your estimation that that is a good amount? Would you recommend more? I mean, it—the ones I am talking to are saying it would be great if it was raised, but—

Mr. MARLOW. I think it is important to look at the combination of DMC with the Risk Management Agency programs as a combined safety net so it is not just DMC standing on its own, and those Risk Management Agency programs are also available to the larger scale operations. So they have the choice of either doing Tier Two, or going into the RMA programs, and looking at it there.

Mr. CLOUD. Okay. I wanted to ask you another question too, because probably the biggest thing I have heard from farmers over the last year has been just the ability to work with their local FSA field agents, and so I was curious if you can give us an update on the teleworking status? Are field agents back to work, what percentage, what is our status on that?

Mr. MARLOW. We continue to monitor COVID issues very closely. All of our staffing levels are based on the science of what the COVID levels are in their areas. We are across the board—and I don't have the number of specific offices, but almost across the board back to 100 percent staffing.

Mr. CLOUD. Yes. For practical purposes, we are almost full—okay.

Mr. MARLOW. Absolutely.

Mr. CLOUD. That really helps. I appreciate it. Thank you very much. That helps me. I appreciate it. Thank you, Mr. Chairman.

The CHAIRMAN. Well, thank you, Mr. Cloud. And, Ms. Coale, Mr. Marlow, thank you. This concludes this part of our hearing today. Panel one, you all did a great job, thank you. And now, Panel one,

you will be excused. We will take a 5 minute break to exchange panels, and then our second panel will appear in 5 minutes. And so, for 5 minutes, we will stand in recess. Thank you.

[Recess.]

The CHAIRMAN. The Committee will come to order. First I want to welcome our second panelists, and to introduce our first witness on our second panel today, I am pleased to yield to the distinguished gentleman from Pennsylvania, my friend, the Ranking Member, Mr. Thompson.

Mr. THOMPSON. Thank you very much, Mr. Chairman. It is my pleasure to introduce fellow Pennsylvanian, Ms. Lolly Leshner. Lolly, her husband William, and three of their children operate Way-Har Farms in southeastern Pennsylvania. The Leshners are seventh generation dairy producers, and have expanded their operation to sell milk and ice cream direct to consumers. She has been very active in the industry in numerous roles over her career, and is a current member of the DFA Resolutions Committee. Lolly, thank you so much for joining us today.

The CHAIRMAN. And I thank the Ranking Member for his comments. To introduce our second witness, I am pleased to yield to the distinguished gentleman from California, the Chairman of the Livestock and Foreign Agriculture Subcommittee, Mr. Costa.

Mr. COSTA. Mr. Chairman?

The CHAIRMAN. Yes, you are recognized.

Mr. COSTA. Can you hear me?

The CHAIRMAN. Yes, I do. Go right ahead.

Mr. COSTA. Thank you very much, Mr. Chairman. I have the honor to introduce Mr. Mike Durkin, who has testified before, back by popular demand, I think. His experience and background I think is well known in the dairy industry across the country. He is the President and Chief Executive Officer of Leprino Foods, representing today the International Dairy Foods Association. Leprino Foods many of you are familiar with. They are the largest producer of mozzarella cheese in America, which makes them the largest in the world. They also export 20 percent of their products abroad, so he is very experienced in the challenges with the food supply chain that we have had in the last couple years as a result of the pandemic and other factors. But what they do is produce protein, lactose, and other dairy ingredients that are critical to our food supply chain, and I might also say baby food formula that they sell to processors.

Leprino Foods has three plants in California, notably in the San Joaquin Valley, two in Lemoore, one in Tracy. It is the home of the largest cheese manufacturing facilities in the world. Mr. Durkin has a lot of experience in senior leadership roles. He holds a Bachelor Degree in Marketing and Finance from the University of Rhode Island, and a Master in Business and Finance from Pace University. We look forward to hearing from him again today, and I thank you for giving me the honor to introduce him.

The CHAIRMAN. And our third witness is Mr. Travis Forgues, who is the Executive Vice President of Membership for Organic Valley from LaFarge, Wisconsin. And our fourth and final witness today is Dr. Marin Bozic, an Assistant Professor of Applied Eco-

nomics at the University of Minnesota from St. Paul, Minnesota. And now, Ms. Leshner, please begin when you are ready.

STATEMENT OF LAURA “LOLLY” LESHER, OWNER/OPERATOR, WAY-HAR FARMS, BERNVILLE, PA; ON BEHALF OF NATIONAL MILK PRODUCERS FEDERATION, DAIRY FARMERS OF AMERICA

Ms. LESHER. Thank you. Good morning. Chairman Scott, Ranking Member Thompson, thank you so much for the opportunity to testify. My name is Lolly Leshner. My husband William and I own and operate Way-Har Farms in southeast Pennsylvania. Our family has milked cows for seven generations, and in the past 50 years we added a retail farm market so that we could sell our milk and ice cream directly to consumers. We milk 240 cows and are joined in the family business with three of our four children. I am proud to be a member-owner of Dairy Farmers of America, and I am testifying to you today on behalf of National Milk Producers Federation, of which DFA is a member.

I am pleased to offer comments on the current dairy policy, but first a few words about the economic landscape. Growth in domestic consumption and exports have been very bright spots for us. Milk prices have reached an all-time high level earlier this year, but the increasingly high input costs are pinching our farmer margins. Just this year our family dairy farm has seen the cost of diesel fuel increase by 290 percent compared to 2019. This is a problem that is only getting worse.

Prior to the 2018 Farm Bill, the dairy policy did not work as well as it does today. The previous Margin Protection Program was well intended, but did not provide an effective safety net, and dairy farmers did not have access to other risk management tools. So, the dairy farmers are very grateful for your work to reform dairy policy in the 2018 Farm Bill and the Bipartisan Budget Act of 2018 (Pub. L. 115–123). Being from Pennsylvania, I am particularly grateful to you, Ranking Member Thompson, for your advocacy. The Dairy Margin Coverage Program is much more effective and has worked well for farmers during these very difficult times.

DMC worked well, as intended, last year, paid out over \$1.1 billion to farmers nationwide, including nearly \$89 million to Pennsylvania producers. Our farm has consistently purchased the maximum available coverage, knowing that DMC may not pay out, but has served as a very much intended safety net when needed, and I was very happy to learn 71 percent of farmers have signed up. However, there is always room for tweaking. DMC’s production history calculation is outdated, and barely relevant. It is critical that, moving forward, farmers can update this calculation to reflect current productions.

The current standard of 2013 was a long time ago, and many farms have grown to meet market demands, or to allow children to join the family farm, just like my family farm did in 2015. To that end, we thank this Committee for enacting the Supplemental DMC to compensate farmers for modest production increases since 2014, and it is critical that this adjustment be carried forward in the 2023 Farm Bill. We also want to thank the Committee and USDA for ensuring DMC better reflects farmer feed costs by fully incor-

porating the dairy quality alfalfa into the feed formula. And, finally, we are grateful that other—like other producers, dairy farmers can now have access to other risk management tools, like Dairy-RP and LGM-Dairy.

Just over a year after the current farm bill was signed, the COVID pandemic took a hold, and the entire country was impacted in hugely—ways. Dairy farmers never stopped producing our nutritious food, but we were not immune to the economic upheaval. The change made to the Class I mover in the last farm bill, combined with the government’s heavy cheese purchase, cost dairy farmers over \$750 million in Class I skim milk revenue in the last 6 months of 2020 alone. The Northeast Order, which includes much of Pennsylvania, lost over \$141 million, which is the largest share of any one particular Order. The pandemic was, of course, a shock for all of us, but it highlighted the need to improve the Federal Milk Marketing Order system.

Fortunately, the dairy industry, through National Milk, is working hard to reach an industry-wide consensus on fixes that we can take to USDA for consideration via a national Order hearing. National Milk farmer-led Economic Policy Committee is examining multiple issues, including the asymmetric risk inherent in the Class I mover, and other areas. DFA is a member of the National Milk, and is actively participating in this process. We recognize that, for our efforts to succeed, we must all work together, giving a little bit to get a little bit. This is way too important for our future, and we look forward to working with the Committee and the broader industry to help these efforts advance.

My written testimony touches on key issues outside of the dairy title. In particular, we urge continued support of the Dairy Donation Program, which helps provide needed dairy products to food-insecure families, and we also support the Healthy Fluid Milk Initiative projects, intended to increase consumption of milk and dairy foods. Again, I want to thank you for this opportunity to testify, and I will be happy to answer any and all questions.

[The prepared statement of Ms. Leshar follows:]

PREPARED STATEMENT OF LAURA “LOLLY” LESHAR, OWNER/OPERATOR, WAY-HAR FARMS, BERNVILLE, PA; ON BEHALF OF NATIONAL MILK PRODUCERS FEDERATION, DAIRY FARMERS OF AMERICA

Chairman Scott, Ranking Member Thompson, Members of the Committee, thank you for the opportunity to testify before you today as the Committee reviews current dairy policy in advance of the upcoming farm bill.

My name is Lolly Leshar. My husband William and I own and operate Way-Har Farms located in southeastern Pennsylvania. Our family has milked cows for seven generations and in the past 50 years added a retail farm market to sell our milk and ice cream directly to consumers. Way-Har Farms consists of 240 milking cows and 400 acres of corn, hay, triticale, and rye. Our farm market operation has a retail store and a wholesale business with distribution to over 70 different outlets. William and I are joined in the family business by three of our four children. We also volunteer in our local community by serving on our local food bank, county Holstein group, the dairy promotion committee, and the Pennsylvania Center for Dairy Excellence Foundation. I also serve on our local school board.

I am proud to be a member-owner of Dairy Farmers of America (DFA) and to serve on the Cooperative’s Policy Resolutions Committee. DFA is the nation’s leading diversified milk marketing cooperative, owned and governed by 11,500 dairy farmer members across the country. DFA’s family farmers are invested in 83 processing facilities that produce a wide range of dairy products, including fluid milk, cheese, butter, ice cream, and dairy ingredients.

I am testifying before you today on behalf of the National Milk Producers Federation (NMPF), of which DFA is a member cooperative. NMPF develops and carries out policies that advance the well-being of dairy producers like me and the cooperatives we own. NMPF's member cooperatives market the majority of the U.S. milk supply, making NMPF the voice of tens of thousands of dairy producers on national issues.

I am pleased to offer comments on current dairy policy as you prepare to craft the next farm bill. First, a word about the current dairy economic landscape. Overall, robust growth in both domestic consumption and cheese exports have been bright spots for the dairy sector. During the first quarter of this year, milk production nationwide was one percent lower than during the same time period last year. In this context, milk prices reached their highest-ever monthly level earlier this year, as measured by the U.S. average all-milk price. However, record or near-record high input costs, including fertilizers, are pinching dairy farmer margins, with many dairy farmers now facing diesel fuel shortages partly on account of Russia's invasion of Ukraine.

When this Committee last began its work heading into the 2018 Farm Bill, dairy policy looked much different than it does today. The previous Margin Protection Program (MPP), while well-intended, fell short of providing the protection required of an effective farm safety net. MPP allowed farmers to insure against low margins—the gap between milk prices and feed costs—but did not offer affordable or meaningful coverage that accounted for the challenges producers endured. As a result, dairy farmers largely opted out of the program or only obtained the free catastrophic coverage. Further, unlike our counterparts who grow crops, dairy farmers did not have access to the risk management options that can help farmers meet their customized needs.

Dairy farmers are grateful for the work this Committee did to reform the dairy safety net in both the 2018 Farm Bill and the Bipartisan Budget Act of 2018. As a Pennsylvania producer, I am particularly grateful to you, Ranking Member Thompson, for your years of advocacy on behalf of dairy farmers in the Commonwealth and beyond. The Dairy Margin Coverage (DMC) program is a significant improvement over its predecessor and has been a strong safety net for dairy farmers during difficult times. It offers producers affordable coverage for margin levels that reflect the milk price and feed cost challenges they face. DMC worked as intended in 2021, paying out well over \$1.1 billion to participating farmers nationwide, including nearly \$89 million to Pennsylvania producers, as they continued to weather the COVID-19 pandemic. The program has provided important security to my family's farm, given the volatility that persists in dairy markets. We have consistently purchased the maximum available DMC coverage since 2019, at a margin of \$9.50 per hundredweight, knowing that it may not pay out every year, but is intended to serve as a safety net when needed. I am glad that more than 71 percent of those dairy farmers who have DMC production history are enrolled in the program for 2022.

However, as valuable as the program has been, many farmers have not been able to fully benefit because DMC's underlying production history calculation is outdated. It is critical that farms like mine and my neighbors have an opportunity to update their production history to reflect current on-farm production. 2013 is far too long ago, and other farm safety net programs do not use such an outdated production reference. Many farms have grown to meet market demands or to allow their children to join the farm. To that end, we thank this Committee for enacting Supplemental Dairy Margin Coverage payments to compensate farmers for incremental production increases since 2014, accounting for a nearly decade-old production history formula. It is critical that this production history adjustment be carried over into the 2023 Farm Bill so that DMC remains a viable safety net. We also appreciate USDA's actions to ensure that DMC more accurately reflects dairy farmer feed costs by fully incorporating dairy quality alfalfa into the DMC feed formula. We know this change would not have been possible without this Committee's work to require the Department to report dairy-quality alfalfa prices in its monthly price surveys.

Finally, we are grateful that, on par with producers of other commodities, dairy farmers, large and small, now have access to both a Farm Service Agency-run safety net as well as Risk Management Agency tools, such as Dairy Revenue Protection (Dairy-RP) and Livestock Gross Margin-Dairy (LGM-Dairy), which give all farmers the ability to adapt their risk management to their needs. We are pleased that USDA recently approved several improvements to LGM-Dairy, including simplifying the purchase process to align it more closely with Dairy-RP and making the program available in all counties in every state. We also support further improvements, including permitting concurrent use of Dairy-RP and LGM-Dairy in the same month

and allowing producers who already have revenue coverage through Dairy-RP to obtain LGM-Dairy coverage with premiums and indemnities solely driven by changes in feed input costs. We hope these adjustments can be made to further strengthen dairy farmer risk management options.

Just over a year after the current farm bill was signed, the COVID-19 pandemic took hold and, from the start, impacted our entire country in significant ways. While dairy farmers never stopped providing households with an abundant supply of nutritious milk and dairy products, we were not immune to the massive economic consequences of the pandemic. In particular, the combined effects of the change made to the Class I mover in the last farm bill and the government's heavy cheese purchases cost dairy farmers over \$750 million in Class I skim milk revenue during the last 6 months of 2020. No one could have anticipated COVID-19 when the change was made to the mover, but the events of the last 2 years have shined a spotlight on the need for an overall update to the Federal Milk Marketing Order (FMMO) system.

To recap, prior to the 2018 Farm Bill, the Class I mover was based on the higher of the Class III or Class IV price each month, commonly called the "higher of" formula. In an effort to accommodate a request for improved price risk management for processors, while also maintaining revenue neutrality for farmers, a compromise was reached to restructure the mover as the monthly average of the Class III and Class IV prices, with a \$0.74/cwt. adjustment factor added to that average. The historical record from January 2000 through August 2017 indicated that this new mover would be revenue neutral for dairy farmers by maintaining essentially the same Class I skim milk revenue as the old mover. The new mover was enacted into law on the basis that farm-level revenue would be maintained.

The new Class I mover took effect in May 2019, but the COVID-19 pandemic dramatically undercut the revenue neutrality that formed its foundation. The Farmers to Families Food Box Program heavily weighted its dairy product purchases toward cheese, priced under Class III. This imbalance caused a wide chasm between the monthly Class III and Class IV prices, making the average of the two significantly lower than the "higher of" the two, even with the \$0.74/cwt. adjustment factor added. As a result, Class I skim milk prices averaged \$3.56/cwt. lower during the second half of 2020 than they would have under the previous mover. This undermined the orderly marketing of milk and represented a net loss to dairy producers of more than \$750 million during the latter half of 2020, including over \$141 million in the Northeast Order, which includes much of Pennsylvania. Dairy farmers are grateful to USDA for creating the Pandemic Market Volatility Assistance Program to partially reimburse farmers for these losses. We urge Congress to provide additional funding to close the gap for those producers who were adversely impacted by the program's 5 million pound per producer limitation. Farmers incurred these losses on all their milk volume, so we thank the Members of this Committee who are working to secure this equitable support.

However, work must also be done to avoid a repeat of this scenario in the future. Fundamentally, the current Class I mover saddles dairy farmers with asymmetric risk because it includes an upper limit on how much more Class I skim revenue it can generate for producers than the previous mover, but no lower limit on how much less can be generated than the previous mover. On this point, even 2 years later, the current mover has not made up for the 2020 losses because it is only moderately different from the previous mover and has not performed significantly better at any point. In other words, when the asymmetric risk inherent in the current mover causes non-trivial losses, as it did in 2020, those losses become effectively permanent.

Fortunately, the dairy industry through the National Milk Producers Federation is treating this matter with urgency and is seeking to find consensus on not only the Class I mover, but also a range of improvements to the FMMO system that we can take to USDA for consideration via a national Order hearing. DFA is a member of NMPF and is actively participating in its process, which involves careful examination of key issues to the dairy sector nationwide. NMPF's producer-led Economic Policy Committee has been meeting to discuss several FMMO updates, and we are grateful to Congress and USDA for their support during this process. The dairy industry recognizes that to successfully enact policies that are better than those we have in place today, we must work together with the goal of achieving consensus. We look forward to working with the broader dairy industry and Members of this Committee as our efforts advance.

I would like to highlight several other areas of great significance to dairy. First, dairy producers are long-time environmental stewards who tend with great care to our land, water, and other natural resources. As a testament to dairy's endeavors, research shows that producing a gallon of milk in 2017 required 30% less water,

21% less land, had a 19% smaller carbon footprint, and produced 20% less manure than it did in 2007. However, we always believe that more can be done, and, as a result, have set industry-wide goals of becoming greenhouse gas neutral or better, improving water quality, and optimizing water use by 2050. Conservation programs like the Environmental Quality Incentives Program are key as we work to continue our ongoing sustainability efforts. Enhanced funding will help dairy farmers scale up innovative climate smart practices, such as new approaches to both feed and manure management, especially as these popular programs are currently oversubscribed.

Second, trade is critical to our success as farmers. Today, exports account for 17% of our production and are likely to comprise an even greater share as global dairy demand continues to grow. Trade promotion programs like the Market Access Program and the Foreign Market Development program promote American-made dairy and agriculture products that compete with heavily subsidized foreign products, returning well over \$20 in export revenue for every \$1 dollar invested in the programs. We support doubling funding for both essential programs to better promote U.S. dairy products worldwide. In addition, we hope to work with this Committee to combat the European Union's efforts to restrict the use of common food names in markets around the world. These efforts are a trade barrier plain and simple, and they must be stopped.

Third, dairy farmers appreciate the enduring connection between agriculture and nutrition. Dairy is a nutrition powerhouse, serving as an excellent source of 13 essential nutrients, but continues to be under consumed according to the most recent Dietary Guidelines for Americans. I thank you, Ranking Member Thompson, for authoring the bipartisan Whole Milk for Healthy Kids Act to allow schools to offer students all varieties of milk, including whole milk, and I also thank you, Chairman Scott, and others on this Committee for supporting this effort. In addition, nutrition programs like the Supplemental Nutrition Assistance Program are vital to linking the food we produce as farmers to families across the country facing difficult circumstances. Finally, we strongly encourage robust support for the Dairy Donation Program to provide nutritious dairy products to food-insecure families and minimize food waste. We also look forward to working with this Committee on any additional enhancements that will help the program meet its goals.

Fourth, in recent years, farmers have endured one difficult year after another. Stress in rural America continues to be a major problem that grips many of our communities. I am thankful to this Committee for working in the previous farm bill to reauthorize the Farm and Ranch Stress Assistance Network, which aims to connect those working in agriculture to stress assistance and behavioral and mental health support programs. We thank the Members of the Appropriations Committee for providing the needed funding and hope those efforts can be increased in the future.

I will close with two issues that are outside of this Committee's jurisdiction, but critically important to dairy producers. First, dairy farmers across the country are facing acute shortages of workers even as they work to provide sustainable nutrition for all Americans at a time of rising food costs. However, unlike the rest of agriculture, the dairy industry is unable to use the H-2A seasonal agricultural worker visa program because of the year-round nature of dairy production. We strongly urge Congress to enact long-needed legislation to allow dairy to meaningfully access H-2A, and to provide current agricultural workers and their families with permanent legal status. The House passed the bipartisan Farm Workforce Modernization Act last spring to achieve these goals, and we continue to urge the Senate to produce an improved version of this bill that can earn 60 votes and be signed into law. Separately, while this Committee does not oversee the Food and Drug Administration, it is critical that the agency finally enforce dairy standards of identity to combat the proliferation of imitation products attempting to use dairy's positive reputation in the marketplace when these products are not nutritionally equivalent to real dairy.

Thank you again for the opportunity to testify before you. I am happy to answer any questions you may have, and I invite any of you traveling through Pennsylvania to stop by Way-Har Farms or visit our market for homemade ice cream.

The CHAIRMAN. Thank you. And now, Mr. Durkin, please begin when you are ready.

Mr. DURKIN. Is it on? Okay.

The CHAIRMAN. Yes. Go right ahead.

STATEMENT OF MIKE DURKIN, PRESIDENT AND CHIEF EXECUTIVE OFFICER, LEPRINO FOODS COMPANY, DENVER, CO; ON BEHALF OF INTERNATIONAL DAIRY FOODS ASSOCIATION

Mr. DURKIN. Good afternoon, Chairman Scott, Ranking Member Thompson, and Members of the House Committee on Agriculture. My name is Mike Durkin, and I am the President and CEO of Leprino Foods, and I am here to testify on behalf of the International Dairy Foods Association and our company. IDFA represents the dairy manufacturing and marketing industry and its members, including independent processors, farmer-owned cooperatives, retailers, and marketers. Leprino Foods, a family-owned privately held company, is headquartered in Denver, Colorado, with over 4,500 employees in California, Colorado, New Mexico, Michigan, Pennsylvania, and New York. Leprino is the largest independent buyer of milk in the United States, supporting over 1,000 dairy farms, and we are also the world's largest producer of mozzarella cheese, and a leading supplier of dairy nutrition products, including lactose and whey.

As the Committee begins to discuss how the next farm bill can bring help to the U.S. dairy industry, I would like to put forward three policy recommendations and raise awareness of a concern for the Committee's consideration. These recommendations were developed by IDFA's Economic Policy Committee. The Association's Boards of Directors, which include proprietary processors and dairy cooperative leaders, voted unanimously to support these recommendations.

First—we also ask the Committee to reauthorize and expand the Healthy Fluid Milk Incentives Projects Program. This program requires USDA to test different methodologies to encourage SNAP participants to purchase more dairy products. Under the program, when a SNAP beneficiary uses their benefits to purchase qualifying fluid milk, they also receive a dollar-for-dollar coupon that can be used to purchase more fluid milk, or another qualifying dairy product. Pilots were launched last year at grocery stores in Texas, and more pilots are coming online this month in New Jersey. In addition, the USDA is expected to award funding by October that will allow approximately 250 new pilots across many regions. In the next farm bill we hope Congress will agree to expand this program to include yogurt and cheese, as well as additional fluid milk options. Expanding the program would help more SNAP families achieve positive health outcomes by increasing their dairy consumption.

Second, IDFA supports a permanent authorization of the Dairy Forward Pricing Program. This program allows producers to enter into forward-priced contracts with milk buyers for milk used to manufacture Class II, III, and IV products. This program expires on September 30, 2023, which means that no forward priced contracts may be entered into after that date. Making this program permanent could facilitate greater utilization of the risk management tool because it would mitigate concerns due to the program's pending expiration date. Given this program has nearly universal support among producers and processors, we recommend Congress make this risk management tool permanent.

Third, and most important to Leprino, and all processors, we ask that Congress require USDA to conduct regular cost of processing studies to generate industry data to develop proposals to adjust make allowances. The Federal Milk Marketing Order System sets the minimum milk price regulated processors must pay. Since 2000 the system directly transfers the market value of products to dairy producers, while processors retain only the assumed cost of manufacturing, or the make allowance. Current make allowances have not been adjusted in 15 years, and do not reflect the cost of manufacturing today's dairy products. Our industry is in this position in part because only two cost studies have been commissioned since 2000. Ironically, the most recent survey is also out of date because it excludes recent significant supply chain and inflation impacted data.

In addition, only $\frac{1}{3}$ of the eligible plants participated in the most recent survey, so the cost information collected may not reflect the true cost of producing dairy products. Congress can improve this *ad hoc* system by directing USDA to conduct regular cost of processing studies to enable regular make allowance updates. In addition, Congress should require that plants reporting pricing data to USDA participate in these cost surveys. This will ensure the resulting data reflects plants of different sizes and regions.

Related to this last request, I would like to discuss an increasingly urgent issue shared by the dairy producers and their processor partners, and that is the regulated pricing formulas. Current make allowances based on 2007 costs are woefully out of date. Coupled with ongoing inflationary pressures, the need to address this lag is increasingly urgent. While our proposal for USDA to conduct regular cost surveys will help in the longer-term, excuse me, the steps must be taken now to ensure adequate processing for capacity remains. Updates to the system will help ensure nutritious dairy products remain affordable to American consumers and exports beyond.

While processors and dairy cooperatives are working together, Secretary Vilsack has stated that USDA will not convene a Federal Milk Marketing Order unless the industry reaches consensus on a proposed solution. Proper resolution via a hearing remains urgent for our dairy industry, so your support of this process will be greatly appreciated. Thank you for the opportunity to appear before you today. I am happy to answer any questions you may have.

[The prepared statement of Mr. Durkin follows:]

PREPARED STATEMENT OF MIKE DURKIN, PRESIDENT AND CHIEF EXECUTIVE OFFICER, LEPRINO FOODS COMPANY, DENVER, CO; ON BEHALF OF INTERNATIONAL DAIRY FOODS ASSOCIATION

Good morning, Chairman Scott, Ranking Member Thompson, and Members of the House Committee on Agriculture. My name is Mike Durkin. I am President and CEO of Leprino Foods Company, and I am here to testify on behalf of the International Dairy Foods Association and our company. As a member of IDFA, I serve as Vice Chair of the Cheese Board and as a member of the Ingredients Board and IDFA Executive Council.

IDFA represents the United States' dairy manufacturing and marketing industry, which supports more than 3.3 million jobs that generate \$41.6 billion in direct wages and \$753 billion in overall economic impact for the U.S. economy. IDFA's diverse membership ranges from multinational dairy organizations to single-plant companies and small businesses. IDFA members include dairy companies with fa-

miliar branded products and companies that co-pack for other brands and private-label products. IDFA members also range from farmer-owned cooperatives and independent processors to food retailers and suppliers. Together, IDFA members represent 90 percent of the milk, cheese, ice cream, yogurt and cultured products, and dairy ingredients produced and marketed in the United States and sold throughout the world.

Leprino Foods, a family-owned and privately held company, is headquartered in Denver, Colorado and has over 4,500 employees in the U.S. in six states including California, Colorado, New Mexico, Michigan, Pennsylvania, and New York. We will soon begin building an additional plant in Texas. Leprino is the largest buyer of milk in the United States supporting over 1,000 dairy farms. Our critical business partners include Dairy Farmers of America and Michigan Milk Producers Association. We are the world's largest producer of mozzarella cheese, and a leading supplier of dairy nutrition products, including lactose and whey. Leprino exports 26% of our milk equivalent volume to over 55 countries, well above the industry average of 16%. I testified in front of this Committee in November on the impact of supply chain challenges on our company and the dairy industry. I can tell you that those challenges persist today coupled with rising inflation and a continued shortage of workers throughout the dairy supply chain.

State of the U.S. Dairy Industry

Taken together, 2020 and 2021 were two of the strongest years on record for dairy sales and among the most challenging in terms of having a workforce to operate.

We are experiencing strong demand domestically across all segments and surging demand around the world for American dairy products.

Domestic demand remains very strong. In 2020 according to USDA data, the average American consumed 655 pounds of dairy in milk, cheese, yogurt, ice cream, butter, and other wholesome and nutritious dairy foods, demonstrating a resilient and growing love for all things dairy. The 2020 figure represents an increase of 3 pounds per person over the previous year and set a new consumption record. Ice cream continued to rebound and grew by 4% year-over-year in 2020. Meanwhile, yogurt consumption jumped 3% and butter notched a 2% increase. Milk and cheese remained resilient throughout 2020 despite the closure of restaurants, cafés, schools, and other institutions that drive demand. Since USDA began tracking dairy consumption in 1975, per capita consumption has grown 22%.

Americans now consume more dairy food products than dairy beverage products. We include dairy in more meal occasions as well as for fitness and recovery, to live a healthy life, and to celebrate special moments. With a greater focus on healthy and sustainable foods, U.S. dairy product consumption could continue growing well into the future.

Nutrition, Health & Wellness

On the whole, dairy foods remain a good buy for the American consumer when compared to other categories including meat and fish, fruits and vegetables, and baked goods. Good nutrition is the foundation of health and wellness, and dairy is a crucial part of a healthy diet beginning at a very young age. In fact, no other type of food or beverage provides the range and density of nutrients that dairy contributes to the American diet. Cow's milk alone has been found to rehydrate the body better than water and delivers 13 essential nutrients that everyone needs to stay healthy. Overall, dairy provides numerous health benefits, including better bone health along with a lower risk of type 2 diabetes and cardiovascular disease. Dairy products also play an important role in the diet of children, where dairy is the top source of calcium, potassium, and vitamin D in kids ages 2–18. The *2020–2025 Dietary Guidelines for Americans* affirmed the unrivaled contribution made by dairy foods and reminded Americans that a healthy diet includes three daily servings of low-fat and fat-free dairy. However, the DGAs also found that 90% of Americans do not consume the recommended amount of dairy, including school-aged children. Dairy products play a critical role in the diet of children, where milk is the top source of calcium, potassium, phosphorus, and vitamin D in kids ages 2–18. Case in point: 73% of the calcium available in the food supply is provided by milk and milk products; and milk is the number one source of protein in the diets of children ages 2 to 11. It is therefore important that this Committee do everything it can to develop laws and support agency policies that promote greater consumption of milk and dairy foods to fulfill critical nutrition gaps in our population.

Before the pandemic, approximately 100,000 schools served nearly 30 million students as part of the Federal school meals programs. School meals offer the most important opportunity of the day for children to get the essential nutrients they need, and dairy foods—including milk, yogurt, and cheese—are critical building blocks for

a child's health and development. At present, USDA is developing updated school meal standards consistent with the DGAs, and we can only hope that USDA will follow its own dietary guidance and continue to make dairy central to child nutrition. An overall decline in school milk consumption has been identified in recent years, particularly after whole milk and low-fat flavored milk options were removed from school meals 10 years ago. USDA can begin to reverse the trend by providing options that kids want to consume while maintaining alignment with the DGAs. More varieties of milk, including low-fat flavored milks, help to increase overall meal consumption and thereby ensure students are getting the nutrients they need, including calcium, vitamin D and potassium.

IDFA and dairy processors greatly appreciate the broad, bipartisan support among Members of Congress for maintaining low-fat flavored milk as a school meal option. This support has been demonstrated through sign-on letters to USDA, co-sponsorship of the School Milk Nutrition Act (H.R. 4635) and the Whole Milk for Healthy Kids Act (H.R. 1861) and adoption of Agriculture Appropriations protections of low-fat, flavored milk in the FY21 Omnibus Appropriations Act and in both the House and Senate FY22 Agriculture Appropriations bills leading up to USDA's "Bridge Rule" which was released in February 2022.

The Special Supplemental Nutrition Program for Women, Infants and Children (WIC) provides nutritious foods to supplement the diets of low-income women who are pregnant, postpartum, and breastfeeding, as well as children up to age 5 who are at nutritional risk. As Congress and USDA consider updates to WIC, we would like to see an update to WIC's Supplemental Food Package that maintains the quantities of milk and other dairy foods but includes flexibility in the varieties of milk and in package-sizing, such as yogurt, within the current allowed food categories that reflect WIC participants' preferences and market availability and allow WIC families to maximize benefit redemption.

The Supplemental Nutrition Assistance Program (SNAP) is the nation's most important anti-hunger program, reaching 38 million people nationwide in 2019. According to USDA SNAP purchase data published in 2016, 5 of the top 20 products purchased with SNAP benefits are dairy products. The Healthy Fluid Milk Incentives Projects, established in the 2018 Farm Bill is allowing participants to buy more milk and help them to make nutritious choices that support a healthy lifestyle. We appreciate the Committee recognizing dairy nutrition in SNAP through incentives, and we would like to see this program reauthorized and expanded to additional milk and nutritious dairy products in the next farm bill and will provide further detail on that later in my remarks.

Dairy products also play an important role at America's food banks, meeting food and nutrition needs for millions of Americans each week. In those settings, fresh fluid milk, cheeses, yogurt, and other dairy products are in high demand. While USDA has made changes to include more refrigerated dairy products procured for food banks and improved the procurement process, additional investments must be made to ensure adequate cold storage and refrigeration to protect perishable food is available to food banks throughout the country—especially in rural areas.

Trade & Global Competitiveness

As the world population grows by another two billion people by 2050 and continues to develop economically, the demand for protein and improved diets will increase the demand for dairy products. Dairy foods are uniquely positioned to meet the nutritional needs of a growing world with more disposable income and an appetite for higher-protein products. This will mean increased opportunities for global trade in dairy.

Recent estimates show that the United States now exports more dairy production than we consume in the form of fluid milk. There has never been a time when trade was more important to the U.S. dairy industry than it is today. Companies (including producer-owned cooperatives) in the U.S. dairy exporting community are committed to doing as much as possible as efficiently as possible to support our long-term global business relationships and maintain our presence in global markets. We recognize that once lost, our market share will quickly go to competitors in producing countries such as those in Europe or New Zealand and is unlikely to be regained given their preferential tariff advantage over the U.S. Looking ahead, with the potential to continually increase production, we believe that global U.S. dairy opportunities abound if we can develop strong trade deals that level the tariff and market access playing field with our international competitors. Given the abundant resources and tremendous ingenuity and efficiency of American agriculture, USDA predicts an additional 25 billion pounds of milk could be produced in the United States by 2030. Based on current consumption trends, we would need to export 40% of that increase in production for dairy farming and processing to remain economi-

cally viable. If we do not build our globally competitive market access now through reduced tariffs, competitive prices, and consistent shipping, our producers will be unable to grow. There is hardly a more critical priority for the U.S. dairy industry than trade.

We applaud the U.S. Government's announcement that it will once again initiate consultations, the first step in a formal dispute settlement case, over Canada's continued manipulation of dairy tariff rate quotas (TRQs) in violation of Canada's commitments under the United States-Mexico-Canada Agreement (USMCA). Our government must stay the course and hold Canada accountable.

We would also like to see the current Administration take immediate action to improve our commercial relationship with China by removing retaliatory tariffs and committing to maintain the gains made for U.S. dairy exporters under Phase One of the U.S.-China Agreement. Becoming the dairy exporter of choice to China and it is 1.4 billion citizens remains in America's long-term interest.

In addition to needing a rules-based system of trade and fair flow of goods with trading partners, U.S. dairy urges the reauthorization of Trade Promotion Authority (TPA) in Congress as soon as possible. TPA will allow the current Administration to pursue trade deals and preferential market access for our exporters, benefitting U.S. producers, workers, and our economy.

Supply Chain Challenges

I mentioned record exports for U.S. dairy to meet rising demand around the world. Today, congestion at U.S. ports is starting to ease. In April, container volume at the ports of Los Angeles and Oakland declined 6% and 15% year over year, respectively, though activity in the Port of Long Beach ticked up 10%. The number of ships moored at port has fallen from nearly 100 at the beginning of the year to below 30 today, close to the pre-pandemic average. On the other hand, East Coast ports are seeing much more traffic than usual as retailers try to diversify their supply chains. We are still seeing high volumes of empty containers leaving our ports, however. In Los Angeles, 36% of containers leaving the port are empties, compared to 28% before the pandemic. We are pleased to see USDA offering cash compensation in the Port of Oakland to shipping companies willing to fill empty containers with U.S. agricultural products and move them to destinations offshore. One company, CMA CGM, a French ocean carrier, has been proactively working on solutions with the industry along with the Port of LA. Altogether, these new efforts are making a difference.

An alliance between the Port of Los Angeles, CMA CGM, and IDFA members has led to improved movement of U.S. dairy exports through the Port of LA. This partnership has led to additional space and equipment allocated to IDFA members through the Port of Los Angeles as well as the prioritization of U.S. dairy exports for shipment to destinations in East and Southeast Asia, especially China, Vietnam, Thailand, and South Korea.

I want to thank Congress for its recent bipartisan passage of the Ocean Shipping Reform Act (OSRA), demonstrating that Congress can indeed work together to provide important tools to address supply chain bottlenecks plaguing U.S. dairy and food exports. The Ocean Shipping Reform Act will provide real, long-term solutions for the myriad issues congesting U.S. ports and slowing U.S. dairy exports. The bill places limits on ocean carriers' ability to decline export cargo and when demurrage can be charged, helping to get U.S. dairy exports on the water in a timelier manner. It also strengthens the oversight authority of the Federal Maritime Commission over ocean carriers, the majority of which are foreign owned.

Workforce & Immigration

At the end of the day, many of our production and supply chain challenges rest upon the worker shortage plaguing our nation's economy, which underscores the continuing need for comprehensive immigration reform. Today, the number of job openings is greater than the number of unemployed. We have nearly 5.4 million more jobs than unemployed Americans. The number of job openings hit 11.4 million in April. For the past few months, 4.4 million Americans have quit their jobs each month. The U.S. cannot meet demand for seasonal workers either, although the government has made available an additional 35,000 H-2B visas for temporary non-agricultural workers through the remainder of fiscal 2022—nearly twice the cap for this program. American employers had 127,000 seasonal employment opportunities they could not fill according to the most recent data. Further, as dairy is a 24/7 year-round enterprise, seasonal worker programs fail to serve as a source of labor for our industry.

By one calculation,¹ the U.S. workforce today has two million fewer immigrants than it would have if immigration had continued at pre-pandemic levels. That is bad news for U.S. agriculture, where immigrants make up $\frac{3}{4}$ of the workforce. We need an immigration system that works for all sectors of our economy, that responds to our worsening workforce challenges, and treats people fairly and equitably. One solution would be to pass legislation to fix America's broken immigration system and create a guestworker program that works for the broader food industry, including non-seasonal commodities like dairy. In addition, it is critical that any immigration legislation include processing jobs to prevent disruptions along the supply chain from the farm to the plant. I know this Committee can help lead the charge on comprehensive immigration reform—you will have a partner in U.S. agriculture and food production—and I encourage you to continue to work to advance this important policy priority.

Sustainability

Collectively, the U.S. dairy industry has committed significant resources to achieve ambitious environmental stewardship goals, including greenhouse gas neutrality, optimized water use, and improved water quality by 2050. In fact, dairy companies and processors that have voluntarily signed onto the U.S. dairy industry's Stewardship Commitment represent 75% of U.S. milk production. As an industry, U.S. dairy produces twice as much milk with half as many cows on half as much land as it did 50 years ago. Over that time, water usage decreased by 65% and dairy's carbon footprint shrunk by 63%. Since this data was gathered in 2007, U.S. dairy has continued to reduce water usage and carbon and methane emissions throughout its supply chain. When writing the next farm bill, this Committee should ensure U.S. dairy remains part of the solution to mitigating and reversing climate change by continuing to have access to voluntary, incentive-based funding opportunities that generate streams of revenue for producers while caring for the environment.

Farm Bill Priorities

As the Committee begins to discuss how the next farm bill can help the U.S. dairy industry grow and prosper, we would like to put forward three policy recommendations for the Committee's consideration. These recommendations were developed by IDFA's economic policy committee after several months of careful review and deliberation. Just last month, the association's boards of directors, which include both proprietary processors as well as dairy cooperative leaders, voted unanimously to support each of these recommendations.

Authorize USDA to Conduct Regular Cost of Processing Studies

Since 2000, USDA's Agricultural Marketing Service (AMS) has twice commissioned a university to survey U.S. dairy processors to estimate the average cost of manufacturing a pound of the four dairy commodity products (cheddar cheese, butter, dry whey, and nonfat dry milk) used in Federal Milk Marketing Order price formulas. The results of the cost surveys typically serve as the basis for changing make allowances pursuant to a Federal Order hearing. The first cost study was completed in support of a milk price hearing held in 2006 and 2007, whose results were implemented in October 2008. The milk price formulas established at that time are the formulas that remain in place today. The costs in that formula dramatically understate today's cost of manufacturing and have resulted in distortions to the dairy manufacturing sector which have constrained capacity to process producer milk. This was manifested in an extended period of milk production surpassing local processing capacity in the Northeast and Michigan, high transport costs to move milk out of those regions for processing, and, in the extreme, dumped milk that was only solved when dairy cooperatives constrained their members' production and invested in additional manufacturing capacity themselves.

The current *ad hoc* cost study program and price formula updating mechanism does not serve the needs of today's U.S. dairy industry. In the first place, cost studies are conducted very infrequently at the Federal level. As stated above, there have only been two national cost studies since 2000, the one for the mid-2000's hearing and a recently completed survey in 2021 that is already out-of-date because the data is based 2018–2020 costs, before the supply chain issues and inflationary surge that has occurred in 2021 and 2022. As a result, the 15 year old make allowances do not reflect the cost of manufacturing today's finished dairy products.

Second, because participation in these cost studies is currently voluntary, just over a third of the plants eligible to submit data for the most recent cost survey

¹<https://econofact.org/labor-shortages-and-the-immigration-shortfall>.

chose to do so.² That means the cost information collected may not accurately reflect the true cost of producing products at different size plants and in various regions of the country. Increasing the participation rate in future studies will yield data that better reflects current economic conditions and has more credibility among various industry stakeholders.

Congress can improve the current situation by directing USDA to conduct regular cost of processing studies to enable regular make allowance updates. (These studies could be similar to the state-wide studies conducted by the California State Department of Food and Agriculture before California entered the Federal Order system in 2018.) In addition, Congress should direct USDA to collect cost information from any dairy processing plant that already provides pricing data under the Dairy Product Mandatory Reporting Program for the four products contained in current pricing formulas. This will ensure the resulting cost information reflects plants of different sizes and in different regions of the country.

Given the regulated pricing system, regular cost of processing updates will provide the dairy industry with valuable information to enable regular make allowance updates, remain viable and be positioned to grow in-line with market opportunities in the U.S. and around the world.

Reauthorize and Expand the Healthy Fluid Milk Incentives Projects (HFMIIP)

Congress adopted a Healthy Fluid Milk Incentives Projects in the 2018 Farm Bill authorizing USDA to test different methodologies to encourage participants in the Supplemental Nutrition Assistance Program (SNAP) to increase their purchases of fluid milk products as recommended by the *Dietary Guidelines for Americans* (DGAs).³ Approximately 90 percent of all Americans do not meet current U.S. recommendations for dairy consumption and only 65 percent of young children, 34 percent of adolescents, and about 20 percent of adults drink milk daily.⁴ As discussed earlier in my testimony, under-consumption of dairy products can contribute to negative health outcomes for Americans in all life stages, including SNAP beneficiaries.

Purchase incentive programs, like the HFMIIP, can help combat this trend by providing SNAP participants with financial encouragement to purchase healthy food for their families. Similar to the Gus Schumacher Nutrition Incentive Program (GusNIP) for fruits and vegetables, the HFMIIP provides SNAP households with financial incentives when they purchase qualifying fluid milk at authorized retailers. For example, when a SNAP beneficiary uses his/her benefits to purchase qualifying fluid milk, they receive a dollar-for-dollar coupon or point of sale credit that can be used to purchase another fluid milk or qualifying dairy product.

The Baylor Collaborative on Hunger and Poverty has been selected by USDA to administer the HFMIIP program. The initial four pilots were launched in Texas in May 2021 with another pilot added in September 2021. Nine more pilots were initiated earlier this month (eight in New Jersey and one in Texas) and another expansion of the program, which would include 33 additional retail outlets, is scheduled to begin in January 2023. In addition, USDA is expected to award additional funding by October that should allow approximately 250 new pilot projects targeting more regions of the country and different types of retailers, including convenience stores, rural retail chains and urban bodegas that are licensed to participate in SNAP.

USDA will be providing Congress with a report on this program by the end of 2022 but based on what we have observed in the initial pilots, our industry believes that the program should be reauthorized with dedicated funding, and that the program should be expanded to include other nutritious dairy products, like cheese and yogurt. Expanding the program would help more SNAP families achieve positive health outcomes due to increased dairy consumption. In addition, we would urge Congress to expand the definition of qualifying fluid milk products to include two percent and whole milk varieties given that more than 80 percent of American consumers choose these varieties in the grocery store. Dairy products of all fat levels add important and under-consumed nutrients to the diet, while an increasing number of peer-reviewed research shows that higher fat dairy products do not have a

²A total of 153 dairy plants were invited to submit data for the most recent USDA cost of processing study. Ultimately, data was provided by 10 cheddar cheese plants; 8 dry whey plants; 27 nonfat dry milk plants; and 12 butter plants for a total of 57 plants.

³Section 4208 of Public Law 115-334, the Agriculture Improvement Act of 2018, December 20, 2018.

⁴*Dietary Guidelines for Americans, 2020–2025*, p. 33.

negative effect on risk of obesity, cardiovascular disease or cardiometabolic risk markers.⁵⁻⁷

Permanently Authorize the Dairy Forward Pricing Program

Congress originally authorized the Dairy Forward Pricing Program in the 2008 Farm Bill, and it has been reauthorized in every farm bill since then. This program allows producers to voluntarily enter into forward price contracts with handlers for pooled milk used to manufacture Class II, III, or IV products. Current authority for this program expires on September 30, 2023. This means that no forward price contracts may be entered into under the program after that date, and no forward contracts under the program may be extended beyond September 30, 2026.

Making this program permanent could facilitate additional industry utilization of this risk management tool because it would mitigate concerns from potential parties regarding forward contracts with shorter durations due to a pending program expiration date. Failure to extend the program will remove a valuable risk management tool which is now available to producers and processors. Given that this program has nearly universal support among producers and handlers (buyers), we would recommend that Congress make this program permanent to make it an even more attractive risk management tool for our industry.

Dairy Donation Program

Mr. Chairman, we would also like to express our support for the Dairy Donation Program that was authorized as part of the Consolidated Appropriations Act of 2021. The purpose of this program is to facilitate the timely donation of eligible dairy products to food-insecure families and to prevent and minimize food waste. The Act provided \$400 million to fund this program.

Since the start of the COVID-19 pandemic, U.S. dairy producers and dairy foods companies have led efforts to feed the hungry and support struggling communities. The Dairy Donation Program has provided our industry with one more tool to reach Americans in need. The dairy industry welcomes the opportunity to continue to partner with nonprofits, charities, and other organizations working to combat hunger and nutrition insecurity. The Dairy Donation Program helps to ensure high-quality, nutritious products like milk, cheese, yogurt and more will get to those who need them most, while ensuring dairy foods processors receive a fair market value for their healthy products.

Milk Pricing

While the focus of this hearing is on dairy programs authorized in the farm bill, I would like to briefly discuss an important and increasingly urgent issue of shared interest for both dairy producers and their processor partners. To ensure our industry can continue to grow and prosper, regulated milk pricing formulas must be addressed.

Developed in the 1930s, USDA maintains the Federal Milk Marketing Order System that sets minimum milk prices that regulated processors must pay. Since 2000, formulas that back into minimum regulated milk prices based upon finished product values, have been used for some product groups. Specifically, milk used to produce the “market-clearing” products of cheese, whey, butter, and nonfat dry milk is priced based upon the net revenue as calculated by USDA. The key elements include: the average price received for those products nationally, the volume of those products assumed to be produced from a given volume of milk, and an assumed cost to convert raw milk into those products. Effectively, it is a system that directly transfers the market value of these products to dairy producers while allowing manufacturers of those products to retain only the assumed cost of manufacturing; this cost is commonly called a “make allowance”.

Current make allowances are based on 2006 and 2007 costs which are now more than 15 years old, rendering the assumed milk processing costs woefully out-of-date. Coupled with recent inflationary pressures, the need to address this lag is now extremely urgent. While our proposal to authorize USDA to conduct regular cost sur-

⁶ O'Sullivan T.A., Schmidt K.A., and Kratz M. *Whole-Fat or Reduced-Fat Dairy Product Intake, Adiposity, and Cardiometabolic Health in Children: A Systematic Review*. ADV. NUTR. 2020; 00: 1–23.

⁷ Duarte C., Boccardi V., Amaro Andrade P., Souza Lopes A.C., Jacques P.F. *Dairy versus other saturated fats source and cardiometabolic risk markers: Systematic review of randomized controlled trials*. CRIT. REV. FOOD SCI. NUTR. 2021; 61: 450–61.

veys will eventually provide data to address this in the longer term, steps must be taken now to ensure adequate processing capacity remains.

Updating make allowances to reflect current costs will enable producer milk to have a home. As the out-of-date make allowances make it difficult for dairy processors to justify capital investments, industry growth is threatened. Further, without an update, farm-level resources will be underutilized and there will be less opportunity for longer-term job growth. This scenario also has the potential to price U.S. exports out of global markets and could even lead to increased imports of certain dairy products. Such a result would represent a major setback for the U.S. dairy industry given our decades-long focus and clear opportunity to become the world's dominant dairy supplier. Finally, if U.S. milk production is limited, prices for milk, cheese and other dairy products will increase, hurting consumers who are already paying more for food purchases due to ongoing inflationary pressures.

In addition, given that dairy producers and their cooperatives own a significant number of cheese/whey plants and especially butter/powder manufacturing facilities, producers who belong to a manufacturing cooperative will benefit from accurate make allowances, as well. Accurate make allowances would match cooperatively owned manufacturing costs and eliminate the need for those cooperatives to "re-blend" (withhold dollars from producer pay prices) to cover manufacturing losses. Updating make allowances to fully reflect today's manufacturing costs would put the farmer owners of manufacturing cooperatives back on even footing with producers who ship to marketing—only cooperatives (cooperatives that do not own processing facilities).

More broadly across dairy processing, additional issues exist, as well. Bankruptcies in the bottling (fluid milk) sector further illustrate updates are needed to ensure dairy processing remains healthy and viable for producers to have adequate outlets for their milk. Updates to the system will help ensure nutritious dairy remains affordably available to American consumers and for export markets beyond.

I am happy to report that discussions are currently underway within our industry to address this issue in the short-term. Processors and dairy cooperatives are working to develop a proposal that can be considered as part of a Federal Order hearing as Secretary Vilsack has stated USDA will not convene a hearing unless processors and producers reach consensus on a proposed solution. While industry discussions are ongoing, we have not yet reached an agreement on a path forward. I urge Congress to allow this collaborative effort to continue and not to address any milk pricing issues legislatively unless they are supported by all segments of our industry. This type of intervention could have unintended consequences, including the creation of artificial price signals that could lead to over-production and allow for market manipulation. That said, prompt resolution to these issues via a hearing remains urgent for our dairy industry.

Thank you for the opportunity to appear before you today. I will be happy to answer any questions you may have.

The CHAIRMAN. Thank you. And now, Mr. Forgues, please begin when you are ready.

**STATEMENT OF TRAVIS FORGUES, EXECUTIVE VICE
PRESIDENT OF MEMBERSHIP, ORGANIC VALLEY | CROPP
COOPERATIVE, LA FARGE, WI**

Mr. FORGUES. Good morning, Chairman Scott, and all Committee Members. My name is Travis Forgues. I have served as Executive Vice President of Membership for Organic Valley since 2013, but more importantly, before that, I was an organic dairy farmer from Alburg Springs, Vermont for 16 years, and yes, I still miss our cows. Organic Valley is a marketing cooperative with nearly 1,800 farmers in 34 states. We are predominantly dairy and market Organic Valley branded products, as well as ingredients for commercial dairy buyers. We own three dairy processing facilities and work with dozens of co-processors across the U.S.

The organic dairy sector witnessed a demand surge as COVID-19 first gripped the nation. Consumer purchasing patterns changed, and, according to the Organic Trade Association survey data, average annual category growth was around 5½ percent for

2020 and 2021 combined. That said, the most recent data shows growth is flat, but we at Organic Valley continue to meet our sales expectations, indicating some of those purchasing shifts to value-added dairy are persisting.

While the co-op is cautiously optimistic about the demand for organic dairy, and, in fact, is bringing on 58 additional farms in the Northeast who will be shipping with us by August, we must note serious headwinds, primarily driven by inflation and international disputes, which threaten the organic dairy marketplace. For context, Organic Valley's transportation costs to get goods to retail has increased 36 percent. Dairy processing costs are up 14 percent and climbing. Organic corn, soy, and hay are up 30, 55, and 48 percent respectively, with some regional variability. Farm pay prices for our farmers have increased slightly, and we are planning to expand the volume of milk we procure from membership four percent by the end of 2023.

To mitigate some of these incurred costs, we have increased consumer prices for our branded products as much as 8 to 14 percent for some items. Some of these price increases are just hitting the marketplace now, so it is unclear how they will be received. These increases are meant to cover co-op operating expenses and are not nearly enough to move resources back to farms that are wrestling with high fuel and high feed costs. The honest reality is the current environment is very daunting for many organic dairy farmers.

For the next farm bill, we urge the Committee to focus on efforts to bring stability for small farms and their supply chain partners, and to strengthen dairy farm resilience. Dairy farming and the dairy industry differ across the U.S. Crafting a national farm policy that spans those variances is a difficult, if not near impossible, proposition. One recent policy development in the last farm bill was the Dairy Business Innovation Initiative, which seeks to address region-specific needs of the industry. Currently there are four initiatives anchored in the States of Vermont, Wisconsin, Tennessee, and California. We urge a reauthorization and expansion of the Dairy Business Innovation Initiative to better service region-specific dairy opportunities and challenges. These initiatives convene farmers, industry partners, and academia with funding to tackle production, processing, and marketing needs of dairy specific to each individual initiative's coverage area.

As we all know, dairy farming is more than just cows and milk, and we believe U.S. farm policy must be intent on leveraging greater sustainability so agriculture can better absorb the shocks of weather, markets, and unforeseen conflicts, be it a pandemic or geopolitical dispute. We must create a more resilient food system. The farm bill should seek to expand the Rural Energy for America Program. Let us get renewable energy on every dairy farm that wants it. We can better support grass-based farming systems. Let us get more animals on the land in a way that provides stacked environmental benefits. Needed is technical assistance, structural cost-sharing provisions, and new technologies. Standardize the accounting and verification of carbon reductions measures in agriculture. Policy and oversight is needed to level set-carbon markets. In agriculture, some commodity and product claims on carbon reductions are reliable. And maximize regenerative farming ap-

proaches. Prioritize manure management techniques, such as composting, and other soil health practices that lessen dependence on off-farm crop inputs.

In conclusion, I cannot overemphasize the need to focus intently on keeping small family farms viable in this next farm bill. They are the social and economic engine of rural communities across this country. It is vital we work together to help these families stay on the land, providing nutritious food and economic opportunities for today, and in the future. My written testimony provides greater details on investments to support organic dairy producers and dairy industry participants. Thank you for the opportunity to provide remarks, and I welcome any questions from Committee Members.

[The prepared statement of Mr. Forgues follows:]

PREPARED STATEMENT OF TRAVIS FORGUES, EXECUTIVE VICE PRESIDENT OF MEMBERSHIP, ORGANIC VALLEY |CROPP COOPERATIVE, LA FARGE, WI

Good morning, Chairman Scott and Committee Members,

I have served as Executive Vice President of Membership for Organic Valley since 2013 and oversee all cooperative membership engagement which includes 167 staff that are responsible for dairy hauling and scheduling, farmer resources, field operations, data analytics, milk management and farmer payroll, feed, meat and produce programs as well as farmer governance and communications.

Before employment at the co-op, I was a farmer-member and the first organic dairy farmer to join the cooperative from Vermont. Between 1999 and 2013 as a farmer-member, I pioneered the co-op's young farmer leadership program, Generation Organic™ (Gen-O™), served on the co-op's board of directors and dairy executive committee, and was active in the Farmers in Marketing program.

Organic Valley |CROPP Cooperative was established in 1988 in southwestern Wisconsin with seven farmer-members. Today, with sales topping \$1.2 billion, the cooperative has nearly 1,800 farmer-members in 34 states and four countries. Focused predominately on organic dairy, the cooperative works with dozens of dairy processors nationwide to manufacture an array of Organic Valley branded products as well as bulk and ingredient commercial offerings. The cooperative maintains three dairy processing facilities in two states as well as two subsidiaries, a distribution company called Organic Logistics and a meat business called Organic Meat Company.

Organic Valley |CROPP Cooperative's mission is to create and operate a marketing cooperative that promotes regional farm diversity and economic stability by the means of organic agricultural methods and the sale of certified organic products. The average size herd on a CROPP Cooperative dairy farm is 78 cows.

State of Organic Dairy

The organic dairy sector witnessed a demand surge as the COVID-19 pandemic first gripped the nation. Consumer purchasing patterns shifted and according to the Organic Trade Association survey data,¹ average annual category growth was around 5.5% for 2020 and 2021 when combined. That said, the most recent data shows growth is flat, but we at Organic Valley continue to meet our sales expectations indicating some of those purchasing shifts to premium dairy are continuing.

While the co-op is cautiously optimistic about the demand for organic dairy, and in fact is bringing on 58 additional farms in the Northeast who will be shipping with us by August, we must note serious headwinds driven by inflation and international disputes threaten the organic dairy marketplace.

For context:

- Transportation costs to get goods to retail has increased by 36%
- Dairy processing costs are up 14% and climbing
- Organic corn, soy, and hay are up 30%, 55% and 48% respectively with some regional variation
- Farm pay prices for us have increased slightly and we are planning to expand the volume of milk we procure from membership 4% by the end of 2023

¹<https://ota.com/news/press-releases/22284>.

To mitigate some of these incurred costs, we have increased consumer prices for our branded products as much as 8% to 14% for some items. Some of these price increases are just hitting the marketplace now, so it's unclear how they will be received. These increases are meant to try to cover co-op operating expenses and are not nearly enough to move resources back to farms that are wrestling with high fuel and high feed costs.

The honest reality is the current environment is very daunting for many organic dairy farmers.

Dairy and Farm Program Review

For the next farm bill, we urge the Committee to focus on efforts to:

- (1) bring greater stability for small farms and their supply chain partners
- (2) strengthen dairy farm resilience

Dairy Business Innovation (DBI) Initiatives

Dairy farming and the dairy industry differ across the U.S. Crafting a national farm policy that spans those variances is a difficult, if not nearly impossible, proposition. One recent policy development in the last farm bill was the Dairy Business Innovation Initiative which seeks to address region-specific needs of the industry. Currently, there are four initiatives anchored in the states of Vermont, Wisconsin, Tennessee, and California. These initiatives convene farmers, industry partners, and academia to tackle production, processing, and marketing needs of dairy, specific to each individual initiative's coverage area.

We urge a reauthorization and expansion of the Dairy Business Innovation Initiative. Specific improvements include:

- Provide an authorization for appropriations of \$30 million each fiscal year
- Instruct USDA to ensure DBI's engage a broad range of stakeholders in programming, grant-making, and priority setting, and to hold an annual public session to assess the previous year's outcomes and to solicit comments on how the funding of awards should be determined
- Review distribution of DBI funding across the four initiatives to understand the scale of results for relevant populations (dairy farmers and dairy processors) served
- Consider adjusting maximum award caps for DBI funded projects and allow minor construction costs, up to \$10,000, be eligible for program funding.

Maintain the Dairy Margin Coverage (DMC) Program. Organic Valley supports the DMC as it is currently offered. We believe the two tiers and premiums levels are scaled appropriately, and the program is an option for producers who wish to mitigate risk when facing a margin condition of high feed costs and low milk price that would be especially traumatic for independent, family-scale dairy operations. While not a perfectly aligned tool for organic producers, who must graze cattle to meet organic diet requirements and are only tangentially impacted by national feed and milk prices, hundreds of our members are enrolled in the program.

We acknowledge the DMC only encompasses a feed-milk price margin dynamic and with inflationary pressures impacting most dairy farm inputs, the DMC is ill equipped to aid producers with other substantial variable costs.

A recent analysis, "U.S. Dairy Market and Policy Overview"² out of the University of Illinois, provided observations that small farms may receive less protection against declines in net returns compared to larger farms. Their summary observations are outlined below.

Summary Observations

Since the U.S. began transitioning to a milk payment program from a milk price support program in the late 1990s, variability of milk price and net return has increased notably.

Analysis in this article suggests a program that bases dairy policy payments on the milk price-feed cost margin, such as the current DMC program, provides the most protection against decline in milk profitability for the largest dairy farms. Protection is notably less for dairy farms with less than 50 cows, with some slippage for dairy farms with 50–99 cows.

²Zulauf, C., G. Schnitkey, K. Swanson and N. Paulson. "US Dairy Market and Policy Overview." (<https://farmdocdaily.illinois.edu/2021/11/us-dairy-market-and-policy-overview.html>) FARMDOC DAILY (11): 158, Department of Agricultural and Consumer Economics, University of Illinois at Urbana-Champaign, November 22, 2021.

This finding prompts a policy equity issue: “Should dairy policy be fair across herd sizes?”

If policy deliberations conclude that this fairness issue should be addressed, a per cow payment for a policy specified, limited number of cows per dairy operation is a potential policy option.

This policy option is in essence a policy addendum to DMC to mitigate an equity issue created by DMC without changing DMC.

It could be implemented by basing the per cow payment on the decline in net return not covered by the change in DMC’s milk-feed margin for dairy operations with less than a given number of cows.

Payment could be restricted to herds with less than the given number of cows. However, such limits are usually difficult to effectively implement because farms rearrange their operation to qualify for payments. A per cow payment up to the given number of cows could thus be made to all dairy operations. Small dairy farms would however receive the greatest benefit since a larger share of their cows receive a payment.

Organic Valley would support Committee exploration of such a policy addendum to DMC that creates a threshold to trigger a per-cow payment at an established number of cows to address the other costs dairy farmers are incurring in the current environment and to ensure greater program equity for small farms.

Organic Valley also supports testimony provided by International Dairy Foods Association, and in particular the *Healthy Fluid Milk Incentives Projects* request. We have maintained an active membership in the trade association where dairy pricing, trade, and industry affairs are frequently discussed.

Dairy Resilience and Dairy Sustainability

As we all know, dairy farming is more than just cows and milk, and we believe U.S. Farm Policy must be intent on leveraging greater sustainability so agriculture can better absorb the shocks of weather, markets, and unforeseen conflicts—be it a pandemic or geo-political dispute. We must create a more resilient food system.

Farm policy concepts to maintain or enhance include:

Rural Energy for America Program

We should strive to get renewable energy on every dairy farm that wants it. Reforms should include:

- **Increase REAP funding to \$300 million per year**—Currently, REAP is at \$50 million per year but the program is historically oversubscribed
- **Increase cost-share**—REAP cost-shares only 25% of a renewable energy project’s cost. This is dreadfully low compared to other USDA farm conservation and value-added programs. To serve more applicants and accelerate technology adoption, Federal cost-share for grants should be increased to 50%
- **Invest in staff and outreach**—Reforms should provide specific direction and resources to USDA on staffing state RD offices with energy specialists. Coordination between other USDA agencies should be enhanced
- **Enhance programmatic elements to ensure family farmers and solar options receive fair recognition**—REAP applicants are judged in part by whether their renewable energy system could replace 100% of a farm’s energy use and whether it can pay for itself within 10 years. However, some utility companies impose net metering limits that discourage farmers from building systems big enough to meet those criteria. These scoring limitations must change since they are out of an applicant’s control. An additional priority should be made to resource technologies and projects with strong net greenhouse gas emissions reductions.
- Enable program components like Reserve Fund and REAP Rebate to leverage clean technology deployment
- **Expand REAP access and equity**—Consider creating set-asides (5% to 10%) of total yearly funds or institute more favorable cost-share terms for Black, Indigenous, and people of color farmers/business owners as well as beginning farmers and ranchers
- **Recalibrate thresholds for the smaller project funding pool**—Increase the maximum award request in the smaller project funding pool from \$20,000 and under to \$40,000 and under. A simple adjustment for inflation since the program’s start would validate an increase and reflect the overall needs of farmers and rural businesses in this category of need

Grass-based Farming Systems

Grass-based livestock systems create a landscape that, when properly managed, is environmentally friendly and can be more resilient to major weather events. Within organic dairy, grazing is required as part of the regulation but complementary support to maximize grazing efficacy is severely lacking. The right recipe of public and private signals can help farmers succeed at incorporating more grass-based production on their farms, be it organic or non-organic. Finding the appropriate public policy incentives and economic footing for this system deserves greater attention. Policy options should include:

- Expand the Grazing Lands Conservation Initiative with \$50 million per year in mandatory farm bill funding. The Federal farm bill's Grazing Lands Conservation Initiative (GLCI) once functioned as a powerful tool that enabled states to effectively deliver tailored education and technical assistance to farmers wanting to graze more effectively. GLCI is a specific allocation to USDA's NRCS that, in turn, is offered to state grazing networks, consortiums, extension services, and conservation entities that are providing hands-on grazing support.
- GLCI was resourced for over a decade, reaching \$27 million by 2008, but over the last 14 years it has only received minor funding. With climate challenges and growing interest demonstrated by producers and consumers for animal products from grass-based systems, the time is now to unleash this once popular and effective effort by rebirthing GLCI at \$50 million a year. Successful transitions to management intensive rotational grazing (MIRG) are characterized by mentorship, education, and resources. A study in Alabama revealed educational events had a positive impact on farmers cultivating appropriate grass types, adopting MIRG and associated technology, and increase their household income. The study emphasized the need for small farm outreach through education and technical support.³
- Prioritize NRCS Financial Assistance to expand the infrastructure for grass-based livestock systems. The Federal farm bill also includes substantial funding for working lands conservation, including grazing, through the Environmental Quality Incentives Program (EQIP) and the Conservation Stewardship Program (CSP). In fact, in the most recent iteration of the farm bill (2018), Congress specifically directed NRCS to make higher incentive payments (a 50% bonus) for advanced grazing management, including MIRG, within the CSP.

NRCS with instruction from Congress can further support sustainable grazing by directing that:

- Half of EQIP funding, offered annually to support animal agriculture, be dedicated to grazing infrastructure and management.
- A wider range of advanced grazing enhancements be added to CSP with robust payment levels.
- CSP payments for the annual management of previously adopted conservation measures pay at cropland rates whenever cropland is used for pasture.
- Restore the CSP funding that was cut in 2018.
- Enhance Risk Management Agency products for grazing systems that are underutilized. The USDA Risk Management Agency (RMA) launched the Pasture, Rangeland, Forage (PRF) Pilot Insurance Program in 2017. The program exists to insure farmers against drought by calculating forage losses based on lack of precipitation per grid area. To date, the program has been under advertised and underutilized.⁴ USDA should further invest in risk management by creating greater incentives for PRF enrollment and increasing accessibility and awareness of the program.

RMA should consider cooperative agreements with organizations and agencies to elevate PRF. Incentives might also be offered to crop insurance agents to encourage them to more actively seek clients.

USDA should also expand and make permanent the June 1, 2021, RMA action that provides farmers who planted cover crops during the 2021 crop year

³Karki, Lila and Uma Karki. "Impact of an Educational Program on a Year-Round Forage Production and Grazing Management System in Alabama." *Professional Agricultural Workers Journal*. 7(1): 49–64. 2019. ageconsearch.umn.edu/record/301211/.

⁴"Pasture, Rangeland, Forage Pilot Insurance Program." Risk Management Agency. USDA. Aug. 2017. <https://www.rma.usda.gov/Fact-Sheets/National-Fact-Sheets/Pasture-Rangeland-Forage-Pilot-Insurance-Program>.

with a \$5 per acre insurance premium discount.⁵ Moreover, given the even greater climate mitigation potential of carefully managed grass-based agriculture, a similar or even greater premium discount should be offered for PRF policies.

- Launch a \$100 million national research initiative to enable adaptive grazing systems in the U.S. The next farm bill should look to establish a cross-cutting research initiative for adaptive grazing systems within the USDA Research, Education, and Economics mission area. With the use of National Institute of Food and Agriculture (NIFA) competitive grants, primary research at the Agriculture Research Service, and cooperative agreements with nonprofit and community organizations with relevant expertise, the nation can:
 - Expand the body of grazing knowledge and learning opportunities for farmers, ranchers, and those assisting producers
 - Leverage technology adoption for more effective pasture management.
 - Optimize forage types for specific livestock, locations, and environmental stresses.
 - Seek ways to better quantify carbon sequestration and the climate science of grass-based systems along with the value of other stacked conservation benefits
 - Enhance farmer and rancher profitability and the reporting of market trends for grass-fed meat and dairy products
- Establish enforceable USDA animal-raising claim standards for grass-fed to govern the labeling of all meat and dairy products. Fraudulent or misleading product labels and claims cost farmers who are following strict standards tremendously in lost sales and income. USDA's Food Safety Inspection Service should work cooperatively with the USDA's Agricultural Marketing Service (AMS) to establish strong, clear standards and auditing and verification procedures, including the option of third-party certification.

Standardize the accounting and verification of carbon reductions measures in agriculture

Policy and oversight are needed to level set-carbon markets in agriculture so commodity and product claims on carbon reductions are reliable and transparent. Along with other stakeholders, we continue to believe a normalized science-based accounting for carbon capture and reduced GHG emissions is paramount. Congress should instruct USDA to advance this positioning.

Maximize regenerative farming approaches

Regenerative agriculture solutions are *already* embedded in Federal farm conservation programs and should be scaled up through existing pathways within the upcoming farm bill.

The following practices should be prioritized for funding and are useful to organic dairy operations:

- Cover Crops
- Crop Rotation
- Organic Amendments
- Conservation Tillage
- Livestock Integration & Prescribed Grazing
- Manure Collection and Storage Improvements
- Agroforestry
- Compost Application

Beyond the aforementioned practices, we recognize there is a large gap in technical assistance to meet the needs of organic dairy farmers across production systems, scales, and geographic regions. We recommend maintaining the Conservation Innovation Grants and Regional Conservation Partnership Program as well as making permanent the new USDA programming for organic transition that was announced June 1, 2022 as part of the "Framework for Shoring Up the Food Supply

⁵"Pandemic Cover Crop Program." Risk Management Agency. USDA. Jun. 2021. <https://www.rma.usda.gov/en/Fact-Sheets/National-Fact-Sheets/Pandemic-Cover-Crop-Program>.

Chain and Transforming the Food System to Be Fairer, More Competitive, More Resilient”,⁶

In addition, Congress should evaluate existing state programs like the Alternative Manure Management Program being used by dairy farms in California to modernize and retrofit manure handling systems that benefit the local and global environment. Creating a Federal version of the California program would be of great benefit to small dairy farms and climate-smart agriculture.

Organic Agriculture Specific Dairy Features

Organic Valley applauds the USDA for publishing the Origin of Livestock final rule in March 2022. The long-awaited final rule clarifies the expectation for how operations source and transition dairy animals for organic milk production. This rule-making was in process for 7 years and regrettably created competitive harm among industry participants during that period of time. It underscores a more systemic challenge in USDA’s ability to update organic practice standards to reflect industry and consumer expectations of certified organic.

Organic Valley strongly supports the Continuous Improvement and Accountability in Organic Standards Act (HR 2918). The bill puts in place an improved Federal process by requiring USDA to:

- Issue and Organic Improvement Action Plan
- Develop a framework to advance standards updates when affirmative recommendations are made by the National Organic Standards Board
- Conduct specific review of certifier’s actions regarding the interpretation and implementation of new standards; and requires an annual report to Congress on the National Organic Program action plan and activities in rulemaking and standards development

Additionally, we support maintaining the National Institute of Food and Agriculture, Organic Research and Extension Initiative baseline funding of at least \$50 million annually in next farm bill, and would encourage you to increase this to \$100 million annually over time. This program has resourced numerous organic dairy research projects at land-grant universities throughout the nation. Last, the co-op supports all efforts to simplify and streamline both the National Organic Certification Cost-Share Program, and the Organic and Transitional Education and Certification Program administered by USDA.

Thank you for the opportunity to provide both oral and written testimony for the “A 2022 Review of the Farm Bill: Dairy Provisions.” I welcome any additional questions or follow-up from Committee Members as you take on the monumental task of developing the next farm bill.

Dairy Farm Representation

Sustainability

The CHAIRMAN. Thank you very much. And now, Dr. Bozic, please begin when you are ready.

**STATEMENT OF MARIN BOZIC, PH.D., ASSISTANT PROFESSOR,
DEPARTMENT OF APPLIED ECONOMICS, UNIVERSITY OF
MINNESOTA, ST. PAUL, MN**

Dr. BOZIC. Chairman Scott, Ranking Member Thompson, Members of the Committee, thank you for inviting me to participate in this hearing. I am employed as an Assistant Professor in the Department of Applied Economics, University of Minnesota. I have been on faculty for 11 years. My research focuses on dairy markets, risk management, and dairy policy. I am going to talk about two topics, DMC, and then Federal Orders.

Agriculture Improvement Act of 2018 substantially reformed the dairy safety net by transforming poorly functioning Margin Protection Program into highly effective Dairy Margin Coverage Program. At the highest coverage level, \$9.50 per hundredweight, DMC provides coverage for 20 percent of U.S. milk production. Had DMC been in effect for the last 21 years, since year 2000, its benefits would exceed costs to producers in 19 out of 21 years. Last year it paid over \$1 billion to producers. This year no payments are estimated, per my model, due to high projected margins.

Several research papers in prior years have expressed concerns that DMC may provoke additional milk supply, however, due to widespread use of processor-level supply management programs introduced during COVID, I do not believe that DMC will cause oversupply, even if rules regarding updates to individual production history were to be further relaxed. By and large, Dairy Margin Coverage appears to be effective in accomplishing the legislative intent.

On Federal Milk Marketing Orders, in 2018 U.S. Congress modified the formula used to calculate the price that fluid milk processors must contribute to Federal Order pools. The reason for the change was to facilitate hedging of raw milk purchases by non-traditional fluid milk processors, such as large restaurant and coffee house chains. The hope was that such change would increase fluid milk sales, and thus increase Federal Order benefits to dairy producers. And, to simplify, as long as prices of cheese and milk pow-

ders would move in the same direction, and with approximately the same intensity, there was little to lose, and potentially much to gain, from the fluid milk formula change. Unfortunately, the pandemic affected cheese and milk powder markets in a profoundly different way. Federal Government intervention through Farmers to Families Food Box Program dramatically increased cheese prices, while milk powder prices were not affected. The new formula resulted in substantially lower milk checks, and a widespread sense of injustice among producers in fluid heavy areas.

There are several broad aspects of this issue that should be considered in future reforms. First, lack of wide public debate on proposed reforms increases odds of a fragile or flawed policy design. Federal Orders have comprehensive protocol for instituting changes through an industry hearing process, and legislative changes are best left for changes that cannot be done through a hearing. Second, to the maximum extent possible, the next farm bill should not make risk management less effective, either for dairy producers or dairy processors. And finally, no reform can be considered complete until it fully contemplates the long-term trends in U.S. dairy markets. My estimates are that over the next 10 years the share of U.S. milk production utilized in beverage milk is likely to fall from 18.3 percent this year to 14.5 percent 10 years from now.

Last year we crossed a major milestone. We now export more milk solids than we consume domestically in beverage milk products. My estimates are that, over the next 10 years, between 45 and 60 percent of all additional skim milk produced because our cows are getting better, that will need to be exported. And if our regulatory framework remains centered on prescribing minimum prices for raw milk consumed domestically in beverage milk products, it will be increasingly irrelevant for the majority of U.S. regions where milk is primarily used in manufactured dairy products. The ultimate question we must ask is the following. Do Federal Milk Marketing Orders suffice, today and in the future, to deliver fair milk prices to dairy producers? I lack confidence to answer that question in the affirmative.

The critical missing ingredient is vibrant competition for farm milk. Today it is extremely difficult for most producers to switch from their current buyer to another one. Anecdotal evidence, from conversing with dairy producers, consultants, and educators, suggests that—some presence of anti-competitive behavior from some processors. Some dairy producers have confided to me that when a prospective milk buy was willing to take them on as a patron, their current milk buyer stopped that from happening. Farmgate price discovery is also challenged by the lack of competition. If a corn producer wishes to know how different local elevators would pay for corn, all they need to do is go online, or tune in to their local radio station. In contrast, when some dairy producers have asked their milk—their consultants or educators for milk pricing—milk price benchmarking information, those service providers have, in multiple instances, faced tacit disapproval, or even aggressive legal threats, from some dairy processors.

Now, we should not rush to generalize from anecdotal evidence, but, in my opinion, it would also be prudent not to ignore it. Fur-

ther research, and an honest debate on competition in dairy, is merited. Thank you for the opportunity to appear here today.

[The prepared statement of Dr. Bozic follows:]

PREPARED STATEMENT OF MARIN BOZIC, PH.D., ASSISTANT PROFESSOR, DEPARTMENT OF APPLIED ECONOMICS, UNIVERSITY OF MINNESOTA, ST. PAUL, MN

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for inviting me to participate in this hearing.

I am employed as an assistant professor in the Department of Applied Economics at the University of Minnesota. I have been on the faculty at the university for 11 years. My research focuses on dairy markets, risk management and dairy policy. I frequently collaborate with the U.S. Department of Agriculture to research policy-relevant issues and develop risk management tools for dairy producers. Outside of my academic appointment, I support the U.S. livestock sector as the principal of Bozic LLC, a consultancy and technology company that designs and maintains all three livestock insurance plans currently supported by the Federal Crop Insurance Corporation: Dairy Revenue Protection, Livestock Risk Protection, and Livestock Gross Margin. As an insurance designer, it is my role to collaborate with the USDA Risk Management Agency to ensure that these programs are actuarially fair and effective for reducing risk in the livestock sector and that policy rules promote program integrity. I also regularly help industry groups understand dairy regulation in the U.S. and overseas. I appear in front of you today representing myself, as an independent academic researcher and a public servant employed at a land-grant university. My statements do not represent the opinion of the University of Minnesota or any other entities in which I have a financial or business interest.

This testimony summarizes my evaluation of two dairy policy reforms passed in the Agricultural Act of 2018: Dairy Margin Coverage (DMC) and Federal Milk Marketing Orders.

Dairy Margin Coverage

The Agricultural Act of 2018 substantially reformed the dairy safety net, by transforming the poorly functioning Margin Protection Program into the highly effective Dairy Margin Coverage (DMC) program. Dairy Margin Coverage indemnifies participating dairy producers when the national average income over feed cost margin falls below the coverage level chosen by the producer (Congressional Research Service, 2019). The 2018 reform increased the maximum coverage level from \$8.00/cwt to \$9.50/cwt and authorized the change in the feed cost formula to include dairy-quality hay prices instead of ordinary alfalfa hay prices.

From January 2019 through April 2022, DMC margins averaged \$8.95/cwt. Margins were lower than \$9.50/cwt in 23 months, or 57% of the time. DMC participation peaked in 2021 at 46.2 billion pounds covered at the highest coverage level, \$9.50/cwt. That represented 20.4% of U.S. milk production. For 2022, 43 billion pounds were covered at the \$9.50/cwt level, representing 19% of estimated 2022 U.S. milk production.

Had DMC been in effect since 2000, over the previous 21 years the program would have had a major impact on net farm income of participating dairy operations. An operation that could cover 95% of their milk marketings at \$9.50/cwt would have seen their net farm income over 2000–2021 period increased on average \$1.40/cwt. Benefits received by producers would be higher than premiums paid into the program in 19 out of 21 years. In 2021, the program paid over \$1 billion in indemnities. For 2022, no payments are estimated due to high projected margins. One of the goals of the DMC program was to slow down the pace of consolidation in the dairy sector. In 2018, U.S. lost 3,261 dairies. Per the latest data available in 2021, the number of farms that exited the sector is only 1,794 dairies.

Several research papers in prior years have expressed concerns that DMC may provoke additional milk supply (Mark, *et al.*, 2016; Nicholson and Stephenson, 2014; Raghunathan, 2014). However, in the aftermath of pandemic disruption of the dairy supply chain, many dairy buyers have introduced supply management plans that help them align the growth in milk supply with growth in demand for their dairy products. As such, I do not believe that DMC will cause oversupply, even if rules regarding updates to individual production history were further relaxed.

By and large, DMC appears to be effective in accomplishing the legislative intent. DMC payments substantially stabilized net farm income for dairies with herd sizes up to 250 cows, and consolidation pace has slowed down. Fixed coverage levels and premium rates keep this program simple and affordable to dairy producers, however

those same design choices may reduce program effectiveness if inflationary pressures persist.

Federal Milk Marketing Orders

Federal Milk Marketing Orders (FMMO) are one of the primary dairy policies in the United States (Bozic and Wolf, 2022). FMMOs are often portrayed as a Byzantine set of regulations that cannot be explained easily. In fact, central premises of FMMOs are common sense and easy to describe. First, FMMOs start from the assumption that the fair commodity value of farm milk can be derived from wholesale prices of commodity dairy products, net of processing costs and reasonable returns to capital invested in manufacturing capacity. If a dairy plant is making undifferentiated, commodity cheddar cheese and dry whey powder, then per FMMO principles, it would be fair to pass most of the revenue from sales of those products to dairy producers. Processors thus get a stable profit margin, and producers get a major share of the wholesale value of dairy products. In contrast, if a processor is making a branded, differentiated product such as aged cheddar cheese mixed with Italian herbs, then the processor has added substantial value above and beyond commodity products, and most of that added value and risk associated with uncertain additional revenue should be kept by the processor, other than unregulated milk premiums needed to attract sufficient milk supply. Another principle of FMMOs is that beverage milk is a superior food that should never be in short supply, and fluid milk manufacturers should never be able to use their market power to pit one dairy producer against another to reduce the input cost, and thus increase the spread between wholesale price of beverage milk and farmgate price of raw milk.

The way these principles are implemented in practice is through establishment of geographically bounded Marketing Orders and requiring milk processing plants converting raw milk to beverage milk products to participate in the Marketing Order. For all other milk processing plants, participation is voluntary, incentivized by the prospect of sharing in revenue generated through sales of beverage milk products. The desired outcome is that all producers in a certain geography get at least the market-average commodity value of milk, referred to as the uniform milk price.

FMMOs start from a set of farmer-friendly ideas and have been successful in regulating orderly marketing of milk, which is why they have persisted as a collective bargaining institution for almost a full century. In recent years, FMMOs have somewhat lost their luster due to declining sales of beverage milk products. In late 1990s, when the last major FMMO reform was passed by Congress, beverage milk share of all-milk regulated under FMMOs was higher than 45%. In recent years, that share has fallen to less than 30%. In my opinion, in regions other than Northeast and Southeast, fluid milk sales no longer provide strong enough incentives for dairy manufacturers to choose to stay consistently regulated under FMMOs.

In 2018, upon the request of the National Milk Producers Federation and International Dairy Foods Association, Congress modified the formula used to calculate the price that fluid milk processors must contribute to FMMO pools. The reason for the change was to facilitate hedging of raw milk purchases by non-traditional fluid milk processors, such as large restaurant and coffeehouse chains (Bozic and Gould, 2019). The hope was that such a change would increase fluid milk sales, and thus increase FMMO benefits to dairy producers. Prior to 2019, when the change took effect, fluid milk skim price was based on the higher of the commodity value of skim milk in cheese and whey (Advanced Class III Skim Milk Price) and the commodity value of skim milk in nonfat dry milk powder (Advanced Class IV Skim Milk Price). Since May 2019, the formula is changed to be equal to the average of Advanced Class III and IV Skim Milk Price plus \$0.74/cwt. The change would result in a higher milk check to dairy producers whenever the difference between Advanced Class III and IV Skim Milk Prices is less than \$1.48/cwt. From January 2000 through December 2018, this difference was lower than \$1.48/cwt over 60% of months and never higher than \$6.77/cwt. To simplify, for as long as prices of cheese and milk powders would move in the same direction and with approximately the same intensity, there was little to lose, and potentially much to gain from the fluid milk formula change. Unfortunately, the pandemic affected cheese and milk powder markets in a profoundly different way. By May 2020, all dairy product prices collapsed due to COVID-19 lockdowns, and the June 2020 Base Class I price (based on mid-May dairy product prices) was higher under the new formula than under the old formula. However, Federal Government intervention through Farmers to Families Food Box Program dramatically increased cheese prices, while milk powder prices were not affected. From July to December 2020, in all months other than October, the spread between Advanced Class III and Class IV Skim Milk Price was much higher than the historic record spread observed prior to December 2018. The new

formula resulted in substantially lower milk checks and a widespread sense of injustice among producers in fluid-heavy areas. Consequently, some producer groups have started demanding the return to 'higher-of' formula in force prior to 2019. There are several broader aspects of this issue that should be considered in future reforms. First, lack of wide public debate on proposed reforms increases odds of a fragile or flawed policy design, and lack of grassroots support for the mechanism in changing markets. FMMOs have a comprehensive protocol for instituting changes through an industry hearing process. Legislative changes are necessary only for changes that cannot be done through a hearing. The Class I milk price formula can be modified through a hearing process. Second, low elasticity of supply combined with low elasticity of demand for dairy products virtually guarantees that milk prices will have high volatility. To the maximum extent possible, the next farm bill should not make risk management less effective, either for dairy producers or dairy processors.

Finally, no reform can be considered complete unless it fully contemplates the long-term trends in U.S. dairy markets. My estimates are that over the next 10 years, the share of U.S. milk production utilized in beverage milk products is likely to fall further, from 18.3% in 2022 to 14.5% by 2032. Last year we crossed a major milestone: U.S. is now exporting more milk solids than are used for beverage milk products. Going forward, dairy exports will be critical for maintaining profitability. Recent estimates are that over the next decade, 45–60% of all add additional skim solids produced due to improved cow productivity will need to be exported (Bozic and Blimling and Associates, 2022). If our regulatory framework remains centered on prescribing minimum prices for milk consumed domestically in beverage milk products, it will be increasingly irrelevant for majority of U.S. regions where milk is primarily used in manufactured dairy products. The ultimate question we must ask is the following: Do Federal Milk Marketing Orders suffice, today and in the future, to deliver fair milk prices to dairy producers? I lack the confidence to answer this question in the affirmative. The critical missing ingredient is vibrant competition for farm milk. Whereas just 6 or 7 years ago, many producers had a choice where to ship their milk, today it is extremely difficult for most producers to switch from their current buyer to another one. One contributing factor is the rise in milk supply which was not matched by sufficient increases in processing capacity. To my knowledge, no current academic research has explored the consequences of these changes on the relationship between producers and their milk buyers. Anecdotal evidence, from conversing with dairy producers, consultants and educators, suggests some presence of anticompetitive behavior by some processors. Some dairy producers have confided to me that when a prospective milk buyer was willing to take them on as a patron, their current milk buyer stopped that from happening, by calling the prospective milk buyer to inform them of repercussions if such a transfer were to take place. Farmgate milk price discovery is also challenged by the lack of competition. If a corn producer wishes to know how different local elevators would pay for corn, all he needs to do is go online or tune in to his local radio station. Dairy producers used to be able to "shop around" and ask various processors what they would pay for their milk. Recently, when some dairy producers have asked for milk price benchmarking information from their educators or consultants, those service providers have in multiple instances faced tacit disapproval or even aggressive legal threats from some dairy processors. We should not rush to generalize from such anecdotal evidence, but in my opinion, it would also be prudent not to ignore it. Further research, and an honest debate on competition in dairy is merited.

The CHAIRMAN. And thank you very much to all of our witnesses. Excellent testimony. Thank you. At this time Members will be recognized for questions in order of seniority, alternating between Ma-

majority and Minority's sides, and you will be recognized for 5 minutes each in order to allow us to get in as many questions as possible. And, as always, please remember, keep your microphones muted until you are recognized so we don't have that noise interference. And let me start with my questions.

Mr. Forgues, I hope I pronounced that okay.

Mr. FORGUES. It is *Forgues*.

The CHAIRMAN. *Forgues*?

Mr. FORGUES. Yes.

The CHAIRMAN. Thank you. I appreciate it. And Ms. Leshner, I want to—and others on the Committee, I am very concerned about the tremendous loss of our family farms, and you all touched upon it, and I want to ask—and others—because we on this Committee are very concerned about this issue. For example, we are losing 17,000 family ranching farms every year. 17,000 ranching farms, in the dairy industry itself, as you pointed out in your testimonies, we are losing record numbers. And so we on the House Agriculture Committee are putting together a bill to address this issue, to give a helping hand, because if we don't, our entire agriculture industry is going to be at stake. And small family farms are the heart and the soul of our agriculture system, and so we are moving to very rapidly put in a bill that will give our small family farms a helping hand, and this is shared on both sides of the aisle, both Democrats and Republicans. And so, just tell me, what do we need to do, from your all's perspective? And I will start with—let us start with ladies first. Go ahead, please.

Ms. LESHER. Thank you very much. I appreciate the question, and so, like every small business, we have challenges, some of which would be labor, some of which would be technology, access to broadband, things like that. Farms are generational, and they truly are the backbone of our communities, and I think things that we need to look at is the labor issue, and how we can do that—creating a more level playing field for pricing across the board that takes into account all the costs that farmers pay, because we pay freight coming in, and we pay the freight going back out, so we do get hit exceptionally hard on costs of inputs, and trying to make use of the best technologies. Things that could help us in those regard I think would be wonderful moving forward.

The CHAIRMAN. Thank you. And Mr. Forgues?

Mr. FORGUES. Thank you, Chairman Scott. You hit on something that, for myself has been a life's work, mostly since I was born in the 1970s, and then in the 1980s went through the whole crisis of being a young child on a farm, and watching agriculture being destroyed across the country. The farm town that I am from had 21 dairy farms when I was young. We are down to three.

The CHAIRMAN. Jeez.

Mr. FORGUES. Two of them that are organic, and one of them that has gotten larger and is conventional. I can't emphasize any more that our farms—and, of course, we are in an organic system, 1,800 families, 34 states—we just barely finished our visits with our regional meetings, where farmers can come in, discuss what is going on. We do that twice a year. And we met across the country, and what we are seeing with this elevated cost of inflation, and what we are seeing with the cost of feed, or just the availability

of feed, because of the climate changes we are seeing, doesn't matter why we are seeing them, but it is extreme out there, and that is causing even availability of feed to be a crisis setting situation. How can we do more?

And I think this is where we all need help, because ultimately, the big question our farmers are saying is well, let us charge it to the marketplace. Well, the marketplace is dealing with absolutely everything else that we are dealing with, right? Everyone is buying gas at very expensive costs, and then increased inflationary costs. Are they going to be able to accept premium cost for the addition on top of their premium half gallon of milk, right? And so that is probably not realistic in these current conditions, we have to find other ways, so I would strongly encourage us to focus the farm bill on areas of resiliency. How to help farmers be more resilient, and how to pay them for things that are—maybe not just for making milk on their farms, but for climate work, for energy work, and such. I would strongly encourage farm resiliency. Thank you.

The CHAIRMAN. And thank you. Well, we are moving on this, and we hope to get this legislation together, because it is an immediate problem, and we are working on it. Hopefully we will be able to get a bill introduced within the next week or so. And now, with that, Ranking Member, I will recognize you for your questions.

Mr. THOMPSON. Thank you, Mr. Chairman. Thanks to all the witnesses. Ms. Leshner, in your testimony you referenced the asymmetric risk facing producers under the current Class I mover formula. Could you go into a bit more detail on this risk, and can you elaborate on where NMPF is in the process of developing any recommendations for the mover?

Ms. LESHER. Yes, thank you very much for the question. So, there is a ceiling on how much better the new mover can perform compared to the old mover, and that ceiling is at 74¢ per hundred-weight, which would occur when the Class III price and IV price are identical, but there is no floor on how much worse it can perform. We saw that play out when the Class III and Class IV prices widely diverged in 2020. Dairy farmers lost roughly \$750 million in Class I skim revenue relative to that old mover. The new mover will often track closely with the old mover, but it won't even exceed it by much, so it didn't bring in the revenue anticipated to make up for it when it generated significant losses. So today the new mover has hardly recouped any of the roughly \$750 million that was lost. That makes these losses effectively permanent, which runs completely contrary to the intent of the 2018 agreement, which is not sustainable long-term.

Mr. THOMPSON. Thank you for that, appreciate it. Mr. Durkin, in your testimony you discussed the need for more relevant and accurate cost of production studies that can form many changes to the make allowance. I know there is a desire to make reporting costs mandatory. Do you think this will be a burden to processors, or would it be an easy lift to include these figures alongside what is already being reported for the current pricing formulas?

Mr. DURKIN. Yes, from our perspective, we look at this as not a burden at all, particularly initially after—once you get the data arranged—set up that, on an annual basis, it could be published and reported on an annual basis with limited issues.

Mr. THOMPSON. Thank you. Dr. Bozic, one thing that concerns me about DMC is the number of operations that did not sign up for the 5 years of coverage and receive the 25 percent discount on their premium, instead have elected to decide whether to participate in DMC on an annual basis. Can you talk about the risks of trying to guess the market like that? Current enrollment in DMC is around 72 percent of farms. What can be done to encourage the other 28 percent to sign up?

Dr. BOZIC. That is a nice—excellent question. The—2020 is the best year, when folks—some folks did not sign up for DMC. They thought it is going to be a good year, but 3 months in, all of that went out the door, and we had a black swan event. In my outreach programming for dairy producers in the upper Midwest, and really nationally, I always say that any time spent thinking about enrolling in DMC is time best spent on something else, because 9.50 coverage, it should be the default choice for dairy producers. The 25 percent discount is a great deal for 5 year coverage, and I hope that that is again available in the next farm bill.

Mr. THOMPSON. Thank you. This question actually is for Ms. Leshner and Mr. Forgues. As members of dairy cooperatives, can you speak to the importance of the cooperative structure in the dairy industry? And, as a producer, what are the benefits that you see from being a member of your cooperative?

Ms. LESHER. I guess I will be happy to answer that first, thank you so much. So, we have been a member of a co-op since my husband and I took over the family farm in 1989. We look at it as a real asset. I know my milk will be picked up, I know I will get paid on a prompt, fair basis. As we learned when our—unfortunately, our—my neighbor shipped to Dean Foods, they did not have that ability. So, co-ops provide a lot of security for dairy farms, and they do work on our behalf to enhance our farm in many ways. They provide a lot of technical support as well. So, it is a real asset to be a member to a cooperative.

Mr. FORGUES. Yes, I would add that, for us, it has given the opportunity for our farmers to be heard. I think that we go out of our way to make sure that farmers are given the ability to be engaged, and we listen to our farmers. As with Farmer 100, I always felt that—the importance of being heard. Doesn't mean you always get your own way, and trust me, with 1,800 families, not everyone is going to be happy all the time, but being heard, and being part of the equation to make things better, especially when you are trying to do something like us, which has been on a stable pay price for 34 years, and working our way slowly up, and holding stability, when you are doing something like that, it is really important to have the ability to be together and cooperative.

Mr. THOMPSON. Well, thank you all for your responses. Mr. Chairman, I would ask unanimous consent to submit for the record, and then submit to our four witnesses some very thoughtful questions that were put together by a grassroots Pennsylvania Dairy Advisory Committee. I appreciate the hard work that those folks do on the dairy issue.

The CHAIRMAN. Without objection.* Ranking Member.

Mr. THOMPSON. My time has expired.

The CHAIRMAN. Okay. Next we go to, excuse me, the gentleman from California, Mr. Costa, who is also the Chairman of the Subcommittee on Livestock and Foreign Agriculture, is now recognized for 5 minutes.

Mr. COSTA. Thank you very much, Mr. Chairman. I think we have had a good hearing, and I think we have—my sense is—have a lot of bipartisan support for a number of the issues that we have discussed this morning affecting—well, California, but America's dairy industry that is so critical, because we all agree that food is a national security issue, and the challenges facing dairymen and -women have been well discussed here today.

Mr. Durkin, you talked of your three points, the healthy fluid milk program and expanding it in the next farm bill. I think there is bipartisan consensus under the SNAP Program to do that. I asked the question about permanent extension on the risk management tool, and I think there is bipartisan support on that effort as well. And the third point about updating the make allowance, you just referenced to the Ranking Member that that is not a challenge, and we ought to update this information in terms of regulating price formulas, and if we don't have current information, knowing the volatility that we have seen in milk markets here in recent years due to the pandemic, and other factors, it must be a part of the ongoing effort to allow these safety net programs to be realized.

I want to shift the conversation a little bit, because another factor of this pandemic have been the upending of our supply chain efforts, both in terms of feed for dairies, and movement of that feed, but also exportation of our milk products around the world. And I know, as I said in your introduction, 26 percent of Leprino's products are exported. How much impact have you found in terms of potential loss of markets as a result of this supply chain effort, and do you think the recent law that the President signed, legislation that we all supported with Congressmen Garamendi and Johnson, will be an important effort to deal with that supply chain issue?

Mr. DURKIN. Yes. Well, thank you for the question, Congressman, and, on behalf of really the entire industry, I want to thank you, and Chairman Scott, and really everybody on the House Agriculture Committee for your support on this bill, for the Ocean Shipping Reform Act (Pub. L. 117-146). We truly appreciate that, and it is going to make a difference, and it already actually has started to make a difference, so we appreciate that support.

Things are definitely better, but nowhere near where they need to be for sure, we are still struggling a little bit with certain—

Mr. COSTA. Have you lost market share in the last year?

Mr. DURKIN. Yes, we have lost in market share, particularly in China, I would say, from an international standpoint. It is—one is consistency and reliability of goods. I know I testified to that back in November, so we have seen some share in certain markets go

* **Editor's note:** the responses from the witnesses to the information referred to are located: Ms. Leshner, on p. 1206; Mr. Durkin, on p. 1208; Mr. Forgues, on p. 1212; Dr. Bozic, on p. 1215.

down. We have been able to maintain it in others, and possibly grow a little bit, but net it has been an extreme challenge.

Mr. COSTA. All right. Well, any suggestions you may have for all of us would certainly be appropriate and appreciated. Mr. Forgues, you talked in your testimony about sustainable solutions in the dairy farmer's toolbox, and I have been very involved in California on how we deal with management of not only wastewater, but also manure management programs, and you noted that in your testimony to deal with greenhouse emissions. You are aware, I am sure, of the 114 projects funded in California that has reduced greenhouse gas emissions by an estimated 1.1 million metric tons of carbon dioxide over 5 years. How could we expand that kind of effort nationwide, and how we might do it in the reauthorization of the farm bill?

Mr. FORGUES. Yes. Thanks for the question, Representative Costa. We have dairy farmers in California that have used the Alternative Manure Management Program, which is really about incentivizing farm systems to reduce methane emissions, but it is also creating better soil amendments for cropping. Some of the changes we see are putting in place a solids separator—yes, and that is what it sounds like—and then developing composting systems with that manure.

Mr. COSTA. I'm very familiar with the details, my friend. I am wanting to know can we expand that in the reauthorization of the farm bill to provide those benefits nationwide, and have you determined what the potential expansion of that would be nationwide if we followed in the example that we know in California?

Mr. FORGUES. Well, we would applaud the program being implemented—or we applaud the program that's being implemented by the State of California. In our opinion, you could really take what California is doing and see if it is something we can offer nationwide as an option in the next farm bill.

Mr. COSTA. Thank you. Mr. Bozic, I only have a little time left, but you talked about competition with dairies, and you talked about being able to move on contracts. In California—the milk pooling effect went into effect, dairy contracts are critical. How do you think we bridge that gap with so many belonging to co-ops? 56 percent of the milk produced in America is from members of co-ops.

Dr. BOZIC. A few seconds only for this answer. I believe that you should look for industry to provide proposed solutions. It is the role of academics to elevate issues for debate, to analyze proposed solutions, to project trends, *et cetera*. But when it comes to solutions, I don't think that it is up to us in academia to be the priests from the ivory tower church. We need to look for industry to come forward with proposed solutions, and then we can analyze them. I do believe that we will see a vibrant debate on this in the months to come.

The CHAIRMAN. Thank you very much. The gentleman's time has expired. And now the gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. Thank you again, Mr. Chairman, and thank you to our second panel for appearing with us today to help educate us on how to best move forward in this new farm bill with regards to dairy. I wanted to, with Mr. Durkin here, go over just some of the

nuances you were talking about in your testimony. As we know, market price for milk is based on several factors, such as butter fat, and solids, and other things that I am not greatly an expert on here, but there is a rate set, the rice I grow, for example, at home, what is the milling quality of my rice as it comes out, broke ends *versus* whole kernels, and such like that.

So we all understand that kind of thinking, so you have these input values, and then you also have the costs, the processing costs, and the terminology used is called *make allowances*, so what we are looking at is that data on cost inputs, and why that is important is very reflective of today's costs—or should be reflective of current costs, whatever year it is, of doing business.

And so, in previous conversation and today, what we seem to have is very old data from these cost studies, cost reflections, that are, in some cases, 15 years old, and a more recent one may have been done, and it may be seen as accurate, but right now, with costs changing practically hourly because of energy, because of feed, lack of feed, drought, whatever, it seems to me there needs to be an ability to have a very adept, very nimble way of keeping costs at the forefront so that prices are going to reflect that, and the industry is healthy. So, with inflation the way it is, I am not even sure how you keep that roller coaster somewhat in line, but we would love to hear what ideas or innovations that we could do to keep it reflective of current costs to drill down on that point, how often should the USDA conduct these cost studies to try and have some level of accuracy in the make allowances portion of cost to the industry?

Mr. DURKIN. Yes. I think we would say on a regular basis, obviously, sooner than 15 years, it would be there, so we would advocate, from a Leprino standpoint, to do it on an annual basis. If it becomes too burdensome, from a cost standpoint, from a USDA perspective, or even some plants—or other companies, there may be an indexing that could be done on a basis, so you do a cost study every other year, or every 2 or 3 years, and then you could index some things after that. So that is a—I think a way to get at that. But if you look at—the recent data would suggest there is a—and then we know it is outdated, it would—says there is close to a 30 percent differential from where it was in the old cost study to the new one. And then on top of that reflect the current cost, so it is probably—

Mr. LAMALFA. And which years of the two?

Mr. DURKIN. Excuse me?

Mr. LAMALFA. Between the 15 year old one and the more current one is—

Mr. DURKIN. Correct.

Mr. LAMALFA. And how about from the one that is most current and, say, today, with—

Mr. DURKIN. Yes. If you were add that too, in excess of 40 percent.

Mr. LAMALFA. Forty percent between the last one and the one that isn't done?

Mr. DURKIN. Correct.

Mr. LAMALFA. Wow. That is tremendous. So you feel if you did a current deep dive, after that it could be kept up with a less complex indexing?

Mr. DURKIN. It could be, and I think that is a way to look at that. I think there is some conversation with industry, as well as the House Agriculture Committee, to talk about what makes the most sense, but—we would be happy with an annual, but if that becomes too burdensome from a cost standpoint as well as—I think there is a—maybe a simpler way to get at that as—

Mr. LAMALFA. Well, do you think that would be a burden on producers, or on USDA products?

Mr. DURKIN. Actually, maybe both, and I was speaking specifically on USDA.

Mr. LAMALFA. Yes. Okay.

Mr. DURKIN. It would not be burdensome from our standpoint as a company.

Mr. LAMALFA. Yes, and probably for other producers as well, similarly, so—

Mr. DURKIN. Correct.

Mr. LAMALFA. So, we just really have to get a reflection from USDA is it something that they could be doing annually, and how we could streamline their ability to do that?

Mr. DURKIN. Yes.

Mr. LAMALFA. Okay. So, these cost studies in the past were only participated, as you mentioned, by about $\frac{1}{3}$ of the plants, and so do we need to have—well, I am sure it is skewed at that level. How do we have a—maybe a 90, 95 percent? Does it need to be requirement? How would we do that?

Mr. DURKIN. Yes, I would—we recommend it be a requirement, and I know that Dana Coale, who spoke before us, also put that out as well. So, we are required to submit prices to USDA. I would think that, as a requirement to submit prices, you are actually going to also submit your cost data as well.

Mr. LAMALFA. Okay. What is the labor situation look like? We worked on the Farm Workforce Modernization Act, and I will—in a word.

Mr. DURKIN. Listen, labor is a challenge across the board.

Mr. LAMALFA. Yes.

Mr. DURKIN. Not only at the farm level, but up through processors, and I would argue the entire supply chain. So if one cog in the wheel is working, but you don't have the others going, whether that is transportation, rail, shipping, farm, or processor, we—the labor is an issue across the board.

Mr. LAMALFA. Got to do it. Thank you. Thank you, Mr. Chairman. Thank you.

The CHAIRMAN. And now we will hear from the gentleman from Georgia, Mr. Allen, is now recognized for 5 minutes.

Mr. ALLEN. Well, thank you, Chairman Scott, and I want thank Ranking Member Thompson, Members of the Committee, for gathering today to discuss these important issues. And I want to thank our witnesses for sharing your insight on these important topics. Frankly, I hear this over and over again in the 12th District of Georgia, and we can't anticipate a lot of these things in writing the new farm bill because the last time we have had this kind of infla-

tion, and supply chain issues, and whatnot was the early 1980s, and, of course, we know what happened to the family farm in the early 1980s. It was probably the biggest crisis we have had until now, and we lost a lot of farmers in early 1980s.

So, what provisions do you make in a farm bill when these things happen? So that is 30 years ago, and so, of course, what I am hearing from our crop growers is input costs. I had a roundtable Friday afternoon, and they just had no idea. I mean, they don't know what things are going to cost next week. And the EPA is severely limiting them on fertilizers, and things that they need, and I know that you mentioned organic, and you are trying to do things a little different there, but, to get the kind of yields that we are getting in agriculture in my district, we have about two percent of the population in this country producing, what, 120 percent of the food needs.

And, of course, I grew up on a dairy farm, and my dad elected not to go production ag. They wanted him to go to 200, 300 cows, the processors, and he had to put the place up, to borrow the money, he had to put the place up as collateral, and he wouldn't do it. My dad went through the Great Depression. We paid cash for every car and everything he ever bought, and so he refused to do it, and in hindsight it was a really good move, because it was a tough situation.

What I asked our roundtable on Friday was, okay, what are your suggestions, we have a fossil fuel crisis, we have a climate crisis, you name it, it is going on out there. So I would almost like to go down the panel, you all work hard, you have plenty of common sense. What do you all think needs to be done in this country right now to get us right side up? Because, what we are doing right now is unsustainable, particularly when you are talking about the farm bill, and funding some of these input costs and other things. So—we will start on this end, and go to there, and I will give the rest of my time to you all, and you tell me how we solve this thing.

Dr. BOZIC. Representative Allen, on the Dairy Margin Coverage we can introduce energy index, or we can increase the maximum coverage level from, for example, 9.50 to 10. That is Title I. In Title XI, in crop insurance, we can design Livestock Gross Margin, which is also a program that I help maintain, so that it allows increased emphasis on feed or non-feed costs as well. They don't have non-feed costs in that part as well. On the climate, and new—and the—mentioning the loss of family farms, I would encourage the House Committee to look at helping small dairy farms meet the standards that the processors will require over the next 5 to 7 years as far as sustainability. It may be more difficult for some of them to meet that, and I would hate to see an increased consolidation pace because of the additional sustainability standards.

Mr. ALLEN. Okay. We are—I have 40 seconds, so you all are going to have to go quick.

Mr. FORGUES. Well, I will just—I wanted to add, Representative Allen, that you mentioned input costs are maybe different in the conventional setting than the organic setting. I just want to let you know that our organic farmers would tell you the input costs are rising everywhere, so whatever we are trying to do when we are dealing with these kind of inflationary costs are going to need to

be addressed for all farmers, because it is hitting everyone, and just wanted to make sure you knew that.

Mr. ALLEN. Yes, sir. Thank you.

Ms. LESHER. So I appreciate the confidence in us, thinking we would have the answer, because it is—I wish we all did. But, work on the DMC to extend the cap so that more milk is covered, because we have losses on all the milk, not just the first 5 million pounds that we produce. I also think we need a handle on labor, having access to guestworkers and things like that. We need access to technology. Assistance in buying technology, and getting involved with technology, is a big thing for us, and costs.

Mr. ALLEN. Okay. Great.

The CHAIRMAN. Thank you.

Mr. ALLEN. I yield back.

The CHAIRMAN. The gentleman's time has expired. And now the gentleman from California, Mr. Carbajal, is recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman, and thank you to all the witnesses participating on today's panel. Mr. Forgues, can you tell me some of the benefits of organic health to consumers, and what about benefits to the environment?

Mr. FORGUES. Thank you, Representative Carbajal. We are very excited about what we are seeing—I will start with the environment first—we are seeing opportunities to make a healthier environment, and we are spending a lot of energy right now within our cooperative to set up a system that is a little bit different than anything we are seeing out there that is talking about carbon reductions as insets within our organization. We are hoping to incentivize our farmers by paying for carbon sequestration that they are doing on their farms, and helping them get money and support to then leverage with—let us just say EQIP and NRCS to do more and more projects to help raise our goal of being carbon neutral by 2050 without buying offsets, by really doing it on our farms. And we are going to offer that opportunity for other partners of ours, and customers, to join in with the work we are doing. I think it is really vital that as that process moves forward, that we all look at ways, and we can find ways, to make our environment better.

As for the health for consumers and customers, we continue to tout the work that we are doing. Healthy cows, healthy soil, leads to healthy products, that leads to healthy people, and we are very excited to be able to offer that opportunity to the public. Organics is not a religion, it is a production method, and we are happy to be able to give that opportunity to consumers through the production methods that, if they want to be able to have a certified organic product, it is available to them. We look forward to being able to continue to show those benefits to the environment, and to the general population, through studies, and through other work we are doing.

Mr. CARBAJAL. Great.

Mr. FORGUES. Thank you.

Mr. CARBAJAL. More on that, what kind of resources does the organic dairy industry need from Congress to continue to operate?

Mr. FORGUES. I think that there is a really big opportunity to start talking about research and farm resiliency. Again, that is a mantra I am going to continue to drive home. There are ways to help better farms, better the farmers' livelihoods and income that might not just be about supply and demand of dairy, because it is so important, right? No one is thinking that it is just about a farmer and their milk check. It is that community piece. It is rural livelihoods that are on the line here, and rural economies. And so we have to find ways to make the farms more resilient, and that may mean finding other ways to provide income streams, which I think is exciting, because it also can help our environment, help our energy issues, and so I think the Federal Government can do a lot by putting money towards those programs, and it helps our organic farmers, but I think it helps every farmer if we are able help small family farms become more diverse and more resilient on their farms.

Mr. CARBAJAL. Thank you. Dr. Bozic, can you expand on what—some of the reasons behind U.S. milk production utilizing beverage milk products is projected to fall over the next decade?

Dr. BOZIC. Lower fluid milk sales, and more milk going to manufacturing. So our per capita consumption of milk has been falling steadily for decades. Recently the gains in population have not been high enough to offset that, so the total volume of fluid milk is trending down for the last about 10 years. In the meantime, we consume more cheese domestically on a per capita basis, but we also are—when we are exporting, we are exporting storable or semi-storable dairy products. 15 years ago we only exported about five percent of U.S. milk production. We are about to be 20 percent of U.S. milk production very soon. And, going forward, exports are going to be critical. So exports and manufacturing dairy products up, fluid milk sales down, and, as a result, percent of milk utilized in beverage product will fall.

Mr. CARBAJAL. Thank you. To that end, what do you see as the biggest challenge to smaller dairy producers? Do you see a place for them in the industry in the future, or will consolidation continue to the point there are no more small dairy producers?

Dr. BOZIC. Dairy Margin Coverage was truly a momentous change that I believe substantially reduced the pace of consolidation in the dairy industry, and did—will afford dairy producers over the next—smaller dairy producers over the next decade to be financially viable. The new emerging challenge may be sustainability standards that are coming up—that will be required by the buyers of dairy products to dairy processors, whether they are private or cooperatives, and then cooperatives will have to ask their members to—and private processors will have to ask their patrons to oblige with—and if such technology is more financially viable on larger farms than smaller farms, that may, again, increase the consolidation pace.

Mr. CARBAJAL. Thank you.

The CHAIRMAN. The gentleman's time, unfortunately, has expired. Now the gentleman from Indiana, Mr. Baird, is now recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman and Ranking Member. We really appreciate all the witnesses here, and the expertise that you

share with us, because you are on the front lines and the cutting edge of the industry, and agriculture is so important to our country, as well as the district I am from in Indiana. And so, my first question goes to Ms. Leshner. And I know dairy farmers have endured significant volatility in recent years, especially during this pandemic. Could you share with us, because I think it is important for us, as a Committee, to understand the role these cooperatives play in helping farmers through these tough challenges? Go ahead.

Ms. LESHER. Thank you for the question. I think that one of the benefits of a cooperative is the fact that they share information with their membership. They help us encourage people to participate in programs like DMC, sign up for that safety net. I call it an insurance policy. The co-ops have been able to help sustain, and of—and, again, as I mentioned earlier, I know I am going to get a milk check every single month. When I ship my milk, I know they are coming to pick it up, I know it is going to—I will get paid for it, so they offer a lot of stability, and they offer a lot of technical expertise to our family farms.

Mr. BAIRD. Absolutely, and that hasn't changed over the years, has it? That steady income is pretty important to the viability of those farms, including dairy farms. My next question goes to everyone. I understand they are calling for the Dairy Forward Pricing Program to be permanent in the next farm bill reauthorization, so do any of the witnesses have thoughts on that proposal? And, as a follow up, would it be supported by all sectors of the dairy industry? So, feel free to go ahead. Ms. Leshner, we will start with you.

Ms. LESHER. I am sorry, I missed part of the question. The dairy—

Mr. BAIRD. The Forward Pricing Program. There is a call for that to be included in the next farm bill—

Ms. LESHER. Yes.

Mr. BAIRD.—and so I want to know what your thoughts are about that, and I want to know about whether or not all the sectors of the dairy industry would support that.

Ms. LESHER. So it was an additional risk management tool for dairy farmers, something that was new to us, and we are still learning how to navigate through the system, but I think anything that will be in place to help mitigate risk is definitely something we need to continue.

Mr. BAIRD. Yes. Mr. Durkin, how about you?

Mr. DURKIN. Yes, we are fully supportive of the program. And to your question, does it have support, and our mind and our understanding is that it has universal support across the dairy industry, so we think it just makes sense. The challenge is, you think about it, it expires at the end of September, so the ability to go beyond September, before the farm bill is actually approved, farmers aren't going to be able to hedge anything, and really, when you go 6 months out, you start to—the validity of the program starts to fall apart, so that is the—really the need to make it permanent.

Mr. BAIRD. Good information. Thank you. Mr. Forgues?

Mr. FORGUES. Yes, thank you for the question. I don't believe that there are any issues on an organic level that we shouldn't have everyone involved with risk management tools. The more tools, the merrier. I think we have to find ways to take risk out

of the very complex piece of dairy farming, so we would be supportive of that as well.

Mr. BAIRD. Thank you. Dr. Bozic?

Dr. BOZIC. Thank you for the question. I am not aware of any farm groups that would oppose this proposal.

Mr. BAIRD. Well, thank you very much, and I yield back.

The CHAIRMAN. The gentlewoman from Minnesota, Ms. Craig, is now recognized for 5 minutes.

Ms. CRAIG. Well thank you so much, Mr. Chairman, and thank you to the Ranking Member, Mr. Thompson, for today's hearing on the farm bill provisions. It is a critical topic in the farm bill, given the many benefits that the dairy industry provides to folks across the country. Minnesota's Second Congressional District is home to more than 350 dairy farms, and more than 45,000 milk cows that account for more than \$200 million in annual sales of dairy products. The family farmers on the dairies across the district are a key part of our rural economy and communities.

Over the past year, I have had the privilege of visiting family dairies in my district, like Zweber Farm in Elko New Market, and the Buck Family Dairy in Goodhue. I have heard a lot about the challenges facing the industry, and the ways in which Federal programs are impacting those operations. One of those programs is, of course, the Dairy Margin Coverage Program, and I first want to turn to Ms. Leshner. Ms. Leshner, in the 2018 Farm Bill it enacted the Dairy Margin Coverage Program, which I know has been just an important safety net to producers in Minnesota. Can you talk a little bit about what factors you weigh, and how you decide to sign up for the program each year?

Ms. LESHER. Thank you very much for the question. So, on our family farm, it is a no brainer to sign up for DMC. I mean, it is like an insurance policy. It is one of those things you invest in, and you know it is there if you really need it. You hope you don't. We hope our margins are larger than what we are insuring for, and we have always bought in at the highest possible coverage. It is an easy way to help mitigate some of our risk.

Ms. CRAIG. That is incredibly helpful as we start to think about the 2023 Farm Bill. Turning now to another topic which has come up during visits with dairies in my district, and that is the attention that producers are paying to land care and management in response to both increasingly variable weather, and also changes in consumer demand, so I would like to ask this question for each of the panelists here today. Can you describe how your operations are dealing with the more unpredictable weather patterns, and the increasing consumer demand for climate friendly products? I know that these are issues that family dairies in my district care deeply about, and I am curious to hear more about the ways you are working on them as well. So let us start with Mr. Forgues.

Mr. FORGUES. Thank you, Representative Craig. It is a great question that you are asking. I think it is really relevant for lots of reasons. It can be a business relevance because, as we are trying to forecast the supply that we are going to see from farms across the country based on biological systems that are affected by weather. And then at the same time, part of a marketing cooperative that is trying to continue to find ways to represent our products in

a way that is authentic and special in the products that we are offering to the consumer, and to our customers. So we continue to look at farm resiliency, and really dealing with climate in everything we do.

Let us be real, all of us in dairy, conventional, organics, Scope Three emissions is the biggest challenges that we are going to have, or at least one of the largest challenges that we are going to have as we move forward. So at Organic Valley right now, like I mentioned, we are already launching into a carbon program right now that really works on insets, and working with our farmers to give them dollars for the work they are doing. I think that the other important piece is really to understand the science of this, and we are deep into the science of what a life cycle analysis of your carbon life cycle is about, and we really think that that is going to be an important key for all of us as we move forward, to really focus on knowing where you are with carbon, and where you are going to move in the future.

Ms. CRAIG. I appreciate that. And I have about a minute left, so, Mr. Durkin?

Mr. DURKIN. Yes. Thank you for the question, Congresswoman. Obviously it is a huge challenge, and we are willing to face that. Obviously we signed on to the Stewardship Commitment as part of the Innovation Center, which is a subset of DMI. This global dairy platform. We honor that as well with the pathways to net-zero. It is a huge challenge. When you think about this—obviously we just talked about it with Travis, about Scope Three, which obviously one and two is our key primary responsibility, but we have to be in partnership with our farmers to make sure we are going to get there. We are seeing huge push from our customers as well, so we are primarily B2B, but our customers that we go to, some of the major food suppliers in the world, it is definitely a challenge that we are going to have to face.

Ms. CRAIG. I am going to give Dr. Bozic the last word, since I haven't heard from him.

Dr. BOZIC. I can only repeat what I answered before, Representative Craig, that Congress should look to the industry for advice on how to make sure that smaller family dairy farmers are not left behind in implementing additional requirements that they will need to meet to stay in business. Some of these technologies work better when you have more cows to spread fixed costs over more head, and we should not—in solving the climate, we should not allow the pace of consolidation to pick up again in the dairy industry.

Ms. CRAIG. Thank you so much. With that, Mr. Chairman, I yield back.

The CHAIRMAN. The gentleman from Ohio, Mr. Balderson, is recognized for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman, and thank you to all the witnesses for being here today on Panel two. My first question is for the whole panel. Trade is critical for American agriculture, and the dairy industry is no exception. Ms. Leshner, in your testimony you emphasized the importance of trade for the dairy industry, and how exports account for 17 percent of production. Can any of you discuss in more detail how important the Market Access Program and the Foreign Market Development Program are for the

dairy industry? And who may ever want to go first, go right ahead. Thank you.

Ms. LESHER. I will be happy to answer the question just to get started. Trade is very, very important to the dairy industry, and most segments of our agriculture in the United States. We do need to have some new free trade agreements. We are limited in those regards, we also have some tariffs in place that are limiting what we can do. The challenges of getting through the ports have created some issues, so we do have some things we need to work on to continue to grow our opportunity and maintain a stable income for farmers through exports.

Mr. DURKIN. Yes, I would add to Ms. Lesher's comments that the trade is usually important. I know Dr. Bozic has talked about the amount of dairy solids being exported. We are right around 25 to 26 percent, which is in excess of what it is for the entire dairy industry as a whole in the U.S. We have a huge opportunity in the U.S. to actually capture a large share of the dairy growth on an international market, so clearly the current programs that we have in place are important, but I would emphasize, and I know Lolly talked about it as well, more free trade agreements, more tariff issues, and non-tariff barriers that are out there have to be eliminated for us to capture that. We are in a prime position, as a U.S. dairy industry, to capture that growth, and, absent some of those programs, I think it is going to be a challenge for us to do that, as well as—I know we talked about some of the supply chain challenges as well.

Mr. BALDERSON. Thank you. Did anybody else want to add—is that good? Okay. I had a follow up, but I think you just addressed it very well. My next question is for Mr. Durkin. You mentioned in your testimony the growth in milk product exports from the U.S. How much additional growth in export markets do you anticipate in the coming years, and what impact will this have on the domestic industry?

Mr. DURKIN. We are, exports are up, there is no doubt about that, and that is even despite some of the supply chain challenges we have, and I testified earlier, even with that, we have actually lost some market share in key markets, China being one, and a few others. So it is a huge opportunity, as I mentioned, for—continue to grow, and we need to work together, the entire dairy industry, as well as government, to kind of bring down those barriers, and help with the supply chain issues to be able to handle that. But we are bullish on international shipments, and hopefully some of those barriers will start to ease.

Mr. BALDERSON. Okay. Thank you all very much. Mr. Chairman, I will yield back my remaining time.

The CHAIRMAN. The gentleman from Iowa, Mr. Feenstra, is now recognized for 5 minutes.

Mr. FEENSTRA. Thank you, Chairman Scott, Ranking Member Thompson. Thank you, Members. Thank you each one of you for testifying today. This is so important to me, and I want to sort of pivot off what Congressman Balderson stated on exports. I mean, this, to me, is a great opportunity for the United States, especially in the milk industry, or I should say in the dairy industry, to create more opportunity for our producers. Dr. Bozic, you referenced

some of this stuff in your testimony. Can you look at what can we do to create better trade partners? What can Congress do, and what can the Administration do? I get concerned that the Administration is not doing a lot in that trade sphere right now, and I would just like your thoughts on this area.

Dr. BOZIC. Thank you for your question, Representative. We should strictly enforce the existing trade agreements, particularly with our neighbors to the north, and beyond that, we should aggressively pursue new trade agreements that open markets for us in Asia, Africa, and other countries—other regions, where we have the ability to add a lot more exports over the next 10 years. Our two main competitors, New Zealand and Europe, are facing problems. New Zealand discovered they are an island, and Europe is moving towards very, very aggressive climate-related policies that will see perhaps the number of cars in Europe—the number of cows in Europe reduced. That opens huge opportunity for us.

Mr. FEENSTRA. Yes.

Dr. BOZIC. Industry will deliver if market access is there. The primary responsibility of the Congress and the Administration is to expand market access.

Mr. FEENSTRA. Yes. I'm glad you said that, about cows and I know there was a question asked a while ago, I have so many small producers in my area in the Fourth District—we don't need more regulation. We can do things voluntarily, and we have the opportunity to do that, but, my goodness, the last thing we need is more regulatory environment. Dr. Bozic, I also want to also address something that you had in your testimony regarding pricing transparency, and the inability of dairy producers to shop around for the best farmgate milk price. Can you expand on that? Because, to me, this is a very critical component.

Dr. BOZIC. So up until—thank you for the question. Up until about 7 years ago, a producer could reach out to processors in their area and say, if I were to move my milk to you, if I were to start shipping my milk to you, what would you pay me? And then processor will say, well, send me your milk marketing records for the last 2 years and I will tell you. So then they would see what they would get paid over the last 24 months *versus* what they are getting paid from their current milk buyer, and, based on that—that is one of the factors they would consider in where to ship milk. They can't do that anymore. The people are having very hard time moving.

Mr. FEENSTRA. That is correct.

Dr. BOZIC. So if you cannot move, what else can you do? Well, you can at least know where you are *versus* the others.

Mr. FEENSTRA. But don't you think we should take action, I mean, this is a fundamental problem, don't you think?

Dr. BOZIC. I think it is very important.

Mr. FEENSTRA. I agree. I agree 100 percent. Last word, Ms. Lesh. You are in it. You are in this business. What advice do you have for Congress as we move forward in the farm bill, and what can we do when it comes to revenue protections, or just even what are your thoughts in this whole dairy scheme?

Ms. LESHER. So I think costs right now are excessive that that is one of the most limiting capacities. Labor is a huge issue, you have heard me mention that before, and technology.

Mr. FEENSTRA. Yes.

Ms. LESHER. No, but making DMC—the cap on DMC, re-evaluating that, making it larger, because there are losses across the board in—on our farm first million—

Mr. FEENSTRA. There is, absolutely, I am glad you said that. That is exactly right. It is across the board to everyone, that is right.

Ms. LESHER. That is correct, so whatever we can do to help level that playing field, and help make sure that we can recoup as many costs as possible that would be incredibly helpful.

Mr. FEENSTRA. Yes. Well, I thank you, and I appreciate all you do. I thank you for each one of your testimonies, but we have to understand, the dairy industry is the fundamental economic engine of food and our production, and we have this great opportunity, this great asset, to export around the country, and around the world, and I sometimes think we lose sight of that. And we are doing 20 percent right now, or a little more than that, but we have so much opportunity as other countries get away from it, as you noted, Dr. Bozic. So this is my passion, and I fully hope to make recommendations as we move forward in the next farm bill. So thanks to each one of you, and I yield back.

The CHAIRMAN. Thank you. And now the gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. All right. Thank you, Mr. Chairman. As you can see, we kind of came in here sliding hot. There are votes that have been called, and I know we are all trying to hustle, so I will just jump right into it.

Just generally for all of our witnesses here today, one of the main concerns that I hear from farmers of all types—keeping in mind that I represent a state that has not only 300 different commodities and specialty crops, but we also are the Dairy Belt for the Southeast—especially dairy producers, it is the lack of a legal workforce. Now, I know that H-2A is not a good fit for dairy. It is a seasonal program when we need year-round. There are a lot of key fixes. Would you support moving or creating a secondary guestworker program under USDA, separate of H-2A, that gets rid of the adverse wage effect, creates a long-term certainty for employees and employers, and helps solve some of these year-round guestworker issues that we have? I would love to hear just a real quick yes/no from each panelist here today.

Ms. LESHER. Thank you for the question. Yes, we would be very much in support of something that would have a way to answer some of those issues that we have about year-long stability for our employees, so that would be a big help.

Mrs. CAMMACK. Beautiful. Thank you.

Mr. DURKIN. Yes. Well, as a processor, we need our farmer partners to be productive, healthy, and growing, so absolutely we agree.

Mrs. CAMMACK. Wonderful.

Mr. FORGUES. Yes, well, we would love to have labor for our farms, so absolutely.

Mrs. CAMMACK. Wonderful. Thank you.

Dr. BOZIC. As an academic, I don't believe I should weigh in support of a particular proposal, but I do want to say that I believe that it is very important for our country to be based on a rule of law, and that everything is regulated by law, not in the underground economy.

Mrs. CAMMACK. Absolutely. Thank you. I just wanted to make sure we got that on the record. Now, Mr. Durkin, in the 2018 Farm Bill, NMPF and IDFA requested a change to the formula for pricing for Class I milk—obviously, Florida, we are a Class I market—which was adopted by Congress and enacted. The purpose of this change was primarily to remove ambiguity from the pricing formula and to allow processors more certainty as they managed risk in the Class III and IV futures markets. Has the new formula been successful in this regard, and are more processors hedging risk in the futures market?

Mr. DURKIN. I have two questions on the Class I mover component of it, we are not part of that program, given we are basically cheese and whey products, so we'll be in the Class III area, so I will yield to some others on the panel to be able to answer that. We are not currently in the Dairy Hedging Program, and that is—that—but we are fully supportive of the program. IDFA is, and the only reason we are not is we are—we buy our milk and sell all our components, so, in fact, we are fully hedged, so—but we are fully supportive of the program, as—in my testimony to that as well, and you have both IDFA, National Milk, everybody is supportive, so we think it is the right thing to do.

Mrs. CAMMACK. Thank you for that. Ms. Leshner—is that right?

Ms. LESHER. Yes.

Mrs. CAMMACK. In my district we have a multi-generation family there, and they are the Leshers, so kind of close. As you know, USDA created the Pandemic Market Volatility Assistance Program to compensate producers for losses relative to the old “higher up formula” for the Class I mover. Can you comment on that program, or any additional work being done to address uncovered losses?

Ms. LESHER. So, we appreciate that question very much, and we appreciate the assistance that the Pandemic Market Volatility Assistance Program offered to dairy farmers. We have not totally recouped all the losses that we had a result of the Class I mover changing. Nobody anticipated what would happen happened.

Mrs. CAMMACK. Right.

Ms. LESHER. We have not gotten there yet, as far as recouping those losses, but hopefully that can be addressed at some time.

Mrs. CAMMACK. We are looking forward to trying to rectify that, so I appreciate you weighing on that. Dr. Bozic, in your testimony you discussed the declining share of demand for fluid milk. In fact, I believe you state that we are now exporting more milk solids than the U.S. drinks. As this trend continues, how do you think it will impact the industry generally, and milk pricing in particular?

Dr. BOZIC. Congresswoman Cammack, for your district I think Federal Orders will be extremely important for the foreseeable future, very relevant as well, and I believe that some big milk buyers would exert more market power on cooperatives and dairy producers in your region were it not for mandated prices for Class I, so I am fully in support of Federal Orders there. Unfortunately, for

a majority of the country, where milk is used in manufactured dairy products, Federal Orders will become increasingly relevant, and that is the part of my testimony in which I have been—build further in my written remarks.

Mrs. CAMMACK. I appreciate that, thank you. My time has expired. I yield back.

The CHAIRMAN. The gentleman from South Dakota, Mr. Johnson is now recognized for 5 minutes.

Mr. JOHNSON. Thank you, Mr. Chairman, and I will start with Ms. Leshner. I know we talked a little bit about markets, and about the farm bill, and specifically what can be done with the two programs to help expand trade. We didn't talk in a lot of depth, so, Ms. Leshner, as we look to the next farm bill, are there any particular tweaks, or expansions or changes we should be looking to make to help you all find new markets abroad?

Ms. LESHER. So thank you very much for the question. Yes, I do believe there are some tweaks we need to do. Some of it would be some of the trade barriers that we are facing, some of the lack of free trade agreements, not following the ones that we have at this point in time, and then—and really endorsing those. And another thing would be the use of common names. So, there are some things like—whether it be parmesan or bologna, things like—the common name usage, we need to address that situation so that those products can be marketed globally without so much of a drama.

Mr. JOHNSON. And so as we talk, ma'am, about making sure that the execution of these deals is as good as what the deals say they should be in paper, I know Canada was a little slower to make good on their commitments, their new commitments out of USMCA. In your assessment, where are we at today, and are we getting closer to the target?

Ms. LESHER. I will be honest, I really don't know specifically on that issue, but I am sure National Milk would be happy to get back to you.

Mr. JOHNSON. Yes, sure, that would be good. And are there any particular market opportunities that you are most excited about? I mean, countries that we should be really putting some lead on the target with.

Ms. LESHER. I think, as we look to South Africa, Africa, South America, other places like that offer tremendous opportunities for us if we could just have access to those markets.

Mr. JOHNSON. Yes, very good. Thank you. And then, for any of the other panelists, I want to give you an opportunity, if you want, to respond to my line of questioning. Anyone?

Mr. DURKIN. Congressman, yes, thank you for the question. There are huge opportunities, and Ms. Leshner talked about one, but I would focus on primarily that—I don't know if it is secondary, but I—we would put it as more primary, and the primary now is the Asia-Pacific region. If you look at—where we have New Zealand as being one of the primary exporters of dairy products in that area, we have a huge competitive disadvantage, really, in just about every country that we compete in, from a tariff standpoint, so that is a big opportunity. And kind of—if we can level the play-

ing field, and we actually still do very, very well relative to them, but it is a challenge we face every day.

Mr. JOHNSON. Yes, and I think somebody last week told me that India used to be a very, very strong market, and now has kind of whittled away to nothing. Is that about right? Am I remembering that right?

Mr. DURKIN. Can you repeat what country?

Mr. JOHNSON. Yes, India. And it may not be for your specific company, but do you think that is true for the dairy industry generally?

Mr. DURKIN. Yes, well, in general it is very difficult to go—import into India just because—given the rules.

Mr. JOHNSON. Yes. Okay. Anything else from any of the other panelists? Thank you very much, Mr. Chairman. I yield back.

The CHAIRMAN. Thank you. And now the gentlelady from Minnesota, Mrs. Fischbach, is now recognized for 5 minutes.

Mrs. FISCHBACH. Thank you, Mr. Chairman. I have been watching the proceedings, and listening, and I really appreciate the panelists for being with us today, and all of the thoughtful questions that Members have asked. And I just wanted to kind of ask, for any of the panelists, as you all know, participation rates in the DMC and its predecessor, MPP, have been a challenge, historically. And, in Minnesota, where I am from, participation rates in DMC have been higher than most of the rest of the country. And are there lessons to be learned in terms of—either incentives marketing, or even mechanics of these programs that can be carried forward into the new farm bill? For any of the panelists, if someone wants to jump in.

Dr. BOZIC. Congresswoman Fischbach, thank you for the question. I work in Minnesota, as you know, and we work very closely with the industry in Minnesota to educate producers about Dairy Margin Coverage, before that Margin Protection Program, as well as Minnesota has always been quite high in the adoption rate. I would like to think that it has something to do with the educational programming that my colleagues at the University of Minnesota and myself have done. Beyond that, as you know, our state also has a state level dairy program, which is additional subsidy for Dairy Margin Coverage. The participation goes down where producers believe that premiums are too high relative to where markets are at. So one way to address that is to make premiums be capped at 15¢, but potentially go down as markets are projected to be far above 9.50, but that would complicate the delivery of the program. But if you were to do that, participation would be more stable in the program.

Mrs. FISCHBACH. Thank you very much. And maybe, if there is anyone who just wanted to add anything to that? Otherwise, I can move on. Mr. Durkin, you mentioned the outdated cost study used to determine *make allowances*. Now that it is more than 15 years old, I know there is another study that is currently underway, but, with high inflation, that study may be outdated by the time it is delivered. Assuming inflation gets under control, with what frequency should the USDA conduct those cost studies to inform accurate make allowances?

Mr. DURKIN. Speaking specifically for our company, we would advocate to be on an annual basis, but if that becomes too burdensome for either USDA, or certain processors in the United States, we would be okay with moving that to every couple of years. But what you may be able to do then, too, is add an index to that, an inflationary index that is a component of that, and, again, it just gets adjusted when the cost studies are done.

Mrs. FISCHBACH. Okay. Thank you. And I guess I would just like to give the panel the opportunity, if there is anything as we are very close to wrapping up, is there is anything that you wanted to add to any of the comments that have been made or anything, just give anybody the opportunity, with my extra minute and a half here. And if not, Mr. Chairman, I yield back.

The CHAIRMAN. All clear. Thank you so very much. And, lady and gentlemen, I want to thank you, on behalf of our Agriculture Committee. This has been an excellent hearing, and you brought out some very, very important points. For example, it was clear that the improvements that led to the creation of our Dairy Margin Coverage during the last farm bill have been beneficial. We are very delighted to hear that. And I am excited to keep optimizing the program we are doing.

But there is one issue here that you all have brought even greater attention to, and that is the status of our small family farms within dairy, as they are within our beef area, of which both of you belong, our beef, our milk. You can't get more vital anchors of our food sources than these two. And so this is why, as I said earlier, I want to make it known, we are determined to address this issue of helping preserve our small family farms. And so, the testimony that you all gave to us will help us as we move forward to draft legislation to do precisely that. I am committed to that. I was born on a farm, grew up on it. A family farm, passed through generations. But now we have younger generations of family farms who are making the decision not to enter, and because of serious issues. So, I believe there is no greater issue we need to tackle than preserving the foundation of our agriculture system in this nation, and that is the family farm.

And so I want to thank you for it. I want to thank you, Ms. Dana Coale, the two who were in here earlier, who were the Deputy Administrator of the Agricultural Marketing Service. Mr. Scott Marlow was in, Deputy Administrator for the Farm Service Agency. And now our second panelists, Ms. Lolly Leshner, she and her husband own and operate Way-Har Farms in southeastern Pennsylvania. Thank you. And Mr. Mike Durkin, President and Chief Executive Officer of Leprino Foods Company, thank you. And Mr. Travis Forgues is the Executive Vice President of Membership, CROPP Cooperative and Organic Valley, and Dr. Marin Bozic, Associate Director of Midwest Dairy Foods Research Center. I want to thank all of you. You have been very helpful. We may need you back again as we pursue the big issue, saving our family farms, because you all are the ones that can help us find out how we can do it. And so I just want to thank you for it, God bless you, and safe travels. Thank you.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional mate-

rial and supplementary written responses from the witnesses to any questions posed by a Member, and now this hearing of the Committee on Agriculture is adjourned.

[Whereupon, at 1:34 p.m., the Committee was adjourned.]

Farm Level Milk Prices Set Record in Back-to-Back Months

Burdine, Kenny. "Farm Level Milk Prices Set Record in Back-to-Back Months".¹ SOUTHERN AG TODAY 2(26.2). June 21, 2022.

After dealing with incredible volatility for much of 2020 and 2021, dairy producers are benefiting from a sharply stronger milk market in 2022. Prices for cheese, butter, and nonfat dry milk are running significantly higher than last year and are fueling farm level milk prices. The U.S. All Milk price set a record in March of 2022, then exceeded that level to set a new record the following month. From March to April, prices rose by \$1.20 to a record level of \$27.10 per cwt. Prior to March of this year, the record high milk price was set in September of 2014.

U.S. All-Milk Price*January 2014 to April 2022, \$ per cwt*

Source: USDA-NASS.

Like most all commodities, milk prices only tell part of the story this year. Dairy producers are dealing with higher production costs as feed, fuel, fertilizer, and other inputs are also much higher. While feed rations differ across all operations, the assumed ration for the Dairy Margin Coverage (DMC) program has become a common metric to estimate feed costs for dairy operations. DMC feed cost includes assumed quantities of corn, soybean meal, and alfalfa hay for a representative dairy operation.

From April 2021 to April 2022, the estimated cost of the DMC ration has increased by \$2.28 per cwt or 18%. The U.S. All Milk price has increased by more than enough offset that increase over the last year, but considering the increase in feed costs does put the historical price levels in a slightly different perspective. While milk prices are setting record highs, estimated returns above feed costs have reached levels comparable to what was seen at times in 2019 and 2020. And, they are not at the levels that were seen during 2014.

Florida dairy farms need a policy update

While 150 cow operations still exist in Florida, the average Florida dairy now has more than 1,300 cows, and policies from dealing with climate change to immigration reform need to reflect those new realities.

¹ <https://www.tampabay.com/opinion/>.

My family's farm started as a 27 cow dairy my grandparents financed. Over the generations, our family farms grew to a milking herd that included 5,000 cows and employed 40 people. From climate change and emissions control to immigration reform, Federal policy needs to reflect these new realities.

Published Mar. 8, [2022]

As they have been for generations, dairy farms are an important part of Florida's fabric. And as always, dairy farms overwhelmingly are family businesses—95 percent of U.S. dairies, in fact, are family-owned and operated, according to USDA statistics.

But what a dairy farm is also has been changing. The average size of a U.S. dairy farm has risen from less than 130 cows 20 years ago to more than 300 cows today. In Florida, family dairy farms are even bigger—while 150 cow operations still exist in Florida, the average Florida dairy has more than 1,300 cows.

My own farm is part of this story. My family's farm started as a 27 cow dairy my grandparents financed after my grandfather returned home from serving in the Army. In the 1960s, 27 cows was enough to raise one family with three sons. My dad and uncle decided to stay on that farm, buying two more small farms with their parents in the mid-1980s. Those three farms—and their 400 cows—provided for three farm families and a few employees.

I grew up on one of those farms—I live next door to it today. When my grandfather retired after our fourth farm was built in 2003, the milking herd across all operations included 5,000 cows and employed 40 people. As my generation graduated from high school and college, the then-four dairy farms split into two businesses. Today, those farms support six farm families, including my own, and 36 employees.

That's a lot of change in three generations. And those changes are why, as part of the next farm bill and in Congress this year, Members of Congress need to remember the needs of dairy farms that are still family-owned, but much more complicated in how they're run. We're seeing missed opportunities from Washington to make a meaningful difference. We're hoping that this year, with elections and the work beginning on the next farm bill, we family dairy farmers might be heard.

One example of missed opportunities is a benefit that's being distributed across dairy country right now: The Federal Pandemic Market Volatility Assistance Program. This program meant to make up for revenues lost during the early days of the pandemic because of a change to the Federal formula on how milk is priced. The Pandemic Market Volatility Assistance Program spends \$350 million compensating farmers for losses of \$750 million.

Unfortunately, while it's well-intentioned, the program caps compensation at an amount that doesn't cover losses beyond what works out to the first 400 cows of an operation. That sounds like a way to help small, family farmers—but many family farms aren't that small, and many farms have multiple operations that give them an edge in payments.

My cousins own three of our original four farms. Because of the rules, they were able to capture up to three times the Pandemic Market Volatility Assistance Program funds I received, despite the fact that my single-family farm produces more milk—and thus lost more money—than their three together. Given the average size and mixed demographics of a Florida dairy business, it's easy to see how the effort falls short.

Another missed opportunity is climate change. U.S. dairy is a global leader in reducing agricultural emissions, with a target of carbon-neutrality by 2050. Federal policy could better help dairies of all sizes transition to an even more sustainable future. While smaller farms play an important role in sustainability, the fact is that larger ones can make a big difference. Farms like ours are already part of the solution—we graze our cows on grass pasture that's sequestering carbon in our soil and absorbs carbon from the atmosphere 365 days a year. We also recycle all our water, and we re-use the manure from our cows as fertilizer. We could be an even larger part of the solution if policies catch up to our promise.

Farmers also need immigration reform. Our current immigration system forces many high-quality workers into the shadows, making it impossible for families and businesses to plan ahead. Immigration policy often gets caught up in emotional debates that have nothing to do with farming—but lower-hanging fruit could be harvested through changes to visa programs that would make a temporary foreign workforce more workable for dairy.

These are only some of the many challenges dairy farmers face—everything from animal care to environmental stewardship is part of what makes a family farm work. And there's a lot of work to do. Family dairies are still doing what we do best—sustainably providing nutritious products to America and the world. Federal officials need to adapt to changes in how that's done to make sure the dairy industry, and the communities they serve, continue to thrive.

Brittany Nickerson-Thurlow was recently elected vice-chair of Southeast Milk Inc., Florida's dominant dairy co-op.

SUBMITTED LETTER BY ED MALTBY, EXECUTIVE DIRECTOR, NORTHEAST ORGANIC DAIRY PRODUCERS ALLIANCE

June 22, 2022

Chairman Scott and Committee Members,

The Northeast Organic Dairy Producers Alliance (NODPA), founded in 2001, is the largest grassroots organization of organic dairy producers in the United States. It has remained true to its original goals of advocating on behalf of producers for a sustainable pay price, regardless of who they sell their milk to, and to protect the integrity of the USDA Organic Regulations. To learn more, visit www.nodpa.com.

I was a dairy farmer for thirty years and have been farming both livestock and produce since I stopped dairy farming in 2000. I have been Executive Director of NODPA since 2005; served on the USDA Dairy Industry Advisory Committee in 2010; and serve on the Executive Committees of the National Organic Coalition and the Organic Farmers Association.

Organic certification is the only third-party audited program in the U.S. and, as a Federal program, is subject to a variety of Federal policies, regulations and programs, along with the enforcement of the organic standard by the USDA's National Organic Program (NOP). NODPA has worked with the NOP and all stakeholders to develop and implement regulations developed from the National Organic Standards Board (NOSB) recommendations that improve the integrity of the organic seal; ensure a living wage for organic farm families and their employees and ensure consistent implementation of regulations across all regions and certifiers.

State of the Organic Dairy Market

Since 2002, the retail organic dairy market has grown to 6.5% of the total domestic retail sales of milk products in 2021. It experienced growth of 7–15% per year in most years from 2005–2015, with the exception of the 2008–2009 recession. Its retail price per half gallon has been consistent, fluctuating between an average of \$3.80 and \$4.20 since 2008, according to data from the USDA AMS. Initially, the retail market was dominated by Horizon Organic, with CROPP Cooperative's Organic Valley brand in the top ten for retail sales. In the last few years, store brand or private label milk has dominated in sales, with Horizon in second place and Organic Valley branded product lower on the list of retail sales. The store brands are supplied by the large, vertically integrated companies in the West and Southwest,

and by CROPP Cooperative, which sources its raw milk from a variety of different sized farms.

The price paid to organic dairy farmers in the northeast had slowly increased with the growth in demand since 2001 when NODPA objected to a cut in pay price by Horizon Organic from \$20 per hundred pounds to \$19. Pay price peaked in 2015, at \$38 per hundred pounds, with demand exceeding supply. Cost of organic dairy production in the Northeast in 2015 was determined to be \$35 per hundred pounds by an ongoing study conducted by the University of Vermont. USDA NASS's organic census showed that an increase in the number of organic dairy cows from 2014 to 2015 was 1,068, while the increase in organic cows from 2015 to 2016 was 38,326. Many of the large vertically integrated organic herds catering to the store brand companies used a loophole in organic regulation (Origin of Livestock) to dramatically increase their cow numbers, and by 2016 there was a surplus. This coincided with a slowdown in demand for organic dairy products, lax and inconsistent enforcement of organic regulation, increased consolidation in organic dairy and an increase in demand for plant based 'milks.' By 2018, the Northeast pay price had dropped by up to 25% and has not recovered.

The pay price average for 2022 is projected to be \$31 per hundred pounds. After 5 years of a pay price below their costs of production, small- to mid-size organic dairy farm families are leaving the industry, with the data showing that only those larger herds of 300+ cows have the ability to survive at the current low pay price. There were two bright spots in the past couple of years; one being that the increase in sales during COVID did reduce the surplus; and CROPP Cooperative gave a 50¢ per hundred pounds (6¢ a gallon) increase in pay price in 2022.

How is pay price determined? The organic pay price is determined by the two national buyers, vertically integrated large organic dairies, and the conventional price for balancing organic milk when there is oversupply. The national buyers are CROPP Cooperative and Danone NA, and the major independent supplier is Aurora Dairy. The two major buyers, with their own dedicated pool of milk, dominate the supply-side; buying organic raw milk at a price they set because monopsony is prevalent in organic dairy. Each buyer has regional pricing depending on geographic location. They also have quality incentives and penalties that are similar but not identical. In many cases, a farmer's decision as to whom they sell their milk is determined by the pick-up route or processing plant that is nearest to their farm. Historical data shows that when there is a surplus of organic milk, the pay price drops across the board. It is only when supply is short or there is a new entrant into the supply market that pay price will increase, but not because farm operational costs increase or there is greater demand on the world market. Milk buyers have to bear the increased costs of balancing supply with demand, and this affects the pay price in both the conventional and organic market because any surplus has to be sold at a lower price. Pay price is now determined by the price that CROPP sets to compete in the store brand market since approximately 70% of its raw milk supply is sold into the store brand or private label market. The price that CROPP pays sets the price for what all organic producers are paid, although recently Danone, owners of Horizon Organic, has cut its pay price below CROPP's.

We are talking about more than just organic dairying. We all know the multiplier effect of small- to mid-size operations that are the backbone of the rural community. In a letter to the USDA Secretary in September 2021, seven United States Senators and six Members of Congress used the phrase "The organic dairy industry is an important economic engine in the Northeast and these farms serve as anchor businesses to many of our local rural economies," to describe the role of organic dairies. Organic Agriculture is also a climate smart system of agriculture. Science demonstrates that organic farming reduces greenhouse gas emissions, builds soil health and sequesters carbon, and fosters resilience to droughts, floods, and other extreme weather conditions. The practices pioneered by organic farmers, such as cover cropping, are being adopted more broadly in agriculture. All farmers can benefit from these cutting-edge practices to reduce greenhouse gas emissions and sequester carbon.

Organic regulations require farmers to use soil building practices, such as crop rotations, cover crops, and pastured grazing for livestock, which have been proven to improve soil health and increase carbon sequestration. Organic is the ONLY federally regulated label to require the use of these climate-smart farming practices.

The following chart is the average northeast base pay price, in dollars per hundred pounds, since 2004:

Average Northeast Base Pay Price—\$ per hundred pounds

2004	\$22.97
2005	\$24.73
2006	\$26.00
2007	\$25.80
2008	\$28.38
2009	\$27.50
2010	\$28.80
2011	\$30.00
2012	\$30.75
2013	\$33.39
2014	\$35.39
2015	\$38.39
2016	\$35.68
2017	\$33.27
2018	\$29.52
2019	\$29.51
2020	\$29.51
2021	\$29.51

Organic Dairy Farmers and their families are in a dire situation and in need of constructive assistance now and continuing aid to maintain their operations in the future. As CROPP has stated in its testimony, they cannot go to the market for an increase in price because they have only a small volume of consumer facing branded product. They are subject to competition from large scale, vertically integrated, low cost operations in the competitive store brand market. Organic dairy has none of the direct risk management tools that conventional dairies have. The process of deciding a pay price is opaque and lacks any process. Eighty nine organic dairies in the northeast lost their market because their buyer Danone wanted to change their logistics to cut costs. CROPP has found a market for only 58 of them in their reserve pool. We can't afford to lose any more.

The following are potential remedies that can be implemented as soon as possible to begin to address the disadvantages facing American Organic Dairy Farm Families.

- **Develop an Organic Dairy Margin Coverage (DMC) Program**
- **Address the Lack of Competition in Organic Dairy:** Congress should instruct USDA to work with DOJ to investigate the effect of lack of competition in New England and eastern New York in light of Danone's decision to exit the region.
- **Expansion and investment in dairy processing**
- **Consistent Regulation Enforcement:** The issues around sustainability for the small- to mid-size operations (80–1,000 organic cows) hang on how well the USDA's NOP enforces the regulations. Inadequate and inconsistently implementation for regulations has allowed the supply side of organic dairy to be exploited by low cost operations that exploit loopholes.
- **Request for more detailed organic milk data to reflect the depth of information provided for non-organic milk production:** We request that the Committee instruct USDA to establish mechanisms for publishing data for organic milk so organic farmers can understand their market in ways similar to the conventional market.
- **Financially reward the good work that organic farmers are doing regarding climate change**
- **FSA/Organic Certification Cost Share Program (OCSSP)**

1. Develop an Organic Dairy Margin Coverage (DMC) Program

Develop a program that analyzes organic milk price and feed cost data to determine possible benefits of an organic counterpart to the existing Dairy Margin Coverage (DMC) Program which has been used effectively in conventional dairy. We are asking that FSA, in coordination with NASS and AMS, use available organic price and feed data to develop an organic DMC program. To the extent possible, USDA should use organic data that is as comparable as possible to the data sets used under the DMC program. If there are data sets used for the DMC that have no com-

parable organic data set, we urge USDA to note that deficiency and provide analysis of the potential to start collecting those organic data.

- The Dairy Margin Coverage (DMC) Program, developed as part of the 2018 Farm Bill, is a national risk management program that offers margin protection to dairy farmers, defined as the difference between the national all-milk price and national average feed costs. The program is particularly targeted to benefit small- and medium-scale dairy farms, and it is this size operation that is suffering the most in organic dairy. Producers can choose their level of coverage. While premiums increase based on level of coverage chosen, those premiums are highly subsidized for a producer's first 5 million pounds of milk production annually, which is the mechanism used by Congress to target the benefits to small- and medium-scale dairy farms. Producers can buy coverage for production above the 5 million pound threshold, but the premiums for coverage above that are significantly higher, by design.
- The factors used to calculate the monthly margin DMC payments are the average national all-milk price minus national average feed costs (including corn, soybean meal, and alfalfa hay). The all-milk price is reported monthly by the National Agricultural Statistics Service (NASS). The corn and alfalfa hay prices are also reported monthly by the National NASS, and the soybean meal price is reported monthly by the Agricultural Marketing Service (AMS). USDA's Farm Service Agency (FSA) uses those data to administer the DMC program.
 - o Conventional and organic dairy producers are eligible for the program. However, the price factors used to calculate the margin are based on conventional prices. While in some circumstances this can be beneficial to organic producers, the current and future situation will have an adverse effect on organic dairy as the pay price is low and inputs high in organic but the conventional price has a high pay price even though inputs have increased in price. In 2022 Class [I] price is in many cases higher than the organic base price.

2. Expansion and investment in dairy processing

Congress should make the investment in scale appropriate dairy processing a priority in the 2023 Farm Bill.

Investment must be made in both existing successful track-record processors who are positioned and can scale production quickly and in new scale appropriate processing facilities to continue to develop system flexibility.

The creation of a new supply-side model for organic dairy is needed that addresses the immediate loss of milk markets for organic dairy producers and provides them with long-term sustainability. It is clear that the major dairy companies in the U.S. are quickly moving away from rural communities in favor of more cost-effective supply chains and huge, vertically integrated operations. It has become apparent that the whole organic milk supply-side model needs to change. The current model for the supply side of organic dairy is obsolete, with many organic dairy farms facing extinction now, and many more likely to follow. A long-term analysis of the future of organic dairy family farms will be regionally based. A new organic dairy supply-side model is needed, and a successful model will feature regionally owned, scale-appropriate facilities to process regional milk that will be sold into the regional market as a source-identified local product that will give an adequate pay price that ensures a living wage to organic family farms in the USA.

3. Address the Lack of Competition in Organic Dairy

Congress should instruct USDA to work with DOJ to investigate the effect of lack of competition in New England and eastern New York in light of Danone's decision to exit the region. New remedies should be proposed to restore competition in the region. The results of this investigation should inform future updates to Federal guidelines on horizontal and vertical merger approvals.

The crisis in New England and eastern New York caused by Danone with their Horizon brand decision to cancel their supply contracts with 89 farm families is a vivid regional example of the impacts of consolidation that plagues the entire organic dairy sector. Previous government decisions have allowed this consolidation to worsen and should be revisited. When Danone purchased White Wave in 2017, the Department of Justice mandated that Stonyfield Organic (owned by Danone with a supply contract with CROPP Cooperative) would have to be sold as a remedy to prevent monopsony in the region. Stonyfield Organic was sold to Lactalis, the second largest dairy company in the world. Now, effectively, there is only one buyer of organic milk in New England and eastern New York: Lactalis. Lactalis purchases 80% of its total milk supply from CROPP and purchases the other 20% either directly from Northeast farms or other sources. CROPP milk from New England and eastern

New York is also used in packaged product under the Stonyfield Organic label, licensed to CROPP by Lactalis.

4. Consistent Regulation Enforcement

Increase enforcement to level the playing field with consistent implementation of all regulations

Finalize the rule to crack down on organic fraud, the ‘Strengthening Organic Enforcement’ Rule.

Fraudulent organic imports and domestic fraud undermines consumer confidence in the organic label and undercuts prices for U.S. organic producers. Congress required USDA to issue a final rule to strengthen organic enforcement by December 19, 2019. The comment period on the Proposed Rule ended on Oct. 5, 2020. The rule is still under review by USDA.

This is unacceptable. We are asking that Congress urge USDA to move this rule forward as swiftly as possible.

Strengthen pasture rule enforcement with particular attention to high risk Concentrated Animal Feeding Operations (CAFO)

Particular attention needs to be paid to the following:

- a. Certifier’s inspection reports are inconsistent in detailing the growing season applicable to each operation. There is published data that reflects the growing season for each area. The operation must follow the applicable growing season rather than fall back on the minimum of 120 days.
- b. In evaluating percentage of dry matter consumption from pasture, each class of animal is required to be assessed separately.
- c. Attention needs to be paid to the crop rotation within the OSP with pasture as a crop.
- d. There is a lack of certifier/ inspector expertise in evaluating the dairy rations of large-scale dairies who use sophisticated technology and teams of veterinarians/nutritionists to prepare reports that may be impossible for the average dairy inspector to interpret when they analyze dairy rations and tie them to production and pasture consumption. NOP needs to mandate that these dairies are inspected by highly qualified dairy nutritionists experienced in pasture management. Surprise inspections of all pasture usage on large-scale dairies during the growing season needs to be required.
 - NOP needs to continue to level the playing field in providing inspectors who can interpret the unsophisticated but honest record keeping of small-scale dairies that do not have the technology, money or time for reports to satisfy desk audits. An experienced dairy inspector can take a walk in the pastures, noting the locations of water, shade and access pathways that are well worn by animals and view the unique signs of grazing within pastures, to assist in their evaluation of meeting regulations.
 - NOP should continue its Dairy Compliance Program; NOP should provide a detailed update with information that would help identify inconsistent enforcement that may be contributing to economic disadvantages for Northeast organic dairy operations.

5. Request for more detailed organic milk data to reflect the depth of information provided for non-organic milk production

We request that the Committee instruct USDA to establish mechanisms for publishing data for organic milk so organic farmers can understand their market in ways similar to the conventional market.

- a. Pay price for organic dairy farmers is set either by direct marketing of products to the consumer; a personal contract with the buyer (organic brand, dairy processor or, in the case of vertically integrated organic CAFO’s, retailer), or as part of a cooperative agreement as a member of a cooperative. There is a scarcity of organic data available for the farmer to make decisions on the state of the organic market, projections on potential changes in supply and demand and the value of their product.
- b. The Federal Milk Marketing Order program (FMMO) already receives data that allows them to provide information on the organic dairy sector. Statistics on dairy also are found at the USDA National Agricultural Statistics Service (USDA NASS) and the USDA’s Economic Research Service (USDA ERS). Every region produces a monthly statistical report that is published up to 2 months in arrears of the usage.

- c. FMMO data is derived from reports submitted by pooled handlers. The majority of organic milk is processed at FMMO pool plants that also process and manufacture conventional milk and are required to report to the FMMO. Only FMMO 1 (the Northeast Order) reports some of this information in its monthly statistical reports, in limited form. The FMMO 1 Monthly Statistical Report breaks out organic Class I fluid volumes for Whole Milk and Reduced Fat Milk (2%), which limits how the report can be used. Providing only part of the needed data, however, the information can also be combined to get an inaccurate picture of utilization of organic fluid milk in the Order and marketplace.
- d. USDA Dairy Programs asserts that it only has the statutory authority to collect Class I (fluid milk) data in the detail necessary to separate milk produced under organic production. We request that the Committee instruct USDA to identify this deficiency and provide analysis of the potential to start collecting that organic data for all Orders.

The collection of the following data is within the statutory authority of the FMMO but is not published on a regular basis:

- (a) Utilization of organic Fluid Milk products and cream from Producer Receipts and Other Sources: Class I milk:
 - 1.i. Marketing Area;
 - 1.ii. Other Federal Markets;
 - 1.iii. Non-Federal Markets
- (b) Utilization of Fluid Milk Products and Cream by Pool Plants for Class [I] Milk, for all Orders:
 - 1. Organic Whole Milk
 - 2. Organic Reduced Fat Milk (2%)
 - 3. Organic Low Fat Milk (1%)
 - 4. Organic Fat Free Milk (Skim)
- (c) Organic Mailbox Price by region
- (d) Export of organic dairy products

6. Financially reward the good work that organic farmers are doing regarding climate change

Organic agriculture should be front and center in policies that address the role of agriculture in combating climate change. Organic dairy farmers should be at the table for these discussions. Congress should reward the good work that organic farmers are already doing and should assist others interested in transitioning to organic.

We are asking that Congress should include provisions in the 2023 Farm Bill to:

- Support organic farmers and help others to transition to organic.
- Increase funding for organic research related to climate change.
- Increase funding for USDA conservation programs to reward regenerative organic farming practices.
- Modernize USDA risk management programs to reward, not penalize, regenerative organic farming practices.

Include provisions in the FY 2023 Agriculture Appropriations bill to:

- Increase funding for USDA's National Organic Program with focus on increased enforcement of existing soil health requirements
- Increase organic research funding related to climate change.

7. FSA/Organic Certification Cost Share Program (OCSSP)

In the previous Administration, USDA's Farm Service Agency (FSA) unilaterally cut reimbursements to organic farmers under the Organic Certification Cost Share Program (OCCSP), in conflict with the 2018 Farm Bill directive. As a temporary stopgap, USDA created a parallel Organic and Transitional Education and Certification Program (OTECP), which NODPA has supported. OTECP is currently slated to provide stopgap funding through FY2022.

For FY 2023, it is critical to fully fund the OCSSP. The OCSSP is especially important for small- and mid-size farms and for underserved producers. A recent survey conducted by the Organic Farming Research Foundation <https://ofrf.org/research/nora/> shows that the cost of organic certification was identified as a major challenge—29% of all organic farmers listed this as a challenge & 61% of Black, Indigenous and other farmers of color identified this as a challenge. Thus far, USDA

has not committed to fully restore the program for FY23, so we are asking Congress to fix the problem through the FY 2023 appropriations process.

Summary

The future for all small- to mid-size organic dairies must include regulations that maintain organic integrity, not undermine it for the benefit of large operations and milk handlers. We must have strong enforcement and certifiers that understand the regulations and a USDA NOP that can ensure consistent enforcement at all levels of production. We must also look at infrastructure that is scale and market appropriate. If we have regulations that are strongly enforced, the processing, packaging and marketing infrastructure will have a secure base to build on. For organic dairy, that will mean having modern processing facilities that are designed to process and package smaller quantities of milk to meet the needs of the value-added products that have a strong market with discriminating consumers. When the next pandemic or weather crises happens, will the food supply chain be more protected or more exposed with less processing capacity and a smaller rural population?

NODPA appreciates the opportunity to provide written testimony for the "A 2022 Review of the Farm Bill: Dairy Provisions." Please reach out to me with any questions or follow-up from Committee Members as you take on the massive work of developing the 2023 Farm Bill.

ED MALTBY,
NODPA *Executive Director*.

SUBMITTED LETTER BY KATE MENDENHALL, DIRECTOR, ORGANIC FARMERS
ASSOCIATION

June 30, 2022

Chairman Scott, Ranking Member Thompson and Members of the Committee:

The Organic Farmers Association (OFA) is a membership organization that represents U.S. certified organic farmers. Our organization was founded by and is controlled by certified organic farmers, and only domestic certified organic farmers vote on OFA's policies and leadership. We would like to share with the Committee some more information related to a problem in organic dairy that the Chairman referenced in his opening remarks.

In August 2021, Horizon Organic (owned by Danone North America) notified organic dairy farms in Maine, Vermont, New Hampshire and several counties in New York that it would terminate their contracts in the summer of 2022. This decision is directly impacting 89 organic family farms. Since the original announcement, Danone announced that it will keep the impacted farms on contract for an additional 6 months (for a total of 18 months from the original notice), but will still be pulling out of Maine, Vermont, New Hampshire and several counties of eastern New York.

This impacts not only the 89 farm families who have to cope with the loss of their milk contract, but could also affect the rural communities where these farms are located, other organic farmers who supply these operations with feed and local businesses who provide services to these farms. And we believe it is a useful example of the damage done by the extreme levels of consolidation that are present in every sector of agriculture, even a specialized market such as organic, where many assume that farmers must be better off because organic products are sold for a premium.

While the crisis caused by Horizon's decision to exit the Northeast is focused in one region of the country, extreme consolidation plagues the entire organic dairy sector nationwide. In the organic dairy market, there are two national brands: Horizon Organic owned by Danone North America, whose parent company is Danone that is headquartered in France, and Organic Valley, owned by CROPP Cooperative based in Wisconsin. The leading retail seller of organic dairy products is store brand/private label products supplied by CROPP Cooperative and very large, confinement-style, vertically integrated organic dairies, such as Aurora Dairy farms and milk plants in Texas, Colorado and Missouri. The vertically integrated dairies have the economies of scale that allow them to undercut competitors in the price sensitive store brand/private label retail market, which by its nature has a lower retail price than branded organic product. In addition to economies of scale, there are ongoing problems with the enforcement of organic standards at these large operations, including requirements that organic dairy cows receive access to pasture and rules for how conventional animals can be transitioned into organic production. This enforcement is the responsibility of the U.S. Department of Agriculture (USDA), which

oversees organic certification. This enforcement problem goes hand in hand with the consolidation of the organic dairy sector—as these large vertically integrated operations entered the market, weaknesses in USDA’s enforcement system became more pronounced, and small-scale operations now compete on an unlevel playing field that puts them at a significant economic disadvantage in a market dominated by a few large buyers.

The consolidation of the organic dairy market gives disproportionate power to international companies to dominate both the supply side and the retail market, which has resulted in a lack of regional processing infrastructure in the Northeast and only one buyer for organic milk. That one buyer can set the price and conditions of any contract or cooperative agreement, leaving the organic dairy farmer only two choices, take the deal or leave organic dairy (or dairy farming altogether), with the resulting repercussions on their family and their rural community.

As you develop the next farm bill, we urge you to consider some specific needs of organic dairy producers. As the organic dairy sector has grown, organic dairy producers have not been able to access the same information about their industry from USDA’s Agricultural Marketing Service as their conventional neighbors. We urge Congress to instruct USDA to work with organic dairy producers to design reports with statistics available through the Federal Milk Marketing Order system to provide insight into the dynamics of how organic milk flows through national supply chains. Lack of transparency about supply and utilization of organic milk has been a source of confusion and frustration for organic dairy producers who would like to better understand these trends so they can adapt to an evolving industry.

Another area that Congress should address in the next farm bill is the Organic Certification Cost-Share Program. All certified organic operations must complete annual inspection and certification. The Federal Government has historically reimbursed up to 75 percent of organic certification fees paid by organic farms and businesses, with a maximum reimbursement of \$750 per certification scope (crops, livestock or handling) per operation, but since 2020, the program has paid a reduced reimbursement rate. In the next farm bill, we urge Congress to increase the reimbursement level and to streamline the program to reduce the up-front cost of certification instead of relying on a reimbursement model.

And in addition to the next farm bill, we urge you to exercise your ongoing oversight of the USDA, which is responsible for ensuring that products bearing the organic label are meeting the same high standards, no matter where they are from or what size operation produced them. Specific actions needed from the USDA include:

- The USDA and the Department of Justice should work with the inter-departmental White House Competition Council (established by President Biden’s Executive Order on Promoting Competition in the American Economy) to examine the organic dairy market in the Northeast as a case study of loss of resilience and harm to farmers caused by consolidation.
- The USDA should step up enforcement of organic pasture standards to level the playing field for smaller organic dairy operations and begin to enforce the newly updated Origin of Livestock standard.
- The USDA should complete and enforce long-delayed regulations necessary to protect the integrity of the organic label. Organic dairy producers rely on consumer trust of the USDA label to market their products, and USDA’s failure to update and enforce organic standards beyond those for dairy production can still put organic dairy farmers at risk of losing consumers’ trust. The USDA must complete the Organic Livestock and Poultry Standards rule and consistently enforce stronger animal welfare standards on organic farms, as well as the Strengthening Organic Enforcement rule that would implement important measures to detect and prevent fraud in organic supply chains, as required by the 2018 Farm Bill.

Thank you for your attention to the critical issues facing dairy farmers, including organic dairy farmers. Please contact our Policy Director, Patty Lovera, if you need more information or have questions about this testimony, [Redacted], [Redacted].

Respectfully submitted,

KATE MENDENHALL,
Director.

SUBMITTED STATEMENT BY STEVEN ETKA, COORDINATOR, MIDWEST DAIRY COALITION

Chairman Scott, Ranking Member Thompson, and Members of the Committee—

Thank you for holding this hearing to discuss important dairy policy issues in advance of the 2023 Farm Bill. I wanted to use this opportunity to introduce Committee Members to the Midwest Dairy Coalition and inform you about the policy positions of the Coalition.

The Midwest Dairy Coalition is an alliance of dairy cooperatives representing dairy producers in eight Upper Midwest states on Federal dairy policy issues. The Coalition collectively represents nearly 5,600 dairy farms, or about 19 percent of the dairy farms in the nation. On a regional basis, the Coalition's membership represents a majority of the dairy farms in the Upper Midwest and provides an effective and useful forum for dairy organizations to discuss, debate and propose common policy action dealing with the ever-changing Federal dairy issues of the day.

Member organizations include **Associated Milk Producers Inc., Bongards Creameries, Ellsworth Cooperative Creamery, First District Association, FarmFirst Dairy Cooperative, and Rolling Hills Dairy Cooperative.**

The Midwest Dairy Coalition has taken strong policy positions on a wide array of Federal policies affecting dairy farmers and their markets. While not all our policy recommendations are within the jurisdiction of the House Agriculture Committee, we believe it is important for the Committee to see the cross-cutting issues affecting dairy farmers and their cooperatives.

Dairy Margin Coverage (DMC) Program

The Dairy Margin Coverage (DMC) Program has proven to be a very important risk management tool for dairy farmers. The voluntary program gives participating dairy farmers the ability to manage risks associated with changes in the margin between milk prices and feed costs. The program was established in the 2018 Farm Bill as a successor program to the inadequate Margin Protection Program (MPP). In the 2023 Farm Bill, the DMC should be continued with the following updates:

- The 5 million pound annual production threshold (about 200 cows) between Tier I premiums and the higher Tier II premiums should be updated to 8 million pounds (about 320 cows). Doing so reflects the growth in average dairy herd size since the 2018 Farm Bill. The average dairy cow annually produces about 25,000 pounds.
- The production history used under the current program is based on a dairy farmer's highest production from 2011, 2012 or 2013. As part of the Consolidated Appropriations Act of 2019, Congress established a parallel program called the Supplemental DMC Program to allow smaller-scale dairy farmers (under 5 million pounds of production history) to receive a Supplemental DMC payment based on their 2019 production history. The updated production history concept of the Supplemental DMC Program should be merged into the base DMC Program to allow dairy farmers with 8 million pounds of production or less to update their production history to 2022 levels for future DMC payments.
- The Committee should also consider increasing the top DMC margin level from \$9.50 to \$10.00 per hundredweight, to partially reflect the increased costs of non-feed inputs used by dairy farmers. Variable feed costs are already captured in the base margin calculation formula of the DMC.

Federal Milk Marketing Order Modernization

The Federal Milk Marketing Order (FMMO) system has not been significantly updated since 2008. Because of the complexity of the system and the inter-related nature of all the aspects of the pricing system, the Midwest Dairy Coalition supports a full-scale review and improvements to the system and opposes efforts to seek more narrow changes.

Changes to the FMMO system should be made through the robust FMMO administrative hearing process, which was developed by Congress to fully consider all perspectives and potential repercussions of proposed changes, as opposed to mandating specific Federal Order changes legislatively.

Many of our members are actively engaged in FMMO discussions with other dairy farmer cooperative leaders from around the country through a process established by the National Milk Producer Federation (NMPF), at the urging of Agriculture Secretary Vilsack. The goal of this effort is to seek broad agreement on a full-scale proposal for FMMO modernization to be undertaken through the existing administrative hearing process within USDA's Agricultural Marketing Service. We urge the Committee to continue to monitor the industry's consensus-building dialogue. It is

paramount that this process be allowed to play out prior to any Committee consideration of legislative action on FMMO issues.

Dairy Pride Act (S. 1346 and H.R. 2828)

Truth in Labeling for Non-Dairy Beverages

Currently, FDA regulations require products labeled as milk, yogurt, ice cream and cheese to be produced from dairy animals. Unfortunately, FDA has not enforced those regulations, which has resulted in many plant, nut-based or lab-generated products being inappropriately labeled using dairy terms.

Consumers are often unaware that the nutritional attributes of milk and other dairy products far exceed those of non-dairy beverages. Bipartisan legislation has been introduced in the Senate and House to require FDA to enforce its own regulations. The Midwest Dairy Coalition is urging Members of Congress to cosponsor this important legislation.

Dairy Trade Issues

United States-Mexico-Canada Agreement (USMCA) Enforcement

The United States-Mexico-Canada Agreement (USMCA), signed into law in January of 2020, includes important provisions to reform Canada's trade-distorting dairy pricing policies and expand U.S. dairy access to Canada. However, Canada has not lived up to its dairy access commitments under the Agreement, which led the U.S. to file a dispute settlement case against Canada's actions. In January 2022, U.S. Trade Representative Ambassador Tai announced the U.S. had prevailed in its case against Canada. As part of the dispute resolution process, Canada was given the opportunity to put forward a proposal to revise its rules to comply with the ruling. Canada's proposals to comply with the ruling failed to address to underlying harms identified by the ruling. This led the Biden Administration in May of 2022 to initiate a second dispute panel over Canada's recent delays in fulfilling its obligations under USMCA. The Administration and Congress should continue to insist Canada comply with the dairy market provisions of the USMCA.

Geographic Indications and Common Cheese Names

The European Union has taken an aggressive stance in bilateral and multi-lateral trade negotiations to block the ability of U.S. dairy farmers and manufacturers to use common cheese names, such as parmesan, feta, and asiago. They argue these names should only be allowed for use by cheesemakers in the regions of the world where that style of cheese originated. However, these generic cheese names have been commonly used in the U.S. dairy sector for generations.

In a January 2022 judicial ruling, Judge Ellis of the U.S. District Court for the Eastern District of Virginia upheld a 2020 decision of the U.S. Patent and Trademark Office's (USPTO) Trademark Trial and Appeal Board regarding use of the term "gruyere." This ruling confirmed "gruyere" is a generic style of cheese that can come from anywhere. The decision reaffirms that all cheesemakers, not just those in France or Switzerland, can continue to create and market cheese under this common name.

Congress and the Administration should take steps in trade negotiations to preserve the ability of U.S. cheesemakers to continue the use of common cheese names.

Support for Bi-lateral and Multi-lateral Trade Agreements

In 2021, dairy product exports totaled 17.3 percent of U.S. total milk solids production, a record for the U.S. dairy industry. The U.S. dairy industry has the capacity to raise its level of exports even further.

The Midwest Dairy Coalition encourages the Administration to pursue comprehensive trade agreements whether bi-lateral or multi-lateral. The Administration's trade policy agenda refers to trade and investment and economic "frameworks" but that doesn't equate to trade agreements built around tariff cuts.

With respect to dairy competitors, the European Union, New Zealand, and Australia are showing signs that their dairy industries have limitations on their ability to significantly grow dairy exports in the future. More bi-lateral and multi-lateral trade agreements will give the dairy industry the opportunity to reach new highs in dairy exports.

Ocean Shipping Reform and Dairy Trade

The Midwest Dairy Coalition has endorsed the Ocean Shipping Reform Act to address the shipping challenges the dairy industry and other U.S. agricultural sectors have faced since the beginning of the pandemic. Therefore, we are very pleased that this bill recently passed Congress and was signed into law by President Biden. The new law will help alleviate delays and disruptions at U.S. ports that have been a

critical part of the export supply chain challenges plaguing U.S. dairy exporters. We thank Congressmen Garamendi and Johnson and Senators Klobuchar and Thune for their bipartisan leadership in getting this important legislation across the finish line.

Agriculture Labor Policy and Dairy Farms

Foreign-born workers are a critical part of the U.S. dairy economy and the communities where they live. While border security is important, establishing a clear process for immigrant dairy workers to establish legal status is critical. The Midwest Dairy Coalition supports agriculture labor reform legislation to:

- Provide an affordable and efficient guestworker program that ensures the continued availability of immigrant labor for all of agriculture, including dairies; and
- Permit those currently employed or with employment history in the U.S. to earn the right to work here legally, regardless of their current legal status.

The Midwest Dairy Coalition supports the Farm Workforce Modernization Act (H.R. 1603), as passed by the House in March 2021, and supports efforts to make improvements and pass the bill in the Senate.

The Role of Dairy in the National School Lunch Program

Dairy foods such as milk, cheese and yogurt provide critical nutrition to Americans of all ages. Dairy consumption helps Americans meet recommendations for calcium, vitamin D and potassium, three of the four under-consumed nutrients of public health concern. Dairy foods also make important contributions to the consumption of protein, magnesium, vitamin A and other nutrients in the U.S. diet.

Access to nutritious milk and dairy products is especially important for children—a large percentage of whom fall short of meeting daily dairy intake recommendations established by the *[Dietary] Guidelines for Americans* through the U.S. Department of Agriculture and the U.S. Department of Health and Human Services.

The decline in fluid milk consumption in schools has been linked, in part, to past Congressional and USDA efforts to prohibit schools from offering whole milk or low-fat flavored milks, which children prefer for a better taste experience. Nutrition and health science professionals have begun to reconsider those policies in recognition of the nutritional benefits of milk consumption for children. For example, a March 2015 Policy Statement from the American Academy of Pediatrics *declared* that “consideration of a beverage such as flavored milk provides a good example of the balance needed to limit added sugars and yet promote nutrient-rich foods.”

To help address the shortfall in daily intake of dairy products by schoolchildren, the Midwest Dairy Coalition supports:

- The School Milk Nutrition Act (H.R. 4635), introduced by Reps. Courtney (D-CT) and GT Thompson (R-PA), to ensure low-fat flavored milk remains an option for children as part of the National School Lunch Program.
- The Whole Milk for Healthy Kids Act (H.R. 1861), introduced by Reps. GT Thompson (R-PA) and Antonio Delgado (D-NY), to require children be offered a variety of fluid milk options as part of the National School Lunch Program, and to allow schools the option of serving whole milk.

Thank you for this opportunity to highlight the broad array of Federal policy initiatives that impact dairy farmers and cooperatives of the Midwest and nationwide. We look forward to working with the Committee as your farm bill hearings and deliberations continue.

SUBMITTED SIGN-ON LETTER BY ACTIONAID USA, *ET AL.*

National Call for Fair Prices for Dairy Farmers and Systemic Dairy Policy Reform

United States Senate,
Washington, D.C.;
United States House of Representatives
Washington, D.C.,
Date: November 10th, 2021
Dear Senators and Representatives,

We, the undersigned 91 farm, food, social, labor, and environmental justice organizations, urge Congress to take immediate action to implement fair prices for family-scale dairy farmers to address the ongoing U.S. dairy crisis.

For years, the prices paid to U.S. dairy farmers have regularly been below their costs of production. Prices dipped so low in 2018 that farmer suicides became national news. Low prices mean that family dairy farmers cannot pay their bills, contribute to their local economies, invest in sustainable practices, pay workers a fair wage, or transition their farms to the next generation. Federal dairy insurance and other payments have made little difference for most farmers, instead amounting to taxpayer subsidies for the large dairy processors who benefit from low milk prices.

Aided by Federal policy decisions, milk production has moved to industrial-scale operations, whose large-scale production contributes to driving prices down. Seventy percent of dairy farms went out of business from 2000 to 2020, even while milk production increased by over 130%.¹ Large-scale industrial operations have lower production costs, but this economy of scale conceals expensive externalities, in the form of water pollution, depressed rural communities, lower property values, worker rights abuses, and more.

Overproduction and low prices have led to an over-reliance on export markets to dispose of excess milk volume. Small- and mid-size farmers are particularly at risk in an export-focused industry, which is vulnerable to global political uncertainties. The fragility of the “get big or get out” approach has decreased the sector’s resilience in the face of shocks, as was clearly exposed in the COVID–19 pandemic, when farmers have dumped tens of millions of pounds of milk even as tens of millions of people are food-insecure.

The dairy insurance programs developed in the last two farm bills have acknowledged the problems, but have not fundamentally addressed chronic low prices, market volatility, and continued consolidation.

The U.S. dairy sector needs systemic reform to support fair prices for family-scale producers, address corporate consolidation, and reduce dependence on export markets.

We need a new U.S. dairy policy oriented towards small- and mid-size dairy farms, rather than corporate agribusiness. Successful models abound: U.S. dairy policies in place from the New Deal through the 1990s managed milk production and ensured farmers a fair price, while the U.S. sugar and cranberry industries and Canadian dairy market use similar elements that have stabilized those sectors in ways that U.S. dairy farmers need and deserve.

Core components of a successful dairy program must include:

- Price floors, based on scale of operation, that allow family-scale dairy farmers to cover their costs of operation;
- Production management mechanisms to re-balance U.S. dairy supply with demand, focused on scaling down the industrial-scale mega-dairies that contribute most to overproduction;
- Managed imports and exports to prevent undercutting farmer incomes and workers’ rights in the U.S. and limit dependence on foreign markets;
- Measures to restore competition to the sector;
- Investment and incentives to rebuild regional dairy infrastructure.

Such a program must include both the organic and conventional markets, and support for entry of new and beginning dairy farmers must be a particular priority. Many in the sector are also calling for reform of the antiquated Federal Milk Marketing Order (FMMO) system; there is great potential to incorporate other necessary changes in the sector into any FMMO reform process.

The benefits of a new way forward for the dairy industry are numerous: for consumers, workers, and dairy processors who will be guaranteed a consistent and resilient milk supply; for the climate and the environment, as family-scale dairies can manage their waste in a more ecologically-appropriate manner and are more likely to graze their animals to build healthy soil and sequester carbon; for rural economies, where a thriving dairy industry will respect workers’ rights while creating good jobs in processing and transportation; and for dairy farmers themselves, who deserve more transparency, competition, and control over the sector they uphold.

It is time for a change in the dairy industry. We call on your political leadership to support farmer- and worker-centered systemic reform of U.S. dairy policy. To sup-

¹ USDA “Milk Production,” 2/16/01 & 2/23/20.

port true sustainability from our kitchen table to our planet, we must support economic justice for dairy producers.

SUBMITTED QUESTIONS

Response from Scott Marlow, Deputy Administrator for Farm Programs, Farm Service Agency, U.S. Department of Agriculture

Questions Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question 1. The scale of dairy operations in Connecticut is much smaller than those in the West, and it is critical to ensure that provisions in the farm bill do not leave them out of the conversation. I hear from producers in my district, most of whom are small, family-owned operations, that they lack the capacity to interface with Federal assistance programs on top of running operations.

Administrator Marlow, is the Farm Service Agency properly equipped to conduct focused outreach to small farms? Would adjusting the DMC Program for small farms, as suggested by Mr. Forgues's testimony, help your agency assist smaller operations in Connecticut and the Northeast?

Answer. DMC is a risk management program providing benefits for participating dairy operations up to 5 million pounds of covered production history. By the numbers, small- and mid-size dairy operations make up a majority of those enrolled in DMC. Small dairy farms are viewed by many as important to the rural character to much of the continental U.S. and efforts are needed to keep them sustainable. USDA-FSA understands smaller dairy operations, compared to their larger counterparts, lack economies of scale, and do not have the technological and management resources the larger dairy operations have available. Finding a way to provide attainable resources for the smaller operations is an important point worthy of consid-

eration and was mentioned more than once during the recent House Agriculture Committee hearing.

Mr. Forgues, Executive Vice President of Membership for Organic Valley, provides suggestions that should be reviewed further. While it is important to remember a segment of small dairy operations are organic, grass based or other and may operate differently from typical dairy operations, it is not a realistic approach for the rest of the current dairy industry. USDA will seriously consider the proposals and make applicable program changes within authority, as we have accomplished in the past for dairy support programs.

Question 2. In 2021, about 19,000 operations had registered for the DMC Program. To date this year, the number of operations registered is about 17,000. To what do you attribute the drop in participation in DMC, and what efforts is the Farm Service Agency making to restore and increase participation?

Answer. Unfortunately, a small percentage of dairy operations determine their annual participation in DMC according to margin projections for the upcoming enrollment year. If indemnity payments are not predicted, the producer does not enroll to avoid payment of the premium fee. During the 2022 DMC Coverage Election Period prior to 2022, the DMC monthly margin projections were above the \$9.50 coverage level and consequently some producers declined 2022 DMC participation.

Prior to and during the DMC Coverage Election Period, FSA promotes the value of DMC risk management protection, and reminds producers the margin projections are not definite. This is not the first time annual participation dropped because there were no expected DMC indemnity payments during the DMC enrollment period. For the upcoming 2023 DMC coverage election period and future enrollment periods, USDA will promote the program benefits and perform significant outreach reminding producers and the dairy industry of the long-term importance of having a risk management program rather than trying to annually predict if the program will trigger.

While 2022 DMC participation is less than 2021 participation, 93 percent of 2021 producers enrolled for 2022 even with no expected indemnity payments. Additionally, it should be noted, nationally some dairy operations have chosen to dissolve and stop commercially marketing milk in 2021 and 2022.

During a very turbulent time for dairy feed and milk prices DMC provided significant financial support in 2020 and 2021 in the amount of \$1.4 billion. Over time, DMC has earned the trust of those producers participating in this important risk management program.

Response from Laura “Lolly” Leshner, Owner/Operator, Way-Har Farms; on behalf of National Milk Producers Federation, Dairy Farmers of America

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question. In your testimony, you highlighted how dairy farmers have long been responsible stewards of the environment. The numbers show that programs like the Environmental Quality Incentives Program (EQIP) are incredibly popular among farmers. However, this popularity leads to oversubscribing, and EQIP lacks the resources to fulfill every application it receives. Even the smallest farms in my district are taking important steps to adopt climate-smart practices, and Congress should be rewarding this behavior by making it easier to access assistance.

What level of investment would you suggest to help EQIP and other conservation programs meet high levels of demand?

Answer. We support enhanced funding for EQIP as well as better targeting the program toward areas of opportunity for dairy like feed and manure management. The recently enacted Inflation Reduction Act included \$8.45 billion in new funding for EQIP over 4 years, including \$100 million for Conservation Innovation Trials with emphasis on projects that use feed and diet management to reduce enteric methane emissions from livestock. We look forward to working with Congress in the upcoming farm bill to build on these initiatives.

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. Farmers have been asking for a national hearing on milk pricing, but the Secretary of Agriculture was quoted in a *Brownfield* interview earlier this month saying dairy stakeholders will have to all agree on one dairy pricing plan before opening a hearing. How do you see this working without a hearing process to evaluate multiple proposals? How do you see this process moving forward in terms of the farm bill and what happens if it does not?

Answer. The dairy industry through NMPF is working to develop a Federal Milk Marketing Order modernization proposal that can be submitted to USDA for consideration in a national Federal Order hearing. A hearing process allows for discussion of numerous ideas and proposals from stakeholders, but ultimately a national consensus will be needed for us to be successful and that's what we are working to achieve. That means a give-and-take that requires a careful balance if dairy farmers are going to succeed in improving our milk pricing system. As we work to develop lasting solutions, we're also engaging with other farmer groups, industry organizations, and experts from across dairy to make sure our proposal addresses widely shared concerns and attracts wide support. This involves open dialogue and fact finding through discussion in the industry, to ensure that all voices are heard. As the largest dairy farmer organization in the United States, as well as the one that represents farmers invested in their own milk processing capacity, NMPF is well-positioned to lead FMMO modernization discussions. USDA can convene hearings under existing law, or Congress can pass legislation, in the farm bill for example, directing USDA to convene hearings.

Question 2. The dairy check-off board representation is weighted geographically by milk volume not by farm numbers and the industry is consolidating with significant geographic shifts in production. As this occurs, should changes be made to the check-off program or should a referendum be conducted so farmers can confirm their support of its direction?

Answer. I have seen firsthand the critical work the Dairy Research and Promotion Program does to advance and promote the interests of all dairy producers. Its Undeniably Dairy media activation has introduced millions of Americans to real dairy farmers, which is important in our society that is more removed from the farm than ever. Through longstanding partnerships with school nutrition programs and food banks, the DRPP pivoted during COVID-19 to rapidly connect dairy farmers to schools and food banks. By leveraging partnerships and bolstering the supply chain, the industry got nutrient-rich dairy foods to children and families experiencing food insecurity through school and emergency food programs. The National Dairy Research and Promotion Board includes 36 dairy farmers who are in constant communication with their farmer neighbors around the country. The Board's members are well positioned to keep the program moving in a direction that serves all farmers.

Question 3. How have the changes to safety net and risk management tools in the last farm bill (*i.e.*, DMC, DRP) worked for your farm and others?

Answer. DMC has worked effectively since being enacted in the 2018 Farm Bill. We have purchased the maximum available DMC coverage each year since 2019, at a margin of \$9.50 per hundredweight, knowing that it may not pay out every year, but is intended to serve as a safety net when needed.

Question 4. What unintended consequences have you or other dairy farmers experienced since the Class I pricing change was implemented?

Answer. Unfortunately, the current Class I mover saddles dairy farmers with asymmetric risk because it includes an upper limit on how much more Class I skim revenue it can generate for producers than the previous mover, but no lower limit on how much less can be generated than the previous mover. Whenever the Class III and IV prices widely diverge, as is happening again today with higher Class IV prices, the current mover will significantly under-perform the previous mover. Even today, the current mover has not made up for the 2020 losses because it is only moderately different from the previous mover and has not performed significantly better at any point. In other words, when the asymmetric risk inherent in the current mover causes non-trivial losses, as it did in 2020, those losses become effectively permanent. This runs contrary to the intent of the 2018 agreement and isn't sustainable long-term public policy.

Question 5. Should dairy farmers have the right to vote individually on Federal Orders instead of being bloc voted by their cooperatives?

Answer. Dairy farmer-owned cooperatives play a large and critical role in the marketing of milk across the U.S., doing the needed work of balancing milk markets to ensure that all-milk supplied by their farmer-owners is marketed for the highest possible return to the farmer and moved as quickly as possible in volumes that manufacturers need. This often involves intricate logistical work that co-ops perform on behalf of their farmer-owners and extends to decisions on amendments to the Federal Milk Marketing Order system. The ability of co-ops to bloc vote on behalf of their farmer-owners is a fundamental component of the co-op's overarching goal of effectively marketing milk for the highest possible financial return to its farmer-owners. Under current procedures, a co-op may elect not to bloc vote on FMMO issues and in those cases its members receive individual ballots to exercise as they wish. A co-op board can also decide to bloc vote on behalf of its members, and if

it does so it must submit a certified copy of a resolution from the co-op board, which represents the co-op owners, authorizing the casting of the ballot.

Question 6. What are some of the dairy market access and competitive concerns we should be looking at in crafting dairy policy for the next farm bill?

Answer. Farm bill funding to support export promotion is a valuable tool—we should invest more in that space in the next farm bill, along the lines of bipartisan legislation recently introduced in the Senate. Also, within the scope of the farm bill, we're seeing a growing number of non-tariff trade barriers in different markets. One that is especially problematic in multiple countries are bans on the use of common food names like parmesan and bologna. The farm bill could help tackle this expanding trade barrier by charging USTR and USDA to negotiate protections for the use of commonly used food terms.

Response from Mike Durkin, President and Chief Executive Officer, Leprino Foods Company; on behalf of International Dairy Foods Association

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. Section 4305 in the 2008 Farm Bill instructed USDA to set up a trial of sorts, providing a variety of whole grain products in school lunch and breakfast programs, then evaluating student consumption and acceptance. Would a similar 'trial' for whole and 2% milk be helpful in this farm bill to evaluate consumption, waste and acceptance—given the facts that student consumption of milk has declined, waste has increased and key nutrients of concern found in milk have been documented as under-consumed over the past decade while schools have been restricted to offering only fat-free and 1% low-fat milk.^[1]

Answer. The 2020–2025 Dietary Guidelines for Americans, which continued the message of previous DGAs, recommended increased intake of dairy products, and identified dairy as an under-consumed food group.^{1*} This is especially true for many school age children, with between 68% and 76.2% of school age males and between 77.4% and 94.3% of school age females failing to meet recommended levels of dairy.² For all youth aged 19 and younger, mean intake of dairy is only 1.9 cup-equivalent per day, which is below recommendations by ½ cup or 1 cup-equivalents, depending on age.³

School meal program nutrition standards should encourage dairy consumption. School meals are a significant source of dairy, with the School Breakfast Program providing 40% of the dairy needed by students each day and the National School Lunch Program providing 47%.⁴ For children, dairy is the number one source of three of the four food substances of public health concern as identified by the DGA: calcium, potassium, and vitamin D.⁵

[1] **Whole Grain Purchases for School Meals:** Section 4305 in the 2008 Farm Bill instructed the USDA to purchase whole grains and whole grain products for use in the National School Lunch Program and School Breakfast Program. The section also instructed the USDA to evaluate whether children increased their consumption of whole grains as a result; which whole grains were found to be most acceptable to children participating in the school meal programs; and recommendations for integrating whole grain products into the school meal programs.

Whole milk contains the same nutrients as all other fluid milk, including calcium, phosphorus, protein, vitamins A, D and B12, pantothenic acid, riboflavin, and niacin. Other full fat dairy products contain similar levels of nutrients as their low-fat or fat-free counterparts. While they do have higher levels of saturated fat than low-fat versions, a growing body of evidence indicates that consumption of full-fat dairy foods (milk, cheese, and yogurt) is not associated with higher risk of adverse health outcomes, including obesity, diabetes, and heart disease.^{6, 7}

Several recent research studies (including systematic reviews and meta-analysis) that examined the effect of higher fat milk consumption found that it was associated with lower childhood obesity and concluded that dietary guidelines that recommend reduced-fat milk versions might not lower the risk of childhood obesity.^{8, 9, 10, 11} One of these systematic reviews¹² also examined cardiometabolic health in children (2 to 18 y) in addition to adiposity and concluded that full-fat dairy consumption was not associated with increased body weight and adiposity, or with cardiometabolic risk in children.

Higher consumption of full-fat dairy has been shown to be associated with lower risk of total body fat mass in children.¹³ Whole milk has been found to increase satiety in children when served with breakfast.¹⁴ A systematic review showed that high-fat dairy products were inversely associated with risk of obesity.¹⁵

A summary of multiple studies on full fat dairy foods found that the evidence showed no association with high blood pressure, cardiovascular disease, and type 2 diabetes. Some of the studies reviewed showed full fat dairy was associated with lower risk of obesity.¹⁶

Consumption of full fat dairy has been found to be associated with neutral or lower risk of heart disease.¹⁷ A meta-analysis of 29 studies indicated that there is no negative effect on heart health of dairy, milk and yogurt, no matter whether those dairy products were full fat or low-fat.¹⁸

A review of the recent science stated: "No long-term studies support harms, and emerging evidence suggests some potential benefits, of dairy fat or high-fat dairy

foods . . .”¹⁹ Another stated, “The present evidence suggests that whole-fat dairy foods do not cause weight gain, that overall dairy consumption increases lean body mass and reduces body fat, that yogurt consumption and probiotics reduce weight gain, that fermented dairy consumption including cheese is linked to lower CVD risk, and that yogurt, cheese, and even dairy fat may protect against type 2 diabetes. Based on the current science, dairy consumption is part of a healthy diet, without strong evidence to favor reduced-fat products; while intakes of probiotic-containing unsweetened and fermented dairy products such as yogurt and cheese appear especially beneficial.”²⁰

Accordingly, IDFA believes that establishing a trial or pilot program in the next farm bill to test whether adding whole and 2% milk to the School Meals Program (SMP) would promote milk consumption rates and reduce food waste in the cafeteria would be beneficial. Such a program would provide important information to Congress and USDA that could help shape future policy decisions regarding the parameters of the SMP in order to encourage better health and nutrition outcomes for participating students.

Question 2. I understand 40% of the milk produced and sold in the U.S. is not transacted within the Federal Order system, according to USDA.^[21] Is the milk you use to manufacture products transacted within or outside of Federal Orders, and what benefits does this choice provide to your company and its suppliers? Has the Class I pricing change from the last farm bill impacted decisions about Federal Order participation?

Answer. Leprino Foods pays the Federal Order class price for all-milk we purchase. However, the technical decision on whether our milk goes into the Federal Order pool is essentially made by our cooperative partners. Accordingly, we do not have specific knowledge as to what percentage of the milk that we use is inside or outside of Federal Orders at any given time. Nonetheless, Leprino Foods believes the Federal Order system, by providing an explicit link between the end products we make and the price we pay for milk, has provided good stability over time to both our company and the farms that supply us milk. This is reflected in the historically steady growth of our milk supply. However, the value of the Federal Order system to Leprino has gradually eroded as Make Allowances, a key component of the formulas, are now distressingly out of date. Regarding the Class I mover, our company does not have any direct knowledge regarding whether the change to the Class I mover has affected Federal Order participation, although some market analysts have pointed out that long-term declines in Class I utilization have impacted Federal Order participation.

Question 3. Farmers have been asking for a national hearing on milk pricing, but the Secretary of Agriculture was quoted in a Brownfield interview earlier this month saying dairy stakeholders will have to all agree on one dairy pricing plan before opening a hearing. How do you see this working without a hearing process to evaluate multiple proposals? How do you see this process moving forward in terms of the farm bill and what happens if it does not?

Answer. When the dairy industry is united and focused on building a future together, we can accomplish almost any shared objective. While the challenges we face today are not new, our approach to the future must be focused on the global competitiveness of our industry. Our industry has grown and evolved considerably over the past 90 years since the FMMO system was established. If we’re going to be a more resilient, sustainable dairy sector able to respond to shifting consumer preferences, we must ensure that the full supply chain remains competitive into the future. Dairy processors continue to support market based FMMO policies as well as a process to develop a collaborative solution that can unify the industry. IDFA, of which we are a member, continues to study the current FMMO system to better understand some of the recent challenges affecting our industry, and our company stands ready to work with other industry stakeholders to develop a path forward on these issues as part of a Federal Order hearing. The dairy industry would be best served if a hearing were to take place as soon as a level of industry consensus is reached on an overarching scope and range for consideration.

¹⁹Mozaffarian D. *Dietary and Policy Priorities for Cardiovascular Disease, Diabetes, and Obesity: A Comprehensive Review.* † CIRCULATION 2016; 133: 187–225.

²⁰Mozaffarian Dariush, *Dairy Foods, Obesity, and Metabolic Health: The Role of the Food Matrix Compared with Single Nutrients.* † ADVANCES IN NUTRITION, Volume 10, Issue 5, September 2019, Pages 917S–923S, <https://doi.org/10.1093/advances/nmz053>.

^[21]A key reason for the Class I pricing change was to increase processor ability to hedge milk and bring stability to the fluid sector to encourage investment in fluid sector, but 7 months after the May 2019 implementation of the new Class I formula, the largest fluid milk processor Dean Foods filed bankruptcy and a few months after that, Borden.

First and foremost, we need to update the make allowances that are part of existing milk pricing formulas to reflect current manufacturing costs. As stated in my written statement, current make allowances are based on 2006 and 2007 costs which are now more than 15 years old, rendering the assumed milk processing costs woefully out-of-date. Coupled with recent inflationary pressures, the need to address this lag is now extremely urgent to maintain a healthy dairy processing sector.

As our industry works to develop a proposal to update current make allowances, we hope that Congress will allow this collaborative effort to continue and not address any milk pricing issues legislatively unless they are supported by all segments of our industry. This type of intervention could have unintended consequences, including the creation of artificial price signals that could lead to over-production or under-production, and allow for market manipulation. That said, prompt resolution to the make allowance issue via a Federal Order hearing remains urgent for our dairy industry.

Question 4. The dairy check-off board representation is weighted geographically by milk volume not by farm numbers and the industry is consolidating with significant geographic shifts in production. As this occurs, should changes be made to the check-off program or should a referendum be conducted so farmers can confirm their support of its direction?

Answer. As a dairy processor, Leprino Foods is not eligible to participate in the Dairy Research and Promotion Program, also known as the Dairy Checkoff Program. This program, which focuses on dairy product promotion, research, and nutrition education, is funded solely by dairy producers and importers. Accordingly, our company does not have a position regarding potential changes to this program.

Response from Travis Forgues, Executive Vice President of Membership, Organic Valley CROPP Cooperative

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question. Mr. Forgues: in your testimony, you pointed to rising transportation and operating costs. Would expanding the DMC Program to account for additional inputs beyond the cost of feed ease this pressure on producers?

Answer. CROPP Cooperative would support Committee exploration in expanding DMC to factor in other variable costs that producers are exposed to such as on-farm energy costs as well as on-farm fuel costs. Determining a national index for such cost factors may be challenging as would overall program cost containment but CROPP believes these options merit review.

These two costs factors (energy and fuel) could be offered as an elective to producers within DMC coverage options akin to policy mechanisms like the Harvest Price Election or the Trend Yield Adjustment that are within Federal crop insurance. Dairy producers would be enabled to choose coverage elements that match their risk tolerance for various inputs.

It should be noted that while numerous CROPP Cooperative farmer-members use the DMC it is not necessarily correlated to the landscape in organic dairy. DMC has no organic elections and there is no mechanism to account for a national organic feed price or national organic milk price. While the current margins are very challenged in the organic dairy market for producers the solution of an organic DMC is not one the cooperative is pursuing.

Given that farmer-level milk pricing in organic is more attuned to consumer preferences and national organic averages are not identifiable, we are not confident development of an organic DMC would be productive or useful. Considering the limited number of organic farm milk buyers, we are also concerned disorderly milk pricing could occur that seeks to shift pay obligations on to the state actor if performance of any of the milk buyers falters.

The current exorbitantly high-cost organic feedstuffs, see attached graphic, is largely the result of international trade distortion caused by:

- discontinuation of the USDA-AMS-NOP recognition agreement with India's Agricultural and Processed Food Products Export Development Authority (APEEDA) in January 2021;^{1*}

¹ *International Trade Policies: India*, Updated: July 13, 2022 † (<https://www.ams.usda.gov/services/organic-certification/international-trade/India>) Agricultural Marketing Service ([usda.gov](https://www.usda.gov)).

* **Editor's note:** references annotated with † are retained in Committee file.

- determination of duties and countervailing duties in March 2022 by the U.S. Department of Commerce in an antidumping investigation of organic soybean meal from India;²
- international conflicts that impede international shipping of organic grains from the Black Sea region.³
- acute drought conditions in certain regions of the U.S. that has decimated crop and forage availability.⁴

This type of market disruption is not a systemic problem but an anomaly that is best addressed by two actions:

1. immediate short-term disaster relief payments, on a historic feed use equivalency, to end-users of organic feedstuffs. These organic livestock producers had no way to plan for, or mitigate these cost realities brought on by trade distortions.
2. Exploration, or/and, extension of existing natural disaster provision such as
 - Emergency Livestock Relief Program and Emergency Relief Program (2021);
 - Emergency Assistance for Livestock, Honeybees, and Farm-Raised Fish;
 - Livestock Forage Disaster Program;
 - Livestock Indemnity Program; and
 - Applicable Farm Service Agency farm loan/credit provisions.

Direct disaster relief payments would stem market exits and allow farms to reorganize or recalibrate for the coming year. Immediate payments would complement existing investments by USDA in the Organic Transition Initiative⁵ that seeks to in part improve the volume and reliability of U.S. domestic organic grain and forage crops.

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. Farmers have been asking for a national hearing on milk pricing, but the Secretary of Agriculture was quoted in a *Brownfield* interview earlier this month saying dairy stakeholders will have to all agree on one dairy pricing plan before opening a hearing. How do you see this working without a hearing process to evaluate multiple proposals? How do you see this process moving forward in terms of the farm bill and what happens if it does not?

Answer. Organic dairy pricing and markets are fundamentally disconnected from the FMMO. In our opinion the Orders represent an unmitigated burden on CROPP Cooperative that diminishes resources we might otherwise offer back to producer members or use to market co-op branded and commercial organic dairy products. The Orders provide no balancing function or farmer milk pricing relevancy for our co-op. As it currently stands, approximately 65 percent of all organic dairy is dedicated to Class I. Within non-organic milk only 30 percent is dedicated to Class I with the vast majority being utilized in Class II, III and IV. This dynamic creates and additional onus on organic dairy since Class I traditionally carries the largest pooling obligations.

Any proposals, be in through the USDA–AMS Dairy Programs hearing process, or within the Congressional arena needs to acknowledge and rectify the untenable position that organic dairy is forced to participate in.

Question 2. The dairy check-off board representation is weighted geographically by milk volume not by farm numbers and the industry is consolidating with significant geographic shifts in production. As this occurs, should changes be made to the check-off program or should a referendum be conducted so farmers can confirm their support of its direction?

⁴*American farmers are killing their own crops and selling cows because of extreme drought* † (<https://www.cnn.com/2022/08/17/business/west-drought-farmers-survey-climate/index.html>)—CNN.

⁵*USDA to Invest up to \$300 million in New Organic Transition Initiative* † (<https://www.usda.gov/media/press-releases/2022/08/22/usda-invest-300-million-new-organic-transition-initiative>) USDA.

Answer. Section 10004 of the Agricultural Act of 2014 (2014 Farm Bill) (*Pub. L. 113-79*)^[1] allows all USDA certified organic dairy producers to file an exemption from the Federal Dairy Promotion Program, carried out by the National Dairy Promotion and Research Board. Organic dairy farmers can voluntarily fill out and submit the Organic Exemption Request form (AMS-15)⁶ annually to exercise the exemption afforded in law.

While organic dairy producers were previously made aware of this option by the National Promotion Research Board that outreach and notice has regrettably been discontinued and falls on the producers to seek the certified organic exemption.

Any modifications to the Dairy Promotion Program should be structured in a way that it does not impede the organic exemption currently allowed.

Question 3. How have the changes to safety net and risk management tools in the last farm bill (*i.e.*, DMC, DRP) worked for your farm and others?

Answer. Changes to the DMC have made the program more attractive to small dairy farmers in the U.S. While most of these farms are not organic producers this segment of farmers is the audience that our family farm-based cooperative is most likely to court as our market position grows or shifts. As consolidation and concentration trends demonstrate more and more pressure on small farmers that are the bedrock of many rural communities, we acknowledge the DMC as a leveling force that can mitigate some episodic margin pressures that might otherwise result in farm departures. As provided in our written and oral remarks we have some farm members that use the DMC but it is not necessarily correlated to the organic dairy landscape. We would suggest a greater priority be placed on enhancing farm resilience in the next farm bill.

Question 4. What unintended consequences have you or other dairy farmers experienced since the Class I pricing change was implemented?

Answer. Please see response to *Question 1*.

Question 5. Should dairy farmers have the right to vote individually on Federal Orders instead of being bloc voted by their cooperatives?

Answer. CROPP Cooperative operates on the democratic principle of one member, one vote. We have consistently maintained that position and would **not** exercise bloc voting if Order reform advanced to a producer vote.

We are in alignment with other industry stakeholders such as American Farm Bureau and National Farmers Union who have advocated for reforms which provide dairy producers an opportunity to cast an individual and confidential ballot during the Federal Milk Marketing Order ballot casting process.

Question 6. What are some of the dairy market access and competitive concerns we should be looking at in crafting dairy policy for the next farm bill?

Answer. CROPP continues to support investments in the USDA Market Access Program as well as a focus on how organic dairy may be positioned to satisfy the cultural preferences of consumers around the world.

Response from Marin Bozic, Ph.D., Assistant Professor, Department of Applied Economics, University of Minnesota

Questions Submitted by Hon. Glenn Thompson, a Representative in Congress from Pennsylvania

Question 1. I hear from constituents about the Class I pricing change and their concerns about milk check transparency and lack of competition. Since only the milk for Class I beverage use is required to participate in Federal Orders, did the pricing change in the last farm bill have unintended consequences on class price relationships and Federal Order participation by processors of other voluntary class products? How has this impacted performance and cost of risk management tools like DRP (Dairy Revenue Protection), especially when price protection is needed most during unforeseen market shocks like the pandemic.¹

Answer. Prior to 2019, the Class I milk price, used for beverage milk, was based on the “higher-of” advanced Class III and Class IV skim milk prices. Advanced pricing allows fluid milk processors to know milk procurement costs before they offer pricing lists to retailers. The purpose of the “higher-of” feature was to ensure that beverage milk can always have sufficient reserve supply from manufacturing plants through financial incentives for dairy manufacturers to voluntarily participate (*i.e.*, “pool”) in the Federal Milk Marketing Orders.

With total fluid milk sales volume declining throughout the 2010s, the hope was that a regulatory reform would make it easier for non-traditional Class I milk buyers such as coffehouse chains and quick service restaurant companies to hedge their input costs, then they would consequently be more willing to include cow milk in their menus and products.

The Agriculture Improvement Act of 2018 replaced the “higher-of” mechanism with a simple average of the Class III and Class IV advanced skim prices plus \$0.74 per cwt. The \$0.74 per cwt differential was based on historical data analysis, and intended to keep producers revenue neutral vs. “higher-of” regime. One fragility of the new design is that when the price spread between the Advanced Class III and the Advanced Class IV Skim Milk gets extraordinarily large, the new Class I skim price can be substantially below the levels it would have been under the “higher-of”. On the other hand, when the spread is zero, the new Class I skim price can only be higher than the old price by \$0.74/cwt. This asymmetry was manifested during the COVID–19 pandemic. In May 2020, USDA implemented the Farmers to Families Food Box Program, a very aggressive set of measures designed to support commodity markets as well as millions of U.S. citizens who overnight lost their jobs. Through this program, the majority of support for dairy went to cheese purchases, as cheese is the product that is sufficiently storable and easy to distribute to individuals. Distributing milk powders in a similar way would not be feasible. As such, this intervention resulted in the extreme price spread, with Class III prices in some months during 2020 almost \$8.00 per cwt. higher than Class IV. This level of price spread was unprecedented prior to the pandemic.

This spread led to negative producer price differentials and widespread depooling. While depooling would have happened even under the “higher-of” regime, it was exacerbated by the changes introduced in 2019. Negative producer price differentials hurt the effectiveness of insurance programs such as Dairy Revenue Protection (DRP) through increased basis risk. Further, the uncertainty regarding pandemic USDA policy direction or duration did cause increase perceived risk in dairy markets, which manifested itself in more expensive CME-traded option contracts, and

¹*Measures of growth in Federal Orders*, USDA AMS, May 18, 2022 <https://www.ams.usda.gov/sites/default/files/media/DairyMeasuresofGrowth19472021.pdf>.

thus consequently, more expensive USDA RMA programs such as Dairy Revenue Protection and Livestock Gross Margin.

As for the new Class I pricing system, two main questions seem to be: (1) has it induced desired behavior by non-traditional buyers of fluid milk, and (2) how to remove fragility in its design, and make it revenue-neutral to producers *quicker*.

Question 2. Farmers have been asking for a national hearing on milk pricing, but the Secretary of Agriculture was quoted in a Brownfield interview² earlier this month saying dairy stakeholders will have to all agree on one dairy pricing plan before opening a hearing. How do you see this working without a hearing process to evaluate multiple proposals? How do you see this process moving forward in terms of the farm bill and what happens if it does not?

Answer. I do think that if a hearing is announced, multiple proposals will be submitted. The lead time created by Secretary's request for consensus has been helpful so far, but I anticipate that by the first quarter of 2023, it will be optimal to proceed with the consensus even if there is no consensus among those that are eligible to vote in a USDA hearing. We should never be afraid of honest, intense public debate. Further, it appears clear already that not all problems in the milk pricing system *can* be addressed via USDA hearing process, and some issues are better addressed through the farm bill. Particularly, new regulation that promotes transparency in milk processing costs (for the purpose of setting and regularly updating make allowances), and transparency in farm gate milk pricing are issues for which processors and producers would respectively have a high degree of interest.

Question 3. The dairy check-off board representation is weighted geographically by milk volume not by farm numbers and the industry is consolidating with significant geographic shifts in production. As this occurs, should changes be made to the check-off program or should a referendum be conducted so farmers can confirm their support of its direction?

Answer. The role of dairy check-off has evolved over time and needs to remain nimble to ever changing challenges facing the dairy industry. The original focus on promotion and advertising is now expanded to social license, U.S. dairy export initiatives, and new efforts on issues such as climate change, animal welfare, and benefits of certain conservation practices. A national discussion on the choice different groups should or should not have in distribution of check-off dollars would be welcome.

Question 4. What are some of the dairy market access and competitive concerns we should be looking at in crafting dairy policy for the next farm bill?

Answer. One of the most important issues facing dairy producers is the lack of competition for farm milk. With few exceptions, dairy producers are tied to one processor and have little to no choice in finding alternative outlets for their milk. To prevent abuses of market power, a set of mandatory guidelines for milk supply agreements could be helpful. Even in a situation where a dairy producer ships milk to a dairy cooperative, the business she owns, it would still be helpful to promote transparency in milk pricing, to make it easy for producers to hold cooperative management accountable for business performance.

Federal Milk Marketing Orders still serve a useful purpose for the dairy industry. To maintain their relevance, more regulatory flexibility will be needed regarding the rules for distributing benefits from beverage milk sales to producers whose milk is shipped to dairy manufacturing plants.

Dairy buyers increasingly require ever more stringent sustainability and animal welfare standards. Regulation and support for implementation of new farming practices should be implemented in such way to avoid accelerating pace of consolidation in dairy farming.

May 18, 2022

2021 Highlights

Total Receipts of milk pooled under Federal Milk Marketing Orders totaled 136.8 billion pounds marketed by 23,292 dairy producers across all Federal Orders in 2021. Total receipts were 0.7 percent lower than 2020. Pooled producer numbers were 6.5 percent lower than 2020. The average daily delivery per pooled producer was 6.4 percent higher compared to 2020. In 2021, milk marketed through Federal Orders accounted for 61 percent of all milk sold and 61 percent of fluid grade milk sold to U.S. plants and milk dealers.

* Revised. N/A—Data not available.

¹2018 includes November and December data from the California Federal Milk Marketing Order which became effective November 1, 2018.

Methodology: Growth in Federal Milk Order Markets

Data: The Measures of Growth in Federal Milk Order markets is created using information on the handling of milk obtained from Federal Milk Marketing Order personnel.

The number of Federal Order markets and the number of handlers is at year end. The annual number of pooled producers is the simple average number of producers pooled each month during that year.

The population of Federal milk marketing areas is obtained from published *U.S. Census Annual Estimates of the Resident Population for Counties* in U.S. Census years (1950, 1960, 1970, 1980, 1990, 2000, 2010, and 2020). Annual Federal Order county populations are estimated by the Census Bureau for Federal Order counties for the years between each U.S. Census.

The receipts of producer milk and producer milk used in Class I reflects millions of pounds. Beginning in 1990, due to disadvantageous price situations in some markets, regulated handlers elected not to pool milk that normally would have been associated with the Order. This has reduced, sometimes substantially, the volume of producer milk receipts reported for some markets. This can also affect significantly the comparability of other “Measures of Growth” based on this statistic.

The percent used as Class I is the percentage of all milk pooled that is used to produce Class I fluid products as defined by the *Code of Federal Regulation* (CFR 1000.15).

The percentage of all milk sold is the amount of producer milk pooled on Federal Orders as a percentage of the total amount of milk sold to U.S. plants and dealers, both as fluid grade (Grade A) and all milk sold. The amount of milk sold to U.S. plants and dealers is obtained from the USDA National Agricultural Statistics Service *Milk Production, Disposition, and Income*, 2021 Summary, ISSN: 1949-1506, issued April 28, 2022.

The milk price at 3.5% butterfat content is the weighted average Federal Order minimum regulated milk price for milk at a standardized 3.5% butterfat content. Milk prices are simple averages for 1950-65 and weighted averages for 1970 to date. Milk prices are based on the blend (uniform) price adjusted for the butterfat content, and starting in 1990, other milk components of producer milk.

The average daily delivery of milk per producer is calculated by dividing producer receipts by the number of producers pooled. The annual average is the average of the monthly averages.

The annual gross value of receipts of producer milk per producer is calculated by dividing the total value of all pooled milk as reported by the Market Administrators divided by the simple average of the number of producers pooled each month during the year.

The annual gross value of all receipts of producer milk is the total value of all milk pooled for each respective year as reported by the Market Administrators.

Reliability: The AMS audit staff periodically perform on-site audits on the amounts of producer milk pooled to ensure accurate reporting of pool, utilization, and price information.

Ag Secretary Answers Dairy Consensus Question

June 3, 2022 By *Larry Lee**

Dairy producers, processors, and other stakeholders will have to agree on one dairy pricing plan. That's according to Ag Secretary Tom Vilsack who tells Brownfield it doesn't make sense to open up the Federal Milk Marketing Order hearing process until they do. "If you have too many competing proposals, essentially, you're back to the same old same old and it makes it more difficult because it's easier to sort of stalemate the process."

Vilsack tells Brownfield he believes having all of the dairy stakeholders iron out the issues before opening up the Federal Order hearing process has the greatest chance of affecting change in a place where a significant percentage of producers think change is necessary. "I think everybody agrees, or most everybody agrees that changes are necessary. Where there is disagreement is precisely how to structure those changes to deal with the regional difference in dairy, and I think its going

⁴<https://www.ascr.usda.gov/how-file-program-discrimination-complaint>.

*<https://brownfielddagnews.com/author/lee/>.

to be important for folks to sit down, work through those difficulties and see if they can come up with a consensus.”

Last week, the American Dairy Coalition sent Vilsack a letter asking him to clarify if he would allow the hearing process to vet different milk pricing options or if the dairy sector had to agree to something first. The letter says there is an industry-wide consensus that the Class I milk pricing change made in the 2018 Farm Bill needs amending, though there are differences in how this should be accomplished.

ADC board's letter to the Secretary also says any move to increase processor make allowance credits should be linked to achieving transparent milk pricing for farmers.

**A 2022 REVIEW OF THE FARM BILL
(FORESTRY)**

WEDNESDAY, JULY 13, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON CONSERVATION AND FORESTRY,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:03 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Abigail Davis Spanberger [Chair of the Subcommittee] presiding.

Members present: Representatives Spanberger, Kuster, O'Halleran, Panetta, Schrier, Costa, LaMalfa, DesJarlais, Allen, Kelly, Johnson, Miller, Moore, and Thompson (*ex officio*).

Staff present: Paul Babbitt, Lyron Blum-Evitts, Josh Lobert, John Busovsky, Patricia Straughn, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER,
A REPRESENTATIVE IN CONGRESS FROM VIRGINIA**

The CHAIR. This hearing of the Subcommittee on Conservation and Forestry entitled, *A 2022 Review of the Farm Bill: Forestry*, will come to order.

Welcome, and thank you for joining today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today, and we welcome you.

Good morning. I would like to welcome you to today's hearing, *A 2022 Review of the Farm Bill: Forestry*. This hearing is an opportunity to hear from Chief Moore of U.S. Forest Service and a variety of American industry, environmental, and forestry-focused organizations on their thoughts about what is and is not working from the forestry provisions of the 2018 Farm Bill, as well as about the other ways this Committee can better support our forests, support the American workers they employ, and support regional economies that they keep afloat.

Healthy forests, both public and private, are critical to our fight against the climate crisis, and we have seen the urgency of this fight as we prepare for and respond to yet another brutal fire season here in the United States. Forests not only sequester carbon pollution, but they can be critical in increasing land resilience to

flooding, improving water quality, and promoting biodiversity. In addition, healthy forests support rural economies, like those I represent, by providing good-paying jobs across the tourism, recreation, logging, and forest-product sectors. As such, farm bill programs that support innovation in wood products and efforts that make forest restoration more successful are key to promoting rural prosperity.

I look forward to hearing from our witnesses about what is working and where we need to make adjustments to the farm bill programs to protect the health of our forests, grow rural economies, keep Americans in good jobs, and combat the climate crisis.

[The prepared statement of Ms. Spanberger follows:]

PREPARED STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER, A REPRESENTATIVE IN CONGRESS FROM VIRGINIA

Good morning, I would like to welcome you to today's hearing, entitled "A 2022 Review of the Farm Bill: Forestry." This hearing is our opportunity to hear from Chief Moore of the U.S. Forest Service and a variety of American industry, environmental, and forestry-focused organizations on their thoughts about what is and is not working from the forestry provisions of the 2018 Farm Bill—as well as about other ways this Committee can better support our forests, support the American workers they employ, and support the regional economies they keep afloat.

Healthy forests, both public and private, are critical to our fight against the climate crisis—and we've seen the urgency of this fight as we prepare for and respond to yet another brutal fire season here in the United States.

Forests not only sequester carbon pollution, but they can be critical to increasing land resilience to flooding, improving water quality, and promoting biodiversity. In addition, healthy forests support rural economies by providing good-paying jobs across the tourism, recreation, logging, and forest-product sectors. As such, farm bill programs that support innovation in wood products and efforts that make forest restoration more successful are key to promoting rural prosperity. I look forward to hearing from our witnesses about what is working and where we need to make adjustments to farm bill programs to protect the health of our forests, grow rural economies, keep Americans in good jobs, and combat the climate crisis.

The CHAIR. I now recognize Ranking Member—whoops, I now recognize the chair of the full Committee if he would like to make any opening comments.

If you will excuse me, I now recognize Ranking Member LaMalfa, the gentleman from California, for opening remarks.

OPENING STATEMENT OF HON. DOUG LAMALFA, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

Mr. LAMALFA. Thank you, Madam Chair. I appreciate the hearing today and the opportunity to talk about something that is going to be very, very timely as, of course, we are entering the heart of the fire season of 2022. I guess we have a fire season all the time anymore. So what we already have are 5 million acres have burned across the country with nearly 80 large fires currently burning. The Forest Service, Committee, and those watching must understand the West is facing a crisis.

The Forestry Title in the farm bill must be used to increase the pace and scale of forest management. Rural and forested communities nationwide can either benefit from logging and proper forest management or they will suffer from mismanaged forests that threaten them and their towns with wildfire. For decades, forest health has declined as active forest management has stalled or stopped even completely. The West has faced some of the most de-

structive wildfires in our nation's history just in the past several years. Our National Forests have never been in more urgent need of increased management and restoration.

In my district, in northern California, we have seen devastating wildfires in recent years such as the Camp Fire in 2018 that had destroyed the town of Paradise. And last year's Dixie Fire, right at a million acres, one fire, a million acres, as well as the loss of two towns, Greenville and Canyon Dam, completely.

Across the West, we live with these challenges every day. Forest management has reached a crisis level, and we must act accordingly and act now. Forest Service needs to act like there is a crisis and cut trees, thin overgrowth of vegetation, and restore our forests. Tens of millions of acres are at risk of catastrophic wildfire every year. Nothing short of a fundamental change in mindset will fix this crisis. The Forest Service must aggressively cut trees. A 10 year plan aims to thin and do vegetation management on 20 million acres of National Forest System lands and an additional 30 million on other Federal, state, Tribal, and private lands.

But, the National Forest system consists of 193 million acres of land. So are we to sit and watch the remaining 173 million acres go up over the next 10 years? The Forest Service needs additional resources, tools, and authorities in place to do this needed work. Tell us now at this Committee. Delay is unacceptable. People's lives are at risk. The asset is at risk. Wildlife is at risk, habitat, water quality, air quality. We know what the risks are, and we have to live with them yearly.

The Forest Service must make real progress to lessen the risk of catastrophic fire. Through the farm bill, this Committee can require the Forest Service to do the work that is desperately needed and way behind, encourage better forest management, help mitigate wildfire, and grow opportunities for rural communities that rely on our forests as economic agents as they used to. Critically, we need to address the over-litigation of projects the Forest Service needs to do to protect forests from catastrophic fire. For example, just at the end of June, a Federal court stopped two projects that the Forest Service planned to do in Idaho, one entirely in the wildland-urban interface. This example is duplicated across the West, ruining landscapes, putting lives at risk, and destroying rural towns. Over-litigation stops or slows necessary forest management, and sadly, many acres that were tied up in lawsuits have now been completely burnt.

As it did to the people of Feather Falls in northern California, destroying the forests and devastating downstream watersheds, some of those forests will take hundreds of years to recover. Look at the fires in California that killed almost $\frac{1}{5}$ of all the giant sequoias in the world currently being threatened right now. The answer so far has been wrap them with foil or put sprinkler systems out? Yes, that will help right now in the short-term, but real work needs to be done. I am glad I am part of a piece of legislation to help do so. But it needs to happen now. The last recorded evidence of mass giant sequoia mortality occurred in 1297. That was the year that William Wallace defeated the English at the Battle of Stirling Bridge.

This can't be stressed enough. Our public lands are facing a crisis, and the Forest Service must act now. Currently, more than 500 sequoias are being threatened in the Mariposa Grove near Yosemite National Park by the Washburn Fire. Well, this is Park Service, not Forest Service. It is basically the same issue. Firefighters on the ground are battling to save these trees in the town of Wawona, and I want to thank them for their efforts every fire season to fight the fires that threaten towns and our public lands. But more work must be done pre-fire season so firefighters are not placed in situations of catastrophic fire. These extremely hot and fast-moving fires are a direct result of poor management and make the firefighters' jobs more difficult and even more deadly. This must end. We must properly manage the forests.

The Forestry Title of the farm bill contains a variety of provisions. We must expand the management authorities in this law. For example, the 2018 Farm Bill contained a renewal of the insect and disease categorical exclusion and expanded it to include hazardous fuels reduction. These should be increased in size dramatically. Our forests need it. For many acres, it is too late as they have already been destroyed by high-intensity wildfire.

Public lands are currently not good neighbors. They are tinderboxes waiting to go up in smoke. So while the private-sector is held to a higher standard if they have an accident or it turns out they didn't, they get sued by the governments, but nobody gets to have a say on when Federal lands or other lands start a fire and affect private lands.

This Committee must expand the Good Neighbor Authority to encourage partnerships with the Forest Service and the states, counties, and Tribes that are harmed most by fire. We must also coordinate with private industry to add value to the timber and the slash that must be removed from our public forests. The 2018 Farm Bill modified the Community Wood Energy Program and continued a research and development program to help encourage new markets and infrastructure for forest products and advance tall wood building construction in the United States. But we must also open new mills and other facilities to ensure that they have a consistent, reliable source of Federal timber to feed those mills over a period of time, at least 30 years. You are not going to build something and invest hundreds of millions of dollars if you can't count on a feedstock. The Forest Service needs to be behind guaranteeing that and not giving us roundy-roundy answers.

The 2018 Farm Bill expanded authorities that have focused a landscape-scale restoration program on cross-boundary restoration and authorize new tools that allow for the collaborative treatment of hazardous fuel loads on bordering non-Federal lands. We must continue this progress by expanding partnerships and authorities that allow for increased landscape-scale treatments. We are seeing landscape-scale fires—the Dixie Fire, again, nearly a million acres—so we need forest management that can match that scale.

Chief Moore, and to all our witnesses, our public lands are indeed facing a crisis. I know that is not news, but the reaction needs to be much stronger. As we begin the process of writing this next farm bill, what authorities need to be added or expanded to address

the catastrophic fires that are threatening the West? I look forward to the answers. Madam Chair, I yield back. Thank you.

The CHAIR. Thank you. I now recognize Ranking Member of the full Committee, Mr. Thompson, for any opening comments that he would like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, thank you, Chair Spanberger and Ranking Member LaMalfa, and happy National Forest Week. I much appreciate today's hearing to review the Forestry Title of the 2018 Farm Bill as it is a key interest to Pennsylvania's 15th Congressional District, the home to Pennsylvania's only National Forest, the Allegheny.

The forestry provisions have progressed in the past several farm bills and will again be an important part of the next reauthorization. As a former Chairman of the Conservation, Energy, and Forestry Subcommittee, I can confidently say this Committee worked hard in both 2014 and the 2018 Farm Bills to provide tools and authorities for the Forest Service to better manage our forests, increase partnerships, and encourage new markets for forest products. Given the challenges before the Forest Service and forest managers nationwide, the next farm bill must build on these reforms and provide additional authorities for those very same purposes and more.

Although the recent infrastructure law provided more than \$3 billion to the Forest Service for restoration and fire prevention activities, funding alone won't address the urgent needs that we have in forest communities and across the National Forest System. If we truly are going to make progress on the tens of millions of acres that are overgrown and in need of immediate treatment, we need every tool available and consider others that will promote forest health, and help meet our long-term management goals.

Now while some continue to call for reworking the conservation programs in title II to emphasize climate benefits, forestry and management must also be a major part of that conversation. The farm bill's Forestry Title presents an enormous opportunity to generate climate benefits, through what I would call *natural solutions* and on a broad landscape scale. Through active management, we can restore our forests and reduce the intensity and risk of wildfire. Simultaneously, we can create stronger carbon sinks that will sequester even more carbon and forest products that indefinitely store it. According to the Forest Service, our forests are currently sequestering 14 percent of all U.S. emissions and could nearly double that through active management.

Now, we can't have a healthy environment without a healthy economy and *vice versa*. And with that in mind, we also need to be doing more to allow for increased timber harvesting in the National Forest System. Sustainable harvests will encourage both forest health and the economic health of the forested communities in many rural counties.

Chief Moore, thank you for being here today and sharing your perspective as we begin the 2023 Farm Bill process. I also would like to welcome all of our witnesses on panel two for your time and

expertise today. We look forward to today's testimony and working with you as we begin developing the next farm bill.

Thank you, Madam Chair, and I yield back.

The CHAIR. The chair would request that other Members submit their opening statements for the record so that witnesses may begin their testimony to ensure that there is ample time for questions.

I am pleased to welcome two panels of witnesses to the Subcommittee on Conservation and Forestry of the larger Agriculture Committee today. On our first panel, our witness is Chief of the U.S. Department of Agriculture's Forest Service, Mr. Randy Moore. Mr. Moore is accompanied by Deputy Chief of the National Forest System of the Forest Service, Mr. Chris French, and Deputy Chief of State and Private Forestry of the Forest Service, Ms. Jaelith Hall-Rivera.

Chief Moore, you now have 5 minutes to deliver your opening testimony. The timer should be visible to you on your screen and will count down to zero, at which point your time has expired. Chief Moore, please begin whenever you are ready.

**STATEMENT OF RANDY MOORE, CHIEF, U.S. FOREST SERVICE,
U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.;
ACCOMPANIED BY CHRISTOPHER FRENCH, DEPUTY CHIEF,
NATIONAL FOREST SYSTEM; Jaelith, HALL-RIVERA,
DEPUTY CHIEF, STATE AND PRIVATE FORESTRY, USFS,
USDA**

Mr. MOORE. Chair Spanberger, Ranking Member LaMalfa, and Members of this Subcommittee, I appreciate the opportunity to testify before you as my first time as Chief of the U.S. Forest Service. I am joined today, as indicated, by my Deputy Chief, Chris French, the National Forest System's Deputy Chief, and as well as Jaelith Hall-Rivera, Deputy Chief for State and Private Forestry.

My testimony today will focus on the important role that the farm bill has played in providing authorities to carry out the agency's work, including with our partners, to steward the nation's forests. The Forest Service, along with many of our partners, work together to sustain healthy, resilient landscapes for all the services the nation's forests and grasslands provide. For instance, forests are America's largest terrestrial carbon sink, which was indicated earlier. Our forests plus harvested wood products and urban forests offset almost 15 percent of the nation's total carbon dioxide emissions and almost 12 percent of all greenhouse gas emissions.

The National Forests alone are the source of drinking water for more than 60 million people living in 3,400 different communities across 36 states, the value of \$367 billion for the City of Los Angeles alone. Forest products play a key role and an important role. In Fiscal Year 2021 the National Forest generated 2.9 billion board feet of timber. That is enough to build 180,000 new single-family homes.

The main way that Americans enjoy and use their National Forests and Grasslands today is for outdoor recreation. We have 370,000 miles of roads to give people access to their favorite spots. Our visitors have 159,000 miles of trails that they can use across the landscapes of all kinds. In 2020, the National Forest System

supported more than 370,000 jobs and contributed more than \$35 billion to the GDP.

Past farm bills have provided and expanded on various authorities that have given the agency and our partners critical tools for managing forests for many goods and services that they provide to the public. These tools have been instrumental in accomplishing our collective work on the ground. For instance, the stewardship contract authority, which was reauthorized in 2014 Farm Bill, has promoted closer public-private working relationships by using the value of timber or other forest products to offset the cost of restoration activities. Over the past 4 fiscal years, use of this authority has resulted in over $\frac{1}{2}$ a million acres of fuel treatments in the wildland-urban interface, 750,000 tons of biomass for energy production, and nearly 400 miles of stream habitat restored for other services.

In addition, Congress permanently authorized the Good Neighbor Authority in the 2014 Farm Bill. This authority allows the agency to more efficiently work with states to perform restoration on Federal lands. And in the 2018 Farm Bill, Congress expanded GNA to include federally recognized Indian Tribes and county governments to allow funds received by the sale of timber sales to be used by the state to accomplish additional work under this authority. To date, the Forest Service has completed 339 Good Neighbor agreements across 38 states, nine Tribal GNA agreements, and seven agreements with counties to accomplish a variety of restoration work.

Timber harvest under GNA continues to grow. Two hundred and seventy-three million board feet were sold in 2021 under this authority, and that is an increase from 89 million board feet in 2018.

The 2018 Farm Bill also reauthorized the Collaborative Forest Landscape Restoration Program, and it allowed for the agency to issue a waiver to extend existing projects up to an additional 10 years. The authority has allowed us to build partnerships and involve communities in decision-making process. The Wood Innovation Grants Program, which was formally established in a previous farm bill, supports proposals that expand and accelerate wood products and wood energy markets to support managing the nation's forests. For instance, the program has helped catalyze U.S. growth in mass timber construction with over 1,400 buildings built, either under construction or in design, and the rate is accelerating each year.

The Forest Service is and will be using prior farm bill and other authorities to carry out the 10 year implementation plan associated with our Wildfire Crisis Strategy to deliver funding provided through the bipartisan infrastructure law. A couple of examples include: in central Washington, the Okanogan-Wenatchee National Forest will use, among other authorities, a GNA agreement with the state to reduce the risk on over 2 million acres over 10 years. In Oregon, the Deschutes National Forest using authorities under the GNA and CFLRP and others to carry out an expected 50,000 acres of treatment over the next 3 fiscal years to reduce the wildfire risks to central Oregon communities.

Throughout implementation of the strategy, we will continue to work with our industry partners through programs like Wood Inno-

vation Grants Programs to develop new and innovative uses of wood and develop markets of biomass for small diameter material.

In closing, I want to thank the Committee for your efforts, and I look forward to working with you as the Committee drafts the next farm bill. Thank you, and I look forward to your questions.

[The prepared statement of Mr. Moore follows:]

PREPARED STATEMENT OF RANDY MOORE, CHIEF, U.S. FOREST SERVICE, U.S.
DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee, thank you for the opportunity to address the Subcommittee regarding the U.S. Department of Agriculture (USDA), Forest Service's implementation of the 2018 Farm Bill forestry programs.

Over the past 5 decades, the Forest Service has received authorization for numerous valuable programs through the farm bill that support our mission to sustain the health, diversity, and productivity of the nation's forests and grasslands to meet the needs of present and future generations. These authorizations have supported both our efforts on our Federal lands, as well as ways to sustain and support the health and conservation of our nation's state and private forestlands. Throughout the 2018 Farm Bill, principally in the Forestry Title, there are many authorities and provisions that assist the Forest Service in accomplishing our priority work, particularly ecological restoration, support to communities, vital voluntary conservation efforts, and reducing hazardous fuels. Together, these provisions demonstrate our commitment to shared stewardship of National Forests and Grasslands, while strengthening relationships with states, Tribes, and local communities.

The Forest Service is using the 2018 Farm Bill authorities to help advance the agency's 10 year wildfire crisis strategy. Along with the tools and investments Congress enacted in the 2018 Consolidated Appropriations Act and the Infrastructure Investment and Jobs Act (IIJA), USDA is using farm bill authorities to combat the growing wildfire risk, create new markets and technology for wood products, and working to restore forests through partnerships and collaboration across landscapes. Today, I will focus on the implementation of the farm bill authorities and highlight the accomplishments achieved through use of the reauthorized Insect and Disease Categorical Exclusion (Section 603 of the Healthy Forests Restoration Act), the expanded Good Neighbor Authority, the new Tribal forestry demonstration project, the Collaborative Forest Landscape Restoration Program, and the Wood Innovation grant programs.

The 2014 Farm Bill's Insect and Disease provisions set requirements for designating affected National Forest System areas, enabling streamlined environmental review procedures to expedite projects that reduce the risk and extent of, or increase the resilience to, insect or disease infestations. As of June 2022, approximately 77.5 million acres across National Forest System lands have been designated as already experiencing, or at risk of experiencing, insect and disease infestations. The 2014 Farm Bill also created a statutory Categorical Exclusion for certain insect and disease projects that met certain stringent criteria. The 2018 Farm Bill extended this Categorical Exclusion authority and allowed projects that reduce hazardous fuels to be carried out in the designated treatment areas (Section 8407). As of May 2022, the Forest Service has signed decisions for or is in the process of analyzing 274 projects encompassing 538,129 acres in 31 states using the Insect and Disease Categorical Exclusion.

The Good Neighbor Authority (GNA), first authorized in the 2014 Farm Bill, allows the Forest Service to work with states, Tribes, and counties to perform treatments across larger landscapes through partnerships. In 2014, this authority allowed the Forest Service to enter into cooperative agreements or contracts with states and Puerto Rico to perform authorized watershed restoration and forest management services by our partners on Federal lands. The 2018 Farm Bill expanded this valuable authority to Tribes and counties and allows states to maintain revenues generated from the sale of National Forest System timber for future GNA activities (Section 8624). To date, the Forest Service has completed 339 GNA agreements to accomplish a variety of restoration work: 38 state agreements, nine Tribal agreements, and seven agreements with counties. This authority is extremely beneficial because it improves the Agency's access to state, Tribal and county expertise to accomplish restoration and hazardous fuels reduction work across larger landscapes. This authority also supports working with and learning from our partners so we can apply collective knowledge broadly on public lands.

USDA is responsible for managing millions of acres of Federal lands and waters that contain cultural and natural resources of significance and value to Tribes, including sacred religious sites, burial sites, wildlife resources, and sources of Indigenous foods and medicines. The 2018 Farm Bill authorized a new Tribal forestry demonstration project to allow Tribes to propose projects on National Forest lands to drive forest restoration and protect Tribal resources from threats such as fire, insects, and disease. As of the second quarter of Fiscal Year 2022, agreements have been executed with Confederated Tribes of the Colville Reservation, Leech Lake Band of Ojibwe, Pueblo of Acoma, Pueblo of Jemez, and The Tulalip Tribes.

The 2018 Farm Bill reauthorized and increased the authorization for appropriations for the Collaborative Forest Landscape Restoration Program (CFLRP) (Section 8629). Through the CFLRP, we are able to accomplish critical collaborative, science-based ecosystem restoration of priority forest landscapes. These projects produce significant outcomes on the landscape, including reducing the risk of catastrophic wildfire, eradicating invasive plants, restoring stream habitat, and accomplishing vital forest vegetation work through planting, seeding, and natural regeneration. Since the beginning of the program through Fiscal Year 2021, the Forest Service has funded 24 CFLRP landscapes nationwide. These projects have advanced treatment on over 4.5 million acres to reduce the risk of catastrophic wildfire, established 224,000 acres of forest vegetation, and enhanced over 1,700 miles of stream habitat. In addition, CFLRP also has significant economic benefits, supporting over \$2.3 billion in total local labor income. In April 2022, USDA announced an additional \$31.1 million in funding for 15 CFLRP projects, including six new projects.

The 2018 Farm Bill codified the existing Wood Innovation Grant Program and established a new program, the Community Wood Grant Program. These grant programs support Forest Service efforts to build innovative markets for wood products and wood energy that support rural economies with more jobs and income. The Wood Innovations and Community Wood Programs help support more and better markets and capacity for sustainable forest management and hazardous fuels reduction. The Wood Innovation Grant Program (Section 8643) allows the Forest Service to award grants to individuals, public or private entities, or state, local or Tribal governments for the purpose of advancing the use of innovative wood products. The program stimulates and expands sustainable wood products and wood energy markets, with a focus on mass timber, tall wood buildings, renewable wood energy, and technological development that supports fuel reduction and sustainable forest management. The Community Wood Grant Program (Section 8644) supports facility expansion or new equipment for thermal wood energy (wood-to-heat) projects and innovative wood products manufacturing. In Fiscal Year 2022, the Forest Service awarded over \$32 million in grants for 99 projects using these two authorities.

Our 10 year Wildfire Crisis Strategy aims to increase science-based fuels treatments by up to four times previous treatment levels, especially in those areas most at risk. Fuels treatments by the Forest Service, together with partners, have made a difference over the years. However, the scale of treatments is outmatched by the rapid increase in the scale and severity of wildfires as climate change accelerates. This Strategy calls for treating up to 20 million additional acres of National Forest System lands over the coming decade, and working with partners, including colleagues at the U.S. Department of the Interior, to treat up to 30 million additional acres on adjoining lands of multiple ownerships, while building a long-term maintenance plan. The intent for these treatments is to reduce the trajectory of wildfire risk to communities, municipal water sources, and natural resources, and to restore fire-adapted landscapes so they are more resilient.

USDA is thankful that Congress has provided extensive tools, programs, and funding for partnerships and landscape scale work to carry out the science-based strategy. Many of these authorities have come through the farm bill, including GNA agreements, CFLRP, and stewardship contracts. Examples of initial projects under the strategy include:

- **Central Washington Initiative.** The Okanogan-Wenatchee National Forest in Washington will use, among other authorities, a GNA agreement with the Washington Department of Natural Resources and stewardship agreements for timber, fuels, and aquatics projects. The project is intended to reduce the risk of wildfire and restore cross-boundary landscapes on 2.45 million acres over 10 years (1.35 million acres of National Forest System lands; 1.1 million acres on other land ownerships).
- **Colorado Front Range.** Due to years of fire suppression, Colorado's Front Range forests are unhealthy and lend themselves to intense wildfires. These forests are key sources of water for the Front Range, making it critical to reduce the likelihood, intensity, and size of fires to reduce the level of sedimentation

in reservoirs. The Arapaho and Roosevelt National Forests and Pike-San Isabel National Forests are utilizing GNAs (among other tools) to carry out an integrated approach to conducting strategic fuels treatments on over 36,000 acres over the next 3 fiscal years to reduce fire risk and effect for people and businesses in the area.

- **Central Oregon.** Central Oregon is experiencing the most extensive community growth in the state with some communities increasing almost 30 percent in the past 10 years. Hundreds of thousands of acres of Federal land are immediately adjacent to communities and subdivisions, and treatment of these areas is critical to reduce wildfire risks. The Deschutes National Forest is working with several partners to restore forested landscapes while reducing wildfire risk to life, property and economic interests in and adjacent to the communities of Bend, Sunriver, LaPine and Crescent. The Forest Service is using authorities under GNA, CFLRP and others to carry out an expected 50,000 acres of treatments over the next 3 fiscal years.
- **Kootenai Complex.** The Kootenai National Forest in Montana is working with several partners to treat hazardous fuels across 150,000 acres within high-risk fireheds surrounding the communities of Libby, Troy, Eureka, Stryker, Fortine and Trego. These communities are at a particularly high risk of being impacted by severe wildfire events. The Kootenai National Forest has a GNA agreement with the state to increase the pace and scale of treatments across the forest using funds from the IIJA in order to mitigate wildfire risk and reduce community exposure.

The wood products industry is an important partner for helping achieve restoration outcomes and reduce wildfire risk under this Strategy. For example, the Kootenai Complex Project will also complement an ongoing county-wide effort to increase infrastructure capacity for wood product utilization. Throughout implementation of the Strategy, we will continue to work with our industry partners through programs like the Wood Innovation Grant Program to develop new and innovative uses of wood and develop markets for biomass and small-diameter materials.

Significant effort goes into drafting a new farm bill every 5 years. USDA looks forward to our work with the Committee to ensure the Forest Service has the tools it needs to address the wildfire crisis as well as successfully implement the full breadth of the Agency's mission. We appreciate your efforts and look forward to providing input as you frame and develop the 2023 Farm Bill.

The CHAIR. Thank you very much.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us to get to as many questions as possible. Please keep your microphones muted until you are recognized.

I now recognize myself for 5 minutes.

Chief Moore, over the past couple of years, the Subcommittee has heard repeatedly about the promising developments and innovations from the wood and forest products industry that offer cost-competitive, durable, climate-friendly building materials, from nanocellulose additives for cement to cross-laminated timber. We really see that the forest industry is leading the way on de-carbonizing our building sector. And in 2018, Congress authorized the Wood Innovation Grant Program at the U.S. Forest Service to help fund these sorts of innovations.

So I would like for you to speak to what progress has been made since 2018 in the implementation of this program. What kind of products have been funded so far? And then comment about the current funding level, whether that has been sufficient to meet the demand.

Mr. MOORE. So thank you, Madam Chair. The previous farm bill—let me start by saying that we have seen a lot of accomplishments under this bill. And we are so thankful to Congress for their

foresight in passing the bill. And we look forward to the next farm bill.

Looking at the Forest Legacy Program as an example, since its creation in 1990, the Forest Legacy Program has permanently protected about just under 3 million acres of land that are considered to be working forested lands. And of those acres, over 80 percent remain in private ownership protected under the conservation easements. And these acres that are conserved through this program are really protected in perpetuity, and we continue to manage those as working forested lands.

One other example and looking at that program, we have invested in Federal funds just under \$1 billion that have been leveraged by an additional \$1 billion in non-Federal costs. And what this shows is that there is strong support both at the local level as well as the state level for the program. So we are having a lot of progress in this particular part of the program, and we look forward to continued work in these areas.

In terms of the Wood Innovation Grants, that is one that this Congress and this Committee should be really proud of. It has been a catalyst for a number of new opportunities across the country. And I will give you an example. Earlier in some of my testimonies I talked about how we have a lot of small-diameter, low-value-type material across the landscape, particularly in the West, and what we needed to focus on is wood innovations. And as I mentioned in my opening statements, so far, that program has really taken off. We have 14 new buildings that have been built using cross-laminated timber, and that really has spurred a lot of developments and a lot of support across the country for utilizing small-diameter, low-value material.

The CHAIR. For those who might be watching who might not be familiar with some of what you are discussing, could you explain why that is important that you can utilize that small-diameter, low-value timber and what that might mean for forest landowners and for the forestry industry?

Mr. MOORE. Yes, if you look—let me focus primarily across the West right now where we are having a lot of the unwanted wildfires across that landscape. And when you look at the type of material that a lot of our industries are set up, it is looking a lot at commercial sawlogs and the larger trees if you will. And what we have that has been growing on a National Forest since 1935, it is a lot of small-diameter, low-value-type material. And so this material is not really suitable for a lot of the infrastructure that we currently have in our country. And what we have been doing is cutting the small-diameter, low-value stuff, piling it up, and then burning it. And what we have been trying to push is wood innovation so that you could utilize this material that we are piling and burning.

And so with the cross-laminated timber as an example, that market has really taken off. We are creating new industries from the West to the Southeast where we are beginning to see production and facilities to utilize this type of material. We have awarded grants to look at working with private industries to refine the technology with our research people. And I am just happy to say that that is an industry that is beginning to really take off. And I see

a lot of utilities in the future in terms of how it is going to help us remove some of that material off the landscape.

I will give you an example why that is important and then I will cut. When you look at the types of ecosystems that we have routinely been managing, a healthy, resilient landscape would be about 40 to 60 trees per acre. What we currently have on these landscapes is anywhere between 800 or more trees per acre. And so if we are going to look at reducing the wildfire hazard potential, we have to remove a significant number of trees and other materials off the landscape. And so creating other industries to utilize material, it just works to create jobs in small communities, but it also creates healthy, resilient landscapes, which—

The CHAIR. Thank you for that answer. Certainly, I think the program is tremendous and benefit economically to communities but also to forest health, and certainly the ability to build buildings using cross-laminated timber is tremendous. I will follow up with written questions related to some of the funding and program dollars that have gone out the door so far. But thank you for your answer.

At this point, I now recognize the gentleman from California for 5 minutes.

Mr. LAMALFA. Well, thank you again, Madam Chair. Thank you, Chief Moore and your colleagues there, for joining us.

Chief, we have known each other a long time, and you may remember about 10 years ago the first time we met was at that park in Sacramento because we had a lockdown on the building we were supposed to meet. And you and I and Tom McClintock and a couple others were there. And so that has been 10 years. And so now, I have seen lately where the Forest Service has devised a 10 year plan to treat 20 million acres of National Forest Service land and an additional 30 million acres of other lands. And so I would kind of count that as we are 20 years in, in a way?

So the Forest Service oversees nearly 200 million, 193 million, so if the plan is to treat 20 million over 10 years, that is ten percent of the total holdings. So on a per-year basis, that averages out to 2 million per year, so basically, we are at the point where we are treating one percent per year, which is about the same more or less pace and scale to use that terminology, which is important, as what we are already at, one percent per year. So that means instead of 10 years or 20 years, we are talking about 100 years just to get over the land one time and if it can be applied to all that. It kind of reminds me of painting the Golden Gate Bridge. They never stop. They start at one end and they get to the other, only it isn't a 100 year cycle.

So I have lost three-plus communities in my own district, and there are many more that are looking down the barrel of the gun of even more fires, year in, year out. And my people at home are not going to be excited about a one percent per year treatment. This needs to be dramatically increased. And so in the plan also it is talking about 30 million acres that are not National Forest System, but there are others, other Fed lands, state lands, Tribal and private lands. Why is the focus 30 million acres on others when they should be doing that themselves? Why is the Forest Service intervening on developing or helping them when they are

not even keeping up with more than one percent on their own? Why does that plan look that way?

Mr. MOORE. So, Congressman LaMalfa, thank you for that question. The best available science tells us that, on average there is 80 percent of the risk exposure to buildings and wildland-urban interface occurs on less than 20 percent of the total landscape. And we also know that the size and placement of hazardous treatments, it matters and it makes a difference. And so when you look at treating 20 million acres of National Forest System's lands, that represents more than a 20 percent that would have a positive outcome on the 80 percent of exposure.

The other piece, we use that same method to come up with the 30 million for private and other Federal and state lands. It is the same method. And how we placed treatments on the landscapes matters as well.

Mr. LAMALFA. But why intervene on state lands, private lands, Tribal lands that are not your jurisdiction?

Mr. MOORE. Well, when you look at the fires and how it appears on the landscape, it doesn't really care about jurisdiction or boundaries. And so what we have been trying to do—

Mr. LAMALFA. No, but those folks would be keeping up with their own if they were allowed to, especially private. It is hard to get a timber harvest permit in California. I worked on that and got a little help. But the private doesn't really need a lot of help other than the ability to go do it. We have had their lands burned extensively, so that we are going to need cooperation from the Forest Service so the private entities will have actually something to cut once the salvage period is over with on somebody's firescapes. So why does the private, why does the states need Federal Forest Service help?

Mr. MOORE. Well, again, Congressman, when you look at what is really happening, the majority of fires start on private lands. And we know that once fires start, regardless of where they start, that it doesn't care about boundaries. And so unless we can all come together to look at treating landscapes with multiple jurisdictional boundaries, we are not going to have the positive outcome on the ground that we need to have in order to have that fire behave.

A lot of these landscapes in the West are created from fire. And in order to maintain that, we need to also continue to have fire but not the unwanted wildfires that we are currently having.

We also know that as we look at treating the landscape at a larger level, the treatment that works best is to go in and do thinning to remove some of those trees that I mentioned to you—

Mr. LAMALFA. No, I got that, sir, 40, 50 trees per acre, mature trees is the right amount, not 500. So is the Forest Service actually engaging—we talked last year at the end about you were assessing the damage from the fires and such, but what work is being done to salvage the million acres in the Dixie Fire and the other various fires? At a timeline—when you talked about you get value out of the trees, when you are talking the small-diameter ones, but you can get value out of these trees, let me ask you this more directly. Are your offices open yet? Because just a few months ago for Christmas tree permits, people couldn't even go into an office and walk in the door because everything's all shut down due to COVID

situation. Are we fully engaged in having open offices and people doing work?

Mr. MOORE. Congressman, I would like to know where you are seeing offices closed. Our offices have always been open. And if they were not open—

Mr. LAMALFA. Oh, come on.

Mr. MOORE.—we always had ways for people, the public to come in and purchase permits of any kind.

Mr. LAMALFA. Well, I will name a couple up in northern California a little later then. But the bottom line, are they fully engaged in doing normal, pre-COVID-type work out in the woods, handling paperwork in the offices that need to be done and getting the permits out?

Mr. MOORE. They are and they have been.

Mr. LAMALFA. Thank you.

The CHAIR. I now recognize Congresswoman Kuster for 5 minutes.

Ms. KUSTER. Thank you, Madam Chair.

Sustainable forestry and conservation are in our blood in the Granite State of New Hampshire. We are home to the White Mountain National Forest, and we appreciate all the Forest Service does to protect and maintain this treasured landscape.

I want to appreciate our colleagues on both sides of the aisle talking about the impact of climate change in our forests today. We are the second-most forested state in the country right behind our friends in Maine. From wood products to outdoor recreation, forests are an essential backbone to our economy, and like Mr. LaMalfa, to my district.

This hearing is a good opportunity to take stock of where we are as we look ahead to the 2023 Farm Bill. We secured a lot of forestry wins in the 2018 Farm Bill, the Great American Outdoors Act (Pub. L. 116–152), the bipartisan infrastructure package, but there are continuing challenges that we are discussing today that we need to address.

In my state, our small forest operations need more outlets for wood products, particularly low-grade wood that can serve as a reliable, locally grown source for heat. And that is why I have introduced legislation like the Biomass Thermal Utilization Act (H.R. 3251).

Our forests also remain vulnerable to invasive pests like the emerald ash borer, as well as to the effects, as I have mentioned, of climate change. We have seen an increase in temperature and a reduction in humidity in New Hampshire. And I know from a recent trip that that is exactly what is going on out in the West in Yosemite.

The good news is that forests are the most powerful clean air technology on Earth, reducing the net amount of CO₂ in the atmosphere as the trees grow. Public- and private-sector stakeholders continue to seek proactive ways to increase the climate contributions of working forests and forest products, but that requires reliable government data to inform these decisions. The Forest Service Forest Inventory and Analysis Program is the only source of forest data that is national in scope and consistent in measurement. I re-

cently co-led a letter calling for increased funding for the FIA, which I have been able to secure in the House spending package.

Chief Moore, welcome. We are delighted to have you with us. How have you seen FIA forest carbon data benefit working forests, and do you have thoughts about how we can continue to strengthen carbon capture data collection and collaboration?

Mr. MOORE. Thank you, Congresswoman, for that question. And, it is interesting that you bring this up because, as I look into the future, the issues that you brought up are going to play prominently into what is the next iteration of America's forests in this country. And when we talk about climate and we talked about carbon sequestration, there is a huge role that we are still trying to venture into. FIA data is going to be one of the foundational pieces of this. I believe you are going to hear from the next panel some of the work that we are doing with different nonprofits and other groups in terms of looking at the FIA data, looking at what the opportunities are for carbon sequestration, and then how do the National Forests play into this new system that seems to be emerging in this country? And I think some basic fundamental decisions need to be made is that if the Federal Government participates in that, what are the policies associated with that so that we don't create undue competition with the private landowner? So we are tiptoeing into this new era, and we would welcome Congress's involvement in this, as well as our continued participation with our partners.

Ms. KUSTER. Well, and I think for Members, this is one of the very rare opportunities for bipartisan work in the carbon sequestration space, so I appreciate that.

In this appropriation cycle, I also teamed up with Congressman Peter Welch from Vermont to secure \$1.5 million increase in funding for the Community Forest Program in this year's House spending package. Again, Chief Moore, could you talk about the impact of the Community Forest Program and how it has enhanced conservation efforts around the country while supporting job creation?

Mr. MOORE. Thank you. Yes, so one of the advantages is that it allowed Tribes to participate as grantees. And so that is one of the advantages and the amendments that we have in to the program, and we welcome that.

Since its creation, the Community Forest and the Open Space Conservation Program, we permanently protected over 27,000 acres through simple fee purchase. And I had mentioned something about conservation easements earlier. The conservation easements are not allowed to participate in this program. But the program targets private lands that are threatened by conversion to non-forest uses and those that are not held in trust by the United States and also lands that can provide the fine community benefits and at the same time allow public use. So this is a program, that is not heavily funded, but the value that it provides is significant.

Ms. KUSTER. Well, I appreciate it. My time is up, I will yield back, but thank you again for your service.

Mr. MOORE. Thank you.

The CHAIR. The chair now recognizes Mr. DesJarlais for 5 minutes.

The chair now recognizes Mr. Allen for 5 minutes.

Mr. ALLEN. Thank you, Mr. Moore, and your colleagues for being with us today and talking about this that we have been talking about. I was just elected and served in 2015, and we seem to be continuously talking about where we are and how to prevent these fires. Obviously, from a climate standpoint, trees need carbon, and so that is a good thing. And if we have a forest fire, obviously, that produces carbon, which we understand is a problem. So we got to get a handle on this somehow.

And how can—obviously we have increased funding, but something is out there that is keeping us from getting the job done. What can we do? I mean, what can we as Congress do to, and maybe it is just not money. Maybe it is certain environmental issues or something like that it is really keeping us, like, for example, to manage the forests, you got to build a road in there to manage the forests. And I understand we can't do that, and we are prohibited from doing that. We can't continue on like this because, like I said, it is not good for the environment. We need more trees, not less trees. And of course, in my state we are 40 percent sustainable. I mean, we plant 40 percent more trees than we cut. And we don't have to deal with these fires because we have a wetter climate and we don't have those winds. But, what barriers can we remove by legislation to make this happen and get this job done?

Mr. MOORE. So, Congressman Allen, first of all, that is a very insightful question, and it is one that has been kind of a thorn for a long time. I would say that if I look at the regulations, we have all the regulations we need and some would argue too many. But I think that Congress has provided us with opportunities that we have not had in the recent past, probably in the last 70, 80 years. I think what we should be focused on now is how do we implement the opportunities that we currently have? And so we are committed to moving forward with that.

In relation to your question about roads, it is my understanding that we can build roads. And in some cases, we have to put them to rest after we finished the project that we built the road for. It just all depends. And what type of road do we build to go in if we are going to have a timber sale or something?

But as you know, people complain about the number of roads we have and can we maintain the number of roads that we currently have? And I think there are opportunities, entering into agreements with counties and other entities where we could work together collaboratively to manage the road system that we currently have.

But I will tell you, we are not funded to handle the level of roads that we currently have in the system, so we would appreciate any insight or help that you as Congress would provide.

Mr. ALLEN. Okay. And that is for the maintenance of the roads?

Mr. MOORE. Yes.

Mr. ALLEN. Okay.

Mr. MOORE. Maintenance, just when we have storms and stuff and you have blowouts from water and those types of things sanitation.

Mr. ALLEN. Right. Okay.

In the southeastern United States, what are your main challenges that you face that would fall under your direction as far as

our part of the country? And I represent the State of Georgia, District 12.

Mr. MOORE. Well, it is always do you have the funding to do the level of work that is needed to do out on the ground? And when I look at what the South has in abundance is that they have done a really good job of managing that ecosystem and the ecologic conditions out there for different environments, like the red-cockaded woodpecker or the pileated woodpecker or some of the other threatened and endangered species. And what we have done in the South is really work with our partners, those local community leaders and others to create these conditions.

I think, looking at the farm bill, the 2018 Farm Bill, it has given us a lot of those tools to create those conditions. Even when I look at prescribed burning, the South contributes probably about 70 percent of all the burning in the U.S. And they have created those authorizing conditions there. And so while there are always opportunities to improve, I want you to know that, the work that is taking place down there is really admirable. It is not to say that we can't do more, we can't do better, but right now, the work that is taking place there is kind of—it is a perfect example of what we were trying to achieve across the country.

Mr. ALLEN. All right. Well, thank you, sir.

The CHAIR. The chair now recognizes the gentleman from Arizona for 5 minutes.

Mr. O'HALLERAN. Well, I thank the Chair and Ranking Member for organizing this meeting. I also want to thank Chief Moore and his team for being here today.

Since your appointment, Chief, I believe that we have made headway on a number of important issues, along with the last few years of Congress has helped to get us to where we are at today on many of those issues.

I also want to highlight that this Congress has been at this for a long time, as was just recognized a little while ago. And during that time, we have continuously up until recently cut the Forest Service time and time and time again. And we also have put hindrances in their way. We have fires to fight. We take staff and put them on fires up until the recent farm bill left last time.

But the underlying issue is that we have to work as a team. And that team has to work in realization of the demands that we have placed on the Forest Service to create such a fast change after years and years of neglect are difficult.

And Chief Moore has been with us for a year now. And I think he is doing, and his team have done, an outstanding job over that course of time. And here, the American Rescue Plan (Pub. L. 117–2) has put money forward and the bipartisan infrastructure bill, but much more remains to be done. But I look forward to continuing this partnership moving forward.

In 2018, we worked to ensure the farm bill created and strengthened conservation and forestry programs vital for rural Arizona and America. Five years later, the nation is facing new challenges that are forcing action. Unprecedented dry conditions do not seem to be easing. Ready access to clean and reliable water for states like Arizona has become dire, and wildfires have grown in both

scope and scale, now posing an even greater threat to local communities. Arizona's 1st Congressional District has not been spared.

In addition to the immediate difficulties these fires cause for communities, wildfires can also dramatically change watershed processes, affecting streamflow and erosion. Often, if the watersheds aren't properly restored, communities are put at risk such as in Flagstaff during the recent couple of fires that have been up there. This same issue threatens much of Flagstaff now with the burn scars left from the pipeline fire just several weeks ago and the monsoon season we are currently having.

Chief Moore, the most significant projects to prevent catastrophic wildfires in northern Arizona is [inaudible]. This week, I went to C.C. Cragin Reservoir in Coconino County and forest in northern Arizona. This is a project with 64,000 acres with 35,300 acres eligible for mechanical treatment. Some of my comments are similar to Mr. LaMalfa's. We don't have the manpower. We don't have the scale that is necessary. Part of that is the current hiring market. I know you are trying to hire people in forests throughout the West, but it is hard to get them on board right now. We are trying to find contractors, but after years and years of contractors not being around, we are having difficulty doing that. I know that the roads are expensive to put in, but you are trying to address that issue. And these delays and slow progress are threatening the ability to get the mitigation work done that is needed on a constant basis actually.

So, Chief Moore, first, how is the Forest Service responding to hiring challenges for full-time staff and contractors? Second, how can we utilize the farm bill to help support the industry that is needed for forest restoration work like biomass and finding markets for the—whether it is the biomass or the timber and getting this done in a way on the scale that is going to be needed into the future? I know you can't turn it around in a year or maybe even 2 years, but we do need to turn it around with the help of all of us. Thank you.

Mr. MOORE. Yes, Congressman, thank you. So I will start with the hiring piece. We are playing catch-up over the last 20 years of what has happened to the agency. As our fire workforce has doubled in size over the last 20 years, we have lost about 40 percent of our non-fire workforce, and so we are playing catch-up in terms of how we build and add capacity in the organization again.

Mr. O'HALLERAN. And, Chief, in order to get us out into the field, we need that workforce also.

Mr. MOORE. Yes, and the part—the 38 percent that I am talking about is primarily from the field, and so we are moving in that direction. But, I don't know if this is a secret within the government or not, but let me just share with you some of the complications that we have with hiring. First of all, we are playing catch-up, and so when we go out and hire positions, the existing employees also want to compete for those positions so they can advance and promote upwards, and that is a good thing about the agency.

What we have to pay attention to is how do we bring new people into the organization, and how do we expand our opportunities to work with community leaders and partners to build this back up, build that capacity up. We are never going to go back to where we

were in terms of number of people, but we do think that through some of the authorities under the farm bill like the GNA and shared stewardship, that we are going to build that authorizing environment through people in these communities to leverage and add capacity to do the work.

And so that is our plan for looking at hiring and adding capacity back in order to effectively utilize the BIL monies (Pub. L. 117-58) and maybe other monies that may be coming down in the future.

Mr. O'HALLERAN. Chief, I am going to have to yield or else I am going to get the hook here. So, Madam Chair, I yield back.

The CHAIR. Thank you. The chair now recognizes Mr. DesJarlais for 5 minutes. Mr. DesJarlais, you are now recognized for 5 minutes.

Mr. DESJARLAIS. I have no questions today.

The CHAIR. Thank you for your attendance at today's hearing, Mr. DesJarlais.

The chair now recognizes Mr. Kelly for 5 minutes.

Mr. KELLY. Thank you, Madam Chair, and thank you for having this important hearing. And, Chief Moore, thank you for being here, and thank you for what you are doing for the Forestry Service.

Expanding markets for timber and forest products are vitally important to both the family tree farmers and larger operations in states like Mississippi, where forestry contributes heavily to our economy, includes over 62,000 jobs. Domestic markets for wood products, as well as exports to Europe and Asia of wood pellets, have been bright spots for Mississippi tree farmers. Chief Moore, is the Forest Service doing what it can to encourage new markets? And are there things we should consider for the farm bill that would assist the Department in developing new forest product markets?

Mr. MOORE. Yes. The short answer is yes, but I am going to have my Deputy Chief of State and Private Forestry respond to that.

Ms. HALL-RIVERA. Thank you, Chief. And thank you for that question, Congressman. And as the Chief has previously stated, we are very much focused on expanding forest markets. And we talked a little bit about small-diameter timber, which is a particular interest in the West. Your state in the Southeast, already there are robust timber markets there, as you know, but we are doing work to grow those markets, particularly around pellets, which I am sure you are very familiar with. And we have work going on both in our part of the agency, as well as with our international programs, because there is a lot of interest in the pellet market overseas, in Europe in particular, as well as Asia. And the southeastern United States is really set up well to be a purveyor of that forest product, and that is a really good connection with private forest landowners as well. So we are doing a lot of work there.

We have had a number of dignitaries here from Europe and have just been taking them to your state and other states to show them how our sustainably managed forests in the United States are a really critical part of the pellet market for Europe and other places.

Mr. KELLY. Thank you. And, Chief Moore, just a comment. We spend lots of money and lots of time. I noticed you said 70 percent of the controlled burns are in the South and Southeast. It seems

like that number should be 70 percent and in our National Forests out West where the wildfires usually occur. Climate and those things go to that. But we throw a lot of money, we have a lot of solutions, but we have to get better. The reality is we keep having these wildfires. I have been here 7 years, and we continue to have the same problems. We have to do solutions that work.

And with that, I yield my time to Mr. LaMalfa.

Mr. LAMALFA. Thank you, Mr. Kelly. Chief Moore, I just wanted to follow up on a couple of thoughts here. The authorities that were given in the 2018 Farm Bill, what was the most helpful out of those so far do you think to move the ball?

Mr. MOORE. I think a number of them were. I think the—when I look at the GNA authorities, when I look at shared stewardship authorities, when I look at the collaborative forest landscape restoration opportunities there, I think they have all been very helpful. And I also think that they are pointing to a direction that is going to help us be more successful than we have in the past in terms of removing and improving a number of acres, particularly across the West.

Mr. LAMALFA. Yes, I like more local cooperation, is pretty big if we are going to win this thing. Let me dwell on some of the fire-fighting aspects for a moment. I get report after report after report that when a fire breaks out, there might be somebody locally on-site, maybe a logger, maybe somebody in construction, somebody like that might be nearby with a water truck, a dozer, Cat, personnel, whatever. And they might go out and be willing to go put out a fire when it is ¼ acre, and they might get run off by somebody aggressively saying if you go out there, we will arrest you. Now, why would we chase people out that have forester ability, whether it is loggers or whoever, and they can put a circle around a fire until somebody gets there? Why the heavy-handed threats that I get anecdotal conversations about? Is that the official policy of the Forest Service is to turn down good Samaritans that want to help on Forest Service land or neighboring responsibilities?

Mr. MOORE. Congressman LaMalfa, I think what we are trying to do now is take a look at all opportunities, going forward. If I focused on how we got to where we are, it is because we were afraid that anyone that was not Red Carded (Incident Qualification Card) to handle wildfires would put themselves at unnecessary risk.

Mr. LAMALFA. These aren't dumb people. These are already people out in the forest that are constructors or forestry people. They can handle themselves if they know how to run a Cat that is already out there?

Mr. MOORE. I understand that, sir. What I am saying is that what we are seeing in terms of fire behavior is not normal. And while an individual may feel like they are qualified to do this work, I am not sure. So the question for me and I think what we want to pursue is what opportunities do we have to look at inviting people from in the community to be Red Carded and qualified to do the very work that you are talking about? So I am open to looking at how we can pull people from the community in to do exactly what you are talking about.

Mr. LAMALFA. But, sir, you are talking like right now is that, oh, we are looking at new opportunities. I have been doing this for 20

years at one level or another. You have been in the Forest Service for a long time. Why are we acting like this is new? These should be established protocols. We are having troubles with the VIPR program getting people with equipment ready to roll and such, too, getting the contracts out because everybody is sitting in their offices—why are we looking at this as a brand-new thing? And I will stop there for your answer.

Mr. MOORE. Well, it is not a brand-new thing, but it is something different because, prior to now, they are not allowed to do that. We are trying to create an environment and the opportunity where we can look at how we might want to do that. And so what I am saying is that I am open to pursuing other opportunities, but we need to make sure that folks are qualified to be on these fires because the behavior is just unlike anything that we have seen. So I would not want to have people go out on these fires and something bad happens.

The CHAIR. Thank you for your answer.

The chair now recognizes Mr. Panetta for 5 minutes.

Mr. PANETTA. Thank you, Madam Chair. I appreciate this opportunity.

Chief Moore, always good to see you here in Washington in front of the Agriculture Committee, and I apologize for not being there in person.

Obviously, you are hearing some themes here from the Members of this Subcommittee, and one of them is about staffing. Clearly, we believe that staffing is important to address what unfortunately has become the number one cause of wildfires, and that is basically humans, basically humans being humans and not necessarily the most intelligent aspect of our human race, especially when it comes to how they deal with fire and basically the cause of many of the fires in our National Forests.

Obviously, you are aware of the bill that I introduced, the Save Our Forests Act (H.R. 5341), which will increase the amount of personnel there in our National Forest. But I also was wondering if you could talk about other aspects of hiring such as housing, such as fire stations, such as incentives in order to keep a well-qualified personnel there. Is that something that you take into account as well in looking at what you can do to not just hire but to retain Forest Service personnel?

Mr. MOORE. Yes, Congressman. First of all, I appreciate all your efforts in the past getting us to where we are now. In terms of some of the challenges, you are right. I think the Forest Service is a microcosm of what is happening in our country right now, and so there is competition for the labor workforce. When you look at the average salary for Federal Government employees, it is less than what some are making at that county, a local level, and certainly at the state level in some locations. We are hopeful that we will continue to try and meet our goals of 100 percent filled in terms of firefighters.

We also know that one of the challenges is housing, particularly in some of our small communities, but also in some of our more popular areas where rent or the cost of a purchase of a home far exceeds our employees'—particularly at that lower level of the organization—ability to afford housing. So we are trying to pursue

opportunities for housing. We are looking forward to creating some of the kind of new opportunities with some locals to look at what are the possibilities there to build housing and to create that infrastructure so that we will have opportunities to fill firefighters and staff engines in some of our remote locations. But also, how do we fill those engines in some of those desirable locations where it is expensive to live and where the competition for the labor market is really hot?

So we would invite the community to step forward. I will give you an idea. It is in everyone's best interest that we have a presence there. And so are there opportunities for some of our community leaders in some of these small rural communities to build housing and allow us to lease those facilities in order to have firefighters and employees live in these communities? And I think that this may be an opportunity for us to collaborate and sit down together with community leaders and others to help find solutions for some of the really tough problems that we have with infrastructure here in some of our locations.

Mr. PANETTA. Okay, Chief, I appreciate that and agree with you wholeheartedly and look forward to continuing to work with you.

Let me pivot to another issue that Mr. O'Halleran brought up real quickly and that is biofuels. Obviously, biofuels produced using feedstocks that are sourced from Federal lands like National Forests, unfortunately, they are not qualifying for the EPA Renewable Fuel Standard, which, as you can tell, disincentivizes the private industry from contributing to wildfire risk reduction on our Federal land. Can you give us an update on whether or not the agency is working with the EPA on this issue? And can you elaborate in what little time we got on where you see the Forest Service and private industry working together to meet those goals?

Mr. MOORE. Yes. Let me ask Chris French, our Deputy Chief for NFS, to respond.

Mr. FRENCH. Yes. So, Congressman, thank you for the question. Absolutely it is a concern. It has been an issue for quite a number of years. We are continuing our advocacy and conversations with the Administration, with the EPA on the way that is defined and see it as a significant barrier in our ability to reduce wildland fuels.

Mr. PANETTA. Okay. Thank you, gentlemen. I appreciate that. Madam Chair, I yield back.

The CHAIR. Thank you very much.

The chair now recognizes Ranking Member Thompson for 5 minutes.

Mr. THOMPSON. Madam Chair, thank you so much. First of all, Chief, just thank you for what you are talking about, identifying the firefighter need. As a former state-certified firefighter, our rural communities are hurting with our mostly volunteer forces. And so I think you are partnering perhaps with USDA Rural Development economic development maybe to see what kind of creative things we could do.

To have a healthy community, you really need obviously qualified healthcare professionals in that community. To have a healthy forest, I think you need qualified silviculturists that are working with that forest.

So my first quick question was what is the status of vacancies or do we have all the qualified silviculturists in the system, or how many vacancies currently exist that we need to be filling for folks who are actually qualified as silviculturists?

Mr. MOORE. Yes, I don't have a number for the actual silviculture position. I have numbers generally across the agency. But, Chris, as the National Forest System's Deputy Chief, do we have information?

Mr. FRENCH. We do. And we can follow up with the specifics. In general, Congressman—

[The information referred to is located on p. 1295.]

Mr. THOMPSON. That is great.

Mr. FRENCH.—what I would tell you is that we are running about 30 to 40 percent lower than the need, and that our attrition rate of folks retiring is almost higher than what we are able to hire. Now, having said that, we are doing large collective hiring events across the entire nation to overcome that.

Mr. THOMPSON. Okay. Well, I think we want to work with you on that. And if you got specific numbers based on region, that is always helpful, obviously. I mean, again, it comes back to the community is not going to be healthy if they don't have access to a healthcare provider, and forests are not going to be healthy unless you have that expertise. And 30 percent, that is huge.

Chief, how much timber do you expect to be harvesting in the coming year? And do you expect the harvest levels to increase, decrease, or remain stable in the next 5 years?

Mr. MOORE. I expect them to increase, sir. What is happening now is that we are creating efficiencies. To give you an example, when you look at the President's budget and what it was funded to do, it wasn't the same budget that we actually got. And so what we actually got was enough to produce 2.7 billion board feet. What the President's budget proposed was about 3.2 billion board feet. Now, looking at the efficiencies that we have gained and looking so far as some of the bill funding that helps supplement that, we will exceed that. And our expectation is that we will continue to exceed that going forward.

Mr. THOMPSON. When you look at exceeding that, are we talking about sawlog? What is the breakdown between restorative cuts and then sawlog? Because that certainly has—both impact the health of a forest but we are also concerned—we are always concerned about not just health or the environment but the healthy economy as well.

Mr. MOORE. Yes, in the past, we have considered sawlogs as success, and that is what we had wanted. When I talked earlier about wood innovations and looking at new markets and new opportunities.

Mr. THOMPSON. Right.

Mr. MOORE. No matter what we produce, whether it is the commercial sawlogs, whether it is biomass, there is industry and there is a market for that material, and that is what we are shooting for. Rather than wasting anything, there is a market to utilize it to create jobs, particularly in our small rural communities because we are finding that they are drying up because there are no jobs to keep them there.

Mr. THOMPSON. Yes.

Mr. MOORE. And I think being able to create markets in some of these small communities does give us a really good chance of maintaining that infrastructure and just the texture of the communities that we have grown to love.

Mr. THOMPSON. Yes, we have met with—it has been a couple of years now, but, one of the things is we need to restore domestic furniture. I was proud to visit one of those this past week. It was very exciting what they are doing, kind of a new startup that is doing great things.

My staff tells me that the Forest Inventory Analysis Program shows that there is over 235 billion cubic feet of standing sawtimber on unreserved National Forest lands, over 200 billion of which is in the lower 48. That seems like it makes you one of the largest holders of sawtimber, if not the largest in the country. Can you explain how you have this much sawtimber, and yet you mentioned having too much low-value material?

Mr. MOORE. Yes, so I am not sure where your numbers come from, but I will tell you, normally when I hear large numbers like that, I know that it is all-inclusive. It includes wilderness areas. It includes areas where we don't go in—

Mr. THOMPSON. Yes, and this specifically was sourced as the on reserve, so it took that into account.

Mr. MOORE. Yes, there is no doubt we have a lot of opportunities and a large need to remove a lot of vegetation off the landscapes out there, so there is no way around that, sir. We have a lot of vegetation removal that we need to do, particularly if we are going to be looking at trying to reduce the unwanted fire that is happening across the landscapes primarily in the West, but throughout as well.

The other issue we have, too, if you look at the South and you are looking at the East and some of those areas, while there may not be fire that destroys a lot of landscapes, it is hurricane and it is other storm damage that we have to be considerate of.

Mr. THOMPSON. Right. Yes, in Allegheny it is invasive species.

Mr. MOORE. Yes.

Mr. THOMPSON. Yes. Thanks.

Mr. MOORE. And it is that wonderful black cherry there.

Mr. THOMPSON. That is right. Thanks.

The CHAIR. The chair now recognizes Ms. Schrier for 5 minutes.

Ms. SCHRIER. Thank you, Madam Chair. And welcome back, Chief Moore. It is great to see you again.

I first just want to reextend my invitation to you to visit my district this summer—it is beautiful in Washington State in the summer—to speak with stakeholders about priority forest restoration and wildfire mitigation projects. My district actually includes much of the land covered by the Central Washington Initiative. In fact, it is one of the ten landscapes selected for an initial investment to implement the Forest Service's 10 year Wildfire Crisis Strategy.

Next, I would like to note that the farm bill programs which authorized trusted Forest Service partners to conduct management projects on Federal land are of great importance to Washington State. For example, Good Neighbor Authority allows the Washington State Department of Natural Resources to hire and collabo-

rate with local companies to perform a variety of important watershed rangeland and forest restoration work.

The 638* Authority is another great example. This authority, the Yakima Nation is conducting a much-needed salmon habitat and stream restoration project on Nason Creek in central Washington. So through 638, the Yakima Nation brought their own funding and expertise to this initiative, allowing the work to move forward quickly and efficiently. And with the additional funding from the bipartisan infrastructure law, they are expecting to rely on continued use of the 638 authority for more projects in the near future.

The last thing I would like to focus on for my question is watersheds. And as you know, forests provide drinking water to more than 150 million people in the United States. The Forest Service's Watershed Condition Framework, which was authorized in the Forestry Title of the 2018 Farm Bill, authorizes the Forest Service to evaluate watershed conditions and develop, implement, and monitor restoration action plans in coordination with other interested parties.

In the Pacific Northwest, forest stakeholders are telling me that much of the watershed restoration needs are related to roads and that the Legacy Roads and Trails Program is the principal source of funding. I was really proud to have my bill to codify Legacy Roads and Trails included in the bipartisan infrastructure law, along with a \$250 million appropriation.

So my question is for you, Chief Moore. First of all, I know that the Service recently completed an update of the Watershed Condition Framework. Can you share a little bit about the findings for the Mt. Baker-Snoqualmie and the Okanogan-Wenatchee National Forest in Washington State?

Mr. MOORE. Yes, I sure can. And first of all, thank you for the question. And I look forward to coming to Washington State again to visit with you and some of your constituents there.

Based on the condition assessment, 93 percent of the 128 watersheds on the Mt. Baker-Snoqualmie are functioning properly, and this is good news. The remaining seven percent are functioning at-risk. When I look at the Okanogan-Wenatchee National Forest, in contrast, 41 percent of the 210 watersheds are functioning properly and 58 percent are functioning at-risk, and you have one percent that are impaired in terms of how it functions. So that is what the framework assessment is telling us about those two forests currently.

Ms. SCHRIER. It sounds like we have work to do, particularly in the Okanogan-Wenatchee National Forest. Can you share your perspective on funding needs for the Watershed Restoration Action Plans in the Pacific Northwest, including Legacy Roads and Trails? Do we have enough appropriated now? What do we need in order to get those numbers much farther up?

Mr. MOORE. Yes, and I may ask for help here, but the total function and needs to complete the work specified in that Watershed Restoration Action Plans—and these plans are associated with 67 priority watersheds in the Pacific Northwest region, which is

* **Editor's note:** This refers to P.L. 93-638, Indian Self-Determination and Education Assistance Act.

Washington and Oregon. So that total is about \$55 million, and about \$32 million could be funded via the Legacy Roads and Trails Program, thanks to you.

And one other piece that I would add is, since 2011, the National Forests in the Pacific Southwest have completed all needed restoration work on 37 of those 67 priority watersheds. And so while there is still work to be done, there has been a lot of work that has already been done and completed. And so kudos to the Pacific Northwest region for their focus on looking at improving those critical priority watersheds in that part of the country.

Ms. SCHRIER. Thank you. That is a lot of money that you talked about. It sounds like almost $\frac{1}{5}$ of what has been appropriated for Legacy Roads and Trails. Do you have any sense of the timeline for rolling out those funds so that we can continue to make progress?

Mr. MOORE. Chris?

Mr. FRENCH. Yes. Thank you, Congressman. We are about ready to announce within a few weeks here over 120 Legacy Roads and Trails projects across the country I think in 38 states. And as you pointed out, if you look at the costs associated with just those in the Pacific Northwest, if you look at the funding that we got in bill, which was \$200 million over 5 years, the true needs across the country far exceed that. And so we are prioritizing those most impaired watersheds, including those up in the Pacific Northwest in this first set of projects we are rolling out.

Ms. SCHRIER. Thank you. I appreciate that. And I yield back.

The CHAIR. Thank you. The chair now recognizes Mrs. Miller for 5 minutes.

Mrs. MILLER. Thank you, Chair Spanberger.

I would like to yield my time to Chairman LaMalfa.

Mr. LAMALFA. You increased my rank. Thank you, though, appreciate that. Chief Moore, thank you again. I wanted to follow up a little bit more on the readiness for this fire season as we are already in the middle of it. For the last couple years, we have had some ups and downs with the VIPR program, which is the program that allows the Forest Service to contract with private owners of equipment that are helpful in fire situations. What is the status of the VIPR program this year? What is the feedback you are getting from these equipment owners that would like to be helpful with their water trucks and their dozers and *et cetera*? How is that looking this year?

Mr. MOORE. So I am not hearing a lot of problems with VIPR. Congressman, as you know, we had attended a meeting with you and some of your constituents there a couple of years back.

Mr. LAMALFA. I appreciate that, yes, sir.

Mr. MOORE. And those same problems existed, but I believe we found a workable solution on an emergency use authorization to get around the problems that we had, particularly in northern California. And so unless you can share with me what some particular concerns or issues we have with VIPR, I think we have worked through those issues that we had in the past, but I am open for an opportunity to improve that if necessary.

Mr. LAMALFA. Okay. I appreciate that. Well, we will follow up on that if we are getting feedback differently than that.

Mr. MOORE. Okay.

Mr. LAMALFA. You mentioned wilderness areas a minute ago. What is the standard for Forest Service on maintaining wilderness areas for fire safety, for healthy forests, for the number of trees per acre that we talked about earlier as healthy and the ability to put out fires in those areas? What is the standard or what should the standard be for access to those and the maintenance of them so that they are healthy forests and fire-safe?

Mr. MOORE. So, as you know, we are not allowed to cut timber in wilderness areas. And if I could just focus on California since that is where you are, when I look at wildfires, all it takes really to use equipment in those areas is for that local line officer, a forest supervisor in this case, to request from the regional forester the authority and the okay to use mechanized equipment—

Mr. LAMALFA. On wilderness?

Mr. MOORE. On wilderness, yes. And during my time there in California, it was a process. And part of it is because right outside of wilderness areas we have communities. And if we didn't suppress that fire within the wilderness, that community was at risk. And so I have always been okay with use of mechanized equipment in wilderness for that reason because when you look at California itself, it said about 93 percent of California is in urban settings. And when you have that number of urban settings across a state, it is very dangerous to not manage a fire, regardless of where it is at.

Mr. LAMALFA. Ninety-three percent of—

Mr. MOORE. Urban settings, like in your district, you have a lot of communities that are built up. It is not necessarily a city, but you have communities that are built. That is an urban setting. And when you look at across the state, it is not equal all over the state. When you look at the average across the state, it is estimated that about 93 percent of California is—

Mr. LAMALFA. That is interesting criteria. So let's take the town of Westwood, for example, which was threatened by fire last year, and Dixie as well. It has a perimeter. So, when you are talking a landscape of 93 percent is considered urban, what is the radius away from these towns that you would count as part of being urban, I guess? Because, there is—I drive my district a lot, and there is a lot of gaps in between that isn't urban, even small towns.

Mr. MOORE. As you know, northern California is different than central, and it is different than southern. And so we are looking at the average. But, in terms of urban communities being threatened, it depends on a lot of conditions like wind, topography.

Mr. LAMALFA. No, but what I was asking, though, is for the landscape to be considered 93 percent urban interface, right, that means a town that is a square mile in the middle of a forest that might not have another town for 30 miles, how many acres around that town are what you are considering the acreage that makes 93 percent? Is it a 1 mile buffer around town that you would consider the urban area? I don't follow you.

Mr. MOORE. Yes, I don't have that level of detail, but it doesn't have to be a little town, Congressman. It could be a little group of homes. It could be just a setting where you have a community. We have a lot of resorts also isolated and remote areas—

Mr. LAMALFA. Okay. Well, that is interesting that that much would be considered urban. On wilderness areas, then, so you feel like you have the access at a simple phone call to send equipment out there for fire starts, and it will start immediately?

Mr. MOORE. Yes, my experience has been that that usually has happened really quick. It has not been an issue in California, sir.

Mr. LAMALFA. You don't have to wait days. Okay. Thank you.

The CHAIR. Thank you, Mr. LaMalfa.

The chair now recognizes Mr. Moore for 5 minutes.

Mr. MOORE of Alabama. Chief Moore, thank you for being here. And, as you know, the goal of forest conservation is to promote and conserve the rich diversity of natural resources found in healthy forests. This goal can be achieved by protecting and improving forests, providing technical assistance, and facilitating conservation efforts. In my district, we have about 4.4 million acres of forest. What program is authorized—and I am fairly new to the farm process, I am a freshman, so I am just curious what programs were authorized in the 2018 Farm Bill that you found to be the most utilized and the least utilized?

Mr. MOORE. So the most utilized program in the farm bill is going to be the Landscape Restoration Program. An example of the effectiveness of this program is that the changes expanded eligible applicants beyond the states to include Tribes, nonprofits, and institutions of higher learning, and they also prioritized investments in rural landscapes. So, it is those projects that contribute to healthy, climate-resilient rural forests and communities. So in short, it expanded the eligibility for people to participate in that. Whereas it used to be with just states, now it includes states, Tribes, nonprofits, and institutions of higher learning.

Mr. MOORE of Alabama. What was the least used, Chief? What did you find to be the least effective program or least utilized?

Mr. MOORE. Well, that is hard to say because where one program may be least utilized in one part of the country, it could be heavily utilized in another part of the country. And so that question would be hard for me to answer that unless you say, well, what is the least utilized program there in your district there, in Alabama, and then I could be more responsive to that in terms of what is actually being used there *versus* the one that is most effectively used there.

Mr. MOORE of Alabama. And I guess based on that, we have kind of gauge effectiveness based on utilization. And are there any programs that are just really popular in the southeastern part of the U.S. that you think my constituents would appreciate and that we would need to fight for in 2018—or in the 2023 Farm Bill I should say?

Mr. FRENCH. Are there sections that were popular in the Southeast that we should go forward with?

Mr. MOORE. Well, I think the GNA, the Good Neighbor Authority, an agreement that we have talked about, is very popular. I think the Shared Stewardship Agreements are another one that is very, very popular. And I think what makes them so popular is that it gives us the opportunity to bring the community into the decision space of not only how we do it, but what we do. And that is one of the things that I think with some of these new authorities and how it has changed how the agency operates from the past, it

gives a voice and decision space to the community in a much bigger way than perhaps what we have had in the past.

Mr. MOORE of Alabama. Thank you. And with that, Madam Chair, I will yield back.

The CHAIR. Thank you. The chair now recognizes the very patient Mr. Costa for 5 minutes.

Mr. COSTA. Thank you very much, Madam Chair, for holding this important hearing with the Subcommittee. Obviously, when we see, as was noted by our colleague, Congressman LaMalfa, we no longer have a fire season but it is a fire year. And we are dealing with that throughout the country in the West, particularly in California.

The last time I participated in a Subcommittee hearing was in the fall of 2020 toward the end of the Creek Fire. Matter of fact, I did a little bit of research here. Of the 20 largest fires in California dating back to 1932, 14 of them have been in the last 10 years. And climate change and many factors has been noted as the cause that we are dealing with.

When I participated 2 years ago, I asked then-Deputy Chief Phipps about what would be needed to do proper forest management to catch up. As you said, Chief, we are playing catch-up. And he indicated at that time—so almost 3 years ago—\$2–\$3 billion a year for 10 years. Now you have your current budget that we have, and then there was the bipartisan infrastructure package, I believe, gave another \$3.2 billion, but you add those numbers up, and they don't come close to \$2–\$3 billion a year for the next 10 years.

As you put your 10 year plan together, how are you prioritizing that and also hopefully allowing for additional partnership and funding in state and local monies? In California, I know we have done a fair amount.

Mr. MOORE. So we have looked at, Congressman, ten landscapes across primarily the West, and that covers about eight different states. And so if I was to just focus on California, we do have landscapes there in California we want to focus on. And what is good about California is that the state has been really aggressive and progressive in terms of treating the landscape conditions there in the state. And so the Forest Service there is partnering with them, and they have a goal to treat 1 million acres per year between the state—

Mr. COSTA. And then they get to there—I know Mr. LaMalfa and I both are at the same point, and that is the funding. Do we have the funding to meet those goals between Federal and state resources? Because what I have observed here in recent years is that we end up augmenting the fire suppression funding, and we take some of that from the forest management and we are always playing catch-up. And we are never—I mean, we have done a poor job, let's acknowledge it, for 20 years in managing our forests, and we are paying the price for that, I think.

Mr. MOORE. Yes. So if you look at the \$5.6 billion or the \$3 billion that we have for hazardous fuel reduction, it is only a shot in the arm in terms of what we actually need to make a difference on the landscape.

Mr. COSTA. Well, I think it would be helpful if you would provide the Subcommittee here with what you would really need to do the job for your 10 year program.

On the private-sector, I was up visiting part of the Creek Fire in the last week or 2 and the devastation that is there. Some of the private landowners indicated that they have taken advantage of NRCS funding to help do this. You have not mentioned that. What is the potential for getting more private landowners involved to help do their part?

Ms. HALL-RIVERA. Thank you, Congressman, for that question. Yes, we work with our sister agency NRCS. They do provide funding for post-fire rehabilitation to private landowners. And, there is a pretty substantial budget there for that—

Mr. COSTA. But we could do more of it, right?

Ms. HALL-RIVERA. Yes, we can do more of it, and we are—

Mr. COSTA. We have to figure out how we include that. On the use of the wood products of—excuse me, I have a lot of questions and a little time. The fact is that it seems to me the salvage operations, again, using the Creek Fire because I was just there twice in the last 10 days, or trying to make progress in getting that salvage timber out, trying to find places where log decking or whatever you call it. But, again, we are playing catch-up, right, Chief?

Mr. MOORE. Right. We are playing catch-up, Congressman.

Mr. COSTA. And that is just one of the 14 fires in the last 10 years that you have had to do that forest management just in California. That doesn't take in the other eight states. Right?

Mr. MOORE. That is correct.

Mr. COSTA. And, of course, we are losing water. We lost over 700,000 acre feet of water in drought conditions.

Let me close on the permitting process because I think it is an important area and I think it is a problem. When the Native Americans managed Yosemite floor, the valley floor, they seemed to do a better job than we did, going in the springtime and live there and then in the fall when the first snow did come out and they would set fires. I understand we are trying to—we got more trees on the valley floor now than ever, and we can't get the permits to properly manage one of the nation's great National Parks.

Mr. MOORE. Yes, that is probably a question for the National Park Service through—

Mr. COSTA. The permitting impacts you as well for other forest areas—

Mr. MOORE. It does, yes.

Mr. COSTA. And is it a problem?

Mr. MOORE. Well, of course it creates unnecessary problems for us.

Mr. COSTA. Recommend how we adjust that. And my time has expired, but there are a number of areas here that I will submit further questions, working with my colleagues not only in California but with the good work of this Subcommittee Chair and the efforts. And thank you for allowing me to participate.

The CHAIR. Thank you, Mr. Costa.

Having concluded all questions for our first panel, the witnesses are now excused. Chief Moore, Mr. French, Ms. Hall-Rivera, the Committee thanks you for your testimony today. The Committee will now take a brief recess for our first panel of witnesses to depart and our second panel of witnesses to take their seats. We would typically do a full 5 minutes, but given that we are coming

up on votes, I am going to take a brief recess as long as it takes for our second panel to get comfortably situated. Thank you so very much.

[Recess.]

The CHAIR. I welcome the second panel of witnesses to the Agriculture Committee today. On the second panel, our first witness is Ms. Rita Hite, President and CEO of the American Forest Foundation. Our second witness is Mr. Douglas Reed, President of Green Diamond Resource Company, testifying on behalf of the National Alliance of Forest Owners. Our third witness is Mr. Christopher Martin, the Connecticut State Forester and testifying in his capacity as the President of the National Association of State Foresters. Our fourth witness today is Ms. Rebecca Humphries, the co-CEO of National Wild Turkey Federation. Our fifth witness is Ms. Sally Palmer, the Central Appalachian External Affairs Advisor for The Nature Conservancy. And our final witness is Mr. Tom Schultz, the Vice President of the Idaho Forest Group, testifying in his capacity as the President of the Federal Forest Resource Coalition.

You will each have 5 minutes to deliver your testimony. The timer should be visible on your screen and will count down to zero, at which point in time your time has expired.

Mrs. Hite, please begin when you are ready.

STATEMENT OF RITA N. HITE, PRESIDENT AND CHIEF EXECUTIVE OFFICER, AMERICAN FOREST FOUNDATION, WASHINGTON, D.C.

Mrs. HITE. Good morning. Thank you for the opportunity to share the views of the American Forest Foundation and the family forest owners we work with across the country every day. It is good to be back here, albeit on the other side of the dais. I had the privilege of staffing this committee on forestry issues a few years ago, so good to see some familiar faces. Well, there is more in my testimony—

The CHAIR. Mrs. Hite, if I could interrupt you. There is an audio issue for those who are joining us virtually. Thank you, everyone, for your patience. All right. Mrs. Hite, you may proceed.

Mrs. HITE. Thank you so much.

The CHAIR. Sure.

Mrs. HITE. While there is more in my testimony about the improvements we suggest in the farm bill, I would like to focus this morning on the significant opportunity we see to unlock private-sector support for family forests and the economic and environmental benefits that these lands provide.

First, I just want to hit a little bit around family forest owners, who they are and such. Most people when they think about forests in this country, they think about the government and they think about corporations. Most don't know that the majority of the largest chunk of our forests are owned by families and individuals. One in four rural Americans own forests. And in fact, many of these forests are associated with a farm operation. About 75 million acres of our family forests are part of a farm operation.

Forests are critical in our rural economies. Family forests supply more than half of the wood supplied for the nation's forest products

manufacturing in the U.S., and they also provide us with clean air, climate mitigation, and a host of other benefits as well.

Family forest owners come from all backgrounds, but they all want to care for their land and have an impact on the planet. They are people like Kedron Dillard, a third-generation African American forest owner who shares ownership with a dozen relatives, but is struggling to find a way for the farm to pay for itself. There are people like Sutter and Taylor Rogers in California, who operate an outdoor summer camp for kids but who can't afford to tackle the overgrown fire-prone stands at the camp. There are people like the Boutwells in Alabama who manage sustainably for timber, and they look for voluntary options and markets to keep their forests economically viable.

Family forest owners want to care for their land but need technical and financial help to do that. And we are not just talking about these four landowners. There are 21 million people in America that own forests. Consider this: Eighty-five percent of forest owners are not working with a forester and don't have a management plan and thus are not maximizing the full potential of their forests. To be clear, the farm bill has helped. This Committee has done a great job in the last few farm bills of really opening opportunities in those conservation programs for forest owners.

But still, we are just scratching the surface. These lands are not yet living up to their full potential, and we are seeing big challenges on the horizon from climate change to wildfires. We have talked about that already this morning. These are challenges that require active forest stewardship, and they are challenges that require technical and financial help for family landowners, and they are challenges where family forest owners can be a big part of the solution.

While increased conservation program dollars are critical and improvements in those programs are critical, there is an opportunity to leverage the rapidly growing market, voluntary carbon market, which we estimate to be worth about \$90 billion in the coming decades, to actually support the same kind of forest stewardship we are doing with those conservation programs and help those programs be leveraged further. To be clear, the government's role in carbon markets should be minimal. The private-sector is driving this. AFF is working alongside The Nature Conservancy on a program called the Family Forest Carbon Program to help unlock these markets for family landowners.

What the farm bill can do and what USDA can do is the same role that USDA has played for a lot of other agricultural markets, catalyze these markets, open up these opportunities for forest owners so we can bring these resources to rural communities, very similar to the SUSTAINS Act (H.R. 2606) that that Congressman Thompson has introduced.

We see a significant opportunity for rural America to benefit from these markets in ways that leverage and support those farm bill programs. The private-sector is eager to invest in these opportunities, but because they are new, and because they require upfront investment, we need tools like what is suggested in the Rural Forest Markets Act of 2021 (H.R. 3790) that a number of the Committee Members here have cosponsored. If we can't overcome these

financing hurdles, this market opportunity will pass rural America, and we will see investments in other technologies, and America's rural family landowners will not benefit.

So, Madam Chair, Ranking Member, I appreciate the time. I see a lot of opportunity to help the farm bill's forestry investments go further by leveraging these market opportunities, as well as improvements in the program.

[The prepared statement of Mrs. Hite follows:]

PREPARED STATEMENT OF RITA N. HITE, PRESIDENT AND CHIEF EXECUTIVE OFFICER,
AMERICAN FOREST FOUNDATION, WASHINGTON, D.C.

[Chair] Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee thank you for this opportunity to testify on behalf of the American Forest Foundation and the 21 million family forest owners of the United States that AFF works with.

The American Forest Foundation is a national conservation organization focused on delivering meaningful conservation impact through the support and empowerment of America's family forest owners. With over 80 years of experience working with family forest owners in conservation, AFF has an in-depth understanding of the motivations, desires and challenges of families and private individuals that own wooded land in America. I personally have known first-hand the sweat and tears it takes to tend to the land. Before my 2 decades in the forest conservation space, I grew up on a beef cattle farm in upstate New York and know the joy and pride that comes from tending the land and seeing the ripple effect in our communities and the larger ecosystem.

I'm also here today as a leader in the Forests in the Farm Bill Coalition, a 100 plus participant Coalition that has worked together since the 2002 Farm Bill to offer and advocate a forest sector view of forest-related priorities for the farm bill. AFF has co-chaired this Coalition alongside our partners at The Nature Conservancy, the National Wild Turkey Federation, and the National Association of State Foresters, here alongside me today, for decades. This Coalition's work has just begun in advance of the next farm bill, and we look forward to sharing further views of this Coalition with the Committee in the future.

As the Committee considers the reauthorization of the farm bill in 2023, I urge you to consider how this critical piece of legislation can do more to support the stewardship and conservation of private forestlands, particularly those owned by family forest owners. This is critical because of the role these lands play in our rural economies, our social fabric, and our environment, and because of the immense challenges facing these lands and people, including climate change and wildfire.

We see a significant opportunity in this next farm bill to further unlock public-private partnerships, including new markets such as carbon markets, that can help increase the pace and scale of conservation and stewardship on these lands while also addressing many of the challenges we're facing as a nation.

Why Are Family-owned Forests So Critical?

All forests, including family-owned forests, provide Americans with important public benefits. They provide critical habitat for wildlife and fish, they help clean our water and air, and they provide a critical source of wood fiber for products and economic vitality for rural citizens and communities. With respect to clean air, these lands already capture and store roughly fifteen percent of our annual U.S. greenhouse gas emissions. These lands have even more potential to address two intertwined challenges we face as a nation that I want to speak to today: the wildfire crisis and climate change.

Families and individuals own the largest portion—39 percent—of all forests in the United States, more than the Federal, state, and local governments or corporations. As the largest portion of our forests, family forests can have a globally significant impact on climate change, through improved forest management, reforestation, avoiding emissions from catastrophic wildfires, and supplying the raw materials for climate beneficial forest products. In doing these actions, forest owners can also benefit their land goals and increase forest health and productivity.

At the same time, more than 1/3 of the high wildfire risk lands in the western U.S., where we have a severe wildfire crisis, are private, family-owned lands. These families can have a significant and essential impact in fostering wildfire resilience in our western landscapes.

Family forest owners own their land for a variety of reasons, but one thing they all have in common is that they care about their land. Landowners want their forests to be healthy, want their lands to support wildlife, and want to pass the land in better shape on to their children.

Bottom line, these landowners want healthy and productive forests that continue to provide these public benefits and do more to address growing issues like climate change and wildfire, and the resulting wildlife and other impacts, but they face significant barriers.

As a result, few are taking active steps to care for their forest leaving untapped potential in these lands for climate mitigation, wildfire resilience, and many other public benefits.

What are some of these barriers? First is a lack of forestry expertise and connection to technical assistance. In fact, only one in five landowners have received formal forest management advice. Many farm bill programs—such as the U.S. Forest Service’s Forest Stewardship Program—are hobbled by flat budgets that result in only the capacity for pennies-on-the-acre investments, leaving a significant gap in the resources available for land management planning and technical assistance among family forest owners.

The second biggest barrier to landowners taking further action to steward their land is cost. Most family forest owners are not generating a regular annual income from their land, as a typical farmer does. In fact, the average family forest owner has an income of less than \$50,000, and may only generate income from their land, once a generation, if at all. So while landowners want to do the right thing, conservation and stewardship actions take money that these landowners often don’t have.

Minority and other underserved landowners—whose ownerships are often on the frontlines in climate-impacted communities—face even greater barriers to forest stewardship. Challenges around heirs’ property, mistrust of government institutions due to decades of discrimination, and a lack of sufficient professional forestry support prevent access to farm bill programs such as the Environmental Quality and Incentive Program (EQIP), the Conservation Stewardship Program (CSP), and Conservation Reserve Program (CRP).

These barriers are not insurmountable. With the right tools and support, we can empower forest owners to unlock the potential in their forests to support our environment and our economy—all while giving family forest owners the opportunity to achieve their own land management goals.

Previous Farm Bill Progress

Through the last four farm bills, this Committee has made significant progress opening conservation program opportunities for family forest owners, right alongside traditional farmers, paving the way for technical and financial support for family forest owners. For this, we, and the nation’s family forest owners are incredibly grateful.

We estimate today that family forest owners are accessing roughly \$100 million in conservation support from the various EQIP, CSP, CRP, and U.S. Forest Service programs. While this is important progress—that’s less than pennies on the acre if it were split across all family forests today, an investment that does not at all reflect the thousands of dollars per acre of value the public is benefiting from these lands, nor does it reflect the level of investment needed to unlock the power of these lands to mitigate climate change, address the wildfire crisis, and improve the other economic and environmental benefits from these lands.

We know that while increased investment and improvements in programs like EQIP, CSP, CRP and various Forest Service is critical and we urge this Committee to aim for that, we also know that we should not rely solely on government funding to invest in forest stewardship and conservation.

What we also know is that increasingly, society is placing real value on the public benefits our forests can provide in addition to traditional timber value—from the clean water, climate mitigation, and wildfire mitigation values these lands can provide. This value is being unlocked through new markets, such as voluntary carbon markets, that allow corporations to pay landowners for additional carbon benefits that offset their corporate emissions.

We see a significant opportunity for this Committee to make improvements in this next farm bill that will leverage these market opportunities with government investments, helping the government dollars go further while also bringing these significant financing opportunities to rural America.

Leveraging Carbon Markets with USDA Programs for Conservation Finance on Family Forests

The voluntary carbon market is growing exponentially. In fact, market trends suggest this market will be valued between \$90–\$480 billion by 2050. This is driven by corporations who are recognizing the risks of climate change in their business strategies and investing in and committing to significant emissions reductions goals to mitigate these risks. While corporations can, and many are, focused on what they can do within their own “fence line,” for many, it will not be possible to achieve their emissions reduction goals without purchasing carbon credits to offset a portion of their emissions.

Today the demand for quality carbon credits far outpaces the supply of available credits, creating a prime opportunity for agriculture and forestry to meet this demand, as our lands are one of the most important strategies for carbon capture and storage.

At the same time, many of the actions we can take in our woods and lands to capture and store carbon to produce quality carbon credits, are also incredibly valuable for improving forest health and productivity—the goals of family forest owners.

For example, in the Central Appalachian region—Pennsylvania, western Maryland, and West Virginia, one of the key forest actions landowners can take to capture and store more carbon is to avoid high-grading. In this region, high-grading, the practice of removing the best trees and leaving behind the poor quality trees, is a common practice on family lands for a variety of reasons, often related to lack of technical assistance and financial pressures. If we can help landowners change this practice, we can help them create a healthier and more productive forest, produce higher quality wood products, and produce additional carbon on the landscape in the form of quality carbon credits that can be sold in the voluntary carbon market.

This is a win for the landowner, the forest, the forest products industry, and the climate.

This is happening today in the private-sector: through a partnership with The Nature Conservancy, AFF has developed the Family Forest Carbon Program (FFCP). The Family Forest Carbon Program is a unique and credible solution to carbon markets for forest owners with small forest holdings, which represent the bulk of family lands in the U.S., who have largely been left out of carbon market opportunities to date due to costs and technical barriers.

The program works by paying family forest landowners to implement carbon-positive forest management practices such as avoiding high-grading, that result in increased carbon sequestration and storage, as well as improved wildlife habitat and forest resiliency, helping family landowners achieve their land goals. The program provides forester assistance, forest management planning, and ongoing technical support for family landowners as well.

The program then sells the carbon generated by landowners to corporate entities interested in reducing their overall carbon emissions, triggering private investment in rural America that would not have otherwise been invested.

The program's carbon credits are produced using a new, innovative carbon accounting method that is pending final approval by Verra, one of the world's recognized third-party verifiers of carbon and other ecosystem credits.

To date, in the Central Appalachians, we have 173 landowners signed up for the program, another 2,557 that have expressed interested, and we've generated \$49.1 million that support forestry and landowner goals. We have just begun to sign up landowners in the Northeast and have plans for expansion to the Midwest and South this year.

So if this is happening in the private-sector, why is there a need for the next farm bill to help further unlock these markets?

There is no doubt that the private-sector can drive this work, and in fact, the government's role in these markets should be minimal. However, given the potential for these carbon markets to bring significant finance to rural communities and rural landowners for the very same goals that the farm bill's conservation programs are supporting, there is a critical role USDA can and should play alongside these private markets.

In our experience working in these voluntary markets, USDA can play a catalytic role, very similar to the role USDA plays for other agriculture markets for farmers and forest owners, helping to bring low-cost financing, technical and scientific support, and market transparency for landowners. Without this catalytic role, the nation's family forest owners will not benefit from these markets at the scale that's possible, leaving our rural forest owners and rural America out of significant revenue opportunities.

In particular, one of the key roles USDA can play is in the area of low-cost financing. For landowners to participate in voluntary carbon markets and produce credible carbon credits, there is a significant up-front cost to implement the practice, that is not paid back until the additional carbon is generated which can take as much as 20 years. AFF is innovating in this space, developing ways for private finance to step in through the bond market or low-cost loans. However, even with this private finance, given this is a new market, investors need to have certainty in their investment, with a guarantee backing their investment. This is not unlike any other emergent agriculture market.

USDA and the next farm bill can help fill this finance gap in a number of ways:

- by leveraging its own conservation program funds to provide some of this capital which provides significant leverage for conservation programs;
- providing low interest loans or loan or bond guarantees, such as those that would be authorized in the bipartisan Rural Forest Markets Act;

There are other ways USDA can help with financing too, such as serving as a buyer of last resort for credits, providing a low-cost insurance product, and even direct co-investing in credits.

In addition to financing, USDA and the next farm bill can also help further unlock this market opportunity for America's rural landowners by:

- Investing in the forest carbon practice science, data and inventory solutions, and program develop through grants and other funding support that can bring innovation, efficiency, continuity and credibility, and continuous improvement to climate-smart forestry action.
- Supporting landowner engagement and technical assistance including a focus on ensuring support for historically underserved forest owners.

Again, there is significant progress happening in the private-sector in these markets, and USDA's role can be catalytic to ensure that America's landowners can benefit from these markets.

Additionally, it's important to note that we believe carbon markets can and should work alongside traditional forest products markets. Strong markets for forest products, that promote use of carbon beneficial forest products, are critical for family forest conservation and climate impact as well. We encourage USDA to continue and expand investment in the science, data, and support for these markets as well.

Like managing for wildfire resilience, implementing practices to maximize climate mitigation require significant up-front investments. Often it is the cost of implementing management practices to improve forest health and planting new trees that hinder forest owners from reaching their management goals. Families and individuals are willing to invest their time and energy but need incentives to align with their goals, incentives that value the real work and environmental benefits forest owners contribute to our society.

Tackling Wildfire Risk with Family and Private Forest Owners

In addition to helping unlock carbon markets for rural landowners, the next farm bill presents an opportunity to address another significant issue we're facing as a nation: the wildfire crisis in the West.

After almost a decade of unstoppable wildfires, gone is the time for modest wildfire protection measures and a sole focus on defensible space around structures and along roads. In line with the vision and strategy of Chief Moore and the Forest Service, AFF believes we must make a paradigm shift to address the health of our forests holistically and restore natural resiliency to wildfire across all forests in a landscape.

The Agency's Wildfire Crisis Strategy and Implementation Plan identified up to 50 million acres of work outside of National Forest System boundaries needed to make a significant impact in critical firesheds, because wildfires don't recognize boundary lines. This goal is unattainable without cross-boundary partnerships that signify shared ownership in the problem and the solution. Cross-boundary partnerships that will be critical to the success of implementing the strategy and implementation plan include public-private partnerships as well as internal partnerships between the Forest Service and NRCS, creating opportunities to leverage resources across sectors and levels of government.

For example, in the Northern Sierra's in California, a state where fifty-one percent of the of high fire risk lands in the state are private, family lands, the State of California through CAL FIRE, the forestry agency, AFF and many other private-sector partners, and the U.S. Forest Service are partnering to work across all ownership boundaries to treat lands at a scale that is unprecedented. Even with these critical

partnerships, we have less than half of the available funding to treat the needed lands on private lands. A significant barrier to this work is match requirements for work on non-Federal lands. When treatments on private lands cost upwards of \$2,000 an acre, family landowners are not able to bring the level of match needed to accomplish the work.

Many forest owners want to do the work and are doing the work, but not at the scale needed to get ahead of the wildfire crisis, due to their own financial limitations.

The Healthy Forest Restoration Act of 2003, as amended in the 2018 Farm Bill, supports cross-boundary work to reduce hazardous fuels by allowing a portion of the U.S. Forest Service hazardous fuels funding to be used by states, private landowners, and non-governmental organizations for work on cross-boundary projects on non-Federal lands, prioritizing high risk areas. While this was a significant leap forward to improve the resilience of forest and rangeland ecosystems, the resources provided to private forest land, particularly family forest owners, have been minimal and insufficient to date.

The Infrastructure bill provided significant new funding for wildfire mitigation. However, the investment is only a down payment on the \$50–\$60 billion needed over the next 10 years to mitigate our wildfire crisis. What is needed is an intentional focus on critical landscapes inclusive of cross-boundary ownership by increasing funding that is specifically directed to private lands within and around fireheds, while encouraging public-private partnerships to leverage funds and capacity to expand the Forest Service’s reach into impacted communities.

Cost-share programs like Environmental Quality and Incentive Program (EQIP) have the greatest potential to relieve the financial burden landowners experience with managing for wildfire mitigation and other conservation outcomes. However, these programs do not have enough funding to meet current contract demands and often present administrative hurdles for landowners to access. Streamlining processes across states to ensure consistency and transparency in the selection process, and increased funding for both cost-sharing and forestry technical assistance would improve program delivery significantly.

In addition to working cross-boundary to mitigate wildfire risk, with the growing wildfire crisis, family forest owners are seeing their forests, their livelihood and legacy, destroyed by these catastrophic wildfires, with little support to get back on their feet after the wildfires.

Forest owners are not eligible for crop insurance and the available disaster programs, including the Emergency Forest Restoration Program, are in need of significant reform. The farm bill provides an opportunity to improve disaster recovery programs to better support family forest owners that are increasingly facing billions in damages and lost value from natural disasters such as wildfires and hurricanes. Without this support, landowners are left with little path to get back on their feet and these forests can then become a liability for local water quality and public health.

2023 Farm Bill Policy Solutions

While the 2018 Farm Bill included important improvements and critical investments to support family forest conservation, we recommend the following improvements be considered in the 2023 Farm Bill and we look forward to working with the Committee to develop these concepts.

- (1) **Creative solutions to leverage and unlock private-sector markets including carbon markets**, with support for:
 - low interest loans or loan or bond guarantees, such as those that would be authorized in the bipartisan Rural Forest Markets Act;
 - leveraging USDA conservation program funds to provide investment alongside private market investment, with improvements in the Regional Conservation Partnership Program’s Alternative Funding Arrangements;
 - forest carbon practice science, data and inventory solutions, and program develop through grants and other funding support that can bring innovation, efficiency, continuity and credibility, and continuous improvement to these private-sector markets;
 - science, data, and technical development of forest products markets;
 - landowner engagement and technical assistance including a focus on ensuring support for historically underserved forest owners.
- (2) **Strengthen Wildfire Mitigation and Disaster Recovery on Family Forests with support for:**

- Increased financial and forestry technical assistance for wildfire mitigation and disaster recovery through programs such as EQIP;
 - Strengthening funding provisions in the Infrastructure bill that allow for increased cross-boundary action, including match waivers where appropriate;
 - Improvements in programs such as the Emergency Forest Restoration Program and other disaster programs aimed at forest owners.
- (3) **Continued investment and improvements in USDA conservation programs including:**
- Increase funding for the Landscape Restoration Program and encourage public-private partnerships, with consideration for underserved communities;
 - Reauthorize RCPP with a more streamlined administrative process to be more aligned with other Title II programs[;]
 - Reauthorize restoration programs such as Conservation Stewardship Program and Conservation Reserve Program[.]

In conclusion, we truly appreciate this Committee's work on forestry and see the 2023 Farm Bill as an opportunity to build on this important work and leverage significant private-sector markets and funding in the process. Thank you for the opportunity to share our views and we stand ready to assist as AFF and the Forests in the Farm Bill Coalition, as the Committee's work continues.

The CHAIR. Thank you for being absolutely right on time with your testimony.

Votes have been called, so we are going to recess while Members of the Committee—there is official language. There have been two votes called on the House Floor. The Committee will take a brief recess, and we will reconvene shortly. We appreciate your patience. Thank you.

[Recess.]

The CHAIR. We will now resume the Subcommittee hearing. Mr. Reed, please begin when you are ready. You have 5 minutes.

STATEMENT OF DOUGLAS REED, PRESIDENT, GREEN DIAMOND RESOURCE COMPANY; CHAIR, BOARD OF DIRECTORS, NATIONAL ALLIANCE OF FOREST OWNERS, SEATTLE, WA

Mr. REED. Thank you, Chair Spanberger, Ranking Member LaMalfa, distinguished Members of the Committee. I appreciate the opportunity to testify today. My name is Douglas Reed. I am the President of Green Diamond Resource Company, a fifth-generation, family-owned forestry company, started by my great-great-grandfather in 1890. Today, our company owns and operates working forests in the West and South. Green Diamond's long-term commitment to forest stewardship is at the heart of our business.

I am here today in my role as Chairman of the board of NAFO, the National Alliance of Forest Owners. NAFO represents privately owned working forests like ours. These forests provide clean air and water, wildlife habitat, and jobs. Of course, they also provide a steady, sustainable supply of products for building homes and schools and thousands of other everyday items. Our businesses also support 2.5 million American jobs, mainly in rural communities.

Working forests are also a critical natural climate solution. Yet there is room to do more, and we have laid a path to get there as a sector. Recently, I joined 42 of my fellow forestry CEOs and our counterparts at the Environmental Defense Fund and The Nature

Conservancy to adopt a climate roadmap for private working forests. We are carrying these ideas to farm bill stakeholder groups.

Working forests sequester and store carbon. At just under half the nation's forest land base, private working forests provide 90 percent of domestic timber harvests, 80 percent of our nation's annual net carbon sequestration, and nearly half of our long-term forest carbon storage. To put this in context, privately owned working forests alone sequester more carbon than is emitted annually by 100 million passenger vehicles.

Sustainably sourced forest products are also a climate solution. Half the dry weight of wood is carbon taken out of the air. When we substitute wood for other carbon-intensive building materials, we can reduce the carbon footprint of our buildings.

The farm bill can help us reach a greener, more resilient future. We are interested in three workstreams: First, the Forest Inventory and Analysis Program; second, programs to support building with wood; and third, addressing the wildfire crisis.

First, FIA: USDA's Forest Inventory and Analysis Program provides vital information on our nation's forest resources. At Green Diamond, we have developed carbon offset projects, and we have efforts underway in four states. Key to this type of work is reliable data to ensure that these projects are rooted in facts and science. As interest in forests as a climate solution grows, more and more stakeholders rely on FIA data to make decisions, sometimes in new ways. Despite attention in the 2018 Farm Bill and increases in funding since then, the program needs additional support to meet all these growing uses. I recommend Congress direct the Forest Service to establish a national 5 year measurement cycle, standardized protocols for data collection and analysis, and ensure FIA has the strategic direction it needs to grow and adapt. These changes should be additive to the good work FIA is already doing.

Second, building with wood. Wood is climate friendly, safe, durable, and can be grown locally, which supports American jobs. With new technology, we can use wood in new ways. I would like to thank you for the successful Timber Innovation Act in the 2018 Farm Bill. There are now over 1,300 mass timber buildings in the U.S., a big jump from 2018. Yet we still lag far behind Europe on the use of mass timber, despite our abundant sustainably managed forests. The 2023 Farm Bill should build on the Timber Innovation Act. NAFO, together with partners such as the American Wood Council, looks forward to working with you on this effort.

Third, severe wildfire: Almost exactly a year ago the Bootleg Fire started on Federal ground and devastated 413,000 acres in southern Oregon, including 110,000 acres of Green Diamond property. Chief Moore's testimony this morning is right that more fires start on private lands where people live and work. But while just 20 to 30 percent of fires begin on Federal lands, 70 to 80 percent of acres burn on our Federal land. What we know is that all stakeholders need to work together, and that active forest management is a proven tool to improve forest health and resilience. Yet, worsening fire seasons are making stewardship objectives harder to achieve. Congress should encourage the Forest Service to use all available resources to fight fires as vigorously as possible. The Forest Service and private forest owners in the West are partnering to fight fire

across land ownership. This innovative partnership will give field officers and incident commanders more tools, more local knowledge and experience to keep fires manageable and less dangerous. We would like to thank Chief Moore for his leadership on these issues.

And thank you again for having this hearing and allowing us to participate. We stand ready to provide any resources the Committee would like.

[The prepared statement of Mr. Reed follows:]

PREPARED STATEMENT OF DOUGLAS REED, PRESIDENT, GREEN DIAMOND RESOURCE COMPANY; CHAIR, BOARD OF DIRECTORS, NATIONAL ALLIANCE OF FOREST OWNERS, SEATTLE, WA

[Chair] Spanberger, Ranking Member LaMalfa, and distinguished Members of the House Agriculture Committee, on behalf of Green Diamond Resource Company and the National Alliance of Forest Owners (NAFO), thank you for the opportunity to testify on the impacts of the 2018 Farm Bill on private working forests.

Introduction

My name is Douglas Reed, and I am President of Green Diamond Resource Company, a forest products company started by my great-great-grandfather outside Shelton, Washington, in 1890. Today, our company owns working forests in Washington, Oregon, Montana, and California. A subsidiary, Green Diamond Management Company, provides forest management services in the U.S. South and West. Like many U.S. forestry companies, Green Diamond's forests are third-party audited and certified by sustainable forest management certification systems.

Green Diamond's long-term commitment to forest stewardship is at the heart of how we run the company. Our forest management is guided by experience and backed by science. Through a continuous cycle of growth, harvest and regrowth, we can ensure that our forests, and therefore our business, will continue to thrive for another 130 years. Our forests provide environmental, social, and economic benefits for the communities where we operate today, and our mission is to ensure that remains true for many generations to come. This commitment is reflected in our day-to-day forest management and in the many innovative, voluntary forest and wildlife conservation programs implemented across our timberlands.

More than $\frac{1}{3}$ of the United States is covered by forests, and 47% of U.S. forests are privately owned working forests—forests owned by families, businesses, and investors. Private working forests provide clean air and water, wildlife habitat, and jobs through market demand for forest products. These forests are sustainably managed to supply a steady, renewable supply of wood for lumber, plywood, energy, paper, and packaging, providing more than 5,000 items that consumers use every day. U.S. private working forests support *2.5 million American jobs*,¹ mainly in rural communities.

Today, I'd like to focus on the impact of the 2018 Farm Bill on working forests and our contributions to the U.S. economy, environment, and climate mitigation.

Importance of Private Working Forests & Wood Products to the Climate

Working forests are a critical natural climate solution due to their natural ability to sequester and store carbon. Maximizing the climate mitigation benefits from private working forests involves three key elements: (1) Strong forest products markets to maintain and increase private working forests on the landscape and continue investment in their health, resilience and productivity; (2) Improved tools and market-based approaches to expand forest carbon sequestration and storage; and (3) Advancements in the use of long-lived wood products and the underlying analysis needed to compare these products with more carbon intensive alternatives. Together, sustainably managed working forests and the forest products they produce are already one of our nation's greatest assets for achieving our climate goals: U.S. forests and forest products offset 15% of the nation's annual industrial carbon emissions.

At just under half of the nation's forest land base, private working forests tell a remarkable carbon story: they provide 90% of domestic timber harvests, while also

¹ https://nafoalliance.org/wp-content/uploads/2018/11/Forest2Market_Economic_Impact_of_Privately-Owned_Forests_April2019.pdf.

providing 80% of our nation's annual net carbon sequestration² and nearly 50% of our long-term carbon storage. To put this in context, *working forests annually sequester more carbon than is emitted by all U.S. passenger vehicles each year.*³ In addition, durable wood products—like homes, buildings, and furniture—store significant amounts of carbon long-term. As a natural material, forest products are recyclable, biodegradable, and renewable. When used to displace more fossil fuel intensive materials, forest products can play a critical role in reducing net atmospheric carbon over time. Healthy markets for forest products, and the continuous cycle of growth, harvest, and regrowth, enable private forest owners to maximize the climate mitigation power of their forests, wood products, and the carbon benefits they provide.

Sustainably managed private working forests are more than capable of meeting additional demand for wood. Each year we harvest about 2% of our working forest land base, while also replanting or regenerating an equal acreage. Replanting and natural regeneration after harvest quickly restarts the growth process and reestablishes the sequestration and storage capacity on the land. *According to the USDA,*⁴ from 1953 to 2011, in a time of expanding population and increasing demand for homes, paper products, and energy, the total volume of trees grown in the U.S. increased by 60%.⁵ Today, private forest owners *are growing 43% more wood than they harvest.*⁶

There are also other important environmental benefits provided by private working forests. Water supplies for many urban and rural communities around the country originate in and pass through forested watersheds, where forests act as a natural filtration system for *nearly 30% of the water we drink.*⁷ Private working forests also play an important role in keeping abundant species abundant, while also conserving at-risk and declining species. Access to these forests is vital to wildlife conservation, as *60% of our nation's at-risk species rely on private forestland for survival.*⁸ Collaborative conservation efforts such as NAFO's *Wildlife Conservation Initiative*⁹ can benefit species while keeping private working forests working.

I am proud that private working forest owners like Green Diamond are leading the way in pursuing natural climate solutions. Recently, I joined the leaders of 42 other leading U.S. forest-owning companies, NAFO, The Nature Conservancy, the Environmental Defense Fund, American Forests, and the American Forest Foundation to adopt a unique set of *Principles on Private Working Forests as a Natural Climate Solution.*¹⁰ These “CEO Principles” express our common vision for increasing the climate mitigation of sustainably managed private working forests and sustainably produced solid wood products through market and incentive-based approaches.

Through NAFO, private working forest owners can speak with one voice to policymakers, and we are actively engaged in the farm bill, bringing nearly 50 member companies and over 46 million acres of sustainably managed working forests—an area larger than my home state of Washington—to the table. NAFO is a part of the Forests in the Farm Bill Coalition, an important group led by several of the organizations here with us today. NAFO is an active member of the Forest-Climate Working Group, which provides a unified voice within the forestry community for advancing forest climate policy. NAFO is also a founding member of the Food and Agriculture Climate Alliance, which works across the working lands community to advance broader climate mitigation solutions.

Climate and Carbon Data in the Farm Bill

The USDA's Forest Inventory and Analysis (FIA) program, a central component of the Forest Service's research program, provides vital information on our nation's forest resources. FIA's forest data and analysis is national in scope and consistently measured across ownerships every year, providing a common source of reliable information for an increasing number of stakeholders. Private forest owners rely on and reference FIA data and analyses to make decisions, and as interest in forests and

⁹ <https://nafoalliance.org/issues/wildlife/>.

¹⁰ <https://nafoalliance.org/ceo-principles/>.

forest carbon grows, so too does our need for information from FIA. At Green Diamond, we have actively pursued carbon sequestration opportunities, and we have projects approved or in progress in four states: Alabama, California, Oregon, and most recently Montana. Key to fostering this type of work is reliable data to ensure that what we project will happen actually comes to pass.

FIA serves as the authoritative data source for our nation's forests and forest carbon measuring, monitoring, reporting and verification. Yet, there are inconsistencies in data measurement cycles across geographies, and new remote sensing technology remains hard to integrate with FIA's existing approaches. Despite attention in the 2018 Farm Bill and increases in funding since then, the current design and capabilities of the program are unable to meet growing needs. Simply put, the world has changed since 2018. Demand for forest carbon data has skyrocketed as the power of forests to address climate change has attracted attention and investors. Increased adoption of remote sensing in private data collection has increased demand for the same from FIA. Finally, we are seeing disturbances like wildfire and hurricanes at a rate not seen before, meaning that the 7 to 10 year remeasurement cycles used by FIA are not keeping up with the rapid changes our forests are experiencing.

In particular, I recommend Congress direct the USDA and the Forest Service to:

- Establish a national 5 year measurement cycle (including the Intermountain West and Alaska) for base grid data collection and analysis with nationally consistent field protocols for measurement and analysis. This will lead to improved data uniformity and greater certainty in carbon estimation, allowing for more accurate analysis of the resource and carbon impacts of management decisions.
- Standardize protocols for national data collection and analysis and for measurement variables, and standardize previously reported data to include estimates from the Intermountain West and Alaska. This will lead to more credible and consistent information.

I encourage Congress to provide additional direction and resources to ensure the FIA program has the strategic direction needed to provide updated, accurate, and reliable information on the status and trends of our forested resources. These changes should be additive, not taking away from the good work FIA is already doing. Green Diamond and NAFO stand ready to offer insight and recommendations into how to bolster this important program.

Sustainable Wood Construction in the Farm Bill

Half the dry weight of wood is stored atmospheric carbon. When sourced from sustainably managed forests, long-lived wood products act as carbon vaults, storing carbon and keeping it out of the atmosphere for the full lifecycle of the product. Wood products in the U.S. currently store *nearly 9.8 billion metric tons of*¹¹ CO₂e, which is more than *twice the amount of carbon stored in all National Parks combined.*¹²

The 2018 Farm Bill recognized the importance of sustainable wood construction, and I recommend this continue into the 2023 Farm Bill. Specifically, the Timber Innovation Act leveraged various farm bill programs to advance sustainable wood construction, and it has made a significant impact. There are now over 1,300 mass timber buildings being designed, under construction, or built in the U.S., representing a 50% increase from July 2020 to December 2021, *according to WoodWorks.*¹³ Yet, despite this progress and continued demand for better, more climate-friendly housing and infrastructure, the U.S. is behind on mass timber production and use. In the 2023 Farm Bill, Congress should build on the Timber Innovation Act to expand opportunities for sustainable wood construction, leveraging the Forest Products Lab and programs like Wood Innovation Grants. The 2023 Farm Bill can reduce carbon emissions and increase carbon storage through support for building with wood. We look forward to providing specific recommendations in the coming months, together with the American Wood Council and other partners.

Buildings are responsible for 39% of global carbon emissions and traditional building materials require a lot of fossil fuel energy to produce. *Steel and concrete produce 15% of global emissions,*¹⁴ which is more emissions than any nation on [E]arth with the exception of the U.S. and China.¹⁵ New engineered wood products,

¹¹ <https://www.epa.gov/sites/default/files/2020-04/documents/us-ghg-inventory-2020-main-text.pdf>.

¹² <https://www.fs.usda.gov/treesearch/pubs/57699>.

¹³ <https://www.woodworks.org/resources/u-s-mass-timber-projects/>.

¹⁴ <https://iea.blob.core.windows.net/assets/3f901e93-c083-4649-a9e6-c591e28a7b70/ETP2015.pdf>.

¹⁵ <https://www.epa.gov/ghgemissions/global-greenhouse-gas-emissions-data>.

like mass timber, offer economic, social, and environmental benefits. Building with wood is a powerful solution for avoiding emissions and storing carbon to maximize the value of our investment.

Wood is a safe, durable, and efficient building material, storing carbon for the entire life of the building and because it is biodegradable and easily recycled, wood does not pose environmental challenges at the end of a building's life. Mass timber uses wood panels that are pre-built and then easily assembled with fewer trucks and equipment, with little to no construction site waste. Mass timber has been shown through research to be blast-resistant, fire-resistant, and earthquake-resistant. Increasing use of wood in buildings can reduce construction emissions by *up to 44% while also storing significant amounts of carbon in wood panels and assemblies*¹⁶ adding tangible value to the building. Mass timber can also be grown locally as a domestic building material supporting American jobs.

Sustainable forest management ensures increased use of wood in construction truly achieves climate, carbon, and other positive environmental outcomes. Third-party certification systems ensure sustainable practices in support of climate benefits. In the U.S. certification includes programs to certify forests to a forest management standard, chain of custody certification programs, and responsible wood fiber sourcing programs provided by the *Sustainable Forestry Initiative*,¹⁷ the *American Tree Farm System*,¹⁸ and *Forest Stewardship Council*.¹⁹ We were pleased to see the clarification in the 2018 Farm Bill to give all qualified certification programs equal treatment in any Federal procurement or other climate change policy involving private working forests. This is an important clarification and should be carried forward in all future farm bills.

Wildfire in the Farm Bill

Beginning in early July 2021, the Bootleg Fire in southern Oregon, the third largest wildfire in Oregon's history, devastated a drought-stricken landscape. Among the 413,000 acres that burned were some 110,000 acres of Green Diamond timberland. We literally watched years of investment and work go up in smoke.

Increasingly intensive fire seasons severely impact the environment, local and regional economies, and public health and safety. Federal, state, and local forest owners and managers have a shared stewardship responsibility to protect natural resources and the communities that depend on them, especially during fire season. Yet, worsening fire seasons are making stewardship objectives more difficult to achieve. Despite increases in Federal firefighting resources, local fire officers and incident commanders often face difficult choices on how to best deploy limited personnel and equipment to attack and extinguish fires during the height of fire season. I would like to commend Chief Moore for rising to the occasion and sending important signals to those in the field about fundamental changes in approach by the Forest Service this fire season.

To help address these challenges, the U.S. Forest Service and private forest owners are taking a new and innovative approach with the objective of better protecting private lands that are providing significant climate and other public benefits. Private forest owners with holdings in western states are partnering with the Forest Service to provide private resources, including people, equipment, and knowledge of local terrain and conditions, to fight fire in areas across ownerships. This partnership will give field officers and incident commanders more tools to keep fires more manageable and less dangerous, local knowledge and experience to maintain safe firefighting operations, and help to better identify and evaluate safety risks and opportunities. It will also enable Federal, state, and private forest owners to better achieve outcomes that protect the resources and communities in their shared stewardship.

Development of this partnership is currently underway and will be commemorated in a memorandum of understanding between the parties. We all want to be good neighbors and by working together, we can protect our forest resources, private property, local jobs, and our local communities. I appreciate that Green Diamond has been included in the Wildland Fire Mitigation and Management Commission created in the bipartisan Investing in Infrastructure and Jobs Act. We look forward to working with the Forest Service this summer, and we are committed to using all available public and private resources to help put the fires out.

Conclusion

The true scale of our forests' climate impact is hard to fathom. My colleagues at the National Alliance of Forest Owners have put together a forest carbon data visualization—available at *ForestCarbonDataViz.org*²⁰—that uses publicly available EPA and USDA Forest Service's FIA data to show the enormous carbon contributions of private working forests and solid wood products. We are proud of the climate mitigation work we do, as private working forest owners.

Thank you again for conducting this hearing. The 2018 Farm Bill made important strides in advancing policies to improve carbon data, increase sustainable wood construction, and address the wildfire crisis. The 2023 Farm Bill can do even more. Green Diamond Resource Company and the National Alliance of Forest Owners stand ready as a resource to this Committee as it addresses the upcoming farm bill and the solutions private working forests can offer.

The CHAIR. Thank you for your testimony.

The chair now recognizes Mr. Martin. Please begin when you are ready. You have 5 minutes.

STATEMENT OF CHRISTOPHER MARTIN, FORESTER, STATE OF CONNECTICUT; PRESIDENT, NATIONAL ASSOCIATION OF STATE FORESTERS, HARTFORD, CT

Mr. MARTIN. Thank you, Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee for holding this hearing today and for the opportunity to testify on behalf of the National Association of State Foresters. I am Christopher Martin, Connecticut State Forester and NASF President. NASF represents the directors of forestry agencies in all 50 states, five U.S. Territories, three nations in the Compact of Free Association with the U.S., and the District of Columbia.

State Foresters deliver technical and financial assistance to private landowners, with the conservation of more than $\frac{2}{3}$ of the nation's forests. They also partner with Federal land management agencies through cooperative agreements and Good Neighbor Authority to manage National Forests and Grasslands. We are the principal conduit for connecting Federal programs and private landowners working with cooperative extension services, certified foresters, conservation districts, and local communities to administer, implement, and deliver the state and private forestry programs authorized under the Cooperative Forestry Assistance Act of 1978 (Pub. L. 95–313), as well as other Federal programs and authorities. We appreciate this Subcommittee holding this important hearing today to review the forestry provisions from the 2018 Farm Bill as we work toward developing the next farm bill.

I would like to highlight for you today three policy priorities for NASF we have identified for addressing the next farm bill. First, the Good Neighbor Authority has allowed the Forest Service to partner with states on Federal forest restoration and management projects, facilitating critical work to improve species habitat, enhance the watersheds, and reduce hazardous fuels and mitigate wildfire risks. In the 2018 Farm Bill, Congress expanded GNA to make Tribes and counties eligible entities to enter into Good Neighbor agreements. However, Tribes and counties are not afforded the same authority as states to retain GNA project revenue to reinvest in conservation, greatly reducing the significant incentive to engage and partner on critical management projects, including wildfire

²⁰ <http://www.forestcarbondaaviz.org/>.

mitigation, invasive species management, and habitat maintenance.

Additionally, the 2018 Farm Bill removed the ability for restoration services that were agreed to under the Good Neighbor agreements to take place off Federal lands. This means adjacent state, Tribal, county, and other land that is essential to the health and productivity of National Forests can no longer be restored as a comprehensive landscape from the revenues generated from GNA projects.

NASF supports authorizing counties and Tribes to retain and expand GNA revenues generated from GNA projects and restoring the cross-boundary nature of GNA by removing the requirement that revenue from GNA projects must be spent solely on Federal lands.

Additionally, NASF supports further expanding GNA to all Federal land management agencies, making the authority permanent or at a minimum extending the 2023 sunset date for states to retain GNA revenue and amending the GNA to authorize the reconstruction, repair, and restoration of roads administered by the Bureau of Land Management and other Federal agencies.

A second priority from the 2018 Farm Bill codified the Landscape Scale Restoration Program but also stipulated a new rural requirement for LSR, resulting in a subsequent rulemaking by the Forest Service limiting LSR work to communities of less than 50,000 people. This significantly reduced the scope and efficacy of the program, eliminating many opportunities for the urban and community forestry program work and reduce the potential for hazardous fuels reduction projects under LSR within the wildland-urban interface. NASF supports modifying the language in section 8102 of the 2018 Farm Bill that designated the program strictly as a *rural* program.

To be as impactful as possible across all ownerships and all lands, including cities, suburbs, and towns, should be eligible for LSR support, as they were prior to the 2018 Farm Bill. The program should not exclude larger communities or populations that depend on trees for their health and well-being, particularly in historically underserved communities. Urban and community forestry projects under LSR are crucial to ensuring all people have equitable access to the many benefits of trees.

Section 8401 of the 2018 Farm Bill provided a new authority for the Forest Service to make grants available to State Foresters for hazardous fuel reduction projects that crossed landownership boundaries. While this new authority is working well in increasing the authorization for appropriations as authorization for appropriations is warranted, it is our understanding the Forest Service used this authority to codify an existing mechanism for implementing cross-boundary hazardous fuel projects commonly known as *Stevens Money*, an appropriations provision championed by the late Senator Ted Stevens. Our written testimony provides more background on the history and purpose of this funding.

The intent of the Forests in the Farm Bill Coalition for section 8401 in the 2018 Farm Bill was to supplement existing mechanism for implementing cross-boundary hazardous fuel projects and augmenting funding available for accomplishing this work, not to sup-

plant Stevens Money. We look forward to working with the Members of this Subcommittee and our partners in the Forests in the Farm Bill Coalition here with us today in developing a solution that will best utilize all available authorities and funding accomplishing this important work.

Thank you for the opportunity to testify here today, and I look forward to answering your questions.

[The prepared statement of Mr. Martin follows:]

PREPARED STATEMENT OF CHRISTOPHER MARTIN, FORESTER, STATE OF CONNECTICUT;
PRESIDENT, NATIONAL ASSOCIATION OF STATE FORESTERS, HARTFORD, CT

The National Association of State Foresters (NASF) is pleased to provide written testimony to the House Agriculture Subcommittee on Conservation and Forestry for this important hearing on, *A 2022 Review of the Farm Bill: Forestry*. Thank you, [Chair] Spanberger, Ranking Member LaMalfa, and Members of the Committee, for holding this hearing today and for the opportunity to testify on behalf of NASF.

NASF represents the directors of the forestry agencies in all 50 states, five U.S. Territories, three nations in compacts of free association with the U.S., and the District of Columbia. State Foresters deliver technical and financial assistance to private landowners for the conservation of more than $\frac{2}{3}$ of the nation's forests. They also partner with Federal land management agencies through cooperative agreements and Good Neighbor Authority (GNA) to manage National Forests and Grasslands. All state forestry agencies share a common mission to protect America's forests and most have statutory responsibilities to provide wildland fire protection on all lands, public and private.

State Foresters believe the farm bill is a unique opportunity to support rural America's economic backbone and improve the quality of life for all Americans by enhancing support for America's trees and forests.

Between the 2018 Farm Bill and the 2018 Omnibus Appropriations Bill, several significant achievements were accomplished, providing new authorities for improving forest management. The 2018 Farm Bill forestry title built upon 2014 achievements, streamlining decision-making and expanding authorities within several programs and creating several new programs and authorities while continuing to address and provide for cross-boundary and landscape-scale forest management.

Recent farm bills have also been instrumental in elevating the role of forestry in conservation title programs. State forestry agencies are proactively involved in working with the Federal agencies in successfully implementing these programs which provide invaluable support to small private landowners in their forest management objectives. NASF appreciates the ongoing program support and attention in the farm bill that is responsible for significant on-the-ground results due to these partnerships.

Good Neighbor Authority

The GNA program has allowed the USDA Forest Service (Forest Service) to partner with states on Federal forest restoration and management projects, facilitating critical work to improve species habitat, enhance watersheds, and reduce hazardous fuels and mitigate wildfire risks.

Since GNA was first authorized by Congress with the 2014 Farm Bill, at least 36 states have broken ground on over 130 GNA projects. Through these GNA projects, states are contributing to the restoration of Federal forests on a scale never before realized. According to the Congressional Research Service, the amount of Forest Service timber sold under GNAs has increased from 14.4 million board feet in fiscal year (FY) 2016 to 182.6 million board feet in FY 2019.

In the 2018 Farm Bill, Congress expanded GNA to make Tribes and Counties eligible entities to enter into Good Neighbor Agreements. However, Tribes and Counties were not afforded the same authority as states to retain GNA project revenues to reinvest in conservation, greatly reducing a significant incentive to engage and partner on critical management projects including wildfire mitigation, invasive species management, and habitat maintenance.

Additionally, the 2018 Farm Bill removed the ability for restoration services that were agreed to under the Good Neighbor Agreement to take place off Federal lands. This means adjacent state, Tribal, county, and other land that is essential to the health and productivity of National Forests can no longer be restored as a comprehensive landscape with revenues generated from GNA projects.

NASF supports authorizing counties and Federally Recognized Tribes to retain and expend GNA timber sale revenues and restoring the cross-boundary nature of GNA by removing the requirement that GNA timber sale revenues must be spent solely on Federal lands.

Additionally, NASF supports further expanding GNA to all Federal land management agencies, making the authority permanent, or at a minimum extending the October 1st, 2023, sunset date for states to retain GNA timber sale revenue, and amending GNA to authorize the reconstruction, repair, and restoration of roads administered by the Bureau of Land Management, and other Federal agencies (should GNA be expanded to include other Federal land management agencies).

Landscape Scale Restoration Program

The 2018 Farm Bill codified the Landscape Scale Restoration (LSR) program which was a key policy priority at the time for NASF. The program originated with the 2008 Farm Bill and existed for a decade as a jointly administered program between the Forest Service and state forestry agencies.

In addition to codifying the program, the 2018 Farm Bill also stipulated a new “rural” requirement for LSR. As a result, and per a subsequent rulemaking made by the Forest Service, LSR work can only be conducted in communities made up of fewer than 50,000 people. This change significantly reduced the scope and efficacy of the program by prohibiting work in areas across the United States with legitimate need for LSR grant support.

The LSR rural requirement has eliminated opportunities for state forestry agencies to leverage their Urban and Community Forestry (U&CF) program work, and greatly restricted their ability to conduct hazardous fuels reduction projects under LSR in the areas with populations greater than 50,000 including many areas within the Wildland Urban Interface (WUI).

LSR should be returned to a flexible program able to address the highest priority needs across landscapes as identified in state Forest Action Plans, regardless of community size. The program should not exclude larger communities or populations that depend on trees for their health and well-being, particularly in historically marginalized communities.

Forests aren’t just found on mountainsides or in wildlands, but in cities, towns, and communities as well. Community forests—especially in areas with over 50,000 residents—are shown to significantly improve human health outcomes and provide tremendous socioeconomic benefits. Healthy community forests aren’t a given; they take work. For decades, state forestry agencies have helped communities manage their forests by providing technical and financial assistance for the planting and care of street, park, and other community trees. State forestry agencies and their U&CF programs are crucial to ensuring *all* people have equitable access to the many benefits of trees.

The LSR program has supported many successful U&CF projects in priority areas with competitive grant funding in the past. It is crucial that LSR projects can once again include U&CF work.

NASF supports striking the rural requirement from LSR legislative language established in the 2018 Farm Bill. To be as impactful as possible across ownerships and on a landscape scale, *all* lands—including cities, suburbs, and towns—should be eligible for LSR support as they were prior to the 2018 Farm Bill.

Promoting Cross-Boundary Wildfire Mitigation

The 2018 Farm Bill amended section 103 of the Healthy Forests Restoration Act (16 U.S.C. § 6513), providing a new authority for the Forest Service to spend up to \$20 million on grants to state foresters for hazardous fuel reduction projects that cross land ownership boundaries, particularly in priority landscapes as identified in state FAPs.

While section 8401 of the 2018 Farm Bill, *Promoting Cross Boundary Wildfire Mitigation*, is working well, there is a need for increasing the authorization of appropriation for this provision. Additionally, it is our understanding the Forest Service used this new authority to codify an existing mechanism for implementing cross-boundary hazardous fuels projects commonly known as ‘Stevens Money’. As such, the helpful authorities provided under ‘Stevens Money’ are no longer being utilized, and the net increase to the authorization of appropriations for cross-boundary hazardous fuels projects is \$5 million. The end result has not been \$20 million in new authority.

In FY 2002, Senator Ted Stevens championed the addition of earmarked hazardous fuels funds. These funds are often referred to as ‘Stevens Money’ and were to be spent towards hazardous fuels treatments on non-Federal lands that were adjacent to National Forest System lands where hazardous fuels work was being con-

ducted or where other work was being conducted that increased the threat to the adjacent lands. The authorization allowed for money to be spent to protect communities when hazard reduction activities were being planned on adjacent National Forest System lands.

This authorization allowed for work on Federal and non-Federal lands to complement each other and provided flexibility for the Forest Service to use the money where it would provide the most benefit. This provision has been added to the Interior-Environment and Related Agencies appropriations bill every year since FY 2002. In the FY 2003 Interior-Environment and Related Agencies appropriations bill the following language was added: "Provided further, that in addition to funds provided for State Fire Assistance programs, and subject to all authorities available to the Forest Service under the State and Private Forestry Appropriation, up to \$15,000,000 may be used on adjacent non-Federal lands for the purpose of protecting communities when hazard reduction activities are planned on National Forest lands that have the potential to place such communities at risk" capping 'Stevens Money' at \$15 million.

The intent from the Forests in the Farm Bill Coalition for section 8401 of the 2018 Farm Bill was to supplement existing mechanisms for implementing cross-boundary hazardous fuels projects, and augment funding available for accomplishing this work, not to supplant 'Stevens Money'. Both 'Stevens Money' and the 2018 Farm Bill authority are important tools in the toolbox for mitigating wildfire risk for communities. We look forward to working with Members of the Subcommittee and our partners in the Forests in the Farm Bill Coalition on developing a solution that will best utilize all available authorities and funding for accomplishing this important work.

Post-Disaster Landowner Assistance and the Emergency Forest Restoration Program

Since the 2018 Farm Bill was passed, forest landowners across the country have been impacted by a myriad of natural disasters. In the wake of hurricanes in the South, the 2020 Derecho in Iowa, catastrophic wildfires in the West, and tornados, ice storms and more everywhere in between, we have realized the significant Federal programming gap that exists in helping landowners reforest and get back on their feet. The Emergency Forest Restoration Program (EFRP) which was codified in the 2008 Farm Bill (Food, Conservation, and Energy Act of 2008) has proven to be woefully inadequate and bureaucratically cumbersome for most landowners to benefit from. Forest landowners should have equal support from the Federal Government compared to other agriculture commodities when faced with the impacts of natural disaster. Timely and ecologically-proper timber salvage and reforestation helps ensure our nation's private forestlands continue to provide public benefits like clean air and water, recreation opportunities, rural economic stimulus and more.

Forestry Support under Conservation Programs

The Environmental Quality Incentives Program (EQIP) administered by the Natural Resources Conservation Service (NRCS) is playing an increasingly important role in helping non-industrial private forest owners (NIPF) access both financial and technical assistance to sustainably manage their forests. EQIP and other conservation title programs like the Conservation Stewardship Program and Conservation Reserve Program are absolutely essential to helping private landowners keep their forests as forests, continuing to provide a full suite of ecosystem benefits to society. Through strong partnerships between NRCS, Forest Service, state forestry agencies and other partners, the share of EQIP obligations going to forestry practices has increased from 4.3% to 7.3% over the past decade, meaning more forest landowners have been able to access assistance to help keep more forest acres in conservation. Commensurate with this increase in financial assistance, more funding for technical service provision through states and other providers is needed to keep pace. NASF appreciates the Subcommittee's ongoing support of EQIP, especially its role in forestry and wildlife habitat conservation.

Conclusion

Thank you for the opportunity to appear before the Subcommittee today and provide testimony on behalf of NASF. We appreciate the ongoing work of this Subcommittee to provide Federal and state forest managers, as well as private landowners, with tools that increase the pace and scale of science based, sustainable active forest management, cross boundary work, and rapid and effective response to insects, disease and wildland fire.

We look forward to working with the Subcommittee, our partners with us here today and our Federal partners, including the USDA Forest Service and NRCS. Our common goal is the same: to support the health of America's trees and forests and

the rural and urban communities which rely on them. We look forward to working with you to provide the collective insights of the nation's State Foresters in developing the 2023 Farm Bill.

The CHAIR. Thank you very much.

The chair now recognizes Ms. Humphries. Please begin when you are ready. You have 5 minutes.

STATEMENT OF REBECCA A. HUMPHRIES, CO-CHIEF EXECUTIVE OFFICER, NATIONAL WILD TURKEY FEDERATION, EDGEFIELD, SC

Ms. HUMPHRIES. Thank you, Chair Spanberger, Ranking Member LaMalfa, and Members of this Subcommittee. It is my pleasure to be with you here today and an honor to talk about farm bill. I am Becky Humphries. I am co-CEO of the National Wild Turkey Federation. That *co* title denotes the fact that I will be moving towards retirement next year, and the new leadership with NWTF will be moving into their roles.

Twenty twenty-three will also be our 50th anniversary year, and we are very proud of the great work we have done at the National Wild Turkey Federation to not only conserve the wild turkey and also preserve our hunting heritage but tremendous conservation work. Since 1985, we have conserved over 20 million acres of habitat.

Today, I would like to just focus on a couple of our partnerships and what we see as additional opportunities for refinement in the next farm bill. The first I would like to highlight, we have had a 40 year partnership with the U.S. Forest Service. This partnership was built with us making tracks as we call it, but it is about active management and helping the Forest Service do active management through stewardship contracting and beyond. We have done the first stewardship contract and over 100 of them since all across this nation. To put it in perspective, in 2019, we were number four nationally of Federal commercial timber purchasers of timber volume sold off the National Forest System, huge. We are usually one of the top ten. And we don't have a mill, we don't make furniture. It is all stewardship. It goes right back into the forest to make those forests more sustainable, to be better managed, and to make sure we have clean water and native species.

Two things that we would like to see. Number one is we would like to extend stewardship authority for all Federal lands. As we talked about earlier in this hearing, not all fires start on Federal lands, but Federal lands, National Parks, refuges, and Army Corps of Engineers lands would open up an additional 180 million acres of land to potential stewardship work, and they are badly needed.

Second, we would like to see 20 year stewardship contracts on the national scale. We desperately need stability in our rural communities and for private investment for future forest management work. And 20 year agreements would put more of our work in long-term perspective rather than redoing agreements that, quite frankly, administrative overhead takes up time and energy.

The other partnership I would like to highlight is our National Forestry Initiative. This is a partnership that we have with USDA's Natural Resources Conservation Service. Through this partnership, we have positions in 24 states to do technical assist-

ance for on-the-ground private forest owners. It is paramount to getting good forest management on the ground. And as my colleague Rita Hite mentioned earlier, we have just a small portion of those forest owners that are seeking that technical assistance, and we need to do more.

And in this next farm bill we would like to see prescribed fire highlighted as a tool. Many times, that is the most cost-effective means of doing active management and ongoing management on the forest but it takes technical assistance and it takes equipment.

The third thing I would like to highlight is a concern, and it goes beyond the farm bill, but quite frankly, we have tried to address it within large categorical exclusions in past farm bills. We are seeing significant pushback in terms of legal challenges when we are trying to go through forest management plans. And what is happening is this expansion of legal challenges is requiring us to go back into forest management plans and update those with every new occurrence of threatened endangered species. That work should really be done at the project level. That is the area, the time when you are doing the actual planning, and the historical review as well as threatened endangered species. And so we would like to see approved forest plans not be ongoing Federal actions but rather have that review at a lower level.

We look forward to working together with this Subcommittee in the days ahead to move forward on our next farm bill. Many great strides have been made, and with some refinement, we can make them even better in the days ahead. Thank you.

[The prepared statement of Ms. Humphries follows:]

PREPARED STATEMENT OF REBECCA A. HUMPHRIES, CO-CHIEF EXECUTIVE OFFICER,
NATIONAL WILD TURKEY FEDERATION, EDGEFIELD, SC

July 13, 2022

Hon. ABIGAIL DAVIS SPANBERGER,
Chair,
Subcommittee on Conservation and Forestry,
House Committee on Agriculture,
Washington, D.C.;

Hon. DOUG LAMALFA,
Ranking Minority Member,
Subcommittee on Conservation and Forestry,
House Committee on Agriculture,
Washington, D.C.

[Chair] Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee on Conservation and Forestry, it is my honor to be here today to provide testimony on the important farm bill programs that do so much for natural resources conservation on our nation's private and public lands.

I am Becky Humphries, CEO of the National Wild Turkey Federation, a not-for-profit organization dedicated to the conservation of the wild turkey and the preservation of our hunting heritage. Next year, we will be celebrating our 50th Anniversary, and I'm very proud to say that through our work with farm bill conservation and forestry programs and partnerships with state fish and wildlife agencies, Federal land management agencies, and private landowners, we have helped to conserve or enhance more than 20 million acres since we started collecting those data in 1985. Each year, we help to conserve or enhance hundreds of thousands of acres for the benefit of the wild turkey, its habitat, and all of the other wildlife and plant species that benefit from well managed forestlands, grasslands, and streamside habitat.

The National Wild Turkey Federation's mission is as crucial today as it was when the organization was founded in 1973. Sadly, we're losing 6,000 acres of habitat every day. What we do on the land in the coming decades will be instrumental in strengthening climate and wildfire resilience in our nation's forests and other upland ecosystems, ensuring clean water for our communities, providing access for out-

door enthusiasts, including hunters, while enhancing habitat for wild turkeys and countless other species.

Hunters are essential to the funding of conservation, but now we're at the point where less than ten percent of the American population hunts, so the funding source is going away. This Committee's work and the significant Conservation and Forestry Title efforts of the farm bill are helping the NWTf to continue to apply conservation to working lands. The NWTf is leading a collaborative effort to solve the problem through our Save the Habitat. Save the Hunt. initiative, our America's Big Six of Wildlife Conservation work on over 80 vital watersheds and 738 million acres throughout the country, our Waterways for Wildlife initiative in the drought-prone Great Plains and American West, and the contributions of our dynamic and passionate volunteer base in 49 states. We spend our volunteers' money and taxpayers' money wisely by leveraging each dollar at least 3:1 but often at much higher levels. As an example, this year's Waterways for Wildlife Initiative projects leveraged NWTf funding at a rate of 19:1 to conserve 77 critical stream miles in eight states. **For every dollar raised by the NWTf, 90¢ goes to mission delivery.**

Since 1985, NWTf volunteers and partners raised and spent more than \$488 million toward our mission. We recognize that accomplishing conservation delivery at a scale necessary to keep food on our tables, our water clean, our forests and grasslands healthy, and vibrant rural communities can only occur with public, private, and nonprofit partners working together across land-ownership boundaries with a common, landscape-scale vision for success.

Private land holdings make up more than 60% of the approximately 2.3 billion acres of land mass in the United States. In the Eastern United States, private lands far exceed public lands and, therefore, are crucial to the success of landscape-scale conservation objectives. These objectives need to include Federal, state, and local work to ensure healthy water, wildlife, and the places where wildlife and people live and recreate, including, forests, grasslands, agricultural lands, and water courses. In the West, the reverse is true, with public landholdings making up 50% or more of the land in many states. Delivering conservation on private lands—in partnership with private landowners—is fundamental to the success of landscape-scale, cross-boundary habitat, forestry, and climate-driven conservation efforts, including the USDA's recently announced 10 Year Wildfire Crisis Strategy.

The farm bill brings the private landowner to the table. This includes generational family farmers and forest owners, Non-Governmental Organizations (NGOs), commercial operations, and American families. Farm bill programs provide the structure by which these conservation objectives are met by providing private landowners incentives for voluntary land stewardship. Additionally, USDA's delivery of technical assistance to private landowners to implement conservation programs on the landscape is crucial.

The NWTf is an invested participant in, and implementer of, a number of farm bill programs. These programs include the Environmental Quality Incentives Program (EQIP), Conservation Reserve Program (CRP), and Regional Conservation Partnership Program (RCPP). NWTf also partners with the USDA's Natural Resources Conservation Service (NRCS), through shared positions, to provide technical assistance at the NRCS State Office level. And through a national partnership, we assist with workforce capacity in NRCS offices across the country.

The NWTf and NRCS are working together to help improve forest ecosystem health and resiliency on private lands and manage the forestry-related workload derived from the farm bill. As part of the National Forestry Initiative agreement, the NWTf is positioned to help improve forest health and climate resilience on an estimated 350,000 acres of private land throughout the country by providing experienced forestry professionals to bolster NRCS staff in 24 states over a 5 year period. To date, NFI has affected over 280,000 acres. Through our work, we see first-hand both the successes of these programs and needed improvements. Today, we offer our insights to improve this influential legislation.

The NWTf strongly supports Title II—Conservation and Title VIII—Forestry programs, as specified in the Agriculture Improvement Act of 2018 (Public Law 115–334) and would like to see reauthorization of these programs to achieve desired landscape-level objectives. We encourage this Subcommittee and Congress as a whole to consider these specific farm bill recommendations for improvement:

- **Actively promote prescribed burning as a valuable habitat and forest management tool.** Prescribed burning is not the only tool in the toolbox, but when applicable, it is often the most efficient and cost-effective technique for reducing hazardous fuel loads, removing unwanted vegetation, and promoting beneficial wildlife habitat in the forest understory. Low intensity, slow moving prescribed burns conserve our grasslands and forests by reducing fuel loads and

removing ladder fuels. They greatly reducing the overall risk of large-scale, costly, and catastrophic wildfires, both in terms of suppression, recovery and restoration of the impacted landscapes. Prescribed fire is also the tool of choice for the routine maintenance of previously treated landscapes. The visual from the *Wall Street Journal* that is attached to this testimony shows the geographic areas with the greatest wildfire threat. It should also be labeled as the areas with the least prescribed fire management. The upcoming farm bill is a perfect opportunity to promote these benefits as well as reduce barriers to implementing prescribed burning on the landscape. Barriers include securing and maintaining the social license, or acceptance from the public, by increasing the comfort level of surrounding landowners and local permitting officials, properly training landowners in the application of fire and smoke management, and allaying fears of liability if a fire jumps a line and causes unintended property damage. In addition, cost and availability of prescribed burning equipment necessary to complete safe, controlled burns is sometimes a barrier, especially in underserved communities.

- **Actively promote technical assistance programs and training opportunities for private landowners and partners such as the NWTF.** Attaining landscape-level conservation objectives requires active engagement across the boundaries of public and private forestlands. Non-industrial landholders are more likely to participate if they know technical assistance and training opportunities are available. We have found that where affiliated partner staff from NGOs, such as NWTF, supplement NRCS local staff, landowner participation tends to increase as a result of additional technical assistance capacity. History has taught us that well-managed forests start with informed, committed forest owners. Technical assistance programs not only help to educate landowners they also create expectations with timelines for management activities. Management is not a one-and-done proposition, but rather a continued commitment, which is more likely with consistent and easily accessible technical assistance and training.
- **Reauthorize the Conservation Reserve Program (CRP) and maintain CRP acreage at current authorized levels, including CRP forestry acreage.** CRP protects highly erodible and marginal agricultural lands from being put back into production. Retaining current mid-contract management requirements and ensuring compliance maximize ecosystem benefits of CRP acreage. And as carbon credits and ecosystem service assets become more prevalent, it is of growing importance to provide clarification on the eligibility of benefits for the CRP program.
- **Reauthorize the Environmental Quality Incentives Program (EQIP) and refocus a portion of the funding to allow more participation in this highly demanded but severely under-funded program, including CRP.** This action would also help maintain existing cover, whether grassland or forestland, on lands with expiring CRP contracts that are transitioning to working lands. It would support infrastructure to encourage grazing, including fencing and water developments. We encourage Congress to maintain the current allocation caps for wildlife habitat activities and require the non-expended apportionment be redistributed to areas where funding does not meet current demand. This would ensure wildlife habitat practices, including forestry practices, remain the focus of those funds.
- **Reauthorize and enhance the Voluntary Public Access and Habitat Incentive Program (VPA-HIP) and allow landowners enrolled in VPA-HIP to participate in other cost-share programs, including USDA farm bill conservation programs.**
- **The Regional Conservation Partnership Program (RCP) has been an extremely beneficial conservation tool; however, administration of this program is difficult.** Moving forward, the NWTF recommends the program be reauthorized, but with the ability to recover all costs—direct and indirect, including outreach activities—associated with the implementation of RCP projects and with the addition of a more streamlined administration process. Mandated recordkeeping and other accounting processes for the continued collection and cataloging of metrics are onerous to the administering partner, and these processes should be consistent with other Title II programs.

During our 40 year partnership with the USDA Forest Service, the NWTF has become the single largest organization involved in Stewardship Agreements across the agency. The Stewardship Authority under which we work was permanently authorized in the 2014 Farm Bill and is the largest vehicle through which the NWTF

delivers its mission on the ground. Work accomplished as a result of the agreements includes: ecosystem restoration/rehabilitation; sustainable forest management; watershed enhancement; wildlife benefits, such as Threatened and Endangered species habitat improvement; wildland urban interface (WUI) protection; fuels reduction; and recreation.

Through our critical partnership with the Forest Service, the NWTF has approximately 50 stewardship agreements ongoing across the National Forests and Grasslands in every Forest Service Region of the country, with more than 100 completed to date. To put this partnership into perspective, in 2019, the NWTF was ranked No. four nationally on the list of Federal, commercial timber purchasers by timber volume sold from National Forest System lands, and we regularly rank in the top ten. The resulting sales of this timber go directly back into these lands for the betterment of habitat and wildlife, water quality, climate and fire resilience, and recreational access. With this vast history of successful implementation of the Stewardship Authority, the NWTF makes these recommendations:

- **Extend permanent Stewardship Authority to all Federal land-holding departments and agencies.** The two agencies with permanent stewardship authority are the Forest Service and the Bureau of Land Management. Granting authority to the National Parks Service, the Fish and Wildlife Service, the Department of Defense including the U.S. Army Corps of Engineers and all other Federal land-holding agencies gives these agencies greater flexibility to better address climate, wildfire, wildlife, and recreational needs. Granting stewardship authority to these agencies could benefit more than an additional 180 million acres of federally-owned lands. The NWTF has MOUs with the Department of Defense through the U.S. Army Corps of Engineers and military installations in a number of states—Fort Polk, Fort Riley and Letterkenny Army Depot, among others—but stewardship would expand those opportunities to treat critical acreage and infrastructure.
- **Authorize long-term, 20 year Stewardship contracts at a national scale.** Forests are not annual crops, and they require longer-term maintenance options to achieve a resilient, healthy condition. Twenty-year contracts provide a number of benefits. It would allow for extended periods of uninterrupted forest treatments that provide sustainable assurances of timber volume for contractors, partners, and agency staff. It also would reduce the need and time requirements for re-application and review processes and the ramp-up/ramp-down periods associated with these interruptions. Just as importantly, 20 year contracts will benefit rural economies, including those currently underserved, through more stable employment opportunities and confidence for small business owners to invest in long-term infrastructure, such as forestry equipment, mills, and staff. This stability in our forest management infrastructure is greatly needed and will be bolstered through longer contract periods.

None of the impactful conservation work we have accomplished together with the U.S. Forest Service, the NRCS and other partners could occur without the authorities and incentive programs established in the farm bill. The Conservation and Forestry Titles are crucial to the NWTF's mission delivery. This is why we actively engage in farm bill stakeholder coalitions, like the Forest in the Farm Bill Coalition, members of which you are hearing from today. While coordination with partners and other stakeholders is still underway, it is important for us to provide these high-level recommendations on behalf of our 200,000 members.

Before I close, I would like to express a final but significant concern. The NWTF is fully supportive of the Endangered Species Act and the National Environmental Policy Act and the great protections they afford Threatened and Endangered Species and our vulnerable natural resources. There has been a long, but growing trend, however, by certain groups to use litigation as a way to halt critical forestland and grassland management work. While we recognize the importance of the individual's right to challenge government actions through the legal process, abuse of the system is tying up agency and partner resources and time that could be better used updating outdated forest plans and working to ensure our National Forests and grasslands are healthy and resilient to climate change, fire, and disease.

A number of recent examples exist where ESA and NEPA have been used to stall work that is long overdue and vital to the health and security of National Forests and the communities surrounding them. Court actions initiating redundant, time consuming, and expensive consultation requirements come at the tax payers' and environment's expense, and are often counter to the actual management needs on the ground.

Congress should address vulnerabilities in the Equal Access to Justice Act that has long been the source of public dollars used to fund court challenges by groups

opposed to Federal land management, even when the management activities are deemed scientifically appropriate and for the greater good. Additionally, ESA challenges shouldn't halt entire forest plans but be addressed at the local, project level, where impacted species and habitats are relevant. One proposed fix for this would be to clarify that cooperatively developed, reviewed, and approved forest plans are not ongoing Federal actions, while leaving the individual project plans open for evaluation and update as new information becomes available.

We urge Congress to find a balance between what is already supported in Federal law and beneficial for the landscape against the right of individuals and groups to recoup their legal challenges against government action, so that the positive impacts and authorities granted by Congress can be realized.

In closing, the National Wild Turkey Federation is committed to be a partner to this Subcommittee and other committees as Congress works to develop the next farm bill. We stand ready to assist by hosting field days and participating in dialog on this critical legislation. America needs a strong farm bill for the future of our nation's food, water, and wildlife.

Thank you for your tremendous work and support, and we look forward to working with you in the months ahead.

Potential for Significant Wildfires Is Above Normal for Growing Share of U.S.

Widespread drought is fueling an early rampup of wildfire season, with more than half of the U.S. wildland firefighting resources already committed.

Potential for significant wild land fires

July 2021

Note: Outlook issued July 1. [Forecast areas are approximate.]

The CHAIR. Thank you very much for your testimony.

And, Ms. Palmer, the chair now recognizes you for 5 minutes.

STATEMENT OF SALLY R. PALMER, CENTRAL APPALACHIAN EXTERNAL AFFAIRS ADVISOR, THE NATURE CONSERVANCY, ARLINGTON, VA

Ms. PALMER. Thank you. Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee, thank you for the op-

portunity to submit testimony on forests in the farm bill. My name is Sally Rollins Palmer, and I am here representing The Nature Conservancy.

For over 70 years, we have worked to protect ecologically important lands and waters for people and nature here in the United States and around the world. It is a privilege to follow Chief Randy Moore of the Forest Service and be joined by leaders in forestry with whom we partner in the Forests in the Farm Bill Coalition.

I am a native of Appalachian foothills in Tennessee. Growing up in this beautiful region gave me an appreciation for nature and all the different peoples who have stewarded these places as their home for centuries. Professionally, I have worked with TNC for over 2 decades, first as a field ecologist and in later years on natural resource policy efforts. I currently serve as the external affairs advisor for our Central Appalachians Program. I have experience working with state and Federal agency partners to implement many programs authorized by the farm bill. While my testimony today will draw on those experiences, our written testimony represents our broad interests and the work of my colleagues on forests in the U.S. and globally.

The need for more collaboration and financial investment to halt biodiversity loss and address climate change has never been greater. The farm bill is a critical part of the solution by providing the authorities and funding to ensure improved stewardship on private working forests; address ecologically sound forest management needs in our public forests; and combat challenges, including climate change, insects and diseases, drought, and catastrophic wildfires.

I would like to share with you examples of how farm bill programs are helping improve our forest for the future in the Appalachians, emphasizing the importance of collaboration and planning at the local and landscape scales. This work is driven by my colleagues in the field, along with partners at the Federal, state, and local levels. For example, the Forest Legacy Program is investing in some of the most biodiverse and climate-resilient forests in North America, including a recent example in Georgia. Located in the southern end of the Appalachians, the Dugdown Corridor spans 100,000 acres and 50 miles between the Talladega National Forest in Alabama and the Sheffield/Paulding wildlife management areas. The State of Georgia and many partners have a goal to conserve and restore forests and increase the amount of publicly accessible recreation land in northwest Georgia.

The Nature Conservancy also has a long history of partnering with the Forest Service working to implement the Collaborative Forest Landscape Restoration Program. In the southern region in Pisgah National Forest in North Carolina, TNC and partners has successfully implemented the Grandfather Restoration Initiative, a long-term effort that has increased prescribed burning and other management practices to more than 40,000 acres. We also collaborate extensively with the Forest Service to implement prescribed fire programs across many fire-adapted forest systems in the Appalachians and in the longleaf pine ecosystem, improving forest health and reducing the risk of wildfires.

In Maryland and West Virginia, TNC has partnered with State Forestry and the Monongahela National Forest on the Landscape Scale Restoration Program. This project involved ten counties and invested in the science needed to establish shared restoration goals. It funded cost-effective approaches to deploying prescribed fire crews in the field, and tested approaches to controlling invasive species on public and private forest lands.

In addition, statewide forest resource assessments and strategies are vitally important for greater collaboration between Federal, state, and other entities. These plans also enable the type of watershed-scale prioritization and management implementation that is becoming even more important, given the drought and extreme rainfall swings our forests are now facing.

The Joint Chiefs Program also is a significant vehicle for delivering both forest and freshwater restoration efforts in the Appalachian region. TNC is currently a main collaborator on Joint Chiefs projects in Virginia and Tennessee.

To support region-wide management needs, I also note that growing markets for low-value forest products is important in Appalachia. TNC generally supports ecologically sound management for forest products and advocates for such strategies to be designed to restore forests to a more ecologically sound condition.

In conclusion, I emphasize TNC's guiding objectives for investing in forests within the farm bill provided in our written testimony. We also hope the next farm bill can provide maximum flexibility and access to forest programs, particularly those funded by the bipartisan infrastructure law. Some have high match requirements that create barriers for financially strapped partners and local communities.

We are grateful to this Committee for its longstanding commitment to address the needs of America's forests and to help Congress advance a global zero deforestation policy agenda. Thank you.

[The prepared statement of Ms. Palmer follows:]

PREPARED STATEMENT OF SALLY R. PALMER, CENTRAL APPALACHIAN EXTERNAL AFFAIRS ADVISOR, THE NATURE CONSERVANCY, ARLINGTON, VA

[Chair] Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee, thank you for the opportunity to submit testimony on forests in the farm bill. The Nature Conservancy (TNC) is a nonprofit conservation organization working around the world to protect ecologically important lands and waters for people and nature. Our mission is to conserve the lands and waters upon which all life depends. We are grateful to this Committee for its longstanding commitment and investment in the future of America's lands, water and wildlife and addressing the many timely challenges that face our forests.

The Nature Conservancy has engaged in the reauthorization of the farm bill and implementation of many of its programs since the Conservation Title was created in the 1985 Farm Bill. Since seventy percent of the land in the lower 48 states is privately owned, the farm bill presents the greatest opportunity to impact conservation on private lands. The National Forest System covers 193 million acres of forests and grasslands, while more than half of the forestland in the United States (475 million acres) is in private ownership. TNC continues to engage in implementation of farm bill programs that benefit both private and public forests. While we enumerate our experience with programs largely enshrined in the Forestry Title (Title VIII), our interests span the conservation of forests broadly impacted and incentivized by the farm bill, across other titles, to ensure continued improvement in stewardship on private non-industrial forests, address forest management needs in our public forests, and combat challenges including climate change, insects and diseases, drought, and catastrophic wildfires that plague both forests and commu-

nities all over the country. Our hope is that the next farm bill builds on the successes of its forestry programs and delivers strong, just, equitable and inclusive outcomes while advancing conservation and community interests.

My name is Sally Rollins Palmer, and I am a native of the Appalachian foothills in Tennessee. Growing up in this beautiful region gave me an appreciation for nature and all the different people who have tended to these places as their home for centuries. Professionally, I have worked for The Nature Conservancy for over 2 decades, first as an ecologist—which is my academic training—and in later years on a variety of conservation planning and natural resource policy efforts. I currently serve as the External Affairs Advisor for our Central Appalachians program. Over my career, I have always been drawn to focus on how we can all work together—sharing our different expertise and experiences—to conserve our natural resources and promote our healthy co-existence with nature. My testimony will convey the perspectives of my colleagues in the Appalachian Region and across the country who share this same devotion.

Our nation's forests provide much of the clean air and water, wildlife habitat, forest products, and recreational opportunities that every American enjoys. They also produce over \$200 billion in products annually, aid in rural economies and provide almost one million direct jobs. Unfortunately, forests are facing a dire situation as wildfires continue to grow larger and hotter, insect and disease infestations spread, and forest health deteriorates. There is an urgent need to increase the pace and scale of ecologically-beneficial forest management on National Forests and provide incentives for state and private land managers to reduce the risk of catastrophic wildfire and improve forest health.

Prior to the COVID-19 pandemic, several global entities—public and private—had turned their attention to steep declines in nature that risk destabilizing the very systems we depend on for our survival. This trend is expected to continue. According to the most recent findings of the Inter-governmental Panel on Biodiversity and Ecosystem Services (IPBES), $\frac{3}{4}$ of the world's land and $\frac{2}{3}$ of its marine environment have been significantly altered by human actions. We have lost half of the world's forests, half of coral reefs, 70 percent of wetlands and dammed $\frac{2}{3}$ of the world's main rivers. We are witnessing this ecological crisis right here at home. It threatens the stability of the entire planet and requires bold and urgent action.

The need for more investment to halt biodiversity loss and address climate change has never been greater. The farm bill is a critical part of the solution, being the single largest driver of conservation investment in the United States. The farm bill provides the opportunity to continue to support our national, state and private forests by improving existing and developing new policies that would bring them to a healthier state. We stand ready to aid you in prioritizing key investments impacting conservation and forestry programs as you consider the 2023 Farm Bill.

At the outset, we offer The Nature Conservancy's guiding objectives for prioritizing forests in the next farm bill that we hope will align with your interests:

- Sustain and grow farm bill programs for private forests and dependent communities and promote watershed-level conservation across relevant Federal agencies.
- Promote more ecologically beneficial forest management policies throughout the farm bill.
- Advance more climate resilience incentives and investments for forests.
- Protect the integrity of bedrock environmental laws that help govern the management of National Forests.
- Ensure just and equitable outcomes in the farm bill also benefit minority foresters, forest landowners and workers, and enable Tribal management and/or co-management of forests alongside Federal agencies.

In addition, we hope the next farm bill can prioritize providing maximum flexibility and access to forestry programs, particularly those also funded by the Bipartisan Infrastructure Law (BIL) with high match requirements, that create barriers for financially strapped partners and local communities needed, to make program implementation successful. The following are key forestry programs authorized in the 2014 and 2018 Farm Bill where TNC has either had direct engagement as an implementing partner or is keen to engage should ecologically meaningful modifications to programs occur in the next farm bill.

Forest Legacy Program

The Forest Legacy Program (FLP) is an important conservation program that has fostered Federal-state partnerships to facilitate protecting more privately owned forest land. By providing economic incentives to landowners to keep their forests as

forests, FLP is encouraging sustainable forest management and supporting strong markets for forest products. The program is a critical tool that invests in natural infrastructure by conserving forests that sequester carbon dioxide and protecting drinking water supplies that reduce the need for costly, human-made filtration and treatment systems. According to the U.S. Forest Service, 180 million people in over 68,000 communities rely on forested lands to capture and filter their drinking water and forested lands sequester 14 percent of annual U.S. carbon emissions.

The Nature Conservancy and our partners have been able to steward more private land conservation efforts in several states thanks to FLP-enabled conservation easements or land purchases. For example, located at the southern end of the Appalachians, the Dugdown Corridor spans 100,000 acres and 50 miles between the Talladega National Forest in Alabama and the Sheffield-Paulding Wildlife Management Areas in Georgia—a region which contains some of the most biodiverse and climate resilient forests in North America, including the last remaining vestiges of the globally rare montane longleaf pine ecosystem. The Nature Conservancy and the state of Georgia’s goal here is to acquire two tracts as a part of a larger initiative to protect and restore the Dugdown Corridor and increase the amount of publicly accessible recreation land in Northwest Georgia. Deliverables of this project include protection of 2,351 acres benefitting multiple threatened and endangered species including the federally endangered gray and Indiana bats and federally threatened fine-lined pocketbook mussel; creation of the first and only public recreational land in Haralson County; and expanded opportunities to restore the montane longleaf ecosystem.

The 2018 Farm Bill authorized \$35 million annually for the FLP and also eliminated its permanent authority to receive annual appropriations. We respectfully ask the Congress to consider increasing the authorization level for FLP in the 2023 Farm Bill while also providing maximum flexibility on the program’s non-Federal cost-share to enable more conservation outcomes and increasingly equitable access to utilize the program.

Collaborative Forests Landscape Restoration Program

Congress created the Collaborative Forest Landscape Restoration Program (CFLRP) in 2009 to enhance forest and watershed health, reduce risk from catastrophic megafires, and benefit rural economies through collaborative, science-based approaches to forest management. In its first 10 years, the CFLRP projects generated nearly \$2 billion in local labor income, supported an average of 5,440 jobs annually, and engaged over 400 organizations in local collaboratives. More importantly, it has attracted and generated over \$450 million in leveraged funding and in-kind contributions.

The 2018 Farm Bill authorized \$80 million for CFLRP. This has been critical to allow for the program to strategically advance the Forest Service’s 10 year Wildfire Crisis Strategy and inspire infusion of new investments such as those granted in the Bipartisan Infrastructure Law, which is now enabling an additional twelve projects in eight states in Fiscal Year 2022 to receive CFLRP funding.

The Nature Conservancy has a long history of partnering with the Forest Service and working in collaboratives to implement CFLRP. Across the West, CFLRP projects are helping to build wildfire resilience and support rural America. From Washington State to Arizona, and from California to Colorado, projects have advanced forest and watershed health, and making important contributions to reduce risks from uncharacteristic wildfire. In Oregon alone, five CFLRP projects—on Deschutes National Forest, in Lakeview and the Southern Blues, and two recent awards in the Northern Blues and Rogue Basin, have allowed TNC to engage deeply in high-priority landscapes to complement the down payment on long-term landscape resilience and wildfire risk reduction. Similarly, in the Longleaf Pine ecosystem, TNC has been an implementing partner on the Osceola National Forest, a CFLRP project funded in 2010. After 3 years of restoration work, a study was commissioned to examine the economic impact of the CFLRP in the landscape. Within the Osceola area, the total economic output for all 3 years was over \$3 million including multiplier effects. Program expenditures also generated \$1.8 million in salaries and wages over the course of the 3 years within the same region of Florida and contributed \$459,000 in local, state and Federal tax revenues. Such a study could be a model for future project evaluation and development of economic metrics. Similarly, also in Region 8, in Pisgah National Forest, TNC and partners have successfully completed a 10 year effort in the Grandfather Restoration Project by increasing prescribed burning and other management practices to more than 40,000 acres of the Grandfather Ranger District.

As the Committee considers the next farm bill, we respectfully request CFLRP to remain a priority. We seek a longer-term reauthorization as well as expanded au-

thorities of the program to address and account for climate resilience, and further strategic wildfire resilience investments.

Water Source Protection Program

Congress took an important step by authorizing a new investment through the Water Source Protection Program (WSPP) in the 2018 Farm Bill at \$10 million annually to encourage partnerships between agricultural producers, businesses, cities, and the Forest Service. We recognize and appreciate that if fully manifested as intended, these partnerships would improve forest health and benefit downstream communities, often bringing in significant new investments from non-Federal partners. Despite widespread interest in WSPP across the country, it has not received dedicated funding. As growing populations and climate change place additional stress on our forests and watersheds, it is critical to invest in programs that support local, collaborative solutions to these challenges.

The Colorado River Basin impacts 36 million people in the West who rely on the Colorado River for water, food, recreation and energy, but the current 22 year drought in the Colorado River Basin points to a future of increasing challenges to forest and watershed resilience and uncertain water supplies. Well-managed forests serve as natural reservoirs, enhancing drought resilience and water-related outdoor recreation and sustaining river base flows in the summer when crops, boaters, and fish need water. Given TNC's longstanding commitment to restore and conserve the Colorado River, we are eager to utilize the authorities of WSPP and see great promise to address watershed-level conservation challenges.

In the next farm bill, we respectfully request a closer examination of this program and urge you to consider the following modifications:

- Require restoration plans and activities to be based on ecological principles and the best available science and designed to enhance resilience to climate change.
- Extend program to cover adjacent and nearby non-Federal lands to support an "all lands" approach to restoration.
- Establish criteria that the Forest Service should use in prioritizing projects for funding, to include (i) quantifiable benefits to water supply and infrastructure, (ii) demonstrated capacity and success of the partners in designing and implementing ecological restoration projects, (iii) amount of proposed match, and (iv) other factors
- Reduce the required non-Federal match from 50% to 20%, commensurate with similar Forest Service programs, while using the percentage of match as a factor in selecting projects to provide an incentive for greater contributions.
- Increase authorized funding level to address watershed-level conservation challenges.
- Require the agency to submit an implementation plan within 180 days of enactment.

Landscape Scale Restoration Program

The Landscape Scale Restoration (LSR) program supports projects that align with the U.S. Forest Service's priorities to reduce the risk of uncharacteristically severe wildfires, maintain or improve forest and rangeland ecosystem resilience, improve fish and wildlife habitats, maintain or improve water quality and watershed function, and mitigate invasive species, insect infestation, and diseases.

The 2018 Farm Bill established a state and private forest landscape-scale restoration fund at \$20 million annually allowing for more projects to be eligible for funding. TNC has a long history of implementing the LSR program particularly in Forest Service Regions 8 and 9. Recently, LSR awarded funding to a 'Treesilience' project in northern St. Louis County, MO for work on private properties. This is a unique geography comprised of 24 municipalities, and one that is particularly hard hit by the emerald ash borer. This investment is providing much-needed resources to municipalities and homeowners for necessary removal and replacement of dead or dying trees that pose risks to homes and people, and is supporting planting of new trees in neighborhoods with the most need. In Maryland and West Virginia, spanning ten counties and in coordination with the Monongahela National Forest, the LSR program has enabled TNC and partners to conduct ecological departure analysis, innovative "on-demand" controlled fire and invasive species management. As the Committee considers the next farm bill, we respectfully request the annual investment in the program to be expanded, particularly to urban environments, while also providing maximum flexibility for the program's non-Federal cost-share to enable more conservation outcomes.

Other Key Considerations

Investing in Wildfire Resilience: Congress took a major step toward stabilizing the Forest Service and Department of the Interior budgets with the 2018 “fire fix,” for which we continue to be thankful. We continue to urge Congress to ensure the fire fix remains durable and comprehensive. An estimated 50 million acres are in critical need of wildfire resilience treatments across all forests due to the impacts of these challenges.

The Nature Conservancy has over 60 years of on-the-ground experience across the country, working with public and private partners to deliver prescribed fire programs as an ecologically based mechanism to reduce wildfire risk and improve forest health. Cross-boundary funding mechanisms such as the Hazardous Fuels Reduction projects authorized by the farm bill support these efforts. A TNC report¹ recommends an investment surge of \$5–\$6 billion per year over the next 10 years for the highest priority work of increasing wildfire resilience and providing communities with much-needed resources for infrastructure and adaptation.

The next farm bill can advance wildfire resilience through many specific actions, including:

- Directing the Secretary of Agriculture to coordinate with the Secretary of the Interior to encourage and expand the use of prescribed fire on land managed by the Forest Service or the Department of the Interior. Inclusion of the bipartisan proposal of the National Prescribed Fire Act can advance this objective.
- Directing the Secretary of Agriculture to establish a pilot program under which the Secretary may enter into a conservation finance agreement with a public or private person, including a for-profit or nonprofit organization, to plan, implement, and monitor a landscape-scale forest restoration project selected by the Secretary. A similar proposal has been incorporated into Sec. 104 of S. 2806 Wildfire Emergency Act.

Forest Management and Environmental Safeguards: Title VIII of the farm bill has shaped forest management policies to address some of the challenges that face large forest landscapes. We look forward to engaging in a dialogue on finding ways to increase the pace and scale of restoration and reducing risks posed by climate change, severe megafires, drought, insects and diseases, while also ensuring public processes and environmental protections are strengthened.

Importantly, as the Congress examines the necessary mix of incentives and investments for forest management, we seek to ensure agencies have sufficient resources and the flexibility to use available authorities and more efficient processes while maintaining environmental safeguards. These will be essential conditions for success, as will be collaboration among Federal and state government agencies, Tribes, Indigenous peoples, scientific experts and other relevant stakeholders. The Nature Conservancy has demonstrated that collaborative planning efforts can achieve efficiencies of scale for management implementation, such as the recent authorization of over 60,000 acres of ecologically-sound forest treatment across the South Zone of the Cherokee National Forest. Key actions in this respect would also need to include ensuring every Forest Service region has adequate resources and capacity dedicated to comply with processes enshrined in bedrock environmental laws such as the Endangered Species Act and the National Environmental Policy Act (NEPA), and access to a minimum of two NEPA strike teams for each Forest Service region.

Natural Climate Solutions: Large-scale global reforestation goals have been proposed to help mitigate climate change and provide other ecosystem services. To accelerate reforestation, the entire “pipeline” for tree planting (*i.e.*, from seed collection all the way to sapling monitoring) need to be scaled up, including seed collection and storage, tree improvement research, nursery production, outplanting, and post-planting treatment and monitoring. To illustrate the requirements for increasing reforestation capacity in the U.S., scientists at The Nature Conservancy and other experts have produced a new report² identifying 64 million acres of natural and agricultural lands, nearly half of the total reforestation opportunity. Accounting for different planting densities by region, it would require 30 billion trees to reforest these lands. This equates to 1.7 billion more tree seedlings produced each year for this land to be reforested by 2040.

To this end, we request Congress to consider supporting increased public- and private-sector capacity for seed collection and storage, tree improvement research, tree

¹https://www.nature.org/content/dam/tnc/nature/en/documents/WildfireResilienceFunding_TNC_6-30-21.pdf.

²<https://www.nature.org/en-us/newsroom/challenges-reforestation-pipeline/>.

nursery expansion, workforce development, and improvements in pre- and post-planting practices. We recommend the following priorities:

- Incentivize/guarantee low-interest or forgivable loans in addition to long-term contracts to expand nursery expansion.
- Support more reforestation friendly outcomes from programs such as Environmental Quality Incentives Program (EQIP) and Conservation Reserve Program (CRP).
- Reduce the barriers for rural landowners to participate in voluntary markets for forest carbon such as those proposed in provisions of S. 1107 Rural Forest Markets Act.
- Address the national shortage of seedlings needed for reforestation efforts such as those proposed in provisions of H.R. 2562 the Solving Our Shortages for Seedlings Act.
- Support funding for the Tree Assistance Program (TAP) and investing in more monitoring and research assistance.

As climate resilience is further strengthened in farm bill programs, we respectfully request the Congress to ensure that such actions also provide ecological benefits, as originally intended, and programs such as Healthy Forests Reserve Program (HFRP) which helps landowners restore, enhance and protect forestland resources on private lands through easements and financial assistance are expanded for their community benefits and incentivized for climate resilience.

Watershed Scale Restoration: Conservation programs and other policies in the farm bill are key drivers of water use and management decisions and, therefore, a primary source of solutions to our shared water challenges. The farm bill has the unique opportunity to enable forest restoration and fire protection efforts to improve the hydrologic function of headwater systems and strategically connect improvements with downstream flow and riparian restoration efforts.

One important mechanism for enabling watershed scale prioritization and implementation has been the Statewide Forest Resource Assessments and Strategies. These plans are important mechanisms for supporting state decision-making regarding forest management, and they promote collaborative stakeholder engagement in the process. In recent years, TNC has partnered with different states to assist with the scientific data and priorities identified by stakeholders in these strategies.

Based on our science expertise and field experiences, we request the Congress to consider innovative mechanisms to advance watershed scale restoration which strategically advance forest health efforts including the following recommendations:

- Enable farm bill programs such as the Regional Conservation Partnership Program (RCPP) and EQIP to advance forest restoration to benefit downstream flow and riparian restoration.
- Require strategic integration of Agricultural Conservation Easement Program (ACEP) and restoration programs such as Conservation Stewardship Program (CSP) and CRP, alongside EQIP and RCPP to prioritize funding to landowners that both maintain agricultural and/or forest production and increase drought resilience by implementing appropriate activities, projects, and use of innovative measurement technologies.
- Authorize funding for the Watershed Condition Framework (WCF) to provide a consistent, comparable, and credible process for improving the health of watersheds on National Forests and Grasslands.
- Alleviate match requirements and implementation barriers to programs in the Bipartisan Infrastructure Law (BIL) to further forest health and watershed restoration. Some examples of implementation barriers include BIL funding requiring its own agreements and a lack of clarity within the Forest Service regarding eligibility for BIL funding for waiver requests.

Community and Urban Forests: Given their ability to reduce the urban heat island effect and energy demand, retain stormwater, and absorb and store greenhouse gases while providing habitat for biodiversity, urban forests can help urban environments and their residents address the challenges of rising energy costs, water shortages and climate change.

The Nature Conservancy has deep experience in delivering urban forest conservation together with the Forest Service and partners in several parts of the country—from New York City to Orlando and beyond, we are advancing urban forest conservation by aiding with technical and science expertise and delivering nature-based solutions to ensure a resilient and equitable tree canopy where a majority of Americans live.

In the next farm bill, we respectfully request the Congress to consider ways to drive more support and investment for urban and community forests including:

- Permanently authorizing the National Urban Community Forestry Advisory Council.
- Establishing provisions for private homeowner assistance (technical and financial) for conservation actions taken to enhance tree canopy on private property, prioritizing mature tree maintenance activities and “underserved” urban communities.
- Investing in a green infrastructure tree planting and maintenance program for communities to improve air and water quality; reduce storm water flooding, water treatment costs, and consumer energy costs; and enhance property values, public safety, and quality of life.
- Expanding key farm bill programs such as the Landscape Scale Restoration to include urban environments.
- Amending the Cooperative Forestry Assistance Act and Healthy Forest Restoration Act to include urban landscapes.

Forest Products and Markets: The 2018 Farm Bill authorized a research, education and technical assistance program for expanding wood energy and wood products markets. The Nature Conservancy generally supports strategies to develop forest products and markets. Such strategies should be designed to restore forests to a more natural condition, correcting the harmful cumulative impacts of past fire suppression and ecologically harmful logging practices, and to enhance resilience to a changing climate.

In certain situations, ecological thinning can help to facilitate the responsible use of prescribed and managed fire as part of efforts to restore fire to its proper role in fire-adapted forest ecosystems. In these places, facilitating development of, and fostering local markets and utilization strategies for, new value-added products from low-value material (small diameter timber and woody biomass) removed from forests during restoration projects may be necessary. Programs like the Wood for Life partnership in the western U.S. (which delivers unmerchantable logs to Indigenous residents for firewood) offer another avenue to support such utilization.

As the Congress turns its attention to doing more for wood energy and the wood products markets, we respectfully request that all such efforts are conducted within proper environmental sideboards that ensure that the overall outcome is ecologically beneficial. Importantly, the lack of, or limitations within existing forest product markets should not serve to discourage the Forest Service from engaging in critical forest management activities to build resilience.

Addressing deforestation and curbing importation of illegally harvested commodities: The farm bill has made meaningful contributions to addressing the importation of illegally harvested timber. In 2008, thanks to the farm bill, the United States—the world’s largest consumer of forest products—became the first country to ban trafficking of products containing illegally sourced wood. The Lacey Act Amendments of 2008 were adopted with bipartisan support in Congress and have contributed to reduced imports of illegally sourced wood products by 32–44%. The amendments have demonstrated their potential for impact, yet significant delays in full implementation and sporadic enforcement continue to limit their effectiveness. Congressional oversight is vital to overcome these delays. We respectfully request the House Agriculture Committee to ensure that USDA implements the requirements of this law, phasing in enforcement of the import declaration requirement for key product categories including furniture, pulp, and paper by the end of this year.

Global forests and other important biomes—such as the tropical rain forests of the Amazon, Congo Basin, Southeast Asia and the Pacific, and Central America and the Cerrado savanna and Pantanal wetlands of Brazil—are critical for human well-being and livelihoods, biodiversity, and carbon sequestration. A comprehensive U.S. approach backed by programs, policies, funding, and diplomatic engagement is needed to ensure the long-term conservation of these ecosystems. This includes specific initiatives to eliminate commodity-driven deforestation, forest degradation, and habitat conversion; halt bad actors from engaging in illegal timber extraction and illegal deforestation; promote sustainable livelihoods and the rights of Indigenous peoples and local communities; and protect and restore forests and other natural landscapes.

The next farm bill provides opportunities to curb global deforestation by leveling the playing field for American ranchers, producers and other businesses competing in the global economy, and through specific bipartisan proposals that directly address commodity-driven deforestation.

As the Congress considers its next farm bill, we respectfully ask that bipartisan proposals such as the FOREST Act (Fostering Overseas Rule of Law and Environmentally Sound Trade Act) are incorporated. The FOREST Act would establish a new mechanism to remove illegal deforestation from agricultural commodity supply chains by creating a risk-based due diligence and reporting framework for key imported products; establish incentives for U.S. businesses and partner countries to reduce deforestation; and update financial crime statutes to apply to criminal enterprises engaged in illegal deforestation.

In conclusion, we appreciate your leadership in examining the status of forestry programs authorized by the farm bill and providing us with an opportunity to share recommendations to strengthen and scale up efforts to reduce challenges such as catastrophic megafires, pests and drought—all impacts exacerbated by climate change—in support of our forests, as well as the local and Indigenous communities and economies that rely on them to thrive. We support substantial reinvestments in programs that increase forest resilience, specifically those that support collaboratively developed, science-based, climate-informed and ecologically focused activities across all forests, and help Congress advance a zero-global deforestation policy agenda. Backed by significant investment, these policies would be an ambitious and important down payment to ensure the future of forests and the role they play in achieving U.S. farm and food policy goals. We look forward to working with you and your staff to advance these aspirations.

The CHAIR. Thank you very much, Ms. Palmer.

Mr. Schultz, please begin when you are ready. You have 5 minutes.

Mr. Schultz, you are muted.

STATEMENT OF TOM SCHULTZ, VICE PRESIDENT OF RESOURCES AND GOVERNMENT AFFAIRS, IDAHO FOREST GROUP; PRESIDENT, FEDERAL FOREST RESOURCE COALITION, COEUR D'ALENE, ID

Mr. SCHULTZ. Thanks. Chair Spanberger, Ranking Member LaMalfa, and Members of the Committee, I am Tom Schultz, and I am here today in my capacity as President of the Federal Forest Resource Coalition, a national nonprofit representing purchasers of Forest Service timber in 37 states. Our members employ over 390,000 people and provide payroll in excess of \$24 billion annually.

The most significant forest management reforms adopted in the last decade have been enacted through the 2014 and 2018 Farm Bills. I am here today to share my experiences with these programs and suggest improvements to address the forest health crisis afflicting our National Forests.

Among other things, the 2014 and 2018 Farm Bills expanded Good Neighbor Authority, made stewardship contracting permanent, created streamlined authorities for forest health and fuels reduction projects on National Forests. I want to focus on these authorities with recommendations on how to improve them.

First is Good Neighbor Authority, or GNA. It has become a crucial tool to improve forest health in the National Forests. Since 2014, the farm bill expanded it to all 50 states. The number of acres treated annually under this program has grown by more than 20-fold and is now averaging more than 60,000 acres per year. In Idaho alone, we have treated more than 8,200 acres of Forest Service lands using GNA authorities. The program is a true state-Federal-local partnership with the Forest Service and the NRCS working seamlessly with private landowners, State Foresters, industry, and others to implement projects ranging from forest thinning to commercial timber sales to the creation of fuel and firebreaks. By

leveraging the capacity of state forestry agencies, GNA allows us to practice what we call in Idaho *no-boundaries forestry*.

As of 2021, 20 timber sales have been awarded under the GNA program in Idaho treating the 8,200 acres I mentioned, and generating over 70 million board feet of timber. Additionally, over 60 restoration service contracts at a total value of \$3.5 million have been awarded to the private-sector. The Idaho GNA program is a true success story, having nearly quadrupled volume outputs in just 5 short years since it began. It is now roughly ten percent of the annual timber program sold from partnering National Forests.

The 2023 Farm Bill is an opportunity to make several key reforms, including allowing states, counties, and Tribes to use revenue generated by the GNA projects on non-Federal lands and to allow revenue from existing projects to be used for this work as well. By allowing new road construction under GNA, this program could retire older, poorly placed roads and replace them with better engineered roads to help reduce water quality impacts. Making Good Neighbor Authority permanent with these reforms will provide a powerful incentive to partners to continue investing in the program.

The 2014 Farm Bill also made stewardship contracting authority permanent. Stewardship contracting has been a vital authority line of the Forest Service to implement forest restoration and management projects and now accounts for about 25 percent of the overall Forest Service timber sale volume. In some regions that has grown to exceed 50 percent.

One thing we have learned is that the loss of forest products facilities makes forest management far more difficult and expensive. The Forest Service has struggled mightily for decades to attract new forest industries to Arizona, where millions of acres of fire-adapted pine forest urgently need thinning. Further loss of building infrastructure could put up to 35 million additional acres of National Forest at risk of the same fate. We urge you to amend the authority to make retention of existing forest products facilities one of the key objectives of the program, as well as allowing receipts from stewardship projects to ensure adequate reforestation to the KV Fund (Knutson-Vandenberg Trust Fund).

The 2014 and 2018 Farm Bills gave the Forest Service new authority to conduct insect and disease treatments and hazardous fuel production work on up to 3,000 acres of National Forest System lands at a time under section 602. These authorities have proven effective in reducing hazardous fuels. Section 602 projects have performed well, and they have encountered wildfires. In every case where the Forest Service has completed all the steps of the fuel reduction process, the treatments have reduced flame length, fire intensity, and rate of spread.

However, the scope of the program is too limited. The Committee should move to substantially increase the number of acres covered by section 602 categorical exclusions. This section does not open a single new acre of land for timber harvest and requires compliance with forest plans. It allows the Forest Service to quickly approve needed treatments after a brief review rather than engaging in lengthy or NEPA processes that can delay projects for as much as 5 years or more.

Our written testimony includes further recommendations for your consideration. FFRC has always appreciated the bipartisan, pragmatic approach to forest management that this Committee has demonstrated. With nearly half of the National Forest System off limits to management, we urge you to continue to build on the authorities you have already enacted to make sure that we can manage the rest of these critical lands sustainably. Thank you.

[The prepared statement of Mr. Schultz follows:]

PREPARED STATEMENT OF TOM SCHULTZ, VICE PRESIDENT OF RESOURCES AND GOVERNMENT AFFAIRS, IDAHO FOREST GROUP; PRESIDENT, FEDERAL FOREST RESOURCE COALITION, COEUR D'ALENE, ID

[Chair] Spanberger, Ranking Member LaMalfa, on behalf of the Federal Forest Resource Coalition, I appreciate the opportunity to testify before you today. My name is Tom Schultz and I am Vice President of Resources and Government Affairs at Idaho Forest Group (IFG), a family-owned business operating five sawmills in Idaho, as well as a new mill we are bringing online in rural Mississippi. I am here today as President of the Federal Forest Resource Coalition, which represents purchasers of Federal timber in 37 states, with over 650 member companies and affiliated associations, collectively representing over 390,000 employees.

By way of background, prior to joining IFG, I served in leadership roles for 2 decades at state land management agencies in both Montana and Idaho, roles I took on following a career in the U.S. Air Force. This diverse background has given me a unique perspective on the challenges facing the U.S. Forest Service.

FFRC is extremely grateful for the leadership this Subcommittee has shown on National Forest Management issues in the last several farm bills. Since 2014, the farm bill has advanced some of the most effective and important policy changes that have aided Forest Service efforts to begin reversing the forest health and wildfire crisis that is challenging the sustainability of our Federal Forests.

The 2014 and 2018 Farm Bills saw the expansion of Good Neighbor Authority, expansion of Designation by Description and Designation by Prescription, permanent reauthorization of Stewardship End-Results Contracting, and enactment of streamlined authorities to treat forest insects, disease, and reduce hazardous fuel loads on National Forests. The next bill, scheduled for 2023, provides an opportunity to build on these successes to scale up management to meet the significant challenges facing the health and sustainability of the National Forest System.

Good Neighbor Reform: The 2014 Farm Bill expanded Good Neighbor Authority (GNA) to all 50 states, following years of pilot authorities which allowed small scale work in several states. The 2018 Farm bill expanded the eligibility of GNA to counties and Tribes. The program has been a resounding success and we urge the Subcommittee to build upon it in the 2023 Farm Bill. Since expanding the authority in the 2014 Bill, the number of acres treated annually under this program has grown by more than twenty-fold and is averaging more than 60,000 acres each year for the last 4 years.

Since the 2014 Bill, three dozen states have begun work on over 130 GNA projects. In addition to improving forest health, GNA has helped increase wood supply to bring additional needed forest products to market. According to the Congressional Research Service, the amount of Forest Service timber sold under GNAs has increased from 14.4 million board feet in FY2016 to 182.6 million board feet in FY 2019. That's enough lumber to frame about 11,000 single family homes. As many Americans struggle with finding affordable housing, this program is helping meet market needs.

With states investing substantial sums of money to support implementation of Good Neighbor Authority (GNA) projects, including cross-boundary projects, treatment of revenue from GNA projects must reflect this reality. However, the 2018 Farm Bill limited the ability of states to utilize GNA project receipts on non-Federal lands—despite the clear direction that these projects be conducted to improve forest health on both Federal and Non-Federal lands. We note that this recommendation is consistent with those provided by the National Association of State Foresters.

Action Requested: Amend 16 U.S. Code § 2113b(2)(c) to allow states, counties, and Tribes to utilize revenues generated on non-Federal lands, pursuant to conditions specified in Good Neighbor Agreements, and direct the Forest Service to update existing Good Neighbor Master Agreements and Project Agreements to use revenue from existing projects for this work.

We also recommend that Congress consider amendments to the GNA authority to allow new road construction and reconstruction under GNA contracts on a limited basis. Restoration work on the National Forest System is not limited the need to reduce hazardous fuels; in many cases, older roads, placed without adequate consideration of water quality impacts, should be retired and replaced by better engineered, correctly placed roads that address water quality issues as well as roads that are just worn out and need reconstruction such as crushed aggregate and vegetation removal for safe and efficient use.

As you move to reauthorize these programs, we urge you to make all of the above changes and extend the authority for this program to the Bureau of Land Management (BLM) as well. The 2014 and 2018 Bills extended several forest management authorities to the BLM, and this Committee should build upon that precedent in the 2023 bill.

Stewardship Contracting Amendments: The 2014 Farm Bill made Stewardship Contracting authority permanent, responding to a request from then-Chief Tom Tidwell. Stewardship Contracting has been a vital authority allowing the Forest Service to move implement forest restoration and management projects. Stewardship Contracts now account for about 25 percent of overall Forest Service timber sale volume, and in some regions, this total has grown to exceed 50 percent.

As the use of this contracting tool has expanded, it has become clear that reforms are needed to ensure that the program doesn't result in unintended consequences, including inadequate resources for reforestation. Moreover, as the Forest Service struggles to expand its treatment of at-risk acres of National Forest System lands, it's become clear that retention of existing forest products infrastructure—loggers, trucking capacity, and wood products facilities—is critical to achieving the paradigm shift the Forest Service has called for.

In the last 3 years, we've seen the closure of five sawmills located near millions of acres of fire prone National Forests, including the IFG mill at St. Regis, Montana. All these closures were precipitated—at least in part—due to insufficient wood supply from nearby National Forests to keep these mills running. Loss of milling infrastructure is a major factor behind what the Forest Service calls its “low-value material” problem.

Our initial analysis of Forest Service Forest Inventory & Analysis data show that there are substantial quantities of standing sawtimber on National Forest System lands across the United States. Using what are known as Integrated Resource Timber Contracts (IRTC's), the Forest Service can generate additional revenues to expand treatments—including non-commercial thinning, prescribed fire, and improved fish passage—while supporting family-wage, year-round jobs in forest management and wood products industries.

By contrast, if nearby mills close, experience has taught us that attracting new investment—particularly where there are few non-Federal forests to support a forest products industry—can be extremely difficult. Following the loss of most sawmilling capacity in Arizona, the Forest Service has struggled for over 12 years to attract capable, well capitalized industry to help it accomplish forest management work that will protect watersheds and communities from catastrophic fire.

Action Requested: Amend 16 U.S. Code § 6591c to strike Section (e)(B) and add clarifying language that requires Deposits in the Knutson-Vandenberg Fund (authorized by 16 U.S.C. § 576) for Stewardship End-Results Contracts that include merchantable timber.

Further, amend the purposes of Stewardship End-Results Contracting Projects (16 U.S. [Code] § 6591(c)) to add an eighth “land management goal” of retaining and expanding existing forest products infrastructure, including logging capacity and wood consuming facilities, in proximity to the National Forests.

Improving the Effectiveness of Farm Bill Insect and Disease, Hazardous Fuels Reduction Authorities: Beginning in the 2014 Farm Bill, Congress provided the Forest Service with the authority to “categorically exclude” insect and disease treatments on up to 3,000 acres of National Forest System lands. The 2018 Farm Bill expanded this authority to allow for hazardous fuels reduction work on acres designated using this authority.

These authorities have proven effective in expediting needed forest management work. However, the size of the areas allowed to be treated is too small to effectively prevent catastrophic fires. The Caldor Fire in California provided numerous examples of effective fuels treatments using the farm bill CE. Within that fire's 221,000 acre burned footprint, there were at least five areas treated using the Insect & Disease and hazardous fuels mitigation CE's. In every case, where the Forest Service had completed all the steps of the fuels reduction process, the treatments reduced flame length, fire intensity, and rate of spread.

However, the treatments were not conducted on enough acres to prevent the fire from being the first in history to burn over the crest of the Sierra Nevada mountains. Assuming all five categorical exclusions treated the 3,000 acre maximum, the treatments on the Caldor fire area amounted to 15,000 acres, or about seven percent of the fire area. If the Forest Service had been able to treat 15,000 acres under each CE, fire intensity and the damage resulting from it could have been reduced on fully $\frac{1}{3}$ of the fire and may have even allowed firefighters to control the fire sooner.

It is critical to remember that the Categorical Exclusions provided to the Forest Service through the last two farm bills do not open a single new acre of land to timber harvest. Use of all Categorical Exclusions requires compliance with existing Forest Plans, including land allocations like designated Wilderness Areas, Inventoried Roadless Areas, and other areas where removal of vegetation is prohibited. These CE's merely allow the Forest Service to quickly approve needed treatments after a brief review, rather than engaging in lengthier NEPA processes that have delayed projects as small as 1,600 acres for as much as 5 years or more.

Requested Action: Amend 16 U.S. Code §6591b to increase the number of acres which can be treated for fuels reduction and pest treatment from 3,000 to 15,000 acres.

Eliminate Unnecessary Restrictions on Infrastructure Spending: The Infrastructure Investments & Jobs Act (IIJA, Public Law 117-51) provided unprecedented investments over the next 5 years for a wide range of forest management actions on National Forest System lands. In effect, this bill both authorized and appropriated funds for several new programs that impact all operations of the National Forest System, including those created from outside the Public Domain. That places these programs firmly within the jurisdiction of the Agriculture Committee, and we'd urge you to carefully review them as the 2023 Farm Bill approaches.

Unfortunately, Congress chose to insert language limiting the application of these funds in ways that limits their effectiveness. For instance, the bill provided \$500 million over 5 years for "mechanical thinning and timber harvesting" and "pre-commercial thinning in young growth stands." However, each of these actions is limited with extraneous or redundant restrictions, including a limitation on precommercial thinning to include only those projects that produce "wildlife benefits to provide subsistence resources."

This requirement could be construed to limit the application of these new funds to only those National Forest System lands where a recognized Tribal government has valid subsistence rights, leaving large portions of the National Forest System ineligible for this important work.

Requested Action: Amend IIJA authorities to eliminate duplicative, unnecessary, or unhelpful limitations on management.

Streamline National Forest Management: Each National Forest is governed by a legally binding Forest Plan, developed through a collaborative process with ample opportunities for public involvement. Each Forest Plan designates some acres of National Forests as being "suited for timber production," while also recommending areas for more restrictive land uses, like wilderness designations.

In practice, these Forest Plans take too long to develop, and frequently, they wind up producing binding restrictions on land management, while land management goals—like early seral habitat—are both difficult to achieve and are rarely monitored to determine whether they are attained. When the Forest Service proposes management actions—such as creation of young forests or thinning fire prone stands—the agency must begin entirely new NEPA processes that make fleeting—if any—reference to the underlying Forest Plan.

The result is both an overly long planning process, and project level analysis that is too dense and voluminous to be of any use to anyone except experts. While the quantity of information required to move forward with a management project is impressive, the quality and accessibility to the public, leaves much to be desired. Moreover, conflicting court precedents, such as the disastrous *Cottonwood* case, have left in legal limbo whether Forest Plans are "ongoing actions" under the law. This has left the Forest Service vulnerable to frivolous lawsuits that frequently block or delay needed management projects.

By one estimate, injunctions based on the erroneous *Cottonwood* precedent have stalled over 350 Million Board Feet of timber in the Forest Service Northern Region alone, enough timber to frame over 29,000 single family homes. Congress stepped in and provided a partial fix to this problem in the 2018 Omnibus Appropriations bill. The 2023 Farm Bill should be a vehicle to complete this work.

Requested Action: Clarify that Forest Plans are not "ongoing actions" for the purposes of Federal law and make clear that consultation under the Endangered Species Act Section 7 is not required at the plan level. Second, Congress should, through amendments to the National Forest Management Act, clarify that projects

conducted on acres designated as suited for timber production should be subjected to reduced analytical requirements under other statutes. Planning for an accounting for “sensitive” resources on the National Forest System must grapple with the fact that about half the acres are in restricted land uses and will likely never see management.

Conclusion: FFRC appreciates the work this Committee has done to provide the Forest Service with streamlined authorities to accomplish needed work on the National Forests. As we’ve seen, the only limitation with these authorities is that they haven’t gone far enough, fast enough. The forest health crisis on our National Forests threatens not only the sustainability of the forest industry that depends on those forests, but millions of Americans who need them for clean air, clean water, and places to recreate. The forest industry is a tool to help achieve management objectives on our National Forests—ranging from hazardous fuels reduction to the creation and maintenance of habitat for multiple wildlife species.

By taking the steps outlined above, this Committee can help arrest the declines in forest health we’ve been witnessing for the last 30 years and put our forests on a better path. We look forward to working with the Committee and the other stakeholders on today’s panel to achieve these goals.

The CHAIR. Thank you very much to our witnesses for your testimony.

I see two of our colleagues on camera, and so I would ask Ms. Schrier or Mr. Johnson if you would consider taking the gavel as I need to no longer chair this hearing. My apologies to the witnesses. Would either of you, in order to proceed with questions, be willing to take the gavel for the remainder of our time or for some portion thereof?

Mr. JOHNSON. Ms. Spanberger, I would of course defer to Ms. Schrier, but I am making my way down to third floor now and could, at least on a short-term basis [inaudible] or others.

The CHAIR. Thank you very much, Mr. Johnson.

So Ms. Schrier, I will recognize you first for questions, and then Mr. Johnson will take over chairing the Committee as soon as he is here. My apologies to the witnesses. I do want to thank you for your testimony, both given and written. And I have a meeting with the Speaker about my legislation, which is why I must excuse myself, but I am very grateful for your time. And I will leave you in good hands with Mr. Johnson.

Ms. Schrier, you have 5 minutes.

Ms. SCHRIER. Thank you, Madam Chair.

Earlier this morning I spoke with Chief Moore about programs impacting forests on Federal land. And I want to turn my attention now to private lands and private forests now. There are over 620,000 acres of privately owned forest lands in my district and over 9 million acres in Washington State. Private forests are often sustainably managed to provide clean air, clean water, and wildlife habitat. They also provide a steady renewable supply of wood, which supports rural markets and jobs within my district. They often also use proper forest management practices, particularly for brush and tree thinning in order to help protect against wildfires. And they do it quite successfully.

Mr. Reed, as you know, timely and appropriate brush removal and tree thinning that reduces wildfire risk and gives trees and wildlife some space to grow and flourish is critical in our home state. Could you speak a bit more about Green Diamond’s expertise in forest management here, and what are the different benefits that these practices provide?

Mr. REED. Yes, thank you for the question, Congresswoman. It is true that the interests of private forest landowners are mostly in healthy forests, and that has obviously an impact on our core business but also many secondary positive effects of clean water and clean air and habitat and then not incidentally, significant reduction in wildfire risk. So we manage our forests with that in mind. It is not inexpensive. And we consider the treatment of forests to be investments in the future health and longevity of those forests and its resilience against the natural pests and fires and whatnot.

It is not a silver bullet, but it does work. And we had the experience—as I mentioned before, we had a significant wildfire cross into us in Oregon, similar forest type to your district. And where we had engaged in active thinning, removing stems either through commercial harvest or a pre-commercial harvest, we saw fire activity significantly change. We watched it across the landscape where we were a neighbor to the Forest Service, which, for any number of reasons, I have a lot of appreciation for the challenges the Forest Service had. They had not done any thinning, and the trees were completely wiped out. When it hit our ground, we still lost a lot of trees, but the fire behavior changed. That gave us an opportunity to address the forest.

So I feel very confident that the forest management activities that private forest owners engage in, again, it is not a panacea, it won't solve everything, but it certainly—

Ms. SCHRIER. Thank you for that stewardship. And that example is exactly why we have put so many resources into the Forest Service and trying to have year-round jobs that will manage our public lands as well.

Can I just quickly get your perspective on the wood products industry? We heard earlier about using every part of trees and how every part has value. And if you could talk a little bit about what that means for rural economies and forest health and for forest landowners, and maybe the role of small-diameter mills in that ecosystem.

Mr. REED. Yes, there is no question that those small-diameter trees provide a much more significant economic challenge than more valuable larger trees. And when you are operating on 100 year timescale like we are, though, you have to figure out how to address all of the issues in the forest. And sometimes the issue is too many small trees. And I think there are lots of programs that can be implemented to help promote the use of those small-diameter materials, but particularly in certain areas where we have lost infrastructure that processes it and in areas where you have to think about a 100 mile haul for this type of small, low-value wood with \$5, \$6, \$7 diesel prices, it is really tough. And in many cases, it is simply not economic even for a commercial owner to treat forests without it being a cost. So it is a challenge. There is no question about it. We are able to do it because we consider it an investment in our long-term future, but it is not a moneymaker.

Ms. SCHRIER. Understandable. That 100 mile haul is something I hear about frequently in the district, and it is why I am looking to bring a small-diameter mill to the 8th District. So thank you very much, and I yield back.

Mr. JOHNSON [presiding.] Thank you very much, Ms. Schrier. And I will recognize myself for 5 minutes.

And my question will be for Mr. Schultz. I just think, sir, about if we are really going to treat these millions of acres of both Federal land and non-Federal land as it is called for in the 10 year plan, how are we going to get that done? It seems to me, sir, that you simply can't get that done without commercial partners and without infrastructure like sawmills to be able to do something with those forest products. Let me give you an opportunity, sir. To what extent am I wrong about that? And if I am right, give us more of a sense of why.

Mr. SCHULTZ. Sure. Thank you, Mr. Chairman. So you are absolutely correct. One of the things to think about, you need to have that milling infrastructure on the landscape, so it is critical that we retain that infrastructure. It is not just the sawmills but it is the logging and hauling workforce that also accompanies that. So if we just focus on small-diameter wood, which I am not suggesting anybody is saying that, but that is problematic, that that cannot sustain the industry unto itself and sustain all of that infrastructure. So you need to be able to partner with the mills. The mills need to be healthy. You need to have a healthy logging workforce and a hauling workforce as well. So those are all critical to being able to manage the National Forests.

Other partners that have been discussed previously, it is the states. I am convinced that the Forest Service alone, as you have heard a lot of their challenges on hiring individuals, cannot get the work done alone without states, without NGOs, and without the industry, so we do need partnerships across—you heard Ms. Humphries talk about the Wild Turkey Federation, and they are a tremendous partner with the Forest Service in terms of the work that they do. So anyhow, we do need partnerships, but you cannot lose the infrastructure that exists, both the mills and the logging and hauling workforce. It is absolutely critical.

Mr. JOHNSON. Mr. Reed, I will give you an opportunity to feed into the conversation as well.

Mr. REED. Sure, no, I think that Mr. Schultz covered a lot of the key points. I would say that private forest land owners are happy to work in partnership with public forest landowners simply from a risk mitigation point of view. And while the core of our business is not harvesting on Federal timber land, we recognize that we have to be good neighbors to them, too. And if we want to mitigate the risk of fire or disease onto our own ground, we have to be willing to engage. And, as I said, I am appreciative of Chief Moore's willingness to engage with private-sector partners to try to achieve some of the goals that he is trying to try to get to, that we are all trying to get to.

Mr. JOHNSON. Yes, very well said. And to tie this up, I would just note that we know that there are some policies that make it more difficult to manage the forest, and a managed forest is a healthy forest. And when our policies cause certain pieces of these infrastructure—you talked about human infrastructure, that is a big one; sawmills, that is a big one. When these pieces of infrastructure decay or erode or go away, it is unbelievably difficult and in some cases near impossible to build them back up. And I think that

is why we want to make sure that when we talk about the sustainability of the forest, and of course we should, we want to understand that part of that sustainability is keeping that infrastructure intact.

With that, unless there are any other Members who seek to be recognized, I want to thank our panelists. They have done an excellent job informing the Committee's work. And of course, I also want to thank Chair Spanberger for her leadership and pulling this together, and for her ill-advisedly trusting me with the gavel for at least a short period of time.

With that, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any question posed by a Member.

And unless there is anything further, this hearing of the Subcommittee on Conservation and Forestry is adjourned.

[Whereupon, at 1:25 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY RANDY MOORE, CHIEF, U.S. FOREST SERVICE, U.S. DEPARTMENT OF AGRICULTURE

Insert

Mr. THOMPSON. . . .

So my first quick question was what is the status of vacancies or do we have all the qualified silviculturists in the system, or how many vacancies currently exist that we need to be filling for folks who are actually qualified as silviculturists?

Mr. MOORE. Yes, I don't have a number for the actual silviculture position. I have numbers generally across the agency. But, Chris, as the National Forest System's Deputy Chief, do we have information?

Mr. FRENCH. We do. And we can follow up with the specifics. In general, Congressman—

Beginning early this year (2022), the Forest Service is increasing the silviculture workforce through national hiring events to respond to ever-growing need for forest management as well as the need to implement the Infrastructure Investment and Jobs Act, which incorporates the REPLANT Act.

The USFS has identified approximately 200 vacant positions in silviculture needed to meet the implementation work mentioned above. We are making good progress in filling these positions. Following a national hiring event this fiscal year, hiring actions on roughly half of these positions are in process or are complete. The remaining vacant positions are expected to be filled through a national hiring event held last month (September 2022) in conjunction with the Society of American Foresters Convention. The Agency continues to further refine estimates of needed silviculture positions through field capacity assessments.

The Forest Service is also growing the silviculture workforce's skills through its silviculturist certification program. In 2020, the agency streamlined the silviculture certification process. The new process reduces the certification process from more than 4 years to 2.5 years, allowing silviculturists to be certified faster.

SUBMITTED QUESTIONS

Response from Randy Moore, Chief, U.S. Forest Service, U.S. Department of Agriculture

Questions Submitted by Hon. Tom O'Halleran, a Representative in Congress from Arizona

Question 1. The vast majority of the Colorado River's headwaters originate in forested watersheds, which contain streams, wetlands, and meadows that capture snow melt and precipitation and provide critical water sources for communities, agriculture, and fish and wildlife. These forests and our natural water infrastructure in the Colorado River Basin are at risk from climate change, which contributes to more severe drought and wildfires. Within the context of the upcoming farm bill, where do you see the most opportunity to increase the pace and scale of investments of managing forests to increase drought and climate resilience? What are perhaps the most significant barriers that Congress could address to meet the scale of forest resilience necessary to respond to climate change?

Answer. Though the Forest Service has been working to manage the health of millions of acres of National Forests across the American West for decades, the scale, methods of work, and funding have not matched the need. In the West, climate change is making the fire and fuels problem even worse by reducing snow and rainfall and by increasing the frequency and duration of high winds and hot dry weather.

To address this crisis, the Forest Service launched a 10 year Wildfire Crisis Strategy to focus investments in landscapes where wildfire poses the most immediate threats to communities. Under this strategy, the Forest Service will work alongside partners to treat up to an additional 20 million acres on National Forest System lands and up to an additional 30 million acres of other Federal, state, Tribal and private lands. The Forest Service, through the Infrastructure Investment and Jobs Act (IIJA), has already made initial investments in ten landscapes across the West. In selecting these landscapes, the Forest Service considered where funding and other Federal investments could reduce exposure of people, communities, and natural resources to the risk of catastrophic wildfire.

The Four Forest Restoration Initiative (4FRI) in Arizona was one of the ten selected landscapes. The 4FRI Restoration Strategy outlines an approach to restore a landscape that includes six of the ten of the highest priority fireheds in the For-

est Service Southwestern Region. Multiple challenge/cost-share agreements and master stewardship agreements are already in place and are in development to implement the work in this landscape. 4FRI-associated watersheds capture, store, and release clean water to municipal, domestic, irrigation, and industrial uses for millions of people in the Phoenix metropolitan area and beyond. As outlined in the 4FRI Restoration Strategy, nine high priority partner projects will improve watershed conditions. One example is the Flagstaff Watershed Protection Project which will reduce the risk of severe wildfire and subsequent post-fire flooding in the Rio de Flag and Upper Lake Mary watersheds.

A second landscape in Arizona was selected as part of the Initial Landscape Investments under the Wildfire Crisis Strategy: Greater Prescott Area Wildfire Protection and Restoration. The project will improve overall ecosystem health and watershed function while reducing the wildfire threat to communities/areas, including but not limited to Prescott, Prescott Valley, Dewey, Humboldt, Mayer, Cottonwood, Crown King, Walker, Groom Creek, Ponderosa Park, Highland Pines, and Jerome. This project will meet the strategic treatment objective of restoring fire-adapted ecosystems to 40 percent of the landscape to reduce 80 percent of the exposure from wildfire.

Recently, \$65 million of IJJA funding was made available for investment in watershed restoration activities through the Collaborative Aquatics Restoration Program (CALR) and Legacy Roads and Trails Program. The Coconino National Forest in Arizona received funding for three separate projects, all of which will improve watershed conditions, reduce sedimentation, improve water quality, and improve wildlife habitat.

The funding from the IJJA and the Inflation Reduction Act (IRA) is a down payment for this work and will not cover the full costs of the treatments or maintenance work moving forward. The farm bill is a key piece of legislation that provides the agency and our partners critical tools to leverage these financial resources to get the work done. Authorities such as Stewardship Contracting, Good Neighbor Authority, Collaborative Forest Landscape Restoration Program, Wood Innovation Grants, and others authorized and expanded in past farm bills are critical in carrying out the 10 year implementation plan associated with the Wildfire Crisis Strategy, and help implement funding provided by the Infrastructure Investment and Jobs Act and Inflation Reduction Act. As Congress considers the next farm bill, we look forward to our work with the Committee to ensure the Forest Service has the tools it needs to address the wildfire crisis as well as successfully implement the full breadth of the Agency's mission.

Question 2 Ecologically based forest management practices, many of which are based on the extensive knowledge and practices of indigenous communities, such as prescribed burning and strategic mechanical thinning and nature-based solutions such as restoring high-elevation wetland and meadow systems have been shown to help manage climate risks to forest watersheds, including reducing post-fire impacts to critical water infrastructure and water quality. What steps have been made, or should be made to better deploy the full suite of forest management and restoration tools to enhance the resilience of forest watersheds and downstream water users to climate change risk?

Answer. The Watershed Condition Framework (WCF) is a tool the Forest Service uses to focus watershed restoration efforts on priority watersheds to return them to, or maintain them in, proper functioning condition. Proper functioning condition means a watershed is better able to withstand disturbances, including climate driven changes, without suffering lasting effects on water quantity, water quality, and aquatic communities. Climate vulnerability assessments and other climate change analysis tools inform the decisions to designate watersheds with priority status. Over the past 10 years, the Forest Service has completed restoration in 130 priority watersheds. There are another 324 designated priority watersheds with an estimated cost of \$800 million to restore. Currently, 53 percent of the 15,000 Forest Service watersheds are in proper functioning condition. The agency goal, with available funding, is to increase that to 54 percent by 2027, which means restoration of another 100 watersheds over the next 5 years.

As referenced above, climate vulnerability assessments are used to guide management or conservation actions and consider adaptive management or policy responses that may lessen negative impacts (or enhance positive impacts) of climate change and have been developed for most National Forests. Other tools that are used to enhance the resilience of forest watersheds and downstream water users to climate change risk include the Forested Watersheds Menu of Adaptation Strategies and Approaches and the recently-developed Streamflow in a Changing Climate application, which provides a variety of observed (historical) and predicted (mid-century

and end-of-century) streamflow metrics to help water resource practitioners understand effects of changing water metrics over time.

Finally, implementation of aquatic organism passages (AOPs) to benefit fisheries and other aquatic species also improves resilience in flood-prone areas while maintaining habitat connectivity. Funding the completion of AOP projects and other watershed-specific activities can contribute to the improvement of watersheds under the WCF.

- Restoring flood resiliency at road-stream crossings benefits active management by ensuring a functional road network and safe access valued by communities and partners.
- The agency's stream simulation design approach for AOPs increases transportation infrastructure resilience to flooding and helps maintain critical access for emergency response, recreation, and other economic activities for local communities.
- Prioritizing the upgrade or mitigation of undersized road-stream crossings represents a key agency climate change adaptation strategy to conserve important fish and aquatic species.

AOP projects are prioritized according to benefits to aquatic species, connectivity, flood potential, and essential projects identified under the WCF. Since 2008, the Forest Service has removed or improved more than 2,000 AOPs and is well on the way to improving another 1,500 AOPs by 2025.

Question Submitted by Hon. Eric A. "Rick" Crawford, a Representative in Congress from Arkansas

Question. Chief Moore, Blanchard Springs Caverns is a U.S. Forest Service-managed site in my district, located in Stone County, Arkansas. Blanchard Springs is a spectacular destination that attracts visitors from across Arkansas and the country. Not unlike other attractions, Blanchard Springs closed at the start of the COVID-19 pandemic. However, when other destinations were reopening in 2021 and early this year, Blanchard Springs has remained closed. In an email to my district staff on March 25, 2022, Forest Service staff outlined a very limited reopening set for June of July of this year. Unfortunately, upon inspection for reopening, significant problems with an elevator were discovered, necessitating repair. This is causing further delay of reopening.

Chief Moore, I am frustrated that a plan to reopen Blanchard Springs was not outlined until just a few months ago. With our knowledge of COVID-19, effective prevention measures, and personal risk assessment, the 2 year closure seems unreasonable. I understand that, until recently, the site did not have sufficient personnel, which might have been avoided with a quicker reopening. Now there is an actual problem—the elevator—which will cause further delay. Not to mention, distrust among the community that loves and supports Blanchard Springs. They want to work with you all to reopen this treasured attraction, and that will require meaningful outreach and transparent communication from your team.

My staff, along with staff from the office of Senator Boozman, had a positive meeting with your team from Arkansas and Atlanta on July 15, 2022. They indicated that the process to begin elevator repairs is underway and that they have sufficient staffing in place for projected reopening in late August.

When will Blanchard Springs Caverns reopen? Can you commit to working with our office to ensure Blanchard Springs is reopened as soon as possible and ensure communication with my team from your office?

Answer. Blanchard Springs Caverns reopened on August 18, 2022, after a 2 year closure. We are committed to ensuring clear communication with your office and the public regarding any questions related to the reopening.

**A 2022 REVIEW OF THE FARM BILL
(THE STATE OF CREDIT FOR YOUNG, BEGINNING, AND
UNDERSERVED PRODUCERS)**

THURSDAY, JULY 14, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 9:32 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: Representatives David Scott of Georgia, McGovern, Adams, Spanberger, Hayes, Brown, Rush, Sablan, Kuster, Bustos, Plaskett, O'Halleran, Carbajal, Lawson, Craig, Harder, Axne, Schrier, Bishop, Davids, Thompson, Austin Scott of Georgia, Crawford, DesJarlais, LaMalfa, Davis, Allen, Rouzer, Kelly, Bacon, Johnson, Baird, Balderson, Mann, Miller, Moore, Cammack, Fischbach, and Flores.

Staff present: Lyron Blum-Evitts, Rodney Brooks, Emily German, Josh Lobert, Lisa Shelton, Ashley Smith, Caleb Crosswhite, Trevor White, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. Good morning, everyone. The Committee will come to order. After brief opening remarks, Members will receive testimony from our witnesses today. And what a great subject and necessary and critical issue we will be dealing with, *A 2022 Review of the Farm Bill: The State of Credit for Young, Beginning, and Underserved Producers*, so important, so critical.

Before we get to our business today, I would like to take a moment and yield to my friend, our Ranking Member, the distinguished gentleman from Pennsylvania, to welcome our newest Member to the Agriculture Committee.

Mr. THOMPSON. Well, Mr. Chairman, thank you so much. It is a great honor and privilege to welcome the newest Member of the House Agriculture Committee, Ms. Mayra Flores from Texas. For those of you who do not know, Congresswoman Flores has an incredible personal story. She was born in Mexico, legally immigrated to the United States, and became a U.S. citizen at 6 years old. She worked alongside her parents in cotton fields to help pay for school, became a respiratory care practitioner, was a frontline worker during the COVID-19 pandemic, and now is a Member of Congress. She is truly an American success story, and I know we will all ben-

efit from her diverse experience and her passion for our country and the agricultural industry.

So, Mayra, welcome to the Committee, and I am certainly looking forward to working with you.

And with that, Mr. Chairman, I yield back.

The CHAIRMAN. And that statement, Ranking Member, goes for me as well.

Mr. THOMPSON. Excellent.

The CHAIRMAN. Welcome, Mrs. Flores. We are delighted to have you.

I am so excited about this hearing. This is a critical issue. We have to make sure that for generations and generations to come that we can have young and beginning farmers in place. And we have to make sure we are addressing those issues. And, so we are looking forward to hearing from each of you.

And I want to start out by saying that it should be noted that the average age of our farmers and ranchers in this country right now is approaching 60 years of age. That right there lets you know that this is a very important issue. It is a national and very critical issue. And we must ensure that there is a next generation of men and women who will take the place of those who are retiring from this grand occupation called farming. I am one of those who was a beginning farmer growing up on my grandfather's farm, and I know the meaning of that. And this is very critical to me.

And credit is one of those tools that we must make readily available. We have to do that. Farming is expensive now. Just going out and trying to get an acre of land is right now at the \$5,000 level. Just think of that. So this is why farming and ranching, which are not exact sciences, but there are ebbs and there are flows. And capital is needed throughout various times before, during, and after the growing season. And now we are having such drastic weather changes, but the farming must go on. And we have to be there with the resources to help our beginning farmers.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning, I'm grateful to be here today to hold another full Committee hearing to review the credit title of the 2018 Farm Bill with a focus on our young, beginning, and underserved farmers and ranchers.

I am also excited for the opportunity to continue to work with my colleague, Ranking Member Thompson of Pennsylvania, who shares an interest in this area.

Our young, beginning and underserved producers face difficulties in obtaining credit that our more seasoned and established producers may not encounter.

Historically, these groups of producers tend to have financial positions that are less desirable to lenders. Their financial position may be linked to a very limited production history that has not allowed for much equity to be gained in their operations or the smaller scale of production that they are engaged in, among other factors.

It should be noted that the average age of our farmers and ranchers in this country is approaching 60 years of age. We must ensure that the next generation of men and women who take the place of those retiring from this grand occupation have the tools necessary to continue to produce the food and fiber that we rely on for our existence.

Credit is one of those tools that we must make readily available to all our producers especially the young, beginning, and underserved.

Access to capital, but even more so, access to credit, is a pillar to establishing a successful agricultural operation. Farming and ranching are not an exact science

thus there are many ebbs and flows. Capital is needed throughout various times before, during, and after the growing season.

Credit access and availability is vitally important to keep a farming operation afloat. A well drafted and realistic farm business plan that displays positive cash flow is required to obtain sufficient credit, whether it be from Farm Service Agency (FSA), the Farm Credit System (FCS), commercial bankers or any other financial entity.

The FSA, Farm Credit System, and commercial bankers account for over 80% of the total outstanding farm loan debt and we want to ensure that these loan programs are meeting the needs of all our farmers and ranchers.

Today, we have a broad range of witnesses before us who will discuss credit. I am eager to learn how changes enacted in the 2018 Farm Bill have affected our producers and how we can improve these programs through effective policy decisions.

The CHAIRMAN. And with that, Mr. Ranking Member, I am going to turn it over to you for your opening statement.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. All right, Chairman Scott, thank you so much for convening this important hearing to assess credit issues in rural America. For any agriculture operation, one of the most critical relationships a farmer may have is with his or her lender. This is especially true for our young and beginning producers. Farming is capital-intensive. The cost of entry is incredibly high and can act as a barrier to entry for these new agriculturalists trying to start or grow their farm operations.

Unfortunately, because of the significant financial risk, some new borrowers are unable to secure commercially available credit, which is where the critical credit programs authorized by the farm bill step in. Direct and guaranteed ownership and operating loans delivered by the Farm Service Agency can provide the necessary funds to start or to grow a farm operation and set-asides for beginning farmers and ranchers ensure new operations have access to these loans.

As a part of the discussion today, I hope we learn what impact inflation is having on the financial health of our farmers. The announcement yesterday showing the consumer price index up 9.1 percent, highest rate in 41 years, has me incredibly concerned for the future of farm operations and for the ability of these credit programs to continue to provide the necessary funding for operations in this high-cost environment.

For me, the measure of success of our credit programs is the ability of borrowers to utilize their loans to get their operations on solid financial footing and eventually obtain access to commercially available credit. With soaring costs, I fear we may be going the opposite direction over the next several years, and we must ensure our Credit Title is adequate to weather the storm.

As many may know, the average age of a farmer is approaching 60 and is on an upward trend. FSA's credit programs can play a role in helping farm operations transition to the next generation, but we cannot examine them in a vacuum. Rather than simply pushing programs that allow producers to borrow more, the Committee should also be looking at solutions that help things cost less and reduce the reliance of young and beginning farmers on government loans.

Mr. Chairman, I would like to ask unanimous consent to enter into the record a letter that I, Leader McCarthy, and 94 House Members sent to President Biden on June 14.

The CHAIRMAN. Without objection.

[The letter referred to is located on p. 1363.]

Mr. THOMPSON. Thank you, sir. This letter identifies tangible steps the Administration could take immediately to address rising farm input costs and provide regulatory certainty for our producers. Reducing these costs will help all farmers, ranchers, and eventually consumers, but those who would see the biggest positive impact would be our young and beginning farmers and producers.

Many farmers and ranchers will borrow more in each growing season than the average American will borrow in their lifetime. But year in and year out our producers take this huge financial risk because they believe in the work that they are doing. They believe in living and raising a family in rural America. And with the right combination of policies, including our credit programs, we can help our farmers feed and clothe both this nation and the world.

So thank you to the witnesses who are here today, and I look forward to hearing your testimony. Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, Ranking Member.

And the chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony and to ensure that there is ample time for questions.

[The prepared statement of Mr. Carbajal follows:]

PREPARED STATEMENT OF HON. SALUD O. CARBAJAL, A REPRESENTATIVE IN
CONGRESS FROM CALIFORNIA

Thank you, Mr. Chairman, and thank you to the witnesses for testifying before this Committee today.

It is vital that Congress empowers young, beginning, and underserved producers to become farmers that can contribute to our nation's food supply and economy. We should be working with USDA to make accessing credit and other resources needed to start farming as easy as possible. Access to resources have improved over the years but we can continue to do more.

And let me welcome our five distinguished witnesses again, and say thank you for taking some of your valuable time to come help us with this very, very important issue. And let me introduce our panel at this time. Our first witness today is Dr. Nathan Kauffman. And Dr. Kauffman is the branch Executive Assistant Vice President, and Economist for the Federal Reserve Bank of Kansas City. Welcome, Mr. Kauffman.

And our next witness today is Ms. Dañia Davy, who is a board representative for the Alcorn State University Socially Disadvantaged Farmers and Ranchers Policy Research Center.

And now to introduce our third witness today, I am pleased to yield to my good friend, the gentleman from Georgia, Mr. Austin Scott.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. Thank you, Chairman Scott.

And it is my great privilege to welcome Ms. Julia Asherman of Jeffersonville, Georgia. She is a first-generation farmer. She owns Rag & Frass Farm and is testifying today on behalf of the National Young Farmers Coalition. She does a wonderful job advocating for them. And I have been to her place in Jeffersonville. And she is not

originally from Georgia. I am glad she has decided to move to the 8th District and have her farming operation there. And I think most interestingly about Julia is she actually claims to have made peace with the fire ants.

The CHAIRMAN. That is very good.

Mr. AUSTIN SCOTT of Georgia. I know nobody who has been able to make that, so perhaps she could explain that from her website in a little while. Julia, we are happy to have you here today and look forward to your testimony.

The CHAIRMAN. I thank the gentleman.

And now our fourth witness today is Mr. Willard Tillman, a Member of the Board of the Rural Coalition.

And to introduce our fifth and final witness, I am pleased to yield to the gentleman from Illinois, Mr. Davis.

Mr. DAVIS. Thank you, Mr. Chairman. It is always good to see you. And thank you, Ranking Member.

I am hoping to be in person here before this hearing is done, but I did want to take the opportunity to introduce my good friend, Adam Brown. Adam and I have been friends for over a decade. Adam is the epitome of what a young farmer should be like and how to actually take a multi-generation operation and make it his own. Adam is a former state legislator in my home State of Illinois. He did a phenomenal job representing many areas that I have been able to represent over the last 10 years in central Illinois.

Adam, it is great to see you there. I am going to come in personally and harass you in just a few minutes. But welcome. We certainly look forward to your testimony.

And I will yield back the balance of any time you have given me, Mr. Chairman.

The CHAIRMAN. Thank you.

And now I want to again just say welcome to all of our witnesses. And now we will proceed with your testimony.

And our first witness will be Dr. Kauffman. Please begin when you are ready.

STATEMENT OF NATHAN S. KAUFFMAN, PH.D., ASSISTANT VICE PRESIDENT, ECONOMIST, AND OMAHA BRANCH EXECUTIVE, FEDERAL RESERVE BANK OF KANSAS CITY, OMAHA BRANCH, OMAHA, NE

Dr. KAUFFMAN. Well, good morning, Chairman Scott, Ranking Member Thompson, and other Members of the Committee. Thank you for the opportunity to testify today. My name is Nate Kauffman, and I serve as Vice President and Economist with the Federal Reserve Bank of Kansas City. In my role, I lead several Federal Reserve System efforts to track economic conditions in U.S. agriculture, with a focus on farm finances and agricultural credit conditions. Because the industry is vital to the region we serve, the Kansas City Fed is committed to understanding developments in agriculture and including perspectives from rural America in national discussions on the economy.

I am here today to share an overview of credit conditions in the U.S. farm sector, but before I begin, let me emphasize that my statement represents my views only and is not necessarily that of the Federal Reserve System or any of its representatives.

Agricultural credit conditions have improved significantly the past 2 years, alongside a rebound in farm commodity prices that began in late 2020. Prior to the pandemic, the U.S. farm economy had been in a prolonged downturn. From 2013 to 2016, farm income dropped by 50 percent, alongside sharp declines in commodity prices and elevated input costs. Although farm income increased modestly from 2016 to 2019, profits generally remained low. Measures of agricultural credit indicated that financial stress was building at a gradual pace through 2019 with increases in loan delinquencies and farm bankruptcies during that time.

Despite disruptions associated with the pandemic, economic conditions in agriculture have recovered dramatically since 2019. In the initial months of the pandemic, in 2020, agricultural prices had continued declining, but many of those prices began to recover later that year and remained elevated even in advance of Russia's invasion of Ukraine. By February of this year, the price of corn for example, was 65 percent higher than 2 years earlier. The prices of other major crops also increased sharply alongside strengthening economic activity and reduced production in several key growing areas. In addition to higher commodity prices, robust government aid programs administered during 2020 and 2021 also provided substantial financial support for many producers.

The recent rebound in farm incomes has eased much of the financial stress that had been building prior to the pandemic. Through 2020, working capital increased substantially, and borrowers remained in a strong financial position through 2021. By the end of last year, the rate of delinquent farm loans held at commercial banks dropped to 1.3 percent following steady increases in prior years. The average value of farm real estate, a key indicator of financial health in the U.S. farm sector, increased by nearly 30 percent from the end of 2019 to the end of 2021 across the Midwestern U.S.

Although agricultural prices have surged in recent years, input costs were also significantly increasing even before the war. Prior to the invasion of Ukraine, U.S. farm production expenses were expected to be 18 percent higher in 2022 than in 2019. The average cost of fertilizer was expected to be 43 percent higher. Since the invasion in February, many of these costs have continued to increase, highlighting a potential need for increased financing amid global concerns about food shortages and food price inflation. In recent months, a modest increase in farm loan interest rates has also contributed to higher production expenses, albeit to a lesser extent.

Despite growing concerns about intensifying cost pressures, agricultural credit conditions have generally remained strong in recent months. Since the beginning of this year, the value of farmland in the Kansas City Fed region has increased by an additional five percent through June. Most lenders indicate that loan repayment rates have continued to rise, problem loans have remained sparse, and credit is readily available to meet borrowers' financing needs.

Although economic conditions in agriculture have recovered the past 2 years and credit conditions have remained solid, the pace of improvement may be slowing. Through 2021, demand for farm operating loans declined steadily as profits expanded, and producers required less financial support from lenders. In the first quarter of

2022, however, lending activity at commercial banks accelerated due to a significant increase in the size of operating loans. Looking ahead, demand for farm loans in the Kansas City Fed district is expected to rise notably, and capital spending is expected to decline in the coming months for the first time since 2020. Numerous contacts have pointed to large increases in costs associated with fertilizer, fuel, and labor as primary drivers of higher expenses and a less favorable industry outlook.

To briefly summarize, uncertainty about the outlook for the U.S. agricultural economy is high and will depend significantly on global factors, particularly the war in Ukraine and the strength of global economic activity. Overall, the U.S. farm sector appears to be well-positioned financially for the remainder of 2022, but some measures do appear to have softened in recent weeks, and some producers may face more substantial credit challenges than others.

While the strength of farm income these past 2 years is likely to sustain credit conditions in agriculture for some time, some borrowers may face heightened financial stress in the year ahead if costs continue to rise and commodity prices ease further.

This concludes my formal remarks. I will be happy to take questions at the appropriate time.

[The prepared statement of Dr. Kauffman follows:]

PREPARED STATEMENT OF NATHAN S. KAUFFMAN, PH.D., ASSISTANT VICE PRESIDENT, ECONOMIST, AND OMAHA BRANCH EXECUTIVE, FEDERAL RESERVE BANK OF KANSAS CITY, OMAHA BRANCH, OMAHA, NE

Good morning, Chairman Scott, Ranking Member Thompson, and other Members of the Committee. Thank you for the opportunity to testify today. My name is Nate Kauffman, and I serve as a Vice President and Economist with the Federal Reserve Bank of Kansas City. In my role, I lead several Federal Reserve System efforts to track economic conditions in U.S. agriculture, with a focus on farm finances and agricultural credit conditions. Because the industry is vital to the region we serve, the Kansas City Fed is committed to understanding developments in agriculture and including perspectives from rural America in discussions on the national economy. I am here today to share an overview of credit conditions in the U.S. farm sector. Before I begin, let me emphasize that my statement represents my views only and is not necessarily that of the Federal Reserve System or any of its representatives.

Agricultural credit conditions have improved significantly the past 2 years alongside a rebound in farm commodity prices that began in late 2020. Prior to the pandemic, the U.S. farm economy had been in a prolonged downturn. From 2013 to 2016 farm income dropped by 50% alongside sharp declines in commodity prices and elevated input costs. Although farm income increased modestly from 2016 to 2019, profits generally remained low. Measures of agricultural credit indicated that financial stress was building at a gradual pace through 2019, with increases in loan delinquencies and farm bankruptcies during that time.

Despite disruptions associated with the pandemic, economic conditions in agriculture have recovered dramatically since 2019. In the initial months of the pandemic in 2020, agricultural prices had continued declining, but many of those prices began to recover later that year and remained elevated even in advance of Russia's invasion of Ukraine. By February of this year, the price of corn, for example, was 65% higher than 2 years earlier. The prices of other major crops also increased sharply alongside strengthening economic activity and reduced production in several key growing areas. In addition to higher commodity prices, robust government aid programs administered during 2020 and 2021 also provided substantial financial support for many producers.

The recent rebound in farm incomes has eased much of the financial stress that had been building prior to the pandemic. Through 2020, working capital increased substantially, and borrowers remained in a strong financial position through 2021. By the end of last year, the rate of delinquent farm loans held at commercial banks dropped to 1.3%, following steady increases in prior years. The average value of farm real estate, a key indicator of financial health in the U.S. farm sector, in-

creased by nearly 30% from the end of 2019 to the end of 2021 across the Midwestern U.S.

Although agricultural prices have surged in recent years, input costs were also increasing significantly even before the war. Prior to the invasion of Ukraine, U.S. farm production expenses were expected to be 18% higher in 2022 than in 2019. The average cost of fertilizer was expected to be 43% higher. Since the invasion in February, many of these costs have continued to increase, highlighting a potential need for increased financing amid global concerns about food shortages and food price inflation. In recent months, a modest increase in farm loan interest rates has also contributed to higher production expenses, albeit to a lesser extent.

Despite growing concerns about intensifying cost pressures, agricultural credit conditions have generally remained strong in recent months. Since the beginning of this year, the value of farmland in the Kansas City Fed region has increased by an additional 5% through June. Most lenders indicate that loan repayment rates have continued to rise, problem loans have remained sparse, and credit is readily available to meet borrowers' financing needs.

Although economic conditions in agriculture have recovered the past 2 years, and credit conditions have remained solid, the pace of improvement may be slowing. Through 2021, demand for farm operating loans declined steadily as profits expanded and producers required less financial support from lenders. In the first quarter of 2022, however, lending activity at commercial banks accelerated due to a significant increase in the size of operating loans. Numerous contacts have pointed to large increases in costs associated with fertilizer, fuel, and labor as primary drivers of higher expenses and a less favorable industry outlook.

To briefly summarize, uncertainty about the outlook for the U.S. agricultural economy is high, and will depend significantly on global factors, particularly the war in Ukraine and the strength of global economic activity. Overall, the U.S. farm sector appears to be well positioned financially for the remainder of 2022, but some measures do appear to have softened in recent weeks. While the strength of farm incomes these past 2 years is likely to sustain credit conditions in agriculture for some time, some borrowers may face heightened financial stress in the year ahead if costs continue to rise and commodity prices ease further.

This concludes my formal remarks and I would be happy to answer questions at the appropriate time. Thank you.

The CHAIRMAN. Thank you so much, Dr. Kauffman.
Next is Ms. Davy. Please begin when you are ready.

STATEMENT OF DĀNIA C. DAVY, J.D., BOARD REPRESENTATIVE, SOCIALLY DISADVANTAGED FARMERS AND RANCHERS POLICY RESEARCH CENTER, ALCORN STATE UNIVERSITY; DIRECTOR OF LAND RETENTION AND ADVOCACY, FEDERATION OF SOUTHERN COOPERATIVES/LAND ASSISTANCE FUND, EAST POINT, GA

Ms. DAVY. Mr. Chairman and esteemed Members of the House Agriculture Committee, I am extremely honored to have this opportunity to highlight ongoing credit access challenges Black farmers, landowners, and cooperatives continue to face despite credit access improvements in the 2018 Farm Bill.

My name is Dānia Davy, and I serve as a board representative of the Socially Disadvantaged Farmer and Rancher Policy Research Center at Alcorn State University. My legal career has afforded me the opportunity to serve rural Black Americans, starting with my Skadden legal fellowship at a nonprofit law firm in North Carolina and performing outreach to socially disadvantaged farmers and ranchers in the *Pigford II*, *Keepseagle*, *Garcia*, and *Love* class-action discrimination settlements, and currently through the Federation of Southern Cooperatives/Land Assistance Fund, where I serve as Director of Land Retention and Advocacy.

I appear before you today from the Mississippi Association of Cooperatives in Jackson, Mississippi, where our legal team is providing estate planning services via our mobile estate planning clinic, which has brought us from Opelousas, Louisiana, to Jackson, and this weekend we will travel to Epes, Alabama. Along the way, we have had the opportunity to meet with many of our members consisting of Black farmers, landowners, and cooperatives that have stewarded the Federation throughout our 55 year history. This has been a deeply enlightening experience and a timely opportunity for us to hear directly from our members, which has largely been limited to virtual meetings due to the ongoing pandemic that continues to disproportionately devastate rural Black America.

This year, the Federation has hosted monthly listening sessions with our members, communities, and allied organizations, the most recent of which was focused on our members' credit access. Leading this work has given me specific insight into the deleterious impact of credit access challenges and ongoing corresponding disproportionate debt burden, loss of land, livelihood, and legacy for rural Black America.

I have spoken to a Black farmer in the Midwest who was unable to purchase the certified organic farm he sought because of the lengthy and duplicitous loan application process with his local Farm Service Agency. Despite the farmer's ability to cash flow his proposal and extensive farm management experience, the loan officer refused to approve the loan because the officer advised the farmer that the home on the farm was too nice.

A Black farmer in North Carolina shared with me that she was unable to expand her farm operations when she was discouraged from submitting her microloan application by her local FSA agent. Her loan officer advised her that she would need to collateralize her \$50,000 microloan with her home, which far exceeded the microloan value. The FSA agent encouraged her to use credit cards to finance her farm instead of applying for a microloan.

Perhaps the most disturbing story I have heard is from a Black rancher in Texas who first contacted us seeking assistance when the debt relief promise last year was delayed, putting his farm operations in a devastating limbo. In our most recent conversation, he further emphasized the vulnerability of his operation due to the combination of an unrelenting drought, extremely high input costs, and the uncertainty surrounding his promised farm loan debt relief, which put him at risk of losing his farm, thereby repeating the pattern of disproportionate land loss that cost his grandfather his entire farm operation, many acres of which this farmer has dutifully recovered to keep his farm ranching legacy alive and pass it on to his children. Despite my assurances of a farm foreclosure moratorium, he referenced contemplating suicide as he has taken the heartbreaking step of initiating the liquidation of his livestock and land to avoid foreclosure.

Access to credit is the lifeblood of any farm or ranch operation. Without it, no farmer can meet the demands of acquiring or accessing land, developing critical infrastructure, or purchasing inputs. The changes in credit access in the 2018 Farm Bill did not anticipate the devastation caused by the global pandemic and thus did

not go far enough to address the credit needs of farmers on the ground today.

Dating as far back as Reconstruction, Black farmers have been disproportionately denied credit or provided less favorable terms, a trend that is so well-documented as to be common knowledge. The longstanding history of race-based discrimination in credit access, properly resulted in the race-based class-action litigation against the USDA. As one devastating consequence of disparate credit access, Black farmers have been at least three times more likely to lose their land compared to White farmers during the same time period.

Our farmers are their communities' first responders. Not only do they perform the critical feat of feeding their families and communities, they create jobs, stimulate rural economies, and lay the foundation for thriving self-sufficient rural regions. As we review the farm bill and prepare for the scheduled reauthorization, we must make use of the opportunity to prevent the looming threat of loss of Black farms, land, and livelihoods that has been institutionalized by racially disparate credit access.

As the farmer stories I have shared this morning have outlined, our farmers need a more flexible, transparent, and streamlined FSA and loan application process. One way to do so is to simplify the first \$100,000 of any farm loan in line with the existing microloan process. This will accomplish both an increased limit for microloans and position our farmers to acquire their initial inputs and establish their initial infrastructure more expeditiously. For any loans that exceed \$100,000, we recommend alignment on farm ownership and farm operating loans to the farm ownership loans \$600,000 limit. There is already a process in place for evaluating a loan application's ability to cash flow up to the \$600,000 limit. And with the increased cost of all inputs, we need our farmers to have access to increased operating loan amounts to remain competitive.

Finally, our farmers need support and resources to develop a financial institution owned and controlled by farmers of color which accomplishes the same rural credit access as the existing Farm Credit System. I humbly submit this testimony. Thank you for the time.

[The prepared statement of Ms. Davy follows:]

PREPARED STATEMENT OF DĀNIA C. DAVY, J.D., BOARD REPRESENTATIVE, SOCIALLY DISADVANTAGED FARMERS AND RANCHERS POLICY RESEARCH CENTER, ALCORN STATE UNIVERSITY; DIRECTOR OF LAND RETENTION AND ADVOCACY, FEDERATION OF SOUTHERN COOPERATIVES/LAND ASSISTANCE FUND, EAST POINT, GA

Mr. Chairman and esteemed Members of the House Agriculture Committee, I am extremely honored to have this opportunity to highlight ongoing credit access challenges Black farmers, landowners and cooperatives continue to face despite changes to credit access in the 2018 Farm Bill.

My name is Dania Davy and I serve as Director of Land Retention and Advocacy for the Federation of Southern Cooperatives/Land Assistance Fund. As you may be aware, the Federation is a Board member of the Socially Disadvantaged Farmer & Rancher Policy Center of Alcorn State University. I have the distinguished privilege of speaking on behalf of both the Federation and the Policy Center.

My legal career has afforded me the opportunity to serve rural, Black Americans starting with my Skadden legal fellowship at a nonprofit law firm in North Carolina, then performing outreach to Socially Disadvantaged Farmers & Ranchers in the *Pigford II*, *Keepseagle*, *Garcia & Love* class action discrimination settlements,

and now through the Federation, a regional nonprofit cooperative association of cooperatives, I serve members throughout the South.

I appear before you from the Mississippi Association of Cooperatives office in Jackson, Mississippi where our legal team is providing estate planning services via our mobile estate planning clinic which has brought us from Opelousas, Louisiana to Jackson and this weekend we will travel to Epes, Alabama. Along the way, we have had the opportunity to meet with many of our members, consisting of Black farmers, landowners and cooperatives that have governed the Federation throughout our 55 year history. It goes without saying that this has been a deeply enlightening experience and a timely opportunity for us to hear directly from our members which has largely been limited to virtual meetings due to the ongoing pandemic that continues to disproportionately devastate Black, rural America.

Earlier this year, the Federation became an intervening party in defense of the American Rescue Plan Act Section 1005 Emergency Debt Relief for Farmers and Ranchers of Color in the *Miller v. Vilsack* case which is currently pending in the Northern District of Texas. We have also hosted monthly listening sessions with our members, communities, and allied organizations, the most recent of which was focused on credit access. This work has given me specific insight into the deleterious impact of credit access challenges and the corresponding disproportionate loss of land, livelihood, and legacy for rural, Black America.

I have spoken to a Black farmer in the Midwest who was unable to purchase the certified organic farm he sought because of lengthy and duplicitous loan application process with his local FSA because the loan officer felt the home on the farm was too nice despite the farmer's ability to cash flow his proposal and extensive farm management experience.

A Black farmer in North Carolina shared with me that she was unable to expand her farm operations when she was discouraged from submitting her microloan application by her local FSA agent who encouraged her instead to use credit cards to finance her farm.

But perhaps the most disturbing story I have heard is from a Black rancher in Texas who made a tongue in cheek joke about committing suicide. Despite my assurance of a farm foreclosure moratorium, this rancher has lost faith that he will ever receive the debt relief he was promised. He also expressed that the cost of maintaining his operation in light of the drought he is facing as well as extremely high input costs keep him in a constant state of severe emotional distress. He has taken the heartbreaking step of initiating the liquidation of his livestock and land to avoid foreclosure—a terrifying position he finds himself in because he believed in his government's promise of debt relief last year under Section 1005 of the American Rescue Plan.

Access to credit is the lifeblood of any farm or ranch operation. Without it, no farmer can meet the demands of acquiring or accessing land, developing critical infrastructure, or purchasing inputs. The changes to the 2018 Farm Bill simply do not go far enough to address the credit needs of farmers on the ground today.

Farmers are their community's first responders, not only do they perform the critical feat of feeding their families and communities, but they create jobs, stimulate rural economies, and lay the foundation for thriving self-sufficient rural regions.

As we review the farm bill and prepare for the scheduled reauthorization next year, we cannot forget about the real challenges our farmers are facing because of the delayed implementation of Section 1005 of the American Rescue Plan as passed by Congress and signed by the President. Our nation cannot risk the looming threat loss of Black farms, land, and livelihoods that this delay has created. The only solution to this threat is that all promised debt relief must be honored.

As the farmer stories I have shared this morning have outlined, our farmers need a more flexible, transparent, and streamlined Farm Service Agency loan application process. One way to do so is to simplify the first \$100,000 of any loan in line with the existing microloan process. This will accomplish both an increased limit for microloans and position our farmers to acquire their initial inputs and establish their initial infrastructure more expeditiously. For any loans that exceed \$100,000, we recommend alignment on farm ownership and farm operating loans to the farm ownership loan's \$600,000 limit. There is already a process in place for evaluating a loan application's ability to cash flow up to the \$600,000 limit and with the increased cost of all inputs, we need our farmers to have access to increased operating loan amounts to remain competitive. Finally, our farmers need support and resources to develop a financial institution, owned and controlled by farmers of color, which accomplishes the same rural credit access as the existing Farm Credit System.

I humbly submit this testimony and recommendations for your consideration.
Thank you.

The CHAIRMAN. Thank you so much, Ms. Davy.
And now, Ms. Asherman, please begin when you are ready.

**STATEMENT OF JULIA ASHERMAN, OWNER, RAG & FRASS
FARMS, LLC, JEFFERSONVILLE, GA; ON BEHALF OF
NATIONAL YOUNG FARMERS COALITION**

Ms. ASHERMAN. Thank you to the Honorable David Scott and Glenn “G.T.” Thompson for holding this hearing and for the opportunity to testify on this important topic. My name is Julia Asherman. I am the owner and operator of Rag & Frass Farm, a 3 acre certified organic vegetable and specialty cut flower farm in rural central Georgia. I have been farming for the past 13 years, the last 10 of which were on my own farm. I employ five people, three full-time and two part-time year-round. We produce and sell 12 months a year, and I do this with no off-farm income.

I am a first-generation farmer who grew up in the city. I learned to farm by trial and error, borrowing equipment from neighbors and learning lessons the hard way. The learning curve was very steep for all aspects of the farm: production, marketing, and running a business. In 2017, I was able to purchase my land with an FSA direct ownership loan. In 2019, I used a Farm Credit loan to buy our home next to the farm. And last year, I used an FSA operating microloan to buy a bigger delivery vehicle.

My farming story is unusual, and my written testimony includes a longer account with more specifics on the process and the barriers. If you take away one message from my testimony today, I hope it is that my experience, while a success story, highlights the roadblocks, risks, and layered complex challenges that young farmers face in accessing credit and finding secure land tenure. I am extremely grateful for the programs that do exist. I know they are part of the reason I am farming today.

When I bought my land in 2017, I had been in business and farming on it for 4 years prior. During that time, I kept detailed production and sales records. These records would become the most important factor in accessing USDA credit. I had no money for a down payment. All I had was experience and proof that it could be done.

My property was marginal land with buildings in poor condition in an unpopulated rural area 2 hours away from any major markets. If any of these factors had been different, it would be unlikely that the seller would wait for me and my FSA process, which took months. The process is quite slow with many steps going back and forth and no pre-approval options. Farmers easily lose out on potential properties by not being able to act fast, and I have known several farmers personally who have not been able to use FSA loans to purchase for this reason.

Diversified farms have the additional burden of fitting our business models into a framework that wasn’t designed to accommodate them. This is frustrating to the borrower and doesn’t build confidence in the application process or the USDA processes in general and is frustrating and more work for the loan officer as well. Any program that requires significant paperwork for what is essentially a gamble is not realistically geared towards being accessible to most farmers most of the year. Often, the cost of wasting time in

the moment is higher than the potential return down the road, and farmers are constantly forced to weigh our options this way.

Some of the loan process depends on a loan agent's familiarity with the type of operation you run. Beginning farmers often do things differently than the farmers many loan officers are used to. We are more likely to be organic; we are more likely to be diversified; we are more likely to be a smaller scale with more focus on specialty crops; we are more likely to direct market; we are more likely to be women, queer, people of color; and we are more likely to be first generation. These factors impact the business model and expectations of the borrower and contribute to the shared fluency or lack thereof between the borrower and the lender. Looking back, I can see my success with USDA loans was due in large part to luck, timing, and persistence.

I want to thank you for the past improvements such as the microloan program and for increasing overall loan limits for direct farm ownership loans. I hope that you continue this work in the upcoming farm bill. Specifically, I ask that you establish clear processes to implement a pre-approval mechanism for FSA direct farm ownership loans so that farmers do not lose out on farm ownership opportunities. I also recommend that USDA index direct farm ownership loan limits to inflation so that farmers can bring competitive offers to the table.

Last, Black, indigenous, and farmers of color need equitable access to USDA programs across the board, and this is especially true with access to credit.

Thank you so much for your consideration of my testimony and for listening to the voices of farmers.

[The prepared statement of Ms. Asherman follows:]

PREPARED STATEMENT OF JULIA ASHERMAN, OWNER, RAG & FRASS FARMS, LLC,
JEFFERSONVILLE, GA; ON BEHALF OF NATIONAL YOUNG FARMERS COALITION

Thank you to the Honorable David Scott and Glenn 'G.T.' Thompson for holding this hearing, and for the opportunity to testify on this important topic.

My name is Julia Asherman and I am the owner and operator of Rag & Frass Farm, which I started in late 2012. I farm 3 acres of certified organic vegetables and specialty cut flowers in rural central GA. I employ five people, three full-time and two part-time, year-round. We grow and sell 12 months a year, and I do this with no off-farm income. Until this year, when I had a baby, I worked 7 days a week. Now I work 6 days a week. Farming is mentally and physically challenging but I am pleased that I found my calling, and hope my testimony is helpful to your policy decisions and to other farmers.

I grew up in the city, born and raised in Boston and went to college in Chicago. I hail from several generations of proud gardeners. As a child my family would regularly drive 2 hours to southern Vermont where my grandparents had family land. This land is no longer in my immediate family, but it holds a piece of my heart. It is where I learned to love the country, walk the woods, and where I formed the foundational experiences that would direct me to farming later on.

While in Chicago, I studied printmaking and metal sculpture, and dabbled in bike mechanics on the side. Indirectly these experiences lead me to farming: the tools, the creation, the problem-solving, working with my hands, and getting dirty.

While in school I realized I wanted to live in the country, to carve out a piece of land and be self-sufficient. In 2009 I graduated and took the first cheap land opportunity I found, bringing me to rural central Georgia to a run down 1970's conventional hog farm. There I set to work turning it into a sustainable market garden with trial and error. There were *a lot* of errors. The learning curve was steep, and I had many hard lessons. Unexpectedly, the benefit to not learning from a more experienced mentor is I had no one telling me what was or was not possible.

It took 3 years of ‘faking it till I made it’ (and books, the internet, *etc.*) to get to a 1 acre small farm, selling at market, with customers. Initially, having not worked on a farm, I thought having one would be like having a big garden. I quickly realized it meant actually running a complex small business. I kept records, mostly so I could try to repeat my successes and minimize mistakes. I didn’t know then that the harvest and sales records would be the most important thing I created.

In early 2012, I was evicted. The land was abruptly no longer available to me, and I had to abandon the small farm I had worked the past 3 years on. I was a landless farmer. I had poured myself into creating my little farm, built infrastructure, but failed to get a clear written lease. This devastating experience was a wake up call to the risks of being a tenant farmer and the fragileness of a handshake agreement. It also planted the seeds of the benefit and security to land ownership.

I moved to a bigger and much more established farm a few hours away and worked as an employee for a season. It was one of the first certified organic farms in the state, and was 10+ acres of veggies and produce. This was a much bigger scale, with more equipment and mechanization. I was part of a 5–10 person crew and helped manage harvests, market, and planning. During this time I realized I never wanted to have tenuous land arrangements again, and I also didn’t want to work on just any farm, I wanted to work on my own farm. A farmer friend suggested I look into FSA loans. My first reaction was a hard ‘NO’, simply because I didn’t want to go back into debt after paying off my college debt. As I researched buying land, it sank in that I would never be able to own anything significant, like land, without debt.

It sounds crazy to say I found my land on Craigslist, but I did. 54 acres with an old fixer upper motel, old storefront, barn, pasture, pond, woods; in Jeffersonville, GA, a small town with 1,500 people and one flashing red light.

By early 2013 I had moved to the property with a sales contract, a business plan, and FSA loan application. When I moved I had \$2,000 in my bank account, my 1994 Chevy, two dogs and a cat. I was lucky and found a real estate attorney who took interest in my plan and drafted my purchase and lease agreements for a bargain. I borrowed a tractor from one of my ‘old man friends’. I disassembled and moved greenhouses that I got cheap from out-of-business nurseries, and put them up again. During the winter of 2012 when I moved to the land, I had no working electricity, no well or running water, and no heat. It was very rustic, I was resourceful, and I got crops in the ground 3 months later. I did not use any operating loans to get off the ground, I saved my debt for the land, and hobbled along for a few years, reinvesting as I went.

I was a tenant on the property (with a frequently renewing sales contract) for 4 years before closing on the property in 2017 with an FSA Direct Ownership Loan for \$75,000. The land had a lien on it, had underground storage tanks from an old gas station, and the seller was in a foreclosure/bankruptcy process, all of which added years to the process. By the time I bought the farm, I was fully in business growing on 3 acres. During the time that I was waiting to buy the land, I was farming and keeping records. These production and sales records, along with the records from the first farm I managed, were the most important factor in accessing USDA credit. I had no money for a down payment, all I had was experience and proof that it could be done.

So far the story sort of sounds like the ‘American dream’. However, in hindsight, my success with FSA has been due to a few specific lucky factors:

I am a persistent and stubborn person—not the giving up type. I stuck with the paperwork, the county loan officers, and did my homework enough that I could make it work, and sufficiently negotiate the deal with both the seller and lender. However, most farmers are busy and use their time strategically. Any program that requires significant frustrating paperwork and a lot of effort, for what is essentially a gamble, is not really geared toward being accessible to most farmers, most of the year. The cost of wasting time right now can outweigh the hypothetical benefits down the road. Having the right documents and records at your fingertips during the right time of year is a must, to make everything come together. Even then, a lot depends on the loan agent’s understanding of the type of operation you run. Beginning farmers often do things differently from the farmers my loan officers are used to working with: we are more likely to be organic or sustainable; we are more likely to be diversified; we are more likely to be smaller scale (with more focus on specialty crops); we are more likely to be direct market; we are more likely to be women, queer, people of color; and we are more likely to be first generation.

Luckily, I was able to successfully navigate the timeline. I was able to secure a lease in addition to a sales contract, and this was because the seller was motivated to sell. The property was on the market for a while, it was not in a desirable or populated area, and the condition of the buildings was poor. I was the only person

interested in it, and that was great for me and the seller. If I had been trying to buy a property in better condition, in a different area or facing any type of development pressure, it would be unlikely that the seller would wait for me and my FSA process, which took months. The current process is slow, with many steps going back and forth, and no pre-approval. Farmers easily lose out on potential properties by not being able to act fast. I have known several farmers who have not been able to use FSA loans to purchase for this reason.

My land was cheap. I paid \$75,000 for 54 acres. It was a small, comparatively easy first ask. Everything I claimed in terms of yield, price, budget, *etc.* was foreign or unbelievable to my loan officers. It would have been very difficult to get them to take me or my farm seriously if I didn't have the records to prove what a small farm can produce in food, or what it can gross in sales. Additionally, as you know the FSA requires 150% equity on a purchase loan—if my property didn't appraise at 150% of the sales price, then FSA would have taken a lien on my truck or tractor—which was pretty much all that I owned at the time. And I bought my tractor with cash, so adding a lien to the most important equipment I owned for land collateral would have been a tough pill to swallow. While my story is one of success, I am sharing it today because it highlights how precarious and fortunate my experience was. As a country, we can't expect farmers to find suitable land for a steal the way I did. We are looking at the impending transition of more than 40% of farmland, and this crisis of land access will only become more acute if we do not address it head on. Farmers like me across the country need access to good farmland, and to have secure tenure. Making sure that good farmland stays or gets into the hands of farmers must be a priority. Making sure we always have new farmers to replace those who retire is a priority. We need to focus this next farm bill process on policies that enable equitable land access and transition, and access to credit is at the heart of this issue.

While loan limits did not play a factor in my land purchase, I applaud Congress for increasing the limits in the 2018 Farm Bill, making land value a bit less of an access issue. However, loan limits certainly still affect many farmers in other areas, particularly near more populated areas. For me, that was not the foremost barrier. For farmers across the board, the lack of a pre-approval combined with the burdensome slow process, and the luck of the draw in finding a local loan officer with the necessary training, openness, and desire to meet the spirit of the law, are all salient challenges to be addressed. One of the great things about FSA is the ability to make annual payments, which reflects the seasonal cash flow of most farmers. If there was loan pre-approval, it would better reflect the seasonal workload. Farmers could get approved in their off seasons, instead of whenever they find the land, which could be in a very busy time.

I also applaud Congress and the USDA for the creation and implementation of the microloan program, especially as a way to open doors to underserved and beginning farmers. Not all loans are of equal size or risk. Last year I applied for a \$50,000 Direct Operating Microloan to purchase a bigger more reliable delivery truck. We did successfully get the loan and get the vehicle, however, the process was nearly identical to a Direct Operating Loan. I filled out the same paperwork, gave the same financial, crop planning, and cash flow projections as I did when I purchased the land. I did ask my loan officers if there was an expedited process since it was a microloan. I was told that since I was already in business, they would need the full paperwork of any operating loan. Essentially, my application process for this microloan (in terms of which documents I would need to supply and to what level of detail) was no different than any operating loan (up to \$400,000) that I might apply for. This is not in keeping with my understanding of the stated purpose of the microloan program, and would certainly be a barrier to any farmer not already familiar with FSA loan processes.

Another considerable factor in accessing land is student debt. While I *did* have student debt upon graduation, I had a 'reasonable amount', which I was able to pay off before borrowing from the FSA. We know from surveys conducted by the National Young Farmers Coalition, that most of the new farming generation is likely to be college educated. If I still had debt to manage, I am not sure if I would have been able to make the numbers work for the loan, let alone start a farm at all. This is a hugely critical issue for young farmers like me, and is an even greater challenge for young farmers of color. It is challenging enough to enter a physically and financially risky profession that requires intense capitalization. For new farmers entering farming with immense debt, they face a real risk of failure or incredible hardship, if they are able to move forward at all. At the same time, I believe that I would not have been successful in my land access journey without my college education, and if I was not college educated, I doubt I would have been able to navigate the loan processes with FSA effectively.

Farmers don't dream of a life filled with debt and financial stress. Access to credit can help us get our farms off the ground but we still need basic quality of life things afforded to most other working people: health insurance, basic risk mitigation, family leave, being able to send our kids to college, rural high speed internet, and a protected natural resources and climate to work within. The old timers say "The quickest way to end up with \$1 million farming is to start with \$2 million."

To my surprise, despite my long repaid Federal student loans, despite my two current FSA loans, and despite my Farm Credit loan, I still do not have a credit score. Apparently Federal and Farm Credit debt do not contribute to credit scores. This means that regardless of my good standing on my loans, I still have no credit history, and if I were to go to a traditional lender, they may not lend to me, or I might pay the highest interest rate on the least favorable terms. I don't understand why this is the case or how you can remedy it, but I work hard to pay off my debt, and my Federal credit counting for nothing seems to cut me out of opportunities. Furthermore, since USDA has an increasing commitment to beginning and underserved farmers, if our Federal debt could help us build traditional credit, we would be more independent and have more options available to us.

I ask that the next farm bill consider these issues.

Establish clear processes and structures to implement a pre-approval mechanism for Farm Service Agency Direct Farm Ownership Loans, so that farmers who have identified available land and gathered necessary supporting information do not lose out on farm ownership opportunities simply because they need to utilize USDA's help. Further, I recommend that USDA index Direct Farm Ownership Loan limits to inflation, so that farmers can bring competitive offers to the table.

Thank you for listening to me and to the voices of farmers, even if we are small or young farmers. The farm bill touches everyone in this country, and your policies have an incredible impact on the direction our farms take. Please consider the big picture urgency for the nation's farmers, and the subsequent opportunity to make agriculture thrive. Our work is dangerous, risky, and exhausting, and we persist despite sacrifice and challenges, forgoing benefits many people enjoy.

Many small, beginning, and underserved farmers feel largely invisible to most consumers, overlooked by most of society, and overlooked by our government. We feed and clothe communities and steward our nation's most precious resources for the future. Our resilience is a matter of national security. Yet many of us survive with luck, willpower, and with little tidbits of USDA support sprinkled in. Young farmers, beginning farmers, and underserved farmers need policies that acknowledge inequities, lift the burdens, give us pathways to success, open doors, watch our backs, and instill equity into agriculture.

Sincerely,

JULIA ASHERMAN,
Owner and Operator of Rag and Frass Farm.

The CHAIRMAN. And thank you, Ms. Asherman.
And now, Mr. Tillman, please begin when you are ready.

**STATEMENT OF WILLARD TILLMAN, MEMBER OF THE BOARD,
RURAL COALITION/COALICIÓN RURAL, OKLAHOMA CITY, OK**

Mr. TILLMAN. Good morning. My name is Willard Tillman. I am a Board Member of the Rural Coalition. Chairman Scott, Ranking Member Thompson, and all the other Members, thank you for inviting the Rural Coalition to speak here today.

I was raised on a farm in Wewoka, Oklahoma. For decades, my family ran cow-calf operations. Me, myself, I am now the Executive Director of the Oklahoma Black Historical Research Project where I work with farmers and ranchers for decades about the challenges that they have in their areas. Right now, I am currently working with the Black mayors of all the historical towns in Oklahoma trying to reveal their economic base. We are seeking investments in rural communities' infrastructure needs and other businesses. This morning, I will concentrate on critical issues with livestock production to help build progress from the 2018 bill to assure fair service to all producers.

The value of land in Oklahoma at this particular time is highly vital. Investors are putting the price of land up so high that young producers can't even get to invest in their own farms. Small-scale operations and multi-gen land tenure for the nation's moderate- and small-scale farmers and ranchers with special emphasis on beginning and historical producers should be a key goal for the next farm bill. Fair and efficient, affordable agriculture credit is an essential underpinning to the continuity of these farms and operations and sustainability of these communities.

Several producers have basically talked about the tactics and everything that they are confronted with in the offices, which basically hinders a lot of the financial services and things that they need such as fair treatment just to basically be able to go in and get the necessary treatment that other people get when they go into the office. There seems to be a double standard. And I think that there should be more stringent checks and balances on these particular things.

But we have demonstrated as a community-based organization over many years that technical assistance to these communities and community-based organizations are who the people trust. Our organization had partners across the country used to technical assistance to farmers learned enough about the programs to understand the benefits and how to access these programs. And we go through this process, and we are here as—I am here as a member of the Rural Coalition, and I urge this Committee to work on more modernized farm loan programs and expanding the FSA microloan benefits. A producer who is starting and transitioning farms needs to have an equitable chance to build sustainability.

Our producers strongly support the 7 year operating loan with no payment for 3 years. A farmer who can build 3 years of equity should be able to make payments on his land, operate the farm, gain the ability to become sustainable. And we urge that the farm be authorized such a loan structure to afford producers the chance to build equity and ensure that they can cash flow and cover the payments of their loans.

In closing, farmers have said to me, "Farming is a hard job. We face all kinds of obstacles, floods, wildfires, and doing all this. But most underserved farmers have a full-time job off the farm. They face all these obstacles, the farmer is committed to the legacy of the land." And I asked him, "Why do you keep doing this?" And the farmer said, "I love it. I just love it. I love farming." Thank you.

[The prepared statement of Mr. Tillman follows:]

PREPARED STATEMENT OF WILLARD TILLMAN, MEMBER OF THE BOARD, RURAL COALITION/COALICIÓN RURAL, OKLAHOMA CITY, OK

Good morning my name is Willard Tillman. I am here as a Board Member of the Rural Coalition. Chairman Scott, Ranking Member Thompson, and Members of this Committee, I want to thank you for your invitation to the Rural Coalition to be here today to share our thoughts about access to credit for historically underserved, limited resource and new and beginning farmers and ranchers.

For 44 years, the Rural Coalition has effectively worked with the U.S. House and the U.S. Senate on legislative proposals involving farm programs, equity, and agriculture credit, which is the topic of today's hearing. The historically underserved farmers and ranchers that we represent play a critical role in the helping our nation maintain and expand its role of as the world's paramount leader in the production and marketing of an abundant, safe, and affordable supply of food and fiber.

I was born and raised Wewoka, Oklahoma, where my family has for decades and continuing until to today, run cow and calf operations. I have myself and farmers. In my role as Executive Director of the Oklahoma Black Historical Research Project (OBHRPI), I've worked for over 2 decades with hundreds of cow-calf and other producers throughout the state of Oklahoma. At present, I am also working closely with the mayors of the historic black towns of Eastern Oklahoma, to rebuild and strengthen their economic bases. This includes seeking investments for local meat processing facilities.

A strong agriculture sector is critical to economic progress in these communities. This progress will require investment in the continuing and expansion of agriculture in this region. And it will also require an investment in protecting land tenure for current farmers and growing a new generation of producers to carry on the deep knowledge of the generations who have held and worked this land.

At present, land values in Oklahoma and beyond are highly volatile with outside investors driving up land prices in many areas. Anticipation of the expansion of carbon markets and authorizing payments for ecosystem services also appears to be driving investment both in farm and forest land. This trend should be monitored closely as we move into the 2023 Farm Bill especially with changes in investment related to climate.

We are working hard to help the next generation understand the value of the land to the family and community. A family can only sell their land once. Sometimes heirs can only see immediate money from a sale without understanding that they are giving up their family's lifetime legacy of a lot of hard work and how their elders in the face of all kinds of discriminatory practices were able to sustain and still hold onto that land.

Protecting and expanding multi-generational land tenure for this nation's moderate and small-scale farmers and ranchers, with special focus on beginning and historically underserved producers should be a key goal of the next farm bill. Fair, sufficient, and affordable agriculture credit is essential underpinning to the continuity of these farming operations and to the stable and sustainable economy of these communities.

In our testimony for the record, we will address our recommendations for credit in more detail. This morning I will concentrate on critical issues for livestock producers and how to build on the progress in the 2018 Farm Bill and your previous efforts to assure service to all producers.

2018 Farm Bill

The Agriculture Improvement Act of 2018 ("2018 Farm Act") increased support for farmers with limited access to traditional lending markets placing "special emphasis on making loans to the next generation of farmers, including beginning farmers, farmers with limited means, and military veterans."

The adjustment in the maximum levels for direct farm ownership and operating levels is helpful as producers here contend with rising land and operating costs. Expanding the loan authorization level especially for direct loans is important. In 2023, we urge the Committee to consider what additional adjustments with special emphasis on building land tenure for beginning and historically underserved producers.

The expansion of funding for direct operating microloans was helpful; we urge the Committee to consider further expansion. We strongly support the 50% loan funds set aside for beginning farmers and ranchers; we urge the Committee to consider a set aside for historically underserved producers. Farm loans are one of the farm programs most important for this group of producers who lack real access to the more richly supported commodity and market facilitation programs due to their smaller scale, livestock, or other diverse operations.

We support the 2018 authority provided to the Secretary to reduce or waive the eligibility requirement that an applicant have participated in the business operations of a farm or ranch for 3 years for farm ownership loans based on certain experience, training, or education—in our full testimony, we will explain why this waiver should be expanded or the requirement adjusted because in our experience it is often not fairly applied and contributes to the active discouragement many historically underserved producers receive.

While we support the increases in the loan guarantees from 90 to 95 percent for socially disadvantaged and beginning farmers, we are still not seeing how guaranteed lending is truly accessible to the producers we serve.

We strongly supported the new Equitable Relief provision which authorizes the Secretary of Agriculture to provide equitable relief to farm loan program borrowers who were who acted in good faith but who have problems in their loans due to mistakes or inaccurate guidance from FSA. Relief measures, including a borrower's

right to retain the loan or other benefits associated with the loan, or other means as the Secretary deems to be appropriate, still need to be implemented, refined, and applied to assure truth and fairness in lending.

We further express our thanks to this Committee for their work to pass and include the historic “Fair Access for Farmers and Ranchers” heirs property provisions in the 2018 bill. Sections 12615 (7 U.S. Code § 2266b. Eligibility for operators on heirs’ property land to obtain a farm number), 5104 (7 U.S. Code § 1936c. Relending program to resolve ownership and succession on farmland) and 12607 (7 U.S. Code § 1936c. Relending program to resolve ownership and succession on farmland) are intended to assure USDA affords fair access to its programs for farmers and ranchers who operate farms on “heirs’ property.” The final language ensures that more farmers—especially African American farmers and farmers of color operating on land with undivided interests—can finally access critical USDA programs that enable and find new support to work out complex heirship issues to obtain clear titles to their land.

Continuing Issues for Livestock Producers

Farming is not an easy job. In Oklahoma, in addition to volatile land prices, producers face all the different weather conditions a person can stand including flood, drought, and wildfires. To face all these obstacles, it is essential that farmers are committed to the land. A farmer who was asked recently “why do you keep doing it?” “Because I love it,” he responded.

However, farmers from our communities remain legitimately distrustful of USDA and the Farm Service Agency in particular. In this section, I’ll address some realities and some opportunities. For example, we have observed many times when local FSA loan officer could have done something to help producers navigate loans and losses, but they did not.

Several producers I work with reported extreme pressure tactics on loan payments that made them feel like their land was being threatened. For example, a producer in Okmulgee County said the local office make them feel like they are going to foreclose. So, the producer paid the debt off before the time it was due. Only later did they learn that when they pay it off early, they were deemed no longer eligible for another direct loan. They were forced to graduate, and then sent to the bank where interest rates were 6–8%—unaffordable for these producers.

In 2021, a Black farmer employed in another state sought the loan he needed to operate the family farm in Oklahoma where he grew up and farmed throughout his life. After his father passed, he filed all necessary documentation of ownership with Farm Service Agency. He contacted us because when he applied for a loan, the local office told him that he had to demonstrate 3 years of experience before he would be eligible for a loan. Before the office would provide him further assistance, they further directed him in a letter to provide a certified copy of a lease to his neighbor so the neighbor could collect benefits from the crops he was growing on this farmer’s land.

The farmer provided the office with a copy of the “cease and desist” letter he had sent to his neighbor to stop using his land and complained to the office about their role in enabling this incursion on his land. The local official then asked him “do you want to sell your land?” He was further instructed not bring this complaint to a higher level because he would “get the previous staff of the office in trouble.” He was unable to secure the loan in 2020, which would have left him unable to benefit from the ARP program. He filed a complaint with the inspector general which remains unanswered and has filed a civil rights complaint that is pending.

Another producer had was unable in 2019 to get a bank loan because he could not get FSA to release a lien on his property. He was trying to replace a 100 year old decrepit barn with a new barn that would include a small meat processing facility. The office suddenly discovered the old barn had a \$30,000 even though it was not included in a previous appraisal nor was it required to be insured. He was unable to secure the bank loan and is still working to secure resources to construct a processing facility he hopes would serve neighboring producers in his community.

Rural communities are often small and insular. County office staff may have social or relational connections to third parties such as appraisers, or to other parties who may have an interest in a farmer’s land that could be advanced by a low appraisal, for example. FSA lacks strong and clear standards and practices designed to prevent and require disclosure of conflicts of interest that can affect land transactions and ownership to the detriment of certain groups of producers.

Appraisals are another area of concern, as are shared appreciation agreements. There are no quick ways to appeal and get a fair review of decisions, or even the ability to submit another appraisal and get a fairer decision in a reasonable length of time. In farming, delay can spell disaster or the loss of market opportunity.

Within the Rural Coalition, we have seen many other examples of discouragement of services, denial of services, and situations where the use of discretion provided to county office staff has convinced black and other historically underserved producers that there are different standards for them than for other farmers.

The authority provided in the 2018 Farm Bill that provides the Secretary discretion to waive the 3 year requirement of experience for beginning farmers and ranchers could be viewed as a step forward. However, is this waiver fairly applied, and how would this Committee know? Will children of the established producers well known to county office staff received the same scrutiny of skills as historically underserved and young farmers who walk in the door?

How does this apply to the Black military veteran who grew up on a farm in southeast Alabama and after completing his tour of duty went into a local office to seek a loan to start farming again. The local office staff member replied by throwing the folder he brought in at his head and telling him not to come back until he could demonstrate 3 years of experience. There need to be the same rules for all producers including in demonstrating experience.

During the pandemic, many of the historically underserved producers who applied for the Coronavirus Food Assistance Program, were required to provide documentation for their claim, while the word of other farmers that their claim was correct was accepted in many offices. In another case, in southeast Alabama, producers were told that the type of specialty goat they produced were not eligible for CFAP. We worked with our members there and raised the issue to FSA headquarters, and some producers were able to secure some assistance. But many others were unwilling to go back into the office due to the treatment they received.

Access to other programs besides loans is critical to being able to cash flow loans. We work with producers to get them to understand the content of the program—this is the part that often does not happen without CBO's. We must break it down for them and show how it works. If farmers don't understand—they won't mess with it. However, programs like EQIP to control invasive species and provide solar water wells for cattle, are very beneficial.

The Livestock Indemnity program is also essential for producers to cover losses of cows, which are also collateral on their loan. However, in this state, producers we serve often farm on more fragile land. There are gullies at the edges of their property. When we have floods, which are frequent, the cows wash away, and you won't find them—you have the picture. The farmers can show in their records that they had this many cows but now only have this many. But FSA requires pictures and documentation that the farmer cannot produce. There needs to be some other way to ID loss.

Producers are very aware that FSA offices took the word of other farmers in certifying production and losses in the livestock indemnity program and in CFAP, but not from them. They want FSA and other USDA agencies to apply the same rules for everyone.

The long history of practices such as these had led farmers not to trust with these agencies. For example, when FSA contacts a farmer to tell them "We need your AGI" the older guys don't know what AGI is or why it is being requested.

We have learned over the years that support for technical assistance by community-based organizations who are trusted to work in the interest of these farmers can help producers understand program requirements and their purposes is essential. Qualified TA is essential to rebuild trust. Our organizations and our partners across the country then use TA to help the farmer learn enough about the program to understand its benefits and learn how to access it. TA investments also help us develop proactive working relationships with FSA and NRCS county offices that help producers.

Even as we work with producers to meet all their responsibilities to programs, we need the help of this Committee to set in place standards for service, and accountability for fair service, and protection from conflicts of interest. This is especially important in a time when there are growing outside investments in farm and forest land that have implications for this nation's small farmers, rural communities, and to the stability of agriculture lending system itself.

Heirs Property and Dormant Land

Oklahoma Black Historical Research Project worked over the past decade to engage Black farmers in NRCS programs. With Rural Coalition and the Scholars of the America University farm bill practicum, the researched the data and experiences of Black farmers in access USDA programs. Their findings are summarized

and published in the research paper on the *Ecological Costs of Discrimination*¹ This research formed the basis for our push to include the Heirs Property provisions in the 2018 Farm Bill.

Invasive species thrive in places facing climatic changes and put farmers at further risk. In Oklahoma, *eastern redcedar* is spreading at the rate of 800 acres a day. Without help for mitigation from USDA especially for historically underserved farmers who farm on heirs' property, small cow and calf operations have seen their grazing land taken over by redcedar, which competes with pastureland by consuming up to 55,000 gallons of water per acre per year and puts the viability of their operations at further risk. Other risks they have faced over the past decade include severe cycles of floods, droughts, fires, freezes and tornados. Farmers who produce on land held in undivided interests were being deemed ineligible for critical NRCS programs, because they lacked the documentation to secure farm and tract numbers to demonstrate their control of the land on which they sought benefits.

The problem of eastern redcedar incursion is compounded by that fact that in Oklahoma, we have had large amounts of dormant land for years. Families may have kept land while they leave to seek jobs in other areas. Or, after the passing of elder landowner the family has been unable to resolve heirship issues, or secure legal assistance to help them. In rural areas, there are very few attorneys to help them and many of them may be conflicted—representing others who have an interest in acquiring that land.

We are working now as hard as we can to connect young farmers to families with dormant land. It takes time to work out long-term lease agreements and point out the benefits of leasing the land to these young farmers that are out there looking for land. Work to protect land tenure and move dormant land back into production is urgently needed at this time because with rising prices of land in some areas due to the influx of outside investors—from \$200–\$300 an acre to \$600–\$800—we are working against the clock to assure that young farmers have a chance.

Rural Coalition is just beginning a new Technical Assistance Project under the National Institute of Food and Agriculture in cooperation with OBHRPI and nine more RC members, to provide technical assistance to both farmers and landowners in assembling the paperwork they need to complete wills and succession plans so they are prepared to work with attorneys to complete these essential documents. We are also continuing our work to help farm operators, be they owners or renters, to secure farm and tract numbers and access to USDA programs. This work includes a special focus on helping producers farming on land held in heirs' property status to use the 2018 Farm Bill alternate documentation authorities to secure a farm and tract number and access NRCS programs[.]

Heirs Property and Forest Land

Securing and building land tenure is also critical to protecting the intergenerational transfer of land and wealth and building a community with a healthy ecosystem and a tax base to sufficient to support quality education, employment opportunities, and a strong infrastructure. The following abstract of the paper "*Taking Goldschmidt to the Woods: Timberland Ownership and Quality of Life in Alabama*"² summarizes the impact of the degree of highly concentrated land ownership on children, families, and the communities:

We use a database of property tax records for 13.6 million acres representing every parcel of privately owned timberland in 48 rural Alabama counties to test two hypotheses inspired by Walter Goldschmidt relating land ownership and quality of life. Our data show private ownership is highly concentrated, and 62 percent is absentee owned. We employed Pearson correlations alongside Poisson and negative binomial regression models to estimate influence of both concentrated private ownership and absentee ownership of timberland. Our findings support Goldschmidt-inspired hypotheses that concentrated and absentee ownership of timberland exhibit a significant adverse relationship with quality of life as measured by educational attainment, poverty, unemployment, food insecurity, eligibility for free or reduced-price lunch at public schools, Supplemental Nutritional Assistance Program participation, and population density. Low property taxes in Alabama limit the ability of local governments to generate revenue to support public education or meet other infrastructural or service needs in rural areas. We call on rural sociologists and kindred spirits to pay more attention to

¹Fagundes, Tillman, et al. *Ecological costs of discrimination: racism, red cedar and resilience in farm bill conservation policy in Oklahoma*, October 2019, RENEWABLE AGRICULTURE AND FOOD SYSTEMS 35(4): 1–15. DOI: 10.1017/S1742170519000322.

²September 2020 *Rural Sociology* 86(1) DOI: 10.1111/ruso.12344 Authors: Conner Bailey, Abhimanyu Gopaul, Ryan Thomson, Auburn University; Andrew Gunnoe, Maryville College.

*the fundamental importance of land ownership which shapes the foundations of power and inequality affecting rural life in America and beyond.*³

The policies this Committee will enact in the 2023 Farm Bill will impact producers, forest and farmland owners and rural communities in a profound way. There are stark implications for communities and the rural economy in the burgeoning investments in both farm and forest land especially in the southeast. Investments in forests related to energy production and climate credits can be expected to increase volatility in land prices.

At the same time, disasters are increasing, including both hurricanes and fires that affect forest in the southeast more than before.

Heirs Property, Housing and Rural Communities

We look forward to other opportunities sharing our proposals to more fully address the set of issues we have raised, including with respect to climate. We further point to a critical need to assure farmers have access to the qualified and trusted legal and technical assistance necessary to protect their land.

In October 2019, Rural Coalition member group, the North Carolina Association of Black Lawyers Land Loss Prevention Project authored a Continuing Legal Education (CLE) manuscript “Assisting Heir Property Owners Facing Natural Disasters: History and Overview of Heirs Property Issues,” and participated in a collaborative CLE webinar to train NC Legal Aid volunteer attorneys on service to impacted heirs’ property owners. According to Legal Aid’s coordinator, there were approximately 124 webinar participants on that date and the course will continue to be available for training purposes.

The benefits of the expansion of individual direct legal intervention, technical assistance, outreach and policy innovation and implementation include increased property retention, removal of barriers to assistance programs, enhanced food access, heightened farm business risk management, and family engagement in multi-generational planning as a safeguard against inherent co-ownership vulnerabilities.

We project that the pandemic will continue to emphasize the need for education on what defines sustainability and how environmental, economic, health stressors are intertwined and cumulative.

Modernize Farm Loan Programs

We urge this Committee to continue its work modernize farm loan programs. Congress should recognize agricultural lending as a good investment in farmers and the farming and rural sector. These farmers who typically have smaller scale operations, do not need large operating loans. However, these loans are crucial to their operations. And they need access credit at the time they really need it.

We recommend that:

- The 2023 Farm Bill emphasize the importance of investments to build land tenure and sustainable and resilient operations for the next generation of young, historically underserved, and mid-scale farmers and ranchers as the basis of strong farm and rural economies.
- Monitor compliance and assure all USDA offices serving farmers automatically provide a complete **receipt for service** for every interaction with producers and require that these receipts also be reviewed by agencies to assure every producer is receiving the same quality of service in each office at the same time of the year.
- Microloans from FSA are beneficial to many producers including in urban areas. Funding for microloans should be expanded.
- Producers who are starting or transitioning farms need an equitable chance to build sustainability. Our producers responded strongly to proposals to provide 7 year operating loans with no payments for 3 years. If a farmer who builds 3 years of equity, should be able to make payments on land, operate the farm and gain the ability to become sustainable. We urge that the 2023 Farm Bill authorize such a loan structure to afford producers a chance to build equity, while assuring they can cash flow their operation, and cover loan payments for farm ownership.
- Smaller scale operating loans are not as attractive to other lenders, nor are real estate loans that keep funds tied up for long periods of time. However, because USDA holds the land as collateral for real estate loans, these loans result in a positive funds balance for the Federal Government. We strongly recommend

³https://www.researchgate.net/publication/344021201_Taking_Goldschmidt_to_the_Woods_Timberland_Ownership_and_Quality_of_Life_in_Alabama.

that FSA expand lending and allow more flexible terms, including authorizing real estate loan terms for up to 40 years.

- Family scale producers, including young and historically underserved producers should not be forced to graduate from FSA agriculture credit. Within certain limits, Congress should provide clear authority for these producers access affordable credit from FSA they are not getting from other lenders and to stay with FSA as their lender if they so choose.
- Congress should permanently waive the prohibition on refinancing of other debt with FSA Direct Loans and FSA Farm Ownership Loans and remove the eligibility restriction for new FSA loans based on past debt write-down or other loss to the agency.
- Land is in short supply, and it is rapidly sold often before a new farmers can navigate the lending process. We strongly support the recommendation of National Young Farmers Association that FSA be authorized to pre-qualify them for loans.
 - TA from trusted CBO's is incredibly important.
- Congress should review and adjust or eliminate the requirement for 3 years of experience requirement to protect from abuses, but also to open new opportunities for producers. Farmers should be able to qualify with mentorship from a working farmer.
- At present, the nation's farmworkers form a large pool of farmers with a deep interest in accessing land and entering farming as a profession. The next farm bill should recognize their skills, experience, and importance to expanding the next generation of producers and adopt policies that incentive and support their goal to enter agriculture.
- Congress should continue funding and expand support for the heirs' property relending fund and examine proposals to strengthen it.
- Congress should expand authority for FSA to accept alternate forms of documentation to enable operators farming on land lacking a clear legal title due to heirs' property issues to receive farm numbers from USDA Farm Service Agency (FSA) and thereby qualify to participate in additional USDA farm and credit program beyond conservation programs and including microloans for farm operating.
- The next farm bill should strengthen checks and balances, including civil penalties to root out conflicts of interest, unfair appraisals and other practices that serve to weaken the ability of producers to retain their land, run a successful and resilient farm operations, and contribute to the local economy.
- At a time when over a million families have lost members in the pandemic, Congress should seek a report on how these losses have affect farm ownership and operators. The next farm bill should include incentives for borrowers and all farmers to adopt wills and succession plans for their farms.
- **Credit Issues and Protecting Distressed Farmers who are Still Operational**—USDA should develop a plan for standing disaster program that automatically goes into effect in the face of emergencies. USDA should have authority to extend as far as possible a moratorium on acceleration, graduation, and foreclosure for duration of the pandemic and economic recovery.

We also further endorse the proposals in the *Top Priorities for COVID-19 C4 Response Legislation* from the Native Farm Bill Coalition, and recommend the Committee provide statutory authority for use in future disasters that would allow FSA to

 - Immediately and automatically defer of all FSA loan principal due for the current production years and extend all loans for 2 years.
 - Offer payments to any lenders if they reduce the interest rate of current loans by 2% and offer the same reduced loan payments and extensions to their borrowers; and
 - Allows the use of FSA Farm Ownership loans to refinance real estate and other debt to aid in recovery from this crisis.

Additional Recommendations

Equitable Relief (Sec. 5304 of Public Law 115-334)—Having made a compelling argument to the U.S. Congress during the 2018 Farm Bill debate, the House and Senate Agriculture Conference Committee, responded proactively to provide a provision of “equitable relief” for farm loan borrowers in those circumstances where an FSA farm loan employee makes a mistake—knowingly or unknowingly—and that

mistake causes a borrower to be in noncompliance on a USDA direct loan. Section 5304 of the 2018 Farm Bill conference report gives the Secretary of Agriculture the authority to offer a farm loan borrower a provision of “equitable relief” when a decision of a farm loan officer causes the borrower to be out of compliance with the loan program. Noncompliance with a loan term or provision can lead to default, acceleration, and foreclosure. Lender mistakes (See deceptive practices **12 U.S.C. Section 5531(d)**) whether intentional or not will cause economic damage to farm business operations. We mention the presence of “equitable relief” in Section 5304 to highlight the existence of irregular lending practices having a flavor of mistake or fraud.

We have called on USDA to assure the Equitable Relief provision of the 2018 Farm Bill are immediately and fully implemented with clear directives in handbooks to field offices. The intent of this provision is to protect farmers from adverse action in cases where errors were made on the part of FSA offices. In the time of extreme stress on both producers and FSA and other USDA field office staff, this protection is critical. Every effort should be made to help farmers and ranchers hold onto their land and have the economic base they need to build back better both their farms and the economic underpinnings of their communities.

However, Congress in Section 5304 did not require regular reporting on incidences when Equitable Relief needed to be applied to correct lending mistakes. The statute must be amended to require at least an annual report to Congress on the implementation of equitable relief.

Emergency Loans: Modernizations and Enhancements to Farmer Eligibility—The 2018 Farm Bill language allows emergency loans to farmers even if a farmer has been previously granted debt write down. Prior to the passage of the 2018 Farm Bill, a farmer cannot receive a USDA “Emergency Loan” if at any time after 1996 the farmer participated in a USDA Farm Service Agency primary loan servicing agreement that included debt write down or debt forgiveness.

The frequent implementation of the debt “write-down” rule has an undue negative impact on socially disadvantaged in dire need of emergency loan. The 2018 natural disasters in North Carolina and California demanded modernization and enhancements in emergency loan programs. Indeed, farmers encounter multiple disasters that coincide with crop losses caused by environmental degradation, or low farm gate income caused by a global trade disruption.

The 2018 language amends section 373(b)(2)(B) to exempt write-downs and restructurings under section 353 from what is considered “debt forgiveness” for the purposes of applying the debt forgiveness loan eligibility limitations. (**Section 5307**).

We have recommended that the Secretary take a dual approach to speedily implement emergency loan eligibility. First, the Secretary should immediately issue a proposed rule to amend 7 CFR 764.352(b) which governs emergency loan eligibility requirements. Secondly, we have recommended that the FSA handbook identified as 3-FLP (Rev. 2) be amended at Page 10.1 to 10.2 to inform field staff and farmers and ranchers that a previous direct or guarantee loan write down is no longer a bar that prohibits a future application for an emergency loan.

The Secretary should further make clear that emergency loan funds can be used to pay off or replace automobiles or higher interest credit cards that were frequently used prior to the disaster designation to finance farm operations. So long as otherwise permissible, the Secretary should further remove prohibitions for direct emergency loans in scenarios where farm loan borrowers have graduated from direct farm loan program with a history of a guaranteed loan loss claim paid by FSA to a guaranteed lender.

This Committee should assure full implementation of this and all other authorities in the 2018 Farm Bill, and to find areas where gaps in authority still require additional statutory authority.

Addressing Known Discrimination in the Farm Loan System

Congress has recognized some of the challenges SDFR face with respect to fairness in loan making and loan servicing. In response, certain statutes require the USDA to collect data on how loans made by race, gender and ethnic, and to establish target participation rates as goals in each county for making loans to socially disadvantaged farmers and ranchers in programs that make direct loans or that guarantee loans made by private lenders. However, USDA has not made this limited data which includes only numbers of loan applied for, made and denied to the county level easily available to the public. The data collected is much less comprehensive than proposed in this rule.

The data collection and targeting of agricultural loans to SDFRs is a method of collecting data on loan making but does nothing to collect data on loan servicing, an action covered by the ECOA. In our long experience in working with producers

on securing thousands of loans and submitting thousands of discriminations claims on their behalf, we have found that loan servicing is where most of the discrimination occurs with respect to farm loans. **See GAO Report July 2019 at page 1 to 2. See ECOA Regulation B, 12 CFR 1002.2(n)** (*Discrimination against an applicant means to treat an applicant less favorable than other applicants*).

The follow section is an excerpt from the comments of the Rural Coalition to the Consumer Financial Protection Bureau on data in lending. The Committee should consider how authorities for accountability by CFPB, and USDA can be best connected and used by this Committee to assure Fair Lending.

Under regulation B, rules designed to implement the Equal Credit Opportunity U.S.D.A., FSA like all lenders, is prohibited from discrimination in loan servicing. **See 12 CFR 1002.2(n)**. Nevertheless, some farmers face serious discriminatory loan transactions designed to end in foreclosure and business operations. The known discrimination takes on many different forms. Producers may face additional collateral requirements and the need to demonstrate their value. Appraisers in a small rural community may be more generous or less stringent with some farmers than with others and may also have inside information or close relationships with FSA or bank staff that could influence appraisals in a way that benefits some producers over others. In many instances, the agricultural lender does not realize that certain transactions are discriminatory by nature and design. The problem is that minority farmers most often carry the burdens of discriminatory farm loan transactions. Farmer related small business data will serve as an educational tool for agricultural lenders who knowingly and unknowingly carry on patterns and practices of farm loan discrimination that have disparate impacts or disparate treatments on the operations of minority farmers. There discriminatory actions violate the following provisions of Regulation B of the Equal Credit Opportunity Act. **Farm Loan Data Collection—Prohibited Basis—12 CFR 1002.2(z)**: “Prohibited basis means race, color, religion, national origin, sex, marital status, or age (provided that the applicant has the capacity to enter into a binding contract); the fact that all or part of the applicant’s income derives from any public assistance program; or the fact that the applicant has in good faith exercised any right under the Consumer Credit Protection Act or any state law upon which an exemption has been granted by the Bureau.” **12 CFR 1002.2(z)**.

Farm Loan Data Collection—Prohibited Basis. 12 CFR 1002.4(a). Discrimination. “A creditor shall not discriminate against an applicant on a prohibited basis regarding any aspect of a credit transaction.” **12 CFR 1002.4(a)**. The phrase “any aspect of a credit transaction” includes farm loan servicing and should be understood as such. As mentioned earlier, farm loan servicing is the state of the loan transaction where minority farmers endure the most discriminatory terms and conditions. Particularly, loan servicing during a disaster related request places the farmer in a position that requires the farmer to accept the burdensome terms and conditions or face foreclosure. Some renegade farm lenders push farmers into unlawful farm foreclosure after the farmer complains verbally or in writing about consumer rights violations. This practice must be recorded on a consistent bases to increase Department of Justice investigations and civil actions against wrongdoers. According to **15 U.S.C. 1691(a)(3) and Regulation B, 12 CFR 1002.2(z)** a farm loan lender may not discriminate against an applicant because the applicant has in good faith exercised his or her rights under various Federal consumer protection laws. **See 15 U.S.C. 1691(a)(3) and Regulation B, 12 CFR 1002.2(z)**. The final language of the proposed CFPB rule must include data collection consumer whistleblower complaints so that retaliation against farmers can be eliminated through strong enforcement actions.

Farm Loan Data Collection—Prohibited Basis. 12 CFR 1002.4(b). Discouragement. “A creditor shall not make any oral or written statement, in advertising or otherwise, to applicants or prospective applicants that would discourage on a prohibited basis a reasonable person from making or pursuing an application.” **12 CFR 1002.4(b)**. The undersigned organization are aware of discriminatory terms and conditions that relate to oral and written statements that discourage minority farmers from making loan applications or requesting loan servicing. For example, young minority farmers are told to accept the same discriminatory terms and conditions: **(a)** loan approval based on mandatory acceptance of same harsh terms placed on farm loans of parents more than 20 years in the past; **(b)** loan approval based on buying farm equipment from the lenders family member; and **(c)** loan servicing based on farmer making a private, personal loan to the loan officer, **(d)** completion of a loan application of

beginning farmer returning to take up the operation of the farm he grew up on when ownership was transferred to him is made contingent on him providing a certified lease to allow a neighboring farmer to collect farm benefits on a crop grown on the beginning farmer's land, despite the fact the younger farmer had sent a cease and desist order to his neighbor—and he is also told not to report this situation to superiors as it might “get the previous CED in trouble”, (e) a SDFR farmer seeks an operating loan to cover costs of spring planting with a plan that includes specific application of treatments to improve his land, but the loan is delayed until it is too late for these treatments to be effective but he is required by the loan agreement to incur these costs, (f) a farmer seeks the release of lien on his farm in order to secure a loan from a private lender, but FSA suddenly discovers a \$30,000 value to the 100 year old barn he is seeking to remove and replace with a facility to process meat at the beginning of the pandemic, despite the fact that no value for the old barn had been reflected in the appraisal for the original loan, (g) a military veteran who grew up on a farm and participated in the operation returns from a deployment and seeks a loan to start farming again. The local office staff member looks at his application in his folder, then throws the folder at his head and tells him not to return “until he can demonstrate 3 years of experience.” Such practices must end. Data collection is a proven way to document and address such discouragement in loan making, discouragement that often is at the core of disparate treatment based on race and ethnicity.

What remains unclear is what tools USDA has, needs, and will use to hold this and other offices accountable for such inequitable and patently fraudulent practices. ***The failure to do so in any tangible way is in our view the single biggest impediment to ever achieving equity and accountability in service to all producers.***

Our members have experienced many such problems on a routine basis. At present farmers have options to file an appeal of a decision to the National Appeals Division, to file a complaint to the office of Civil Rights and report of fraud to the Inspector General. There is a lack of clear guidance to help producers know which system to use to resolve issues that they are facing.

We believe Congress should consider establishment of a process with specific contact information designed to immediately address and correct problems with program requirements, and internet access, but also related to service delivery, problems in program access, appraisals, especially on the attitudes of USDA workers, and not only the location of USDA offices but of the failure of USDA field staff to let farmers know how and when they can be reached.

USDA needs to routinely measure outcomes in program participation as part of a proactive assessment of the operation of its county offices. But it should move beyond data on the application and participation in programs by race, gender, and ethnicity to the county level. It should also measure additional metrics related to its lending programs—specifically the month in which the farmer first contacts the office about a loan, and the month the loan is disbursed. The delays in loan making and slow walking the provision of benefits contributes is a continual factor in the precarious financial position of many producers whose cases we have reviewed.

USDA should also routinely measure the highest and medium number of programs

USDA should use comparative data from NASS and from the U.S. Census to assess land tenure, land concentration, broadband access, and factors including poverty and health disparities.

Receipt for Service. The USDA National Appeals Division recognizes that FSA's employees have a greater understanding of program requirements. Administrative Law Judges recognize and understand that “while a program participant is responsible for exercising due diligence in understanding the requirements of a program, NAD case decisions recognized that it is not reasonable to expect a program participant to have greater understanding of program requirements than FSA's own employees.[”] This is why receipt for service is so critical to understand what farmers are told by FSA staff. It is also important to note that the receipt for service reveals what the farmer was not told in terms of program benefits and services.

This Committee should review the use of the Receipt for Service and adopt new measure to assure compliance by all local offices that serve farmers.

Ensure Fair Access to USDA for Producers Farming on Heirs Property (FSA, NRCS, NASS)

Sections 12615, 5104 and 12607 of the 2018 Farm Bill Conference Report are intended to assure USDA affords fair access to its programs for farmers and ranchers who operate farms on “heirs’ property.” The final language ensures that more farm-

ers—especially African American farmers and farmers of color operating on land with undivided interests—can finally access critical USDA programs that enable them to

Tenure, Ownership, and Transition of Agricultural Land (TOTAL) Survey—\$15 million

Land access continues to be the biggest challenge facing beginning, current, and aspiring young farmers. Without secure land tenure, farmers are unable to invest in on-farm infrastructure or conservation practices critical to building soil quality, financial equity, and successful businesses. Land loss is also a major challenge for Black, Indigenous, and people of color (BIPOC) farmers who do not have clear titles to their land because it was passed down without a formal will; the land is then subject to fractured ownership among many relatives, becoming what is known as heirs' property.

In the 2018 Farm Bill, Congress tasked USDA with completing an updated TOTAL Survey, the results of which will provide comprehensive data on farmland ownership, tenure, transition, and entry of beginning and BIPOC farmers and ranchers as a follow-on to the Census of Agriculture (Sec. 12607). Further, the 2018 Farm Bill required that this survey include data collection on the extent of heirs' property so that the full extent of this land tenure challenge can be understood. Access to this information is crucial to better understanding the policies and trends that lead to secure land tenure and thriving farm businesses.

Unfortunately, this vital data gathering has not been funded since the 2018 Farm Bill was passed. Given that it requires surveying landowners who are not as well connected to the USDA—including non-farming landowners and heirs' property owners—it requires dedicated funding this year to make up for the lapses over the last two funding cycles.

To ensure that the USDA can produce a robust analysis leading to better access and more secure land tenure for young and historically underserved farmers alike, we urge this Committee to assure that Congress fund the survey for FY 2023 at the level of \$15 million (the total authorized amount), and that you increase the investment for this important study in the 2023 Farm Bill.

Current and comprehensive data is critically important to understanding the challenges farmers face related to land access and transition. We urge policymakers to ensure the data collection components of the 2018 Farm Bill are fully implemented and to continue to invest in recurring data collection, reporting, and research on farmland tenure, ownership, and transition to better understand the large-scale trends and challenges related to land access for beginning and historically underserved producers.

We [also] urge this Committee to assure this Land Tenure is expeditiously conducted because of the growing volatility in land ownership and operations, and the potential impacts to farmers and ranchers, rural communities and the entire farm and food sector. We have seen volatility in land values impact the entire agriculture lending system in the past in years past, including 1987, and we believe it is of critical importance now to understand and mitigate these impacts as we enter the 2023 Farm Bill debate.

We will be providing additional recommendations on the issues covered in the testimony. We pledge to work with you in any way we can to support the adoption of landmark 2023 Farm Bill.

The CHAIRMAN. Thank you. Thank you very much, Mr. Tillman. And now, Mr. Brown, please begin when you are ready.

STATEMENT OF HON. ADAM BROWN, OWNER, B&B FARMS, DECATUR, IL; ON BEHALF OF ILLINOIS FARM BUREAU

Mr. BROWN. Chairman Scott, Ranking Member Thompson, other Members of the Committee, I want to begin by thanking you on this Committee for all that you have done for America's farmers and ranchers getting through the difficult times of the past several years. The farm economy has bent, but it has not broken through volatile commodity prices, a pandemic, and now a resulting supply chain and inflation crisis that are driving up input prices for production and increasing the cost of goods across the economy.

My name is Adam Brown. I am a sixth-generation family farmer from central Illinois, where I raise 1,100 acres of corn and soybeans

on some of the blackest soil in the world. Our ancestors broke sod in the 1860s to provide for their family, who had pioneered West from New Hampshire. The land proved to provide great food, a home, and way of life for the family. The care and conservation of that land began then and has persisted through multiple generations and continues today.

At the end of 2017, my grandpa passed away as I was in the process of buying my uncle's share and preparing to buy my dad's share in the operation. Cash flow and debt loads were strained by the passing of my grandpa, as I would need to purchase several hundred acres from the many heirs of my grandparents' estate. The USDA FSA's Direct Farm Ownership Joint Financing Loan Program was a solid fit for this transaction. As my lender, Farm Credit Illinois, also had stellar young, beginning, and small farm real estate offerings to make the 50/50 split a workable solution for my situation. Still, to get through the cash crunch, I had to rely on participation in other USDA programs like the NRCS's Conservation Stewardship Program and FSA's Marketing Assistance Loan Program.

After the successful acquisition of the other heirs' portions of my grandparents' estate, I had to change the formation of my business from a partnership to a sole proprietorship, which resulted in changes to USDA paperwork. The unwillingness of NRCS to review my application to CSP because of an administrative paperwork error remains a singular source of frustration and speaks to the inefficiencies of government that oftentimes prevent new and beginning farmers from gaining access to the programs they need to stay afloat until they have their feet under them.

After a year of being forced to the sidelines, however, I finally re-qualified for the conservation program. And as a result, I expanded my use of no-till practices and, for the first time, created a pollinator habitat and utilized cover crops on my farm.

Government programs certainly can't make up for every cash flow problem a farmer may face. Tight margins over the last few years have forced us to find ways to tighten our budget to make ends meet, including the liquidation of nonessential farm equipment, the most painful sale being that of the first tractor that my dad ever rode on, a 1950 Ford Ferguson TE20, which brought in \$1,480. And while that was a difficult and emotional step to take, the survival of my farm for the next generation is my top priority, just like it was for the generation that passed it on to me.

Even those tough business decisions were not enough. I still needed some help to keep things running. And the loan programs that were available for young, beginning, and underserved producers came through for me in one of the most difficult and stressful times of my life.

I found ways to pay it forward as I served on the most recent USDA Advisory Committee on Beginning Farmers and Ranchers, where I led a workgroup dedicated to providing recommendations to USDA for improvements to existing programs on behalf of new and beginning farmers and ranchers. These recommendations include access to capital, access to land, tools for transition, information, and customer service, as well as a revised and aligned definition of a *beginning farmer* and *rancher*.

According to FSA, there has been no carryover of approved unfunded loans since Fiscal Year 2018. Therefore, heading into discussions for the next farm bill, the focus should be on ensuring that everyone that potentially qualifies for a loan under the program has equal access to it and that both the farm operating and farm ownership loan limits are keeping pace with the rising costs of farm equipment and farm real estate.

I thank you again for the opportunity to share my story with you today. I look forward to any questions you may have.

[The prepared statement of Mr. Brown follows:]

PREPARED STATEMENT OF HON. ADAM BROWN, OWNER, B&B FARMS, DECATUR, IL;
ON BEHALF OF ILLINOIS FARM BUREAU

Chairman Scott, Ranking Member Thompson, and other Members of the Committee, I want to begin by thanking you for everything this Committee has done to help America's farmers and ranchers get through such a difficult time. The Farm Economy has bent, but not broken, through volatile commodity prices, a pandemic, and now a resulting supply chain and inflation crisis that are driving up input prices for production and increasing the costs of goods across the economy.

My name is Adam Brown. I'm a sixth-generation family farmer from Central Illinois, where I raise 1,100 acres of corn and soybeans on some of the blackest soil in the world. Our ancestors broke sod in the 1860s to provide for their family who had pioneered west from New Hampshire. The land proved to provide great food, a home and way of life for the family. The care and conservation of that land began then, has persisted through multiple generations and continues today.

At the end of 2017, my grandpa passed away as I was in the process of buying my uncle's share and preparing to buy my dad's share in the operation. Cash flow and debt loads were strained by the passing of my grandpa, as I would need to purchase several hundred acres from the many heirs of my grandparents' estate. The United States Department of Agriculture (USDA) Farm Service Agency's (FSA) Direct Farm Ownership Joint Financing Loan program was a solid fit for this transaction, as my lender Farm Credit Illinois also had stellar young, beginning, and small farm real estate offerings to make the 50-50% split a workable solution for my situation.

Still, to get through the cash crunch, I had to rely on participation in other USDA programs like the Natural Resources Conservation Service's (NRCS) Conservation Stewardship Program (CSP) and FSA's Marketing Assistance Loan program. After the successful acquisition of the other heirs' portions of my grandparents' estate, I had to change the formation of my business from a partnership to a sole proprietorship, which resulted in changes to USDA paperwork. The unwillingness of NRCS to review my application to CSP because of an administrative paperwork error remains a singular source of frustration and speaks to the inefficiencies of government that can oftentimes prevent new and beginning farmers from gaining access to the programs they need to stay afloat until they have gotten their feet under them. After a year of being forced to the sidelines, however, I finally re-qualified for the Conservation program. And as a result, I expanded my use of no-till practices—and for the first time—created a pollinator habitat and utilized cover crops on my farm.

Government programs certainly can't make up for every cash flow problem a farmer may face. Tight margins over the last few years have forced us to find ways to tighten our budget to make ends meet, including the liquidation of non-essential farm equipment. The most painful sale being that of the first tractor that my dad ever rode on: a 1950 Ferguson Ford T20, which brought in \$1,480. And while that was a difficult and emotional step to take, the survival of my farm for the next generation is my top priority, just like it was for the generation that passed it on to me. Even those tough business decisions were not enough. I still needed some help to keep things running, and the loan programs that were available for Young, Beginning and Underserved producers came through for me in one of the most difficult and stressful times of my life.

I have found ways to pay it forward as I served on the most recent USDA Advisory Committee on Beginning Farmers and Ranchers where I led a workgroup dedicated to providing recommendations to USDA for improvements to existing programs on behalf of New and Beginning Farmers and Ranchers. These recommendations included access to capital, access to land, tools for transition, information and

customer service, as well as a revised and aligned definition of a beginning farmer and rancher.

According to FSA, there has been no carryover of approved, unfunded loans since Fiscal Year 2018. Therefore, heading into discussions for the next farm bill, the focus should be on ensuring that everyone that potentially qualifies for a loan under the program has equal access to it, and that both the Farm Operating and Farm Ownership loan limits are keeping pace with the rising costs of farm equipment and real estate.

I thank you for the opportunity to share my story with you today, and I look forward to any questions you may have.

The CHAIRMAN. Thank you very much. I thank each of you for your excellent testimonies. They were very, very good.

And now at this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow us to get as many questions in. And also, Members, we are on a tight schedule, so I am going to hold strict discipline to your 5 minutes because we will soon have votes on the floor. And we would like to make sure we are able to conclude our hearing before the noon hour. I appreciate your cooperation in this.

And of course, as I always say, please keep your microphones muted until you are recognized in order to minimize background noise.

And my first question will go to you, Mr. Kauffman. You mentioned that the global uncertainties such as the war in Ukraine may impact our financial stability, going forward, and that is an excellent point. So if the war continues into 2023, what financial impact will this have on our agriculture sector?

Dr. KAUFFMAN. Well, thank you for the question. And I guess I would start by recognizing that the war has had a pretty direct impact on the price of commodities but also the price of inputs, specifically fertilizer but also fuel, that has created an environment of uncertainty and elevated volatility in markets. It has made decision-making a bit more challenging. It has elevated the need for financing in some cases. It has also elevated the sense of concern among lenders just given the push on profit margins from some of those increases in costs.

The CHAIRMAN. And tell me, what suggestions, what recommendations could you share with this Committee as to what you feel we need to do?

Dr. KAUFFMAN. I would suggest that it starts with disciplined risk management strategies on behalf of producers. That might include marketing strategies. It might include leveraging the programs that are there that some others on the panel have already discussed. It would also include interacting directly with lenders to understand the position of lenders and some of the things that they might require to ensure that the capital is there to move forward.

The CHAIRMAN. And would you not agree that—I was absolutely stunned to find out—and many people did not know this until I mentioned to our Chairman of our Federal Reserve and my Financial Services Committee, that right now, Russia controls and produces 66 percent of all the fertilizer. So my question to you, how do you feel we might be able to address this? We have some funding going forward in another bill, but I would like to hear from you. What do you think we can do? Can we stimulate more fertilizer production and growing right here at home?

Dr. KAUFFMAN. There may be some possibilities of ways to increase fertilizer production, but it could take some time to do that. As I mentioned earlier, I think having some of the discussions between those entities, those that might be involved with securing those inputs could be useful. I know in many cases farmers struggle not just with the cost of those inputs but even just the availability and how to navigate some of the systems. I think having processes in place that might clarify some of those could be useful.

The CHAIRMAN. Yes, I would certainly agree with you.

Now, Ms. Davy, you know and said that in your testimony that Black farmers have historically been denied access to credit. Black-owned farms are often less profitable than White-owned farms and less able to obtain Federal payments that support their profitability. We are addressing these. But let me ask you, would you share with us what you think are some of the most effective ways in which we can break this cycle, Ms. Davy?

Ms. DAVY. Thank you for the question. I think that we do need and would benefit from a more robust civil rights process at the local levels. That is where the majority of the complaints of perceived and actual discrimination are taking place. So one recommendation could be the development of a local civil rights ombudsman that conduct annual civil rights reviews, something that has not consistently taken place, despite the acknowledgement of the discrimination that was happening at the local level through the class-action discrimination lawsuits.

The CHAIRMAN. Well, thank you. And we are addressing that, and we will continue to do so.

And now with that, I will now turn to the distinguished gentleman from Pennsylvania, my friend, Ranking Member Thompson is now recognized.

Mr. THOMPSON. Well, thank you, Mr. Chairman. First of all, Mr. Brown, I commend you for all that you have done in just 5 years of farming. Eleven hundred acres of prime Illinois farm ground isn't cheap. And it is a true success story that you were able to utilize these programs in the way that they were intended, to transition the farm from your grandfather, father, and uncle.

In your experience with several different credit programs, what do you believe was the most successful? And did you have any complications or issues that we can look to address in the next farm bill?

Mr. BROWN. Thank you, Ranking Member Thompson. I would say that the most successful program was the Joint Farm Ownership Loan Program where I was able to establish real estate in my name early on in my operation, and that was through joint financing between the FSA's program and Farm Credit Illinois, which has a stellar what we call FreshRoots Young & Beginning Farmers program. Giving access to capital for young, beginning, and small farmers is an initiative obviously near and dear to my heart, but I want to see other farmers in my same boat succeed. And I don't think I am uncommon in the approach that I have taken and the access to capital for young farmers just starting out will continue to be an issue down the road. So I would ask that that program be extended and that the caps on that program be raised as the

costs of our inputs, and the cost of our land continue to increase as well.

I would mention that my troubles transitioning through the CSP program, the Conservation Stewardship Program, were incredibly frustrating as we changed the structure of our farm from a partnership to a sole proprietorship. And I think that stumbling block continues to be an issue for farms as they transition from one generation to the next.

Also, I think it is important that the USDA acknowledge the Advisory Council for beginning farmers and ranchers. We had a lot of proposals that have not been acted upon by the USDA at this point. So thank you.

Mr. THOMPSON. Well, thank you. One of the issues I hear, the most reoccurring question I heard—and it was actually a phone call just 2 days ago, most recently, from new and beginning farmers and, quite frankly, seasoned farmers that are struggling knowing what to do with their farmland, the transition is the issue of solar fields. In the rush both at the Federal and state level for alternative green energy, we have consistently had very generous subsidies and tax breaks that has driven up the price of leasing ground. And for young and beginning that is kind of where normally folks will start with trying to lease off of larger tracts of lands from other farmers, and it has pushed the value of this acreage, these leases for solar well—at least in my experience the people I am talking with—well beyond what typically you would be able to lease for agriculture. I am not opposed to solar obviously. I would sooner see it on marginal lands, lands that are maybe environmentally sensitive *versus* fertile production lands. But I heard that on a call that I did initially with young agriculture professionals throughout the Commonwealth of Pennsylvania, and it has been a consistent theme.

So in your experiences, and this is for all witnesses, have you heard about this issue at all? Is this something that is in the different states represented here?

Dr. KAUFFMAN. I can start by offering just one comment, and that is to agree that what we have heard is that there are certain aspects of land that do add value to that land. It might be by way of solar farm, it could be wind operations, it could be other mineral rights. And that has been going on for some time. What that has led to is obviously a larger equity for those that own the land but, perhaps to your point, raising the costs for those that are trying to operate. And so it does make it a little bit more challenging than for those trying to enter, just given the high cost of entry.

Mr. THOMPSON. Thank you, Dr. Kauffman. Just real quickly, Dr. Kauffman, what is the near-term threat to credit conditions for farmers? Is it high interest rates, weakening commodity markets, lower land values, or something else?

Dr. KAUFFMAN. I think in the near-term it is the high input costs combined with a potential for reductions in commodity prices. For this year, much of that environment looks pretty sound because many farmers do make sales in advance and they have already secured their inputs in previous months. The concern might potentially be moving to the end of this year as they are securing those inputs for next year, and there could be lower profit margins.

Mr. THOMPSON. Very good, thank you.

The CHAIRMAN. Thank you very much.

And now the gentleman from Massachusetts, Mr. McGovern, who is also the Chairman of our House Committee on Rules, is now recognized for 5 minutes.

Mr. MCGOVERN. Well, thank you to all of our witnesses. And I want to thank the Chairman for convening this important hearing. I think it is critical that we hear directly from farmers when systems that are supposed to empower them aren't working the way that they should be.

And I will just quickly say to my colleagues that I think we need to be prepared to be responsive to what we have heard today.

Ms. Asherman, I want to make sure I get this right. When I was reading your testimony, did you say you grew up in Massachusetts?

Ms. ASHERMAN. Yes, I was born and raised in Boston.

Mr. MCGOVERN. Well, maybe that is why I thought you were particularly compelling today. But in any event, I want to congratulate you on all your successes, and we are certainly proud of the work that you are doing. But what struck me during your testimony was how much your story reminded me of stories that I have heard from farmers and would-be farmers in my district. They are interested in getting away from traditional row crops and opting for sustainable practices with the goal of contributing to local food systems. Often, they are the ones helping to build local food systems from the ground up.

But just as you detailed, translating the desire to start farming into being launched is a daunting task. So I have a two-part question for you. First, could you please elaborate on some of the hurdles that you face while seeking a loan from FSA? And do you feel that FSA and other lenders sufficiently value your type of operation in the overall farm economy?

Ms. ASHERMAN. Thank you for the question. I would say, I mean, the initial hurdle for myself was that I had no experience or understanding on how to go into any type of ownership process. My dad sort of explained to me, most people just buy one home in their life, and that is a pretty big deal. So just navigating the language, the paperwork was its own initial challenge, and I think that was really made more difficult by the fact that the language that my loan officers—their expectation of what a farm would look like, what it would gross per acre, what it could produce per acre, was just in a totally different realm from what my understanding was because they were really talking about a different kind of farming.

And that sort of goes to your second part of the question, which is just there are very different kinds of farming practices out there, and if the loan officers on the ground are not open or well-versed and familiar in the kind of operation that you are running, they are not only going to struggle to make sense out of your supporting documents but they, I feel like, often do undervalue the type of farming that you do. And I definitely feel like a minority in my area in terms of the type of farming that I am doing.

Mr. MCGOVERN. Well, as a follow-up, let me just say, I am inspired by the work you are doing to build a more just food system and one that works for existing farmers and aspiring farmers while

making healthy food accessible to every community. So how can expanding access to credit for farmers like you help with that vision?

Ms. ASHERMAN. Well, I am a big proponent of the local economy. I absolutely have respect for larger farmers that are shipping international and growing on just a totally different scale than what I am doing. I feel like local food economies are the most resilient food economies. I feel like I saw this during the pandemic when Walmart was running out of food and we were still setting up at the farmers' market. I think that smaller farms that are selling within a more narrow radius are keeping that money in the local economy better. I think that we are employing people in our communities who are staying in our communities. And I just believe in the power of smaller farms, producers of our domestic food.

Mr. MCGOVERN. Well, I thank you for your answer, and I share your vision here. And I want to thank the entire panel of witnesses.

And Mr. Chairman, I will yield back my time.

The CHAIRMAN. Thank you, Mr. McGovern.

And now the gentleman from Georgia, Mr. Austin Scott, is now recognized for 5 minutes.

Mr. AUSTIN SCOTT of Georgia. Thank you, Mr. Chairman. And I want to mention with regard to the FSA loan process, one of the most successful farmers I know in Georgia who I have had a relationship with for a long time, called me. He was trying to help his son get started. And after about a year, he finally went to the local bank and just cosigned the note with his son. And his comment to me was nobody who could access credit anywhere else would go through the process at FSA. So I am sure that the loan process is flawed. I think we need to work on that.

I do want to mention one thing, and I want to say this cautiously, but I do know we are trying to make progress with this. And this really goes, I guess, very quickly to Ms. Davy, Mr. Tillman. But one of the key issues in my area in talking with professionals at Fort Valley State is the heirs-related issue and no clear title to property. And so when there is timber on the property, the timber companies are scared to contract to cut the timber because it is the heirs-related issue and no clear title. It is hard for a bank to loan money without clear title. I know we are doing some USDA—there are some USDA initiatives with that right now.

But I will leave it with you, Mr. Tillman. I am from Georgia. Is the heirs-related issue with minority farmers—how big of an issue is that in Oklahoma where you are from, and how much progress is being made on resolving that issue?

Mr. TILLMAN. It is most definitely a problem. When you have a parcel of land and you have 25 or 30 heirs to it, that is kind of a pickle of a mess. And trying to sort through things of that nature is quite expensive and basically very hard to deal with. And we are basically doing a lot of heir property workshops and development of wills and things of that nature to make it that much easier for the next generation, because all of that basically occurs when the unexpected happens, and then you got that challenge there of trying to divide up everything equally among all the heirs.

Mr. AUSTIN SCOTT of Georgia. David and I have been good friends for a long time, and we have some pretty heated conversa-

tions on some of the issues revolving around race and agriculture, but this is one of the issues that I do—this clearly disproportionately impacts minority farmers, and it is one of the issues that needs to be resolved for everybody. And so I look forward to working to help continue to resolve that because if you don't have clear title, you can't get the loan. That is the bottom line.

Mr. TILLMAN. Right.

Mr. AUSTIN SCOTT of Georgia. And I do think through Fort Valley State and some other institutions we can work to help people. It won't be perfect, but it will be better than it is.

I do want to mention this, Ms. Asherman. You hit on this. Ninety percent of our food supply in this country comes from about 12 percent of the farmers. We have to have large-production agriculture. One of the things I see that is so difficult for our beginning, young, and small farmers is it costs more when you are a beginning, young, and small farmer. And so what you get if you are a big farmer might pay the bills, it might not right now, but it won't pay the bills that same ratio if you are a small farmer. How far do you have to travel to get to a farmers' market, Ms. Asherman? Ms. Asherman?

The CHAIRMAN. You may need to unmute, Ms. Asherman.

Ms. ASHERMAN. I am sorry, my internet is extremely slow. I was trying to unmute. I drive 2 hours to my major market, and I also sell on the farm and a half an hour away [inaudible] market.

Mr. AUSTIN SCOTT of Georgia. This is one of the issues, Mr. Chairman. If you are a beginning, young, and a small farmer and you are growing the way Ms. Asherman is, you have to have access to markets to sell your products. And as our farmers' markets have closed, just like as our smaller meatpacking facilities have closed throughout Georgia, it has made it that much more difficult for our beginning, young, and small farmers. And candidly, it has given more control of our food supply over to the largest of the corporations.

With that, I know my time has expired, and I apologize for your internet service, Ms. Asherman. I am hopeful that your EMC will be delivering 1 gigabyte to you shortly.

[Information supplied by Ms. Asherman is located on p. 1369.]

The CHAIRMAN. Thank you, Mr. Scott.

And now the gentlelady from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Mr. Chairman. Thank you also to the Ranking Member for hosting the hearing. This is an important topic to our witnesses. Thank you for your testimony. It is timely.

There is a new generation of farmers in America. They are different from older generations, younger, more diverse, and choose to grow other crops. An increasing number of them are women. At the same time, farmland is transitioning to new hands, and while the 2018 Farm Bill made strides in programming and microloans, there are still major gaps in the Federal agricultural credit system.

Ms. Davy, your testimony briefly mentions these gaps, especially for Black and minority farmers. Farm Service Agency loans require 150 percent equity on purchase loans, require copious amounts of paperwork, and they take months to process. So what should Con-

gress do to simplify the application process for young and socially disadvantaged farmers?

Ms. DAVY. Thank you for the question. Congress has already done a lot. And with regard to the previous question that was asked with regard to the heir property issue, the most recent farm bill, the 2018 Farm Bill, Congress already acknowledged the need for services for heirs property landowners, and authorized the Heir Property Relending Program. And so I think that the microloan program is another example of the intentionality that Congress has brought to addressing these communities and this issue.

I think that the loan application process itself has had a lack of transparency. There are times when farmers are telling us that they are receiving requests for duplicitous information. And in the example of the farmer that I spoke with that was told that the farm home was too nice for the property, when he asked his FSA agent to explain what the house had to be like or look like to conform with their expectations of what a farmhouse should look like, there was never an explanation given. There has never been really any clear, transparent guidelines on what pre-approval or what an approved loan would look like. And so there needs to be assistance in addressing the information of what is required up-front, as well as a process that is streamlined in many ways similar to the reduced paperwork burden of the microloan process, but I definitely think transparency.

Ms. ADAMS. Thank you. Thank you, ma'am. Okay. So let me ask about ag's government-sponsored enterprise, GSE farm credit. Congress requires other GSEs to set aside their profits for grants. So should Congress mandate similar set-asides as grants for farmers? Ms. Davy?

Ms. DAVY. I am sorry—

Ms. ADAMS. Should Congress mandate similar set-asides as grants for farmers? I mean, they require other GSEs to set aside their profits for grants. So should we mandate similar set-asides as grants for farmers?

Ms. DAVY. We are grateful for the set-aside programs that exist and definitely think that any opportunities to expand set-asides that would benefit socially disadvantaged farmers and their ability to own and control their finances would be a benefit to all—

Ms. ADAMS. Great. Okay. Thank you very much. Dr. Kauffman, you mentioned that demand for farm loans is expected to rise. I was surprised to learn from Ms. Asherman that Farm Credit and Farm Service Agency loans are not reported to credit bureaus. So can you help me understand why that is and the impact it may have on farmers' ability to build credit?

Dr. KAUFFMAN. I can't speak specifically, I guess, to the reporting mechanisms. My comment was to recognize that some of the credit demands appear to be rising in conjunction with the rising input costs.

Ms. ADAMS. Okay. All right. Thank you very much. Mr. Chairman, I am going to give the 51 seconds back to you. I yield back.

The CHAIRMAN. Thank you very much, Ms. Adams.

And now the gentleman from Tennessee, Mr. DesJarlais, is recognized for 5 minutes.

Mr. DESJARLAIS. I thank the Chairman. I just have a couple of quick questions, and I was going to address those to Mr. Brown.

First, supporting the next generation of farmers is a huge priority for all Members of this Committee. If the elimination of stepped-up basis had occurred prior to your generation, how would it have impacted your ability to maintain the farm?

Mr. BROWN. Thank you for the question, Congressman. Stepped-up basis changes would be devastating for our operation. As a sixth-generation family farmer, my intent is to pass the farm on to the next generation and to take advantage of any tax breaks that are at all possible will just provide us the opportunity to feed that money back into the operation where we thrive on stewardship of our land and growing the economy in our rural town. As you know, keeping money locally is very important for us as farmers, and local towns are really struggling for us, our local bank and our local elevator. So as much of that money as we can keep in the local economy, we will.

Mr. DESJARLAIS. Okay. Second, I often find that some perceive beginning farmers and ranchers that have smaller operations or operations that are not their full-time job. Could you add some color to why this perception is wrong and the importance of beginning farmers and ranchers of all sizes, including larger operations?

Mr. BROWN. Sure. Let me say that as our operation is 1,100 acres, I would consider that small in this day and age. We have to compete with very large corporate-type farms, which have access to economies-of-scale that we can't readily compete with. So, as I mentioned in my testimony, we like to take advantage of conservation programs and continue to incentivize programs that we have done in the past and build up our soil quality and efforts to maintain a healthy community.

It is very important for me to keep a corn and soybean operation. Our conventional system is what I am used to, what I know well, and what we built our grain system around. We are currently putting up a grain bin and trying to be as efficient as possible. And if very small, niche farms are more heavily incentivized than ourselves, it puts me at a competitive disadvantage because I can't pivot as quickly as some of those operations as we continue to focus on corn and soybean operation.

Mr. DESJARLAIS. Okay. Well, Mr. Brown, thank you for being here today. And I would like to thank all the witnesses for being here for their testimony for this important hearing.

And, Mr. Chairman, I will yield back the balance of my time.

The CHAIRMAN. Thank you very much.

And now the gentlewoman from Illinois, Mrs. Bustos, who is also the Chair of the Subcommittee on General Farm Commodities and Risk Management, you are now recognized for 5 minutes. Mrs. Bustos? You may want to unmute, Mrs. Bustos.

If not, we will come back to Mrs. Bustos.

Now, we will recognize the gentlewoman from Ohio, Ms. Brown, for 5 minutes.

Ms. BROWN of Ohio. Thank you, Chairman Scott and Ranking Member Thompson, for holding this hearing.

Access to credit is one of the most important components of long-term success for young, beginning, and underserved farmers and

ranchers, and Congress must do all it can to support these farmers and ranchers. I represent the City of Cleveland, an urban area which many of my constituents live in food deserts and have limited access to fresh fruits and vegetables. Urban farming ventures offer an innovative solution to fighting food insecurity and building healthier communities.

Vice President Kauffman, thank you for joining this panel. In your role at the Federal Reserve Bank of Kansas City, you examine agriculture credit condition and farm finances. Can you please speak to the accessibility of credit to urban farmers, how they are using these loans, and whether the loans are sufficient to meet their needs?

Dr. KAUFFMAN. Well, the first thing that I would suggest I guess there is that, generally speaking, the access to credit is one where those that have the most established relationships have typically been most easily able to navigate some of the systems with credit. So that has been maybe a bit more of a challenge for some of those that are exploring niche opportunities such as those in urban locations. There are opportunities, though, for those individuals, and it seems like some of those niche opportunities have become more prominent, alongside some of the other comments about local food systems.

Ms. BROWN of Ohio. Okay. So it sounds like there are some challenges with accessibility, so if you could speak to how Congress can improve these programs to better serve urban farmers.

Dr. KAUFFMAN. I think one of those might be to recognize where there could be opportunities to, again, help with the relationship development, understanding what the programs are, understanding what the resources are, and maybe contacts that can help connect those that recognize where there are market opportunities with those lenders that may be unfamiliar with some of those opportunities but still stand at the ready to be able to provide that credit.

Ms. BROWN of Ohio. Thank you so much. Well, with that, Mr. Chairman, I will yield back the balance of my time.

The CHAIRMAN. Thank you, Ms. Brown.

And now the gentleman from Illinois, Mr. Davis, is recognized for 5 minutes.

Mr. DAVIS. Thank you, Chairman Scott. I also want to thank Ranking Member Thompson. Earlier this Congress, I introduced the Farm Credit Administration Independent Authority Act (H.R. 7768) with my colleagues Representatives Jimmy Panetta, Michelle Fischbach, Abigail Spanberger, and Angie Craig to mitigate a serious threat to the viability of the Farm Credit System from the CFPB to implement an overreaching one-size-fits-all proposed rule on small business lending data collection. The proposed rule would demand new, costly IT infrastructure, additional staff, and would ultimately make lenders guess the demographic information of a borrower in the name of fair lending if left unreported. Our bill clarifies the Farm Credit Administration as the independent regulator of the Farm Credit System and would stop the implementation of the CFPB's proposed rule as it applies to Farm Credit.

Right now, we are working to move this bill through the appropriations process, given the time-sensitive nature of this issue and the immediate harm that it would cause rural America. And I hope

that the Rules and Appropriations Committees will work with us to resolve this quickly. Farm Credit System lenders have proven to be an effective tool for rural communities, and we must preserve their independent regulatory status.

Now in the context of the conversation that we are having today on the state of credit for young, beginning, and underserved producers, this is an important issue we should be seeking to address in the immediate. On top of all the supply chain issues, increasing input costs, raging inflation, we can't also put the availability of credit on the line that will only serve to discourage individuals like each of you from seeking careers in farming and agriculture.

Now, my question, and I will start with my good friend, Representative Brown, if new and beginning farmers do not have continued access to ag-lending entities like the Farm Credit System, what could the future of your operations look like, and do you see it as a barrier to entering the field?

[Information supplied by Ms. Asherman is located on p. 1371.]

Mr. BROWN. Well, I would hate to even imagine what it would look like for us to not have Farm Credit in the mix. Farm Credit Illinois has been the steady hand in our operation through our transitioning farm, and they offer educational courses as well as through their FreshRoots Program that I noted before, breaks the interest rates on operating notes and real estate notes for young farmers. In fact, about 35 percent of new notes that come to Farm Credit Illinois are from young, beginning, and small farmers. And so we are growing the future of Illinois agriculture. Without the assistance of Farm Credit, I would be hugely concerned.

Mr. DAVIS. Well, I mean, I don't know your financial picture. I have known you a long time. I probably wouldn't lend you \$20. So, Adam, thank God we have the Farm Credit System to help operations like yours grow. And obviously I say this in jest because I have seen your operation and I have seen what a system of availability of credit from an entity like Farm Credit has been able to do for you and your family to grow your operation. So, I mean, as you mentioned, this would be a devastating blow to anyone in your situation or anyone who may be in a situation where they might not be able to get that available credit without the entity.

Mr. Tillman, would you like to address the issue of the CFPB rule that I mentioned?

Mr. TILLMAN. Well, what I see is like—and I am trying to deal with the credit issue. When a farmer basically gets a loan from FSA, he pays the loan off before a time. But he was forced into a lot of these things by the actions that were basically taken towards him as they meet and discuss where they really are. This was more of a threatening type thing for the particular farmer, so he pays it off ahead of time. Now, when he did that, not knowing that he would not be able to get a loan again like that, whereas that if somebody does some good, why should he be punished for it? So you can't get another direct loan. You graduated in other words to the other state of that particular deal.

Mr. DAVIS. Wow, thank you.

Mr. TILLMAN. And that is a point that I would really like to make, whereas like if you have done something good, why are you not able to stay with something that you are accustomed to?

Mr. DAVIS. Well, thank you for your comments, your remarks. I yield back.

The CHAIRMAN. Thank you, Mr. Davis.

And now the gentlewoman from Virginia, Ms. Spanberger, who is also the Chair of the Subcommittee on Conservation and Forestry, is recognized for 5 minutes.

Ms. SPANBERGER. Thank you so very much, Mr. Chairman. And to our witnesses, I thank you so much for your time for being with us today. And I was wondering if you could just give us—and I know that you have submitted written testimony and certainly answered many of our questions. But if you could identify one thing in the system—and I know there are many challenges, but one thing in the system that you would change and what that potential impact would be. I was wondering, if you could wave a legislative magic wand, what would you suggest for us? And I open it up to any of the witnesses.

Ms. DAVY. If I had my legislative magic wand, I think that, as I mentioned in my previous answer, a more robust civil rights process at the local level would be the biggest need for our community, despite the increases in credit limits and despite the availability of the Heirs Property Lending Program, if people cannot get their applications reviewed and processed because of any discrimination that is occurring, that is going underreported and under-recognized, that barrier is insurmountable and doesn't even open the door to access in credit. And so I definitely think that would be the highest need at this time.

Ms. SPANBERGER. Thank you. And thank you very much for your testimony. Certainly thank you for sharing your experiences, and thank you for bringing greater clarity to your answer and in raising awareness about having local steps for raising concerns or bringing challenges.

To any of the other witnesses, would you care to add anything else?

Ms. ASHERMAN. I would love to add something. In addition to waving the wand for that ask, I do think that a pre-approval process for ownership loans is really important. It is something that most other lenders offer, and it would keep farmers competitive. And I also think that one of the amazing things about FSA repayments is you can make an annual payment instead of monthly payments. And I am assuming that is because FSA recognizes cash flow is very seasonal for farmers. Well, workload is also incredibly seasonal, so being able to do some of that burden, some paperwork, or do some of that preplanning, get a pre-approval in your off-season and then be able to look for land, in an ongoing fashion, would be a major benefit to farmers.

Ms. SPANBERGER. And so you are saying recognizing that there is already a sort of uniqueness to the industry, if you will, that FSA has already taken certain steps, and so applying those kind of on the front end as well, those assumptions or those understandings. Okay. I appreciate that.

Any of the other witnesses? I can't see in the committee room.

Mr. TILLMAN. I would like to basically make a suggestion. This is administration of equity and fairness. And being of equity and fairness, I think that there need to be programs to develop based

on the past discrimination of a lot of these things, whereas that a person who basically receives an ownership loan and an operating loan, the first 3 years of his operating loan, he should have a waiver for him to build equity and sustainability in this process. This will give him cash flow, a chance for him to basically build a sustainable base for his operation. And with this, he can therefore take the monkey off his back and be able to actually manage, operate, meet the necessary needs of his farming operation.

Ms. SPANBERGER. And have that breathing room as things are getting up and started and the operation is sort of working out the challenges. That makes sense. Well, thank you very much to our witnesses.

Mr. Chairman, I want to abide your instructions for us to stay on time, so I yield back. Thank you so much.

The CHAIRMAN. I appreciate that, Ms. Spanberger.

And now the gentleman from Arkansas, Mr. Crawford, is now recognized for 5 minutes.

Mr. CRAWFORD. Thank you, Mr. Chairman, and I thank the witnesses for being here today.

I guess there is a long history of young and beginning farmer programs and probably have their roots, as we know them today, going back to the 1960s as part of the Great Society under the LBJ Administration, and yet we see a continual trend for the average age of a farmer continues to climb. And, as indicated by the Chairman and the Ranking Member, we are bumping 60 years of age and climbing on the average age of a farmer in the United States.

I had an occasion to text a good friend of mine who is a farmer back in my district. I said if you could distill it down to a sentence, what do you think could be done to bring down the average age of a farmer in the United States? And here was his surprising response, and we are going to talk about this. His response was stop consolidation of the ag distribution network.

So if we unpack that a little bit, the genie is basically out of the bottle here. Can we put it back in? I don't think so because the smaller guys are paying 25 to 30 percent more for inputs because the system is set up to accommodate the leverage, the strength in numbers, the economies-of-scale. Look, I am not going to malign economies-of-scale. I don't want to penalize people for being successful. But at the same time, if we are going to backfill our production base, we have to think forward about how we address this and all the credit programs. And it is not just the Federal Government. There are all kinds of entities in every state that are engaged in some form of young and beginning farmers incentives, and yet, we still see those numbers climb. We haven't moved the needle at all.

So I want to talk about this system that we rely on: the ag distribution network. And, Mr. Brown, I will start with you because you look like a real success story, and that seems to be the exception *versus* the rule with regard to integrating young farmers into the system. Give me your take on that statement on the ag distribution network.

Mr. BROWN. Well, I will note that the ag network is difficult to navigate for a young farmer. And as you mentioned, input costs, commodity prices, weather all present many variables and chal-

lenges to me as a young operator. How do I compete with that? I think we compete with relationships, with education, and you compete with the corporate advantage, what I would call, with hard work. And the only way that I can overcome these challenges is by outworking, by out-communicating, and having greater access and understanding of how our operation is set up and why it is a better approach than maybe the corporate attitude that you mentioned.

Mr. CRAWFORD. Well, and I don't want to get into a dynamic of where we are talking about "corporate farms," quote/unquote. I am not here to try to paint a negative picture of economies-of-scale. We rely on those economies-of-scale. What I want to do is to talk about how we get that young person. I mean, as I said, I think you tend to be a little bit of an exception to the rule when we see a continued upward trajectory in that age. And then, on the other side of the spectrum, you look at Ms. Asherman, who is on small acres and that is another success story, again, probably a little bit of an exception. I am going to ask Ms. Asherman to kind of weigh in on this as well. What have some of the challenges been for you? It is probably not so much access to capital as it is to the competitive disadvantage you find yourself in because you are starting from a position of not being an economy-of-scale? Do you want to weigh in on that, Ms. Asherman?

Ms. ASHERMAN. I do. I will say that I think it is important to clarify that when we talk about small farmers, we need to clarify are we talking about small acreage or small gross sales? And there is a big difference between a commodity grower, a row crop grower, and a direct produce market grower.

[Information supplied by Ms. Asherman is located on p. 1369.]

Mr. CRAWFORD. Right. So this is illustrating the need for rural broadband. I think I take your point, Ms. Asherman. And let me just say that—and you do, you make a good point about the difference between gross sales *versus* acreage. And I am talking about sales really. I mean, your revenue generated from your efforts, not so much the size of the operation in terms of physical acreage but the impediments to being successful on the front end. And Mr. Brown alluded to this. You have to be this much better than your competitors to be able to get the capital you need, but you still start from a distinct disadvantage. To me, those are the things that we are going to have to wrestle with if we are going to move the needle on our aging farm population.

With that, Mr. Chairman, I am going to yield back.

The CHAIRMAN. Thank you very much.

And now the gentlewoman from New Hampshire, Ms. Kuster, is now recognized for 5 minutes.

Ms. KUSTER. Thank you so much, Mr. Chairman, and I apologize for not being available earlier. I want to thank our panel for being with us today. I am so grateful we are having this conversation.

As it has been noted this morning, the average age of farm producers is 57 years old, and the most recent Agriculture Census in New Hampshire found that $\frac{1}{3}$ of our producers are over 65 years old, but only seven percent are under 35 years old. So that disparity is very troubling, especially in the long-term.

I have yet to meet a farmer producer who isn't passionate about what they do. The work requires passion. Growing our food can be

incredibly rewarding, but it is not an easy life by any means. And that is why Congress must do all we can to ensure that young and beginning farmers have the tools and support that they need to succeed. We are going to need them to continue the legacy of small family farms in America and to grow enough food to feed our nation and others around the world.

We have to incentivize young people who are interested in agriculture, such as our speakers here today, because the challenges facing them are daunting. And as the next generation of farmers looks increasingly diverse, including women and people of color, including those from historically underserved communities, I think this will enrich our nation's agricultural sector tremendously.

I am grateful there is an incredibly dedicated community of lenders in our state, as well as stakeholders who focus on education, training, and farm transition planning. We have great partners as well within the Farm Service Agency. But nevertheless, young, beginning, and underserved farmers still face barriers, including access to land and capital.

Ms. Asherman, maybe it is because you are a New Englander at heart, but I really enjoyed your story and your testimony. And I was so struck by how you finally found farmland on Craigslist. Could you elaborate on the challenges you faced in finding affordable farmland and how having a pre-approval process for FSA direct farm ownership loans might have helped your situation?

Ms. ASHERMAN. Thank you for the question. I will say that I am fortunate, and in my area, affordable farmland is very available. I think that that is rare, and I know for a fact from my farming peers that that is not the case in all of the states and in all of the regions and even with all the regions within my State of Georgia. So in my case, finding affordable farmland was actually relatively easy.

I think a pre-approval process would enable farmers to plan, and farmers are naturally planners. It is very difficult to be shopping for land, meet a landowner, make an offer, and then have to say, "Oh, but by the way, I still have to go actually secure financing, so even though I have given you an offer, would you please wait and let me see if I can secure financing," and then have that financing process take several months.

A pre-approval process would mean that you would be able to have a business plan where you actually know the maximum budget that you are going to spend on your land, be searching for a property within that number, and then when you find land, you can actually make an offer and you don't have to go then and secure financing.

Ms. KUSTER. Got it. Good. Well, I agree, a quick and streamlined process would be helpful.

Mr. Tillman, just briefly here, thank you for raising the appeals point in your testimony. Can you describe this appeals process, and are there changes that we need to make?

Mr. TILLMAN. I didn't quite hear you.

Ms. KUSTER. Mr. Tillman, did you hear my question?

Mr. TILLMAN. I didn't quite understand the question. Would you repeat it, please?

Ms. KUSTER. You had referenced the appeals process, and I just wondered if you would describe that and if there is anything that we need to do to fix that in the upcoming farm bill.

Mr. TILLMAN. The appeals process?

Ms. KUSTER. Appeals for denials of loans.

Mr. TILLMAN. Yes. There needs to be some type of structure there in the appeals process. A lot of times—

The CHAIRMAN. If I may, Mr. Tillman, the lady's time has expired, but if you would not mind submitting that in writing the really good idea you were about to express to—

Mr. TILLMAN. I would appreciate that. That I would appreciate.

[The information referred to is located on p. 1379.]

Ms. KUSTER. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. Yes, ma'am. The gentleman from Georgia, Mr. Allen, is recognized for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman and Ranking Member Thompson, for hosting this hearing today. And I want to thank our witnesses for taking time to talk about these important issues. Obviously, we are concerned about where agriculture is presently. It certainly—and it is a global problem. We know that there are a lot of threats out there. We just saw yesterday where the June CPI inflation report shows about a 9.1 percent increase. And of course, one of the things that I get the most complaints about is if I am in the grocery store, people grab me and say, where is this going? Or if I am filling up my car at the gas station, they are saying—I mean, they walk up to me and say what are you going to do about this? And I can't imagine—well, I talk to businesses, and I know what you are going through on the farm. And frankly, there is not a lot in the farm bill to deal with this other than you just hope that commodity prices will keep pace with the inflation, which then if commodity prices keep pace, then the grocery store and the other things happen. So this is just this vicious cycle that we have to tackle. And certainly, the two ways to tackle that is discontinue the increase in money supply and quit spending government money. I mean, that is a recipe for inflation.

So we can have this important farm bill oversight hearing on access to credit today, and I am glad that we are, but I know until we can get a handle on this economy and quit running it from the White House and let it be a market-driven economy so that we can get a handle on this, it is going to be difficult to predict what is out there.

Obviously, we know in every industry that the average age of owners and operators and those in just about every business is almost over 58 years old. And we have to replace those folks. In fact, we have had, I don't know 11 million people disappear in the workforce. We don't know where they are. We don't know if they retired. We don't know what is going on.

But I guess my first question to you, Mr. Brown, is can you elaborate on the recommendations that were given to USDA on behalf of new and beginning farmers and ranchers and specifically related to programs that could be included in the next farm bill?

Mr. BROWN. Absolutely. Thank you, Congressman Allen. I would first note that there is not an aligned and uniform definition for *young, beginning farmers* inside of the U.S. Department of Agri-

culture, and that is unfortunate because we need to understand who we are dealing with before we can shape meaningful programs around this group of very important farmers. And the recommendations that we made included access to capital, access to land, tools for transition, and information and customer service. All of these had well-thought-out recommendations that we had formulated over about 2½ years. Unfortunately, the USDA has acted upon zero of those initiatives. All of them are meaningful and helpful for our committee that represented young and beginning farmers, and I would ask that we have predictability going into the next farm bill. We have so much volatility throughout my operation, throughout the ag economy. If we know what we are dealing with, we can better shape.

Mr. ALLEN. Yes.

Mr. BROWN. And as one of the other speakers noted, we can we can plan better.

Mr. ALLEN. Yes.

Mr. BROWN. And that that provides us peace of mind. And let's not have a knee-jerk reaction here, but let's have a well-thought-out plan where farm families have the opportunity to do what we do best, and that is produce the best crops in the world.

Mr. ALLEN. Exactly. And the last time we faced this kind of inflation was in the 1980s, and we know what that did to agriculture and to farmers.

And, Mr. Brown and Ms. Asherman, I mean, how is this unpredictability impacting your decisions right now—and quickly; I have 24 seconds—on how you are going forward.

Mr. BROWN. Let me say that it is unprecedented for my operation. I have been involved in operations since I was 10 years old, of course, but I have owned it for just the past 5 years, and the volatility is very difficult. Fortunately, I bought through the Joint Financing Program, as I mentioned, FSA and Farm Credit, was able to secure some land before the massive inflation hit. But that doesn't mean that we are not going to face tremendous challenges in the future, so I am trying to keep my powder dry and prepare for the worst.

Mr. ALLEN. Good. Thank you. Ms. Asherman, I am out of time.

The CHAIRMAN. Thank you.

Mr. ALLEN. If you would respond to this Committee in writing. I would appreciate it. With that Mr. Chairman, I yield back.

The CHAIRMAN. Yes, please respond to him in writing. It would be very helpful.

And now the gentlewoman from Illinois, Mrs. Bustos, who is also the Chair of the Subcommittee on General Farm Commodities and Risk Management, is now recognized for 5 minutes.

Mrs. BUSTOS. Thank you, Chairman Scott. And I also want to say thanks to our Ranking Member for holding this important hearing. This has been enlightening. And we appreciate your time.

As the Chairman said, I chair the Subcommittee on General Farm Commodities and Risk Management as part of the whole Agriculture Committee, and that has jurisdiction over crop insurance. So what I am especially interested in is how crop insurance and agricultural credit complement each other and how we can get these two programs to work better as we look at the 2023 Farm Bill. We

are in the middle of going across the country. Austin Scott is the Ranking Member on our Subcommittee, and he and I just got back from Arizona. We are going to be going to Minnesota later this month to Angie Craig's district and then to Ohio to Congresswoman Kaptur's district to really take in, what do we need to know?

So for our panel here, any of our producer witnesses, why don't we start there, how has your buy-up of crop insurance impacted your access to credit, if at all? And whoever wants to take that, again, to the producers on the panel.

Ms. ASHERMAN. If I may, very quickly, I do not have crop insurance. And to my knowledge, I am too diversified to access those programs. So when I apply for credit or really when I go about my business and my farm planning, I have to take that risk and just own it.

I will say that part of the reason I am so diversified is that provides its own level of insurance, and then I can lose any individual crop and not go under entirely for that year. But I and many producers like me do not benefit from crop insurance.

Mrs. BUSTOS. So Ms. Asherman, then, a quick follow-up. What should we know as we go into the 2023 Farm Bill as it pertains to insurance for the line of ag that you are in? What would make things better for you and your colleagues?

Ms. ASHERMAN. I would say that just generally risk mitigation is a huge factor for all farmers of all sizes, scales, and complexities. And I believe that there is a way to offer crop insurance to diversified and smaller farms. I don't know off the top of my head the nuances of that, but I think crop insurance would be beneficial, and any risk mitigation would be beneficial.

Mrs. BUSTOS. Okay. All right. Thank you. Well, we could talk maybe a little bit more offline as to how that might look.

Again, back to my question about buying crop insurance and how that has impacted your access to credit if at all, anybody else have anything to add to that question?

Okay. I am going to move on to the whole panel then. Do you see ways for crop insurance and ag credit to work better for young and beginning and underserved producers? That is to the whole panel.

[Information supplied by Mr. Tillman is located on p. 1381.]

Mr. BROWN. Congresswoman Bustos, thank you for your question. I will note that crop insurance is vital to our operation and ensuring that our risk is mitigated to a reasonable point. I haven't had to rely upon it myself fortunately. With a recent claim in 2012, we had horrendous drought in central Illinois and throughout the State of Illinois. And at that point, it came in very pivotal to the survival of our operations.

So I would note that in the future as simplified as we can get crop insurance, I know we would like to cover yield as well as price, but it is an overly complex program at this point from my perspective.

Mrs. BUSTOS. Okay. I am going to go ahead and move to my next question since nobody chimed in right away. So I want to switch gears to the value of property in today's market. So during the last farm bill—I have been involved with helping markup two farm bills

now in my time here in Congress. But I was really proud to be able to work with Ranking Member Thompson on the inclusion of Farmers of Tomorrow Act (H.R. 4513, 115th Congress). And what that did is it eased some of USDA's financing requirements on young farmers and veterans to help them access credit to buy land.

Obviously, it is clear that more needs to be done in our next farm bill to keep up with the increasing property values. So just wondering, any thoughts that anybody on the panel has about this? And, Dr. Kauffman, if you can speak to the impact that high real estate values have on young, beginning, and underserved producers who are trying to get into farming?

Dr. KAUFFMAN. Well, just very quickly, in the interest of time, what I will say is that does present a barrier just in terms of cost. I think one suggestion might just simply be to evaluate what the risk profiles are of producers that would be consistent with the goals of this Committee. Crop insurance is of course important, but there could be other mechanisms that attempt to try to reduce those risks.

Mrs. BUSTOS. Okay. Thank you. Sorry, we are out of time.

The CHAIRMAN. Thank you.

Mrs. BUSTOS. Thanks, everybody. Thanks, Mr. Chairman. I yield back.

The CHAIRMAN. The gentleman from Alabama, Mr. Moore, is now recognized for 5 minutes.

Mr. MOORE. Thank you, Mr. Chairman, for holding this and for Ranking Member Thompson for—obviously, on the Committee.

Mr. Brown, a couple of questions. We have a farm and we quit farming in 1980. The drought and armyworms kind of pushed us out. And so my cousin's son has kind of come back into that operation and he is trying to get it going. And what do you see—I have talked to Garrett a little bit about this, but what do you see as the largest barrier to entry for young farmers and obviously underserved producers? What do you see as some of the just—I know you had different set of sort of approaches you had to take and I think you had to navigate some pretty tough issues, but what do you see as the largest issue right now?

[Information supplied by Ms. Asherman is located on p. 1371.]

Mr. BROWN. Thank you, Congressman Moore. I would note that the biggest challenge for me in transitioning into the farm operation was the lack of communication and understanding throughout the generational divide but also in relation with our lenders and associated parties. It is important that we educate those that are entering the agricultural field and for us as young farmers to understand the options that are out there and the programs that are available.

I think USDA, from my point of view, does a poor job educating on the programs that are out there and accessible. And with farm bills changing every several years, a lot of times those programs go away or are new out there, and we don't see them at the grassroots level for a decade or so. We hear about them by word of mouth rather than by direct FSA or county offices notifying us, so it is it is tough to be aware of all the programmatic changes. As I mentioned, consistency is key for us to understand what is out there for young farmers as far as access to capital.

Mr. MOORE. You said consistency is key. So I think with him, he has kind of spoken with a lot of the older farmers in the community, but his dad ended up going and cosigning the note to get him started. I think navigating through that process was just too difficult and it just took up too much time. So I will encourage you to—your granddaddy's tractor, do you know where it is still? You said you sold it.

Mr. BROWN. We do. It is still local at this point.

Mr. MOORE. We sold a 641 Ford four-cylinder diesel, my granddaddy's first tractor, and it is in the family now and totally refurbished, but they sold it in the 1980s. So just keep your thumb on.

Mr. BROWN. Thank you.

Mr. MOORE. Hopefully, you can get it back.

Quick question, Dr. Kauffman. How does the current state of the farm economy influence access to credit generally but especially for young, beginning farmers? Because there are some uncertainties, obviously, with fuel and inflation. What do you see, going forward?

Dr. KAUFFMAN. What I would say is that farming is inherently a risky business, and that is true at any time. But in the environment that we are in right now, those risks are elevated, obviously, with commodity prices and the volatility there with input costs, with severe drought in many places. And so what I would say there is that for those that are already at higher risk and have higher risk profiles, that risk is probably a bit more elevated for those producers, and those tend to be those producers that have the least amount of equity then to absorb any potential shocks.

Mr. MOORE. Any suggestions on how we soften that landing?

Dr. KAUFFMAN. I think a recommendation would simply be to identify what the opportunities are to address those risks in the next farm bill. We have talked about crop insurance as one of those mechanisms. But again, there is a growing diversity of farm operations that reflect in many ways the diversity of production, and so adapting those programs and the processes to then again reflect the risk profile of those that are entering the business could be one step.

Mr. MOORE. Thank you. And with that, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from the U.S. Virgin Islands, Ms. Plaskett, who is also Chair of the Subcommittee on Biotechnology, Horticulture, and Research, is now recognized for 5 minutes.

Ms. PLASKETT. Thank you so much, Mr. Chairman, and thank you for this very timely and important hearing that we are going to have. And I want to thank all of the witnesses who have been a part of the discussion thus far this morning. There has been so much information that has been shared, so many experiences. I am really grateful for it.

Mr. Chairman, it is so interesting, just yesterday, at the lunch of the Congressional Black Caucus, one of the handouts that the caucus made available was some clips from the *Dallas Morning News*, which talks about Black Texas farmers push on USDA loan relief efforts, which have remained stalled in the courts. Some of the statistics that they shared in that were also startling and

showed the difficulty that Black farmers have, and also all farmers of color have with loans. Knowing that, just looking at some of the statistics that they shared with us that, there are farmers who a CNN report said that the USDA rejected 42 percent of direct loan applications by Black farmers, 37 percent by Asian farmers. In 2021 in contrast, only nine percent of White farmers were denied loans last year nationally. This is not what happened in *Pigford*. This is what is still going on today.

Another statistic, last year, 71 percent of Asian farmers and 61 percent of Black Farmers were rejected from direct loans, compared with 23 percent of White farmers who were denied loans. The statistics each year are very much the same. So talking about credit and access to credit for farmers, particularly young farmers as well, is really important.

The questions that I have are related to this. Access to affordable farmland is a major challenge nationally, particularly for people of color, who today make up two percent of farmland owners. We know that owning the land is very vital and important to seeking loans and for credit. There has been a history of backlog of loan applications. If individuals are looking to lease land and purchase a farming entity in the next year, they must make decisions in a timely manner.

So I wanted to ask the witnesses, do you find your current application process to be timely, allowing individuals to pursue their goals having land within a year's framework? I was going to ask that question to Mr. Willard Tillman or Ms. Dañia Davy, if you all have found any information about this.

Ms. DAVY. What we heard consistently at the Federation of Southern Cooperatives/Land Assistance Fund through our monthly listening sessions is that the process of applying for a loan is so lengthy and burdensome as to discourage new and beginning farmers and ranchers of color and existing Black farmers from accessing the resources that they need from the Farm Service Agency. And that is part of why one of the solutions that we advocate for is a Black farmer financial institution that is modeled after the Farm Credit System in which the farmers themselves have an ownership stake in the credit process, as well as that decision-making. And we have also—to the preliminary remarks that you made, heard consistently the ways in which the debt burden that continues to handicap those farmers, those 17,000 socially disadvantaged farmers and ranchers of color that were promised that debt relief last year have also impacted their ability to access credit going into this year, and we fear that that will result in the next wave of land loss for socially disadvantaged farmers and ranchers of color.

[Information supplied by Mr. Tillman is located on p. 1381.]

The CHAIRMAN. Yes.

Ms. PLASKETT. Thank you. Thank you so much. The other question I have, Ms. Asherman, thank you so much for being a part of the hearing this morning and for the work that you are doing. In 2017, the Census of Agriculture, 88 percent of farmers in my district in the U.S. Virgin Islands were over the age of 45. Can you speak about effective methods to educate and grow the future generation of farmers, as well as encourage their continued participation in the agricultural space?

[Information supplied by Ms. Asherman is located on p. 1371.]

The CHAIRMAN. I think she is having a bit of difficulty.

Ms. PLASKETT. She is. And as I have gone over the time, thank you so much, Mr. Chairman. And if any of the witnesses are able to put their answers in writing, I would really appreciate it

The CHAIRMAN. Sure.

Ms. PLASKETT. Thank you so much, and I yield back.

The CHAIRMAN. Thank you for your cooperation.

Ms. Asherman, staff has informed me that you are experiencing some connectivity issues, so if you would like to turn off your video, it seems that your video is interfering with your audio. So if you turn off your video and proceed with audio only, that might improve it, and we can hear your responses and respond. You are making valuable comments, and we want to hear from you. I apologize for the technical difficulties.

And now the gentleman from Indiana, Mr. Baird, is recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman and Ranking Member Thompson. I really appreciate the opportunity to have this discussion, and I always appreciate the witnesses and their expertise and the information you can bring to us to help us make better decisions.

I just have to make a comment, Mr. Chairman, that I am one of those farmers over 57½ years old, and I don't have any intentions of having one foot in the grave just yet. But anyway, I think that is an asset from the standpoint we can serve as mentors. We can serve as advisors. We can also be knowledgeable about some of these programs and can help young people get started in farming.

One of the old adages is that the older farmers are probably long on assets but they are short on labor, but the younger farmer is short on capital and long on labor. So that combination of the older individual needing labor and the younger individual needing capital, I think we capitalize on that. And so I appreciate you allowing me to make those statements.

So now we get down to the real issues. Dr. Kauffman, we have talked a lot about the extreme uncertainty in the global supply chain, as well as the rising cost of inputs, bureaucratic red tape. So I am particularly interested in EPA's recent decision to threaten the access to some of these crop protection tools, glyphosate, Dicamba, those kinds of things. And I know this is not necessarily in your wheelhouse, but it probably comes into some of the discussion with producers. So can you share any insight into how that uncertainty maybe impacts producers' decision-making if you will?

Dr. KAUFFMAN. Yes, thank you for the question. I can't speak to the specifics of the policy uncertainty around the EPA, but what I would say is just simply a comment on the anecdotes that we have received from producers that would reflect that idea that the volatility in those markets and the inability to secure inputs is of paramount concern, especially going into the fall as many producers would be going into renewal season.

Mr. BAIRD. And so that ability to have—or that uncertainty adds to the inability to plan and look forward and so on, so it is really

an asset when you can have your capital lined up and your inputs lined up.

Dr. KAUFFMAN. Yes, I would agree with that. Certainly being able to make decisions with confidence that you can secure the necessary inputs, going forward, is a pretty key part of the planning process.

Mr. BAIRD. Thank you. Mr. Brown, do you have any comments in that regard?

Mr. BROWN. No, I will note that we had a bit of a workaround last year as we saw fertilizer prices, chemical prices, seed prices climbing through the fall into the winter, so we had the opportunity to work around and prepay a lot of our input costs last year. This year, we don't have much of a workaround. We see fertilizer just a tad bit coming off its highs at this point, but chemicals, fuel. Fuel is up two times over last year. So we are going to face the challenge of do we lock in our prepaids before the end of the year or do we risk locking those in, in the springtime, and hoping that they have improved at that point.

Mr. BAIRD. Thank you. Mr. Tillman, your observations, please?

Mr. TILLMAN. No, I think that basically getting a comprehensive plan to just going from here to there is the key to all the success that you are going to have to have. You are going to have challenges as you go from here to there, so I think that reevaluating with the rising cost and expenses of everything, you basically have to revamp your whole plan.

Mr. BAIRD. Thank you. Do any other witnesses have any comments in that regard? We have about 45 seconds.

Ms. ASHERMAN. I would just like to point out that one of the reasons that I believe beginning farmers are often doing things differently than our parents and our grandparents is to sort of mitigate some of the challenges that are happening, including becoming organic as a way of not having to deal with the potentially hazardous or unavailable inputs.

Mr. BAIRD. Thank you, and I thank our witnesses for their comments. And with that, I yield back.

The CHAIRMAN. Thank you, Mr. Baird.

And now the gentlewoman from Washington, Ms. Schrier, is now recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman. Today, I would like to discuss some of the barriers that young, beginning, and underserved producers in my district face accessing credit. The 2018 Farm Bill made really nice strides to improve financial assistance for young, beginning, disadvantaged producers by increasing loan limits and set-asides. But farmers in my district still need help in order to access these loans and opportunities for first-time farmers who often don't have generational knowledge. Mr. Baird alluded to that need for mentorship. Or if they don't have comfort navigating a local USDA office, these loans can sometimes just seem out of reach.

Accessing these loans and programs also requires substantial time and a high degree of business and financial acumen that new, beginning, underserved farmers might not have. And navigating a Federal bureaucracy is daunting to say the least. And certainly

knowing how to how to get the necessary technical assistance for these loans and other opportunities is also really challenging.

So, for example, when one farmer in my district looked into Federal loans to help him buy land, he quickly came to the conclusion that the process was too tedious and strenuous to be worth considering, and he decided to use a private mortgage company instead. So what this meant is that he actually had to sell his house in order to afford the down payment on the land, and he used his personal credit lines to then pay for farm equipment, and that is a big risk. So for him and for others in my district, there is this pervasive sense that these programs are just not meant for them.

So ultimately, there is this substantial unmet need for connecting farmers with the technical assistance that the USDA and FSA programs provide, particularly to ensure that these beginning farmers know what programs are out there, who they can talk to, and what assistance is available.

Ms. Asherman, you talked about some of these challenges, and you talked about starting up your farm and that your eventual success with FSA was due to the right combination of persistence and good fortune. But your story also demonstrates how effective these loans are to get people started. Can you talk about how the USDA can better meet beginning producers where they are to provide technical assistance and let them know what loans or what other assistance they can provide?

Ms. ASHERMAN. Yes, I mean, well, I completely agree with everything you just said about feeling like the loans are just not for you, and so trying to decide is it even worth applying for them. I think that, I mean, it would be nice if the process were simpler and if we could mitigate that issue, but I do think that it is possible, and the benefits for new farmers to get to that next step, whether it is buying the tractor, buying the land, that capital is so important for especially first-generation farmers who don't necessarily have inherited land or inherited equipment. So while the programs are very difficult to navigate, I do think it is a testament to the success of them, and the intention of them is very important.

And if I can just say, relating to a point made earlier about how do we move the needle on the average age of farmers in this country, I really think it is not just making sure farms can transition. It is also making sure there are new farmers who did not come from farming, that new land is in production. I think that is so critical.

Ms. SCHRIER. It is really interesting because we often talk about how we are losing that farmland, and so to be able to bring not just new farmers but new land into the question is an interesting one.

I was going to ask also, you can kind of comment on whichever one you want, like the cumbersome paperwork and long processing times, if you could either talk about how the USDA could streamline this process or talk about this leap—so many of the young farmers in my district are leasing the land, so they never get the capital needed to like buy the tractor and get a foot up. If you want to comment either on—

Ms. ASHERMAN. Yes, I mean, I think that I see a lot of young farmers leasing because that is the easier thing to do. So in terms of getting started, getting access to the land, getting crops in the

ground, getting cash flowing, leasing is so important, but it doesn't build long-term equity, and it doesn't provide secure land tenure. So ownership is really important.

The CHAIRMAN. The lady's time has expired.

And now the gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. Thank you, Mr. Chairman. And thank you to our witnesses for appearing before the Committee today.

As someone who represents a rural district with a lot of young farmers, this is a really timely issue. So I will just jump right in.

Mr. Brown, what was the process like when applying to multiple different loan programs at USDA? And specifically, can you elaborate on the inefficiencies that you saw during the application process? Do you think that the process itself could deter farmers from applying for the loans altogether? And I think we all know the answer, so if you could dig into some of the specifics, I would be appreciative.

Mr. BROWN. Absolutely. Thank you, Congresswoman. So it has been a mixed bag for me. The real estate loan process went fairly smoothly for me, largely based on the joint status of the loan being between FSA and Farm Credit, as I mentioned previously. That helped smooth the operation because the communication with Farm Credit was extremely fluid and helpful in regards to understanding what I was getting myself into.

Now I have had two challenges with other USDA programs. The Conservation Stewardship Program, as we transitioned from one structure in our operation to another as a generation phased out, kicked me out of a conservation program per year and caused extreme frustration when I needed the revenue the most. And also the farm storage facilities loan I didn't apply for this year because it requires 3 years of ag production history. The problem is with the young farmer, we are growing at such a rapid rate to keep up with competition, I am expanding my grain storage to keep my costs on my operation down actually so I don't have to pay an elevator to store my grain. I would like to store it myself.

Well, I picked up some ground and had 1 year of history, but it was such a substantial amount of ground that I needed that grain storage available. And I wasn't able to access the farm storage facilities loan because I didn't have 3 years of history. So I would encourage that to be addressed in the future as well.

Mrs. CAMMACK. Were you finding that the levels of support were adequate?

Mr. BROWN. Absolutely not. The problem is farm real estate in my area is explosive. You have \$20,000+ per acre land selling this year, which is up in some areas about 40 percent from last year alone. And also operating expenses are extremely high. So I don't use the operating note that is available through the FSA because the limits are unreasonably low for my operation.

Mrs. CAMMACK. And I hear that all over the country, but thank you for that.

Ms. Asherman, as a young farmer yourself, what gave you the confidence and security to utilize the USDA loans and trust you would have the ability to access the credit to start your operation? Is there any way—and as a small government conservative, I al-

ways say repeatedly that we just need to get government out of the way. Specifically, what can Congress be doing in helping build trust with our new farmers?

Ms. ASHERMAN. I do explain in my written testimony a little bit more detail on this, but I just—I read the FSA website, and I was like, ooh, this is for me, I meet these requirements. And then once I felt confident that I met the requirements, it was just, again, farmer stubbornness and persistence at working with my loan officers and chipping away at the process. And I honestly had no other alternative, and I had nothing to lose. So I was sort of at the point in my farming career where I was either going to stop farming because I did not want to be a tenant farmer any longer, or I was going to find a way to have my own farm. And if either of those—if I hadn't been able to find ownership opportunities, I probably wouldn't be farming today. So I just—it was stubbornness and I wouldn't say confidence except for once that first loan process went through, I do feel now like I understand how to navigate the process. I am more confident I can do it in the future. But that is because I had that first experience.

Mrs. CAMMACK. Wonderful. Thank you so much. And with that, thank you, Mr. Chairman and Ranking Member, and I yield back.

The CHAIRMAN. Thank you. And now the gentlewoman from Iowa, Mrs. Axne, is now recognized for 5 minutes.

Mrs. AXNE. Thank you, Chairman. And thank you to our witnesses for being here, I very much appreciate it. It is a really important topic, so I am glad we are having this hearing.

Since coming to Congress, I have certainly made it a priority to help our family farms. I am a fifth-generation Iowan with family farm in my blood as well. Great to see our state next door being represented here, so I will have some questions for you. But I have done a lot of things from working to make sure that we didn't change the stepped-up basis that would really hurt our farmers, to securing disaster relief, to making sure that our operations can recover from the difficulties they have seen, and of course, addressing things like cattle market transparency so that smaller producers can actually get a fair shake. But we know that farming remains a viable option for many people but not for a lot of our new farmers to get involved.

And so as has been mentioned here, we know that the average age of a farmer is nearly 60 years old, and $\frac{2}{3}$ of farmland is managed by someone who is older than 55. So as we continue to see these declines in rural population, we need to make sure that this upcoming farm bill offers support for those who want to move to rural America and start a new farming business. And I am seeing this every day of the week. I see people who want to be out in our rural communities and absolutely want to farm.

We know that the 2018 Farm Bill made some notable improvements like increasing loan limits for FSA loans or establishing the Farming Opportunities Training and Outreach Program, but we have a lot to do. And so, of course, I have heard the biggest hurdle is simply the cost of land. We have seen in Iowa, of course, incredibly significant increases in the cost of the land. And you may have heard that just last month, a farm in northwest Iowa went for a record \$25,000 per acre. We thought we were big-time. I remember

about over a decade ago and it was \$7,000 an acre. We thought oh, my goodness, so this is something else.

So, Mr. Brown, my question, I am sure you have seen these similar trends next door. You are right next door to us in Illinois. And you noted in your testimony that you led working groups compiling recommendations on improving policies for new and beginning farmers, including that access to land. Are there some specific recommendations you can make to this Committee so that we can get you guys onto the land when we are looking at \$25,000 per acre right now?

Mr. BROWN. I think, as I mentioned in my testimony, just keeping up with the rapid pace of change in agriculture is important. And you increased those loan limits in the last farm bill, they are going to have to be increased to be beneficial in this farm bill as well. Land costs will continue to escalate in my opinion, and cash rents obviously are going to keep up with that as well. So even if a farmer doesn't have access to purchasing the land at this point, they are going to have to have access to their operating note because their cash rents are going to go through the roof as well. So I think we have to look at both approaches in the future because they are both going to be instrumental to our survival.

Mrs. AXNE. Thank you for bringing that up. And I recently just heard when I was out doing a roundtable somebody say they are going to increase their rent. They have to. There is just no ifs, ands, or buts about it. So thank you for letting us know we have to address both of those sides of the coin.

And, Ms. Asherman, at a roundtable I held in my district last year, a farmer relayed concerns that while these programs have been critical in helping many beginning farmers get started, they age out of them, and then they are stuck in the middle where they might not have the equity that that older farmer has to keep them established. So what can we do here in this middle world where we can develop some programs for our new farmers but we have those middle farmers who are falling off on a cliff when those opportunities stop for them?

Ms. ASHERMAN. Can you explain how they are aging out? I am not sure I understand.

Mrs. AXNE. Yes, well, the policy doesn't apply to them anymore as far as being able to get the grants for new farmers, but they are like—it is kind of just like a small business, a startup phase and then you move into the middle phase, you are trying to—farming is a small business so you are trying to keep that middle ground running while you grow your business and you have lack of access to capital because you don't necessarily have a strong running farm yet. So it is that middle ground where they can't get access to the loans. They are beyond just the new farmers, but they are not up at that 60 year old farmer yet, and they are trying to make ends meet. What can we do for those folks in the middle?

Ms. ASHERMAN. I mean, I would say the policy needs to change to understand that there is a vast number of farmers with different experiences and different resources. So some people will come from a sixth-generation farm, and they are going to have automatic equity in that land that they have that they are keeping afloat. And then some people are going to start with nothing. I feel like I was

in the sweet spot between having experience and having the ball rolling where I was too busy to apply for anything, but I am not sure. I am not sure.

Mrs. AXNE. So it sounds like something we should look at. Thank you so much.

The CHAIRMAN. And thank you.

And now the gentleman from Ohio, Mr. Balderson, is now recognized for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman, and thank you for this hearing today. My first question is for Dr. Nathan Kauffman. Dr. Kauffman, thank you for being here today. And my question to you is in your testimony, you talked about intensifying cost pressures that are being put on farmers. Despite these pressures, you say that agricultural credit conditions have remained strong. Cost pressures and access to credit are two major barriers to entry for young and beginning farmers. While these cost pressures are not having an impact on credit right now, do you anticipate that will change if the costs continue to rise?

Dr. KAUFFMAN. I do think that the risks are elevated in part because profit margins have been so strong and, generally speaking, input costs tend to rise as commodity prices also rise, so those profit margins could get squeezed. It wasn't that long ago prior to the pandemic that we were in an environment where those profit margins were low, so there are some possibilities that those risks could intensify in the coming year.

Mr. BALDERSON. Okay. Thank you very much for that answer. If you didn't direct it that way, I was going to have you do a follow-up, but that is great, so thank you.

My next question is for Ms. Asherman. Good morning, and thank you for being here. I want to shift to the topic of microloans. FSA's loan webpage describes these loans by saying they are designed to meet the needs of small and beginning farmers by easing some of the requirements and offer less paperwork. Ms. Asherman, in your testimony, you shared your experience obtaining a microloan and stated that the process was nearly identical to a direct operating loan. Can you describe in more detail what this process looked like for you?

Ms. ASHERMAN. Yes, I was really disappointed because I was busy and trying to take advantage of a microloan specifically for the expedited nature. Essentially, the paper, the documents that I had to fill out, which are all PDFs on FSA's website, for this operating microloan, which was a \$50,000 loan, what I actually ended up filling out were all of the same documents for the standard direct operating loans. So, I mean, just the exact same paperwork and then my additional documents that I needed to supply cash flow projections, yield history, yield projections, all of that was to the same detail and extent that it was for me to purchase my land actually. And so there was really no paperwork difference for me last year when I was accessing a microloan.

And when I asked my loan agent why that was and I sort of suggested that the microloans were supposed to be a less paperwork-heavy process, they said that because I was already in business and I already had this documentation, that they were going to need it. So essentially, I felt like my paperwork burden was actually in-

creased because I am running a successful business instead of decreased because I have a successful business that I have shown I can repay a loan.

Mr. BALDERSON. Thank you very much for that answer. And I want to do a follow-up, and I will start with you. I want to be conscious of the time. We are done pretty quick but, Ms. Asherman, I will ask you first since you are already right here. What changes to the microloan process or the FSA loan process in general do you think need to be made to make these loans more accessible for small and beginning farmers?

Ms. ASHERMAN. I am not sure what the paperwork should have been, but I think it seems like an implementation problem, at least at my local level. The concept seems great. I just don't know if it happened the way it was supposed to on the ground.

Mr. BALDERSON. Okay. Thank you. Would anybody else like to add to that?

Seeing none, Mr. Chairman, I yield back my remaining time. Thank you.

The CHAIRMAN. Thank you. And now the gentleman from Florida, Mr. Lawson, is recognized for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman, and also Ranking Member Thompson, and welcome to all of the panel to the Committee today.

My first statement is centered around what Ms. Asherman mentioned in her testimony, that the high cost of student debt is a major challenge for new farming generation when accessing credit and building capital, especially for young farmers of color. Ms. Asherman, can you talk more about what the value of higher education was to you and other young farmers, in addition to your believing that Federal forgiveness of student loan debt for young, beginning, and underserved producers would be beneficial in your work? And what could this forgiveness program look like?

Ms. ASHERMAN. Yes, I mean, I definitely feel like a college education is a really important thing for all Americans who want to have it. It is where you become yourself and you identify what you want in life, and it gives you important skills. I definitely think that going into farming with a bunch of student debt would make it very difficult to succeed, if not even start. And to me it just seems like philosophically farming is so important and it is such a sacrifice and farmers work so hard and for so little reward, that there is an opportunity to incentivize the new generation of farmers to go into farming when they maybe didn't come from farming by offering relief for student debt. It seems like that could dovetail really well with rural development because I do think there are people who want to live in rural places, and I do believe rural places need more people who are motivated to work there. So to me, it just seems like there could be an incentivization to help make people choose farming.

And I think it is worth asking the question, why do a lot of current farmers not want their children to go into farming? And I think the answer is because it is so risky and so challenging. And by going into farming, you are potentially going to go without a lot of basic things that most people get from their jobs, from their employers, safety nets. It is just very hard to choose it, and so there

needs to be ways of helping people to choose farming, and I think that would be in the best interest of our country and in the future of food security.

Mr. LAWSON. Okay. Ms. Davy, I would like for you to—because of your work at Alcorn State University and I have Florida A&M University agricultural program, I will ask you to comment on that. But what I first want to say is that the Chairman last year, we provided scholarships for students to help attract students to stay in agriculture, especially historically Black colleges. And so I would like to see if you want to comment in this area.

Ms. DAVY. Thank you for the question. As a matter of fact, the law students that are traveling with me this summer providing estate planning services to heirs property, landowners in Black farming communities, they were just learning about that program that is provided through the HBCUs and a partnership with USDA. And they said that they wish that they had learned about that because there are so many careers in agriculture that don't require being a farmer in particular. But I definitely think that the education, a college education gives any small business owner an advantage in navigating all of the bureaucracy and all of the financial planning and business planning that is required.

I think that even though farming is a generational industry, you don't generally wake up and decide to become a farmer. It is usually something that you have inherited through the previous generations. But because of the widespread race-based discrimination that Black farming communities have faced, there has been a tendency to discourage the next generation from going into agriculture. So I definitely think programs like those and partnerships with the HBCUs that can incentivize students to pursue careers in agriculture, as well as getting the opportunity to have their student loan debt forgiven, that would definitely make a huge difference.

I know for myself, even as an attorney serving Black farmers, those grants that are available for serving as an attorney in those communities, it was very beneficial to me to have student loan forgiveness connected to that. So I would echo that recommendation.

Mr. LAWSON. Okay. Thank you very much. And I know I am getting ready to yield back, but that program is really working that the Chairman fought so hard for over the years. And I had a nephew to come out of that program and currently working with USDA.

Mr. Chairman, I yield back.

The CHAIRMAN. Yes, and thank you both. Ms. Davy, you hit it right on the mark. That is one of the reasons why we fought very hard, and now we are making that scholarship program permanent and we are adding \$100 million for the 1890s land-grant college scholarships at these schools. Thank you for recognizing that. And thank you, Mr. Lawson.

And now we have the gentlewoman from Connecticut, Mrs. Hayes, who is also the Chairwoman of the Subcommittee on Nutrition, Oversight, and Department Operations. You are recognized for 5 minutes, Mrs. Hayes.

Mrs. HAYES. Thank you, Mr. Chairman, and thank you to our witnesses for your testimony today.

An overwhelming majority of farms in Connecticut's 5th District are small and family-owned farms. Property costs are rising across

the country. The national farm real estate value averaged \$3,380 per acre in 2021, up seven percent from 2020. Beginning farmers in my state are at an even bigger disadvantage. In 2021, the farm real estate value in Connecticut was an astounding \$12,500 per acre, the fourth highest in the country.

Ms. Asherman, I appreciate you sharing your story about starting your own small farm, which is similar to many of my constituents. Would increasing the cap on direct farm ownership down payment loans and counting those loans towards credit history help beginning farmers today in your opinion, and through your experiences?

Ms. ASHERMAN. Yes, I mean, I think that having FSA loans contribute to credit history is incredibly important, especially if USDA wants farmers to also be able to outgrow some of these programs and be able to stand on our feet with [inaudible]. I definitely think that would be helpful.

Mrs. HAYES. Thank you. And I noticed that we heard from several witnesses and also, Mr. Tillman, in your testimony, you pointed out the lack of the pre-approval process for FSA loans slowing down the startup for beginning farmers. The process to obtain a loan can take up to 6 months, during which time a farmer could lose their opportunity to purchase land to non-farm entities with access to commercial lending. We have seen just how tight the real estate market has been across all sectors, so I would imagine that it is equally as tight in the farming sector.

Mr. Tillman, how often do you see farmers losing opportunities because they are kept waiting for a loan to much larger entities who have direct access to capital?

Mr. TILLMAN. We see that quite a bit. We have an issue with timely transactions of the applications. A young lady, Norma, wanted to basically start a business and needed a loan. It went on for over 9 months. So each time that she located some land, before she could close the contract, she had to go do another one. So those are just some of the issues that basically young farmers have in getting into the thing.

But in Oklahoma at this particular time, the land is so extremely high, based upon new investors and certain types of businesses that are moving into Oklahoma. It is basically put at a position whereas that a farmer has to really put everything on the line just to secure the land, not only having to go through the process of getting an operating loan enough to basically partially carry all the liabilities that come with that.

And one other thing—

Mrs. HAYES. Go ahead.

Mr. TILLMAN.—that basically is here, that when a farmer—we are talking about cow-calf operations, get into the Livestock Indemnity Program, which is a part of that, and based upon all the weather conditions and things that we basically have in Oklahoma, there are a lot of things that occur, whereas that the inventory of the liability is loss. And there is no way to recover, and the FSA wants you to have pictures and everything like that. But that needs to basically be addressed in some other kind of way that we can identify a way to—a clear path that this guy had this number of cows at this time. After a storm, he didn't have this many cows.

And so that is an issue I would really like to have on the record there.

Mrs. HAYES. Well, thank you so much for that. And I want to be respectful of the time, but I will ask one last question if you could submit it, anybody on the panel. I am particularly interested in how Congress can reduce barriers for underrepresented farmers, for young BIPOC minority farmers. I am from the State of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, we have just some really creative things going on in the state that have not been accounted for in this industry. So anything you can offer in that area for how Congress can help, I would appreciate it.

With that, Mr. Chairman, I yield back.

[The information supplied by Mr. Tillman is located on p. 1380.]

The CHAIRMAN. Yes. And please do respond to Mrs. Hayes in writing because she is on to a very important point, and we appreciate you responding your recommendations in writing to Mrs. Hayes. Thank you.

And now the gentleman from California, Mr. LaMalfa, is now recognized for 5 minutes.

Mr. LAMALFA. Thank you, Mr. Chairman. Apologies for being out of the room, so many multiple committees and this, that, and the other. But I am glad to be able to take part here at the end.

So I want to focus a question on rising interest rates, Dr. Kauffman, please. Just in straight terms, the borrowing power of producers at this point, what does that look like with these interest rates? What is your opinion on especially for entry level folks getting into agriculture when they may have to go pretty heavy on the borrowing in the beginning to secure equipment, land, inputs, *et cetera*?

Dr. KAUFFMAN. Yes, as a general comment, what I would say is that those farmers who are in most need of financing and maybe have the least amount of equity would then be most exposed to some of those increases because of the amount of leverage. I would say that, generally speaking, those interest rates are still quite low in a historical perspective, but they have been rising. And so it does represent an increased cost burden. I would say that it has not necessarily been the most significant comment about the concerns that we have heard that have been reflected more on input costs, fertilizer and chemicals, specifically.

Mr. LAMALFA. Mr. Brown, as a producer, would you want to touch upon that a little bit, too?

Mr. BROWN. Absolutely. I would say rising interest rates are an issue for us as far as cash flow goes. That is probably my greatest pressure point on my balance sheet right now. I have a lot of pretty strong ratios. I have built up working capital in preparation for these higher input costs, and I am squirreling away as much as I possibly can. But higher interest rates, if I were to take out a real estate loan or continue to use operating money could create a cash flow issue for me.

Mr. LAMALFA. Well, how is the price of land looking as far as the return on investment for—I am a farmer in my real life, too, northern California. We farm rice there, and the price of rice ground because of California's—it is not even realistic if you were just to

walk in, especially as a young grower and trying to get a loan on that and get a return. What is that looking like in your home state as far as the production *versus* costs to service buying land.

Mr. BROWN. Yes, it doesn't pencil out right now. Land prices currently are up 40 percent from last year in my immediate area. Cash rent is quickly following. There is a lot of cash-rented acreage nearby.

Mr. LAMALFA. Cash rent is probably pretty high, too.

Mr. BROWN. But yes, if one were to purchase, it would not pencil out in the long-term at \$20,000 an acre.

Mr. LAMALFA. So really what it looks like for me at home, so if you are not part of an already farming family and had that momentum maybe going back to land from the 1980s or the 1950s or 1940s or whatever, I just don't see how a person comes in at an entry level. Yes, you are going to pay cash rent for a while, and maybe you are going to make some money at that. Talk about that a little bit.

Mr. BROWN. I think it is extremely difficult in the current environment. Me, as a young farmer, I am preparing for an eventual downturn, and I am hoping that I have the cash reserves there to strike at that opportunity. In the meantime, it is all about relationship-building, relationship with your landlords, relationship with your vendors to get everything priced as fairly as possible.

Mr. LAMALFA. As a fellow farmer, what should we be focusing on in Washington, D.C.? In my notes here we are talking about—we hear a lot about, it is Russia, it is the war, and all that, but I also look internally at some of the things we have done to make things cost more because we are not producing energy. What is your view of that from your field and what should Congress be doing?

Mr. BROWN. Energy in particular?

Mr. LAMALFA. Yes.

Mr. BROWN. Is that your question?

Mr. LAMALFA. American energy?

Mr. BROWN. Well, I take a look at what is going on around me, and there is a huge push for solar, and there are a lot of wind turbines popping up in central Illinois. My concern is good ag land is going out of production to facilitate some of those operations. And I myself, I have solar panels on top of both of my machine sheds, so I am not against solar power by any means, but I think we have to be cognizant about the long-term impacts of taking up some of the blackest soil in the world with solar farms and wind energy. And every decision we need to make should be for the long-term.

Mr. LAMALFA. Yes, Mr. Brown, same thing in California. We have some of the most productive ag land in the San Joaquin Valley that is being covered. And they are aggressively—the state wants to buy land and take it out for habitat because the water doesn't get from our storage to the fields these days, our tremendous Federal and state storage systems, and it is not anymore. We are taking hundreds of thousands of acres of land out. I like to tell people what we don't plant now is what you don't eat next year. It is going to be something else. You see food prices now. Anyway, hang in there. God bless you. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you.

And now the gentleman from Illinois, Mr. Rush, is recognized for 5 minutes.

Mr. RUSH. I really want to thank you, Mr. Chairman. It has been quite an interesting hearing so far. And, Mr. Chairman, I want to start by asking the question of Ms. Davy. Ms. Davy, you have a very curious and insightful perspective [inaudible] Black farmers in the South and the stories that you have shared [inaudible] issue of Black farmers [inaudible] that they face [inaudible]. And I don't want to [inaudible], but we on the Agriculture Committee have a special and unique mission to try to help solve the problem of Black farmers in our nation. And I think that we need the political courage [inaudible] and the understanding that [inaudible] not going to be able to solve the agricultural mission in their entirety for the rest of the nation. Can you kind of share with us what [inaudible] Black farmers [inaudible] will be and how we are failing our nation's citizens by allowing [inaudible] Black farmers over the last couple of decades or even more than a couple of decades [inaudible]?

Ms. DAVY. Going all the way back to the enslavement of Africans, there was a particular expertise who are now known as African Americans brought to the field of agriculture. And so the expertise of agricultural production, of anticipating weather changes, and managing those businesses are very, very critical resources that have educated many farmers, not just within the African American community, but even during the 1980s crisis. There were a lot of efforts by African American farmers to share with other farmers who were underserved about some of the ways in which they were able to navigate the U.S. Government, as well as staying in ownership and possession of their lands, despite many institutionalized attempts to dispossess them of that land ownership. And so the increasing loss of African American farmers from our agricultural system is a devastating tragedy to all farmers because of that wealth of knowledge, but also in particular for the African American community, that loss of wealth estimated in excess of over \$300 billion. Where African American farmland is lost, there is a significant loss of not just Black wealth but American wealth.

And so it is a very important issue that we address, maintaining the existing African American farmers that we do have, but also incentivizing relationships for the next generation of Black farmers so that they can be those first responders for their communities. Black farmers are the first responders. We saw throughout the COVID crisis that in their communities, they were still feeding and providing food for their communities. And so we really think that it is important to make specific investments in Black farmers because they are extremely underrepresented. They continue to be underrepresented even in programs that are set aside based on socially disadvantaged farmer status. There have been ways in which African American farmers have set the foundation for many of the civil rights that we all enjoy today, and so it is imperative that we address this issue.

Mr. RUSH. Mr. Chairman, I don't think I have any more questions, so I yield back.

The CHAIRMAN. Thank you, Mr. Rush.

And now, ladies and gentlemen, we have reached the conclusion of the hearing. And I just want to say a big thank you to each of you. Your testimonies were so helpful, and we will look forward to continuing this dialogue. And you could tell from our Committee Members how seriously we are taking this issue. As we know, this falls in our domain here in the Agriculture Committee to see about our agriculture business, to make sure we are foremost and first in the world, quite honestly. And this is so important.

So I want to thank you, Dr. Nathan Kauffman. Thank you very much. Ms. Dania Davy, thank you for your help. And Ms. Julia Asherman, thank you so much. Mr. Willard Tillman, thank you for your excellent testimony. And Mr. Adam Brown, thank you. You all were very helpful.

This is a continuing process, and we are going to make sure that we have a firm foundation for moving forward with the next generation. But, as you see, it is going to take us staying on this case and making sure we get the help out there to our beginning farmers.

And now with that, I would like to turn it over to the Ranking Member for his closing.

Mr. THOMPSON. All right. Well, Mr. Chairman, thank you. It has been great to work with you on this hearing. Thank you to all of our witnesses, those that are in attendance and those that are attending virtually.

American farmers are facing historical challenges, increased interest rates, they are just now starting to go up; increased input costs; a lack of access to crop protection tools; lack of affordable energy, diesel, propane, gasoline; 9.1 percent inflation as of this week and growing. These are compounded for our young and beginning farmers and our underserved producers. Access to acreage, access to credit, that has been the focus of this hearing.

So given the average age of American farmers at roughly 57½ years, for America to maintain food security, we have to address each of these headwinds, including facilitating efficient access to credit for young, beginning, and underserved producers.

And with that, once again, thank you for being a part of this, and thank you, Mr. Chairman. I yield back.

The CHAIRMAN. And thank you, Ranking Member.

And now, under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from our witnesses to any questions posed by a Member.

This hearing of the Committee on Agriculture is adjourned. Thank you.

[Whereupon, at 12:17 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. GLENN THOMPSON, A REPRESENTATIVE IN CONGRESS
FROM PENNSYLVANIA

June 13, 2022

President JOSEPH R. BIDEN,
The White House
Washington, D.C.

Mr. President:

Long before Russia's invasion of Ukraine, America's farm families and consumers were struggling with fractured supply chains, skyrocketing input costs, and historic levels of inflation, each of which continue to contribute to increased food prices and diminished inventories. U.S. consumers are experiencing the largest price increase in nearly 40 years, with the U.S. Consumer Price Index (CPI) for food rising by 9.4 percent between April 2021 and April 2022. According to the U.S. Department of Agriculture Economic Research Service (ERS), the cost of eggs increased 22 percent, beef increased by over 14 percent, and dairy product increased over nine percent.

The war between Russia and Ukraine, two of the world's biggest suppliers of wheat and sunflower oil, further disrupted the global food system resulting in increased energy prices, fertilizer cost spikes and shortages, and worsening food shortages in developing countries. According to the Food and Agriculture Organization of the United Nations' (FAO) latest scenarios, the conflict could increase chronic undernourishment by an additional 18.8 million people by 2023.

Despite these impending crises, your Administration has neglected to take serious action to increase American production. In fact, you have proposed massive new tax liabilities for farmers, and your regulatory agenda would further limit American farmers' ability to meet global food demand. America's agriculture sector is vital to alleviating global food crises, and we urge your Administration to take the following actions to strengthen that role.

Address Farm Input Costs:

Historic inflation has significantly increased the cost of farm inputs, including energy and fertilizer costs. America's energy independence is compromised, which sends additional shockwaves through our already fractured supply chain. Producers are paying 115 percent more for diesel, while natural gas is up 202 percent. Fertilizer inputs such as nitrogen, phosphorus, and potassium increased 125 percent in cost from January 2021 to January 2022 and an additional 17 percent in the first 3 months of 2022.

To provide immediate relief from the energy and fertilizer crisis plaguing the agriculture industry, we request you:

- Withdraw recently proposed revisions to the National Environment Policy Act (NEPA);
- Allow phosphogypsum (PG) to be safely recycled in road construction or other uses (which eliminates hundreds of millions of dollars in compliance costs);
- Update the definition of critical minerals to include potash and phosphate; and
- Take immediate steps to increase domestic energy exploration, production, and transport, including increasing oil and gas leasing on Federal lands and waters, expediting pipeline permitting, and abandoning rulemakings designed to discourage investment in American energy.

Stop WOTUS Changes:

Recently proposed changes to the *Waters of the United States (WOTUS)* rules create enormous uncertainty for farmers, ranchers, and landowners. The underlying law is vague in defining what constitutes a Federal waterway, noting only they are "navigable," which has historically resulted in egregious, nationwide land grabs by the government. In 2020, this was largely resolved with the Navigable Waters Protection Rule. However, your Administration thwarted that progress last year by reopening the WOTUS regulations, plunging producers into a regulatory red tape nightmare once again.

To address this uncertainty, we respectfully ask your Administration to:

- Reverse its position and allow the overall objective of the Clean Water Act to be realized: to restore and maintain the integrity of the nation's navigable waters.

Refocus EPA on Sound Science:

Exacerbating an already untenable position for American agriculture, the Environmental Protection Agency (EPA) has recently made decisions impacting the abil-

ity of producers to access crop protection tools necessary to combat pests and disease and improve soil health. These decisions include, but are not limited to, EPA's decision to prohibit the use of chlorpyrifos on food crops grown in the U.S., recent biological evaluations (BEs) and proposed interim decisions (PIDs) for a variety of crop protection tools, and the reversal of longstanding policy relating to Federal preemption. This Administration's decision to undermine its career scientists has created additional uncertainty for producers, leaving them without readily available alternatives for key planting decisions.

The politicization of crop protection tools was further heightened in a May 2022 Solicitor General's brief in the case of *Monsanto Company v. Edwin Harderman* regarding the doctrine of Federal preemption. In the brief, which was submitted at the request of the Supreme Court, the Solicitor General surprisingly reversed course on the Federal Government's once consistent and scientifically-sound position regarding the labeling of pesticides. On May 23, 2022, fifty-four agricultural groups sent you a letter expressing their "grave concern" with the Solicitor General's brief and the "change in long-standing policy regarding the regulation and labeling of pesticide products relied upon by farmers and other users."

American farmers use glyphosate on roughly 40 percent of their acres, helping to enable higher productivity, greater yields, and improved soil quality. At this vital time when our producers are striving to feed a world threatened by food shortages and insecurity, this reversal of policy further undermines the ability of U.S. agriculture to meet global food needs.

To return EPA to its science-driven, risk-based, Congressionally mandated review process for these and all other critical crop protection tools, we request the Administration:

- Rescind the EPA's August 2021 final rule revoking food tolerances for chlorpyrifos;
- Proceed with reviewing current uses under the ongoing registration review of this chemistry;
- Reassert EPA's clearly defined Federal preemption of crop protection tools and immediately withdraw the Solicitor General's current brief before the Court.

End Onerous Climate Rules:

The war on agriculture has even expanded to other Federal agencies, most recently through the proposed Securities Exchange Commission (SEC) rule, "The Enhancement and Standardization of Climate-Related Disclosures for Investors," issued on March 21, 2022. This rule, through so-called scope 3 emissions, would require farmers, regardless of size, to track and report data to the companies with which they work. Many small farmers do not have the time or resources to comply with such onerous requirements. During a time when this Administration purports to support deconsolidation in the agricultural system, this rule would result in the exact opposite.

- To prevent increased costs and risks for producers and consumers, we request that your Administration withdraw this harmful rule.

In short, your Administration's Federal regulatory barriers and policies are undermining America's ability to meet the food and fiber needs of the globe by creating uncertainty for U.S. farmers and ranchers. We cannot afford to continue without a comprehensive plan to reverse course on this destructive agenda and address this crisis. *We request that you immediately meet with Congressional Members to develop a plan that restores domestic production and allows American farmers to lower food prices at home and provide critical humanitarian aid abroad.*

SUPPLEMENTARY MATERIAL SUBMITTED BY JULIA ASHERMAN, OWNER, RAG & FRASS FARMS, LLC; ON BEHALF OF NATIONAL YOUNG FARMERS COALITION

Date: July 22, 2022

Hon. DAVID SCOTT,
Chairman,
House Committee on Agriculture,
Washington, D.C.;

Hon. GLENN THOMPSON,
Ranking Minority Member,
House Committee on Agriculture,
Washington, D.C.

Re: A 2022 Review of the Farm Bill: The State of Credit for Young, Beginning, and Underserved Producers before the U.S. House of Representatives Committee on Agriculture

The National Young Farmers Coalition (Young Farmers) thanks the U.S. House of Representatives Committee on Agriculture, and the Honorable David Scott, Glenn 'G.T.' Thompson, for holding the hearing on July 14, 2022 to discuss the challenges facing young, beginning, and underserved producers in accessing credit.

Please find below additional written testimony from witness Julia Asherman, Owner and Operator of Rag and Frass Farm in Jeffersonville Georgia, in response to questions posed during the hearing.

Insert 1

Mr. AUSTIN SCOTT of Georgia. . . .
. . . How far do you have to travel to get to a farmers' market, Ms. Asherman? Ms. Asherman?

The CHAIRMAN. You may need to unmute, Ms. Asherman.

Ms. ASHERMAN. I am sorry, my internet is extremely slow. I was trying to unmute. I drive 2 hours to my major market, and I also sell on the farm and a half an hour away [inaudible] market.

Mr. AUSTIN SCOTT of Georgia. . . . And as our farmers' markets have closed, just like as our smaller meatpacking facilities have closed throughout Georgia, it has made it that much more difficult for our beginning, young, and small farmers. . . .

Thank you, Representative Scott, for your question and for your warm introduction. To clarify, I do not believe I have had the pleasure of showing you around my farm, I think you are mistaking another small farm in Gordon, GA (about 20 minutes from me) that you toured during a round table I participated in. I have had the pleasure of touring some staff of yours around my farm, but I would love to have you out to see our operation. You have an open invitation for anytime you are available.

As I said in my testimony, I travel 2 hours for my main market, and I travel half an hour for my local market. What I would like to clarify is that I started to go to my further market, which is much bigger, in 2015 because our local market was too small, it couldn't sustain our business. Now our bigger metro market subsidizes our smaller local market. Many direct market farmers travel 30 minutes to 2 hours to reach the best markets, in my case I had to be far away from my market to find affordable land. Conversely, farmers located close to great markets will often not be able to afford land. You can either have affordable land or proximity to markets, but you can rarely have both.

Thankfully, because I direct market and I sell at smaller community-based markets which are operated by farmers, local nonprofits, or by local government, they are more nimble and resilient, and very close the end consumer we are selling to. I would say that USDA programs that support local markets and small-scale aggregation is incredibly important to this type of market's continued success, and by extension, the success of the farmers who rely on them. This type of market gives us a bit of resilience to supply chain disruptions or bigger market disruptions, and affords us the maximum margin for our products, which is key to most vegetable operations that are less than 10 acres.

Insert 2

Mr. CRAWFORD. Well, and I don't want to get into a dynamic of where we are talking about "corporate farms," quote/unquote. I am not here to try to paint a negative picture of economies-of-scale. We rely on those economies-of-scale. What I want to do is to talk about how we get that young person. I mean, as

I said, I think you tend to be a little bit of an exception to the rule when we see a continued upward trajectory in that age. And then, on the other side of the spectrum, you look at Ms. Asherman, who is on small acres and that is another success story, again, probably a little bit of an exception. I am going to ask Ms. Asherman to kind of weigh in on this as well. What have some of the challenges been for you? It is probably not so much access to capital as it is to the competitive disadvantage you find yourself in because you are starting from a position of not being an economy-of-scale? Do you want to weigh in on that, Ms. Asherman?

Ms. ASHERMAN. I do. I will say that I think it is important to clarify that when we talk about small farmers, we need to clarify are we talking about small acreage or small gross sales? And there is a big difference between a commodity grower, a row crop grower, and a direct produce market grower.

Thank you for the question. I believe this question is extremely important to address and also offer a huge opportunity for course correction in policy. Firstly, the key to addressing moving the needle on the average age of farmers is recognizing that there needs to be multiple angles and tactics to address this. One obvious place to start is we need policy that helps existing farmers transition their operations to the next generation within the family farm structure; this means legal support, financial planning and education, business support and training around the specific issue of farm succession.

However, most of the U.S. population (close to 80%) lives in urban areas. This means the future farming generation cannot be expected to exclusively (or even mostly) come from rural communities, or come from farming families. Of course, wherever this is possible it must be supported, but the fact is there are more people being born and growing up in cities than in rural America, and that much of rural America is aging. Young people today often want to get out of the country and away from the farm. There needs to be policy in education, workforce development, and that incentives and supports young people to learn to farm and return to the country to farm. Without this step, there will not be enough farmers. We can't expect that all the doctors our county needs will be the children of doctors, and we can't expect that all the farmers will be the children of farmers, not while we have lost so many farms and farmers over the last century. The more farm bill policy can redirect young people to the support resources, encouragement, skills, and credit to buy farms or start new farms, the more we will see new farmers join the industry and succeed. This could have a huge benefit not only to the future of food security, but to the rural development, farming innovation, and strengthen the economy. In addition to existing farmland being preserved, we should be open to new farms popping up wherever the opportunities arise. There are many opportunities for small farms in many parts of the county.

Farming is a skill that will always be honed by years of experience, but it is a skill that can be learned, like any other. It is a myth that that only those who grew up on farms can be successful farmers, and this is a myth we need to let go of immediately. Some of us are many generations removed from the farm, but nearly every human alive is descendant from farmers, and we have not adequately given good reasons for young people to choose farming over other, easier occupations.

To lower the average age of farmers (and decentralize farms, making agriculture on the whole more resilient to ownership changes) we must support succession planning for existing farms, incentive farming overall, and open the doors to first generation farmers all at the same time.

For your second question, I believe the biggest challenges for my farm was the steep learning curve, with little mentorship to get started. I spent many years working harder, not smarter, for lack of examples. I spent time reinventing the wheel instead of making strides.

I think it is an oversimplification to assume smaller farms have a competitive disadvantage. A farm of any scale (micro to large) can be profitable and successful, or can go under. A key point of any farm's success is having the appropriate economy of scale—in labor, production, equipment, and capitalization. Being smaller can certainly afford certain challenges, but likewise being too large can as well; it all depends on if all the factors of your economy of scale make sense. In many ways I feel being a smaller farm has made me more successful, and more competitive, because I am not over-burdened by debt, I am not over capitalized. I am not beholden to huge payments that are hard to manage in a bad year. My biggest challenge as a farm is labor, which honestly is as much about being a vegetable farmer as it is about being a small farmer. I am not big enough to need certain planting equipment, but even if I was, harvest is still by and large by human hand . . . so the labor issue plagues vegetable farms of **all** acreages.

Insert 3

Mr. MOORE. . . .
 . . . but what do you see as the largest barrier to entry for young farmers and obviously underserved producers?

* * * * *

Ms. PLASKETT. . . . The other question I have, Ms. Asherman, thank you so much for being a part of the hearing this morning and for the work that you are doing. In 2017, the Census of Agriculture, 88 percent of farmers in my district in the U.S. Virgin Islands were over the age of 45. Can you speak about effective methods to educate and grow the future generation of farmers, as well as encourage their continued participation in the agricultural space?

Thank you for the questions, and since they are similar I will answer them together. The barriers are many and varied, and the policy needs to address each to really full serve young farmers.

Land access is huge, and can be address by improving access to credit as has been discussed. I believe the other key is incentivizing both land owners and farmers. Can land owners be rewarded to rent or sell land to new farmers? Or to keep farm land undeveloped? Can young farmers be encouraged to stay (or go into) farming with affordable healthcare or education? Can learning to farm specifically, be more affordable and accessible?

Currently, it is well known that to enter farming means large amounts of debt, stress, little financial return, physical or mental risks, no vacation, potentially no healthcare, and potentially taking a second job or relying on spousal income for basic benefits like retirement or health insurance. Can you pay for your kids to go to college? Possibly not without non-farm income. If this is the reality for many, and certainly a well-known possibility for most, why do it? Why choose farming over something else? This reality is what needs to change to make farming a viable choice.

Insert 4

Mr. DAVIS. . . .
 . . . if new and beginning farmers do not have continued access to ag-lending entities like the Farm Credit System, what could the future of your operations look like, and do you see it as a barrier to entering the field?

For my farm, at the stage in my business I am in, not having access to credit would be devastating. I do not go into debt easily, so every loan I take at this point is very carefully considered for at least a year. I have worked hard with few resources to establish my business for enough years now that I need it to get easier and continue to get more efficient. Credit allows me to upgrade my equipment, replace it if necessary, and make real improvements to my infrastructure to reach a better economy of scale where I can be more profitable and efficient. I don't need to keep my head above water, I need to be able to swim and make progress. My farm is in its 'teenage' years; it has gotten off the ground, survived and the ball is rolling, but I need to continue to reinvest so it can sustain us for the long haul of my career, maybe even for the next generation.

Not having credit is a barrier to entry, and not having credit throughout the evolving life of a new farm business can be devastating too. Honestly, I am tired from years of running a farm. Now that I have a young child (6 months old) I see that it is not enough just for the farm to exist despite every sacrifice. It also needs to provide a decent quality of life for my family so that I *want to do it* for the rest of my career. To avoid burnout, the farming needs to get better and easier with age, and credit helps us to do that as we make smart investments in our infrastructure.

Sincerely,

JULIA ASHERMAN,
Owner and Operator of Rag and Frass Farm.

Re: A 2022 Review of the Farm Bill: The State of Credit for Young, Beginning, and Underserved Producers before the U.S. House of Representatives Committee on Agriculture

The National Young Farmers Coalition (Young Farmers) thanks the U.S. House of Representatives Committee on Agriculture, and the Honorable David Scott, Glenn ‘G.T.’ Thompson, for holding this hearing to discuss the challenges facing young, beginning, and underserved producers in accessing credit.

The National Young Farmers Coalition works closely with young farmers across the country to understand the challenges they are grappling with in pursuing their farming dreams, growing food for their communities, and stewarding our natural resources. Young farmers are passionate and resilient, managing increasingly severe climate change impacts, a pandemic, and economic pressures from inflation, highly competitive real estate markets, and the burden of debt—especially from student loans. Despite all of these challenges, they persist. But there are limits to this resilience.

Young Farmers Struggle to Access Capital & USDA Programs Are Not Reaching Them

Farming is a capital-intensive undertaking. The majority of current farmers identify as first-generation, meaning that they most likely did not inherit farmland, infrastructure, or equipment, and/or training from their families.¹ Land, tractors, fencing, housing, and other farm infrastructure needed to grow a successful farm operation are extremely expensive, and when coupled with the burden of student loan debt, or lack of existing credit, access to capital can be a major barrier for building a successful farm career.

In our previous two National Young Farmer Surveys of young farmers and ranchers around the country, we have heard that access to capital is consistently a challenge. It is also one of the key reasons that young people are leaving agriculture. For farmers of color, who have faced years of discriminatory lending, been subject to policies preventing them from building generation wealth, and been prevented from utilizing USDA programs, credit access is an even greater challenge.²

USDA’s Farm Service Agency (FSA) offers low interest rate loans that are designed to make credit available to our nation’s farmers and ranchers, but only a small percentage of young farmers are using these programs. In our 2017 survey, only five percent of current farmers listed USDA Farm Loan Programs as the most helpful policy, program, or institution to them. The FSA Operating Microloan is the most streamlined of the loan programs, but less than 20 percent of farm owners reported using the program. This was followed by the Farm Ownership Loan programs (13%) and Farm Operating Loan Programs (11%).³

We must deliver equitable land access and transition policy change in this next farm bill, and improving access to credit is a critical component of this work. Without it, the diversity and resilience of our food and farming systems is at risk, and thus the security of our food supply. The early months of the pandemic clearly highlighted the incredible importance of smaller scale farms serving local and regional foodsheds. We need this new generation to be successful. **We need farmers like Julia Asherman, Owner and Operator of Rag and Frass Farm in Jeffersonville Georgia to flourish, to grow fresh, high quality foods for their communities.**

But as you heard from Julia’s testimony during last week’s hearing, the difficulty of accessing credit, and thus the difficulty of finding secure land access, put young farmers on thin ice, forcing them to rely on luck and the sheer will to persist. We have outlined below some of the top challenges that young farmers face accessing credit and a number of policy solutions that we believe can help them succeed. These policy recommendations come from Young Farmers as well as our partners.

Key Credit Challenges Facing Young Farmers

- **Competing in the real estate market**
- **Discrimination and disproportionate challenges for young farmers of color**
- **Young farmers operate unique, diversified farm operations**

Newkirk II, “The GreatLand Robbery,” *The Atlantic*, September 2019, www.theatlantic.com/magazine/archive/2019/09/this-land-was-our-land/594742/.

³*Building a Future with Farmers II*.

- **Access & paperwork burdens**
- **Lack of uniformity and application of programs in local offices**
- **Access to housing**
- **Starting and growing a farm operation**

Detailed Challenges & Policy Solutions

Competing in the real estate market

Land values are rapidly increasing and the real estate market is incredibly difficult for young farmers to compete in. Farmers have seen steadily rising real estate values that are out of sync with what it is possible to produce on the land.⁴ In 2016, the ratio of real estate value to production value was the lowest it has ever been with \$1 dollar's worth of farm real estate generating just \$0.16 in production.⁵ This dynamic has only been exacerbated since the COVID-19 pandemic, with individuals looking to move out of urban areas and invest in rural real estate.⁶ Young farmers and ranchers are being outbid by cash purchases and land transactions that happen faster than they can access credit through FSA or other agricultural lenders.

We have heard from numerous young farmers that FSA Land Ownership loan programs simply are not working for them in this real estate market. The waiting time and paperwork required, as well as the necessity for a legal description of the property, means that in practice these FSA loans are primarily accessible to farmers who can find a landowner willing to accept the delays of the FSA process. Some landowners—particularly retiring farmers without many savings—simply are not in a financial position to wait. This also has equity implications, given that 98 percent of U.S. farmland is owned by white individuals, and therefore white farmers are much more likely to have access to networks of landowners who they have a close relationship with or who will work with them through the FSA process.⁷

Access to real estate matters. Land ownership provides the security that is critical for many of the long-term investments that farmers must make in soil health, infrastructure, and irrigation. Being able to plan on a timeframe over which farmers can realize a return from activities such as drilling a well, building soil organic matter, or pouring concrete in produce handling areas can significantly improve profitability, environmental impacts, and food safety. The stability that comes from land security can also have immense impacts on farmer mental health and resiliency in the face of the many challenges of farming.

A 2018 USDA report found that farm real estate is a substantial share of total household wealth and is the most important source of equity used to secure loans. During periods of land appreciation, farmers who owned a greater share of their farmland—who tended to be older, more experienced farmers—gained more wealth and land than similar farmers who rented more of their land. Renters, unlike landowners, do not enjoy wealth gains from land price appreciation. Instead, rents usually rise along with land values, raising operating costs. The authors also found that, “the gradual transfer of land between generations . . . may slow during periods of rapid appreciation.”⁸

Given these challenges, it is urgent that Congress take action to improve the speed and accessibility of FSA loan programs to help young farmers compete in the real estate market. As Julia pointed out in her testimony, the current process is slow, with many steps going back and forth, and no pre-approval option.

Recommendations

- **Establish clear processes and structures to implement a pre-approval mechanism for Farm Service Agency Direct Farm Ownership Loans.**

⁷National Young Farmers Coalition, *Land Policy: Towards a More Equitable Farming Future*, 2020, www.youngfarmers.org/land/wp-content/uploads/2020/11/LandPolicyReport.pdf.

⁸Christopher Burns, Nigel Key, Sarah Tulman, Allison Borchers, and Jeremy Weber, *Farmland Values, Land Ownership, and Returns to Farmland, 2000–2016*, USDA ERS, Economic Research Report Number 245, February 2018.

Currently, farmers are required to provide a legal description of the property they wish to receive financing for in order to begin working with FSA—in practical terms, this means a contract for purchase. The majority of sellers, however, will refuse to sign a contract and forego other potential purchase offers until they see proof of pre-approval or pre-qualification from buyers. This means that farmers who have identified available land and may otherwise be ready to make the purchase are unable to move forward and often lose out on the opportunity. Most private lenders offer some form of pre-approval or pre-qualification, but FSA does not.

FSA recognizes the seasonality of farming by allowing farmers to make their loan payments on an annual basis and should extend this understanding by offering a pre-approval mechanism that would allow farmers to complete paperwork and begin the credit access process in their down season so they are ready to jump on a land opportunity at any time that it becomes available.

In order to extend scarce funds and resources, FSA lending currently leverages lending from private banks. Congress could consider a similar model of partnership with private lenders for creating the capacity to offer pre-approval.

- **Index the Direct Farm Ownership Loan limit to rising land values.**

In the 2018 Farm Bill, Congress increased the Direct Farm Ownership Loan Limit to \$600,000 and indexed Guaranteed Direct Farm Ownership Loans to inflation. The farm bill does not, however, address the rising land values for farmers depending on the Direct Ownership Loan. In order to continue serving the needs of young and economically distressed farmers as land prices continue to rise, the Direct Farm Ownership loan limit should be tied to regional farm real estate valuation. This data could come from the annual ERS reporting on agricultural real estate values and be geographically specific. In indexing the loan limit to land values it is critical to maintain a floor of \$600,000.

- **Allow Socially Disadvantaged and Economically Distressed farmers who access credit elsewhere to refinance with FSA to secure affordable, long-term financing.**

Accessing credit elsewhere may be more immediately helpful to overcome the fast-paced demands of the current real estate market, but these loans can burden farmers with high interest rates down the road. By creating flexibility for Socially Disadvantaged and Economically Distressed farmers to access credit at the most accessible and fast-paced option, but then allowing them to refinance with FSA at a later date, will set them up for longer-term success and business viability.

- **Increase FSA capacity & ensure FSA staff reflect the full diversity of the communities they serve.**

Another critical aspect of ensuring that FSA programs continue to meet demand and help farmers compete is to ensure that all county offices are adequately staffed to meet producer needs and that FSA county office staff reflect the full diversity of the communities that they serve.

Discrimination and disproportionate challenges for young farmers of color

USDA's documented history of discrimination, particularly when it comes to lending, has contributed to the disparity in access to credit experienced by young farmers of color. The debt relief offered in the American Rescue Plan was a necessary and important step, but farmers are still waiting to see this funding be made available to them as a result of numerous legal challenges. While farmers with direct loans from FSA have been instructed to pause payments, those with guaranteed loans are left out and are at risk of default. Further, the longer that this current situation continues, the greater the threat of having to make all those delayed payments at some point, if the American Rescue Plan funding does not materialize.⁹

- **FSA should explore and act on all options available to protect guaranteed loan borrowers, including loan servicing, restructuring actions, and buying back guaranteed loans, to secure debt relief for Socially Disadvantaged and Economically Distressed borrowers.**
- **Ensure robust accountability and transparency at the local level in the civil rights process, including continuing to collect relevant data on the Farm Service Agency's lending outcomes, particularly as they relate to**

⁹See: <https://www.gao.gov/assets/gao-19-539.pdf> and <https://crsreports.congress.gov/product/pdf/R/R46768>.

Socially Disadvantaged and Economically Distressed farmers and ranchers.

- **Expand funding for, and effectively implement, the Indian Tribal Land Acquisition Loan Program and the Highly Fractionated Indian Land Loan Program.**
- **Ensure that tenants in common have a clear path to eligibility for direct or guaranteed farm ownership and operating loans.**
- **Create a down payment grant program for Socially Disadvantaged and Economically Distressed borrowers.**
- **Echoing the recommendations of the Federation of Southern Cooperatives and Alcorn State University, create a Black farmer financial institution modeled on Farm Credit to support and resource these farmers.**

Young farmers operate unique, diversified farm operations

Young farmers are more likely to be farming using organic or sustainable practices; diversified; small-scale; focused on specialty crops; selling direct-to-consumer; first generation; and to be women, queer, or farmers of color.¹⁰ They are also increasingly likely to be farming in cooperative or non-family operations. The result is that young farmers run operations that may not look like traditional farm models that FSA loan officers are accustomed to. Additionally, given the high costs of land and other farming inputs, as well as a desire to be connected to their communities, many young farmers rely on elements of agritourism to support their farm operations.

Recommendations

- **Ensure USDA programs support the diversified farm operations that young farmers are running, including considering income from agritourism as part of their overall financial picture.**

Agritourism income is not currently recognized by USDA loan programs as eligible income, yet for many, this is an incredibly important part of their overall financial viability and a way to be more engaged with their communities. USDA should recognize this income as part of young farmers' financial position in considering providing financing to them.

- **Invest in alternative lenders, such as CDFIs, to provide more affordable financing options.**

CDFIs are trusted, community-based lending institutions that often have flexibility to work with farmers. California FarmLink, Self-Help Credit Union, Coastal Enterprises Inc., and the Indian Land Capital Company are examples of organizations providing flexible, accessible financing to farmers who know and trust the organization. Increased funding and flexibility for the Healthy Foods Financing Initiatives (HFFI) at both the CDFI Fund and at USDA will help CDFIs to build their healthy food lending work.

- **Support cooperative and collective ownership models and establish lending guidelines for farmer cooperatives.**

As farmers grapple with the challenges of accessing land, patterns of ownership and access may look different than they have in the past. Policies and programs should recognize farmers' need for land security while supporting models of cooperative and collective land ownership or working into ownership over time, among other strategies.

- **Ensure young farmer representation on county committees.**

County committees are important decision-making bodies at FSA and should be inclusive of next generation farmers, particularly Socially Disadvantaged and Economically Distressed farmers. Reform the county committee process to increase inclusion by clearly disseminating election guidelines, enforcing term limits, and changing statute so that all farmers who are eligible for USDA programs are eligible to run and vote in county committee elections. These reforms should include reporting to measure outcomes.

Access & paperwork burdens

We have heard from our network that many farmers *want* to apply to FSA loan programs but do not have enough experience or income from farming to meet FSA's requirements. Likewise, they may start the process but be overwhelmed by the amount of paperwork involved. They may also be constrained by poor, or limited,

¹⁰*Building a Future with Farmers II.*

credit history. FSA can help these farmers gain access to credit through simplified loan program offerings with lower lending limits and significantly reduced paperwork.

- **Waive collateral and experience requirements for FSA Microloan programs of \$10,000 or less for small-scale farm financing needs.**

While the USDA Microloan programs are incredibly helpful to producers, there is still a need to help some small-scale farmers begin to build credit and their relationship with FSA as a lending institution. By waiving some of the collateral and experience requirements for FSA Microloans of \$10,000 or less, the Agency can assist farmers in beginning the process of building credit and accessing FSA programs with minimal paperwork.

- **Ensure FSA services are easily accessible online.**

Continued modernization and online accessibility of FSA services, including remote loan servicing, is incredibly helpful to young farmers. This helps to ensure that they can easily apply for credit and understand their financial picture without traveling in person to an FSA office. This may also allow them to work with loan agents who better understand their operations, access FSA services during the farming season when traveling to an office in person is difficult, and generally have more ease of access to credit.

Young farmers are burdened by existing debt, particularly student loan debt

Farming is a capital intensive and risky undertaking, and accessing credit for farming is already difficult. When saddled with thousands of dollars of student loan debt, many young farmers are denied loans to launch or grow their farm businesses. After land access, student loan debt is the most significant challenge to young farmers—we hear again and again that student loan debt is keeping young people from succeeding in agriculture.

Recommendations

- **Establish a pilot Debt Consolidation and Buy-Out Program within FSA, to facilitate refinancing and debt management for Socially Disadvantaged and Economically Distressed farmers.**
- **Pass Federal legislation to help farmers manage their student loan debt so they can better access capital for land purchases.**
- **Establish guidelines so that potential Socially Disadvantaged and Economically Distressed borrowers are not restricted based on a previous debt write-down or other loss within FSA's loan programs.**
- **Ensure that Socially Disadvantaged and Economically Distressed borrowers who miss a payment are still eligible to access FSA funds.**
- **Eliminate the waiting period for Socially Disadvantaged and Economically Distressed borrowers resolving tax lien issues on land.**

We have heard that farmers who are resolving tax lien issues on land have been told to wait a period of years following the clearing of title before they can access FSA programs. This policy negatively impacts farmers who need to take every opportunity they can to access land as quickly as possible. FSA should inspect this practice and ensure it is removed as a barrier.

Lack of uniformity and application of programs in local offices

One challenge that young farmers face is lack of uniformity among local FSA office staff in program awareness and implementation. Increased FSA staff capacity, hiring FSA staff who reflect the full diversity of farmers they serve, providing increased training, and a focus on culturally-appropriate services will all help alleviate this.

One particular example that we have heard is that alternative certification, used to help Indigenous producers access FSA programs, is unevenly applied and understood by FSA loan officers. We also know that the Land Contract Guarantee Program should be more widely utilized. It creates a helpful way for young farmers to access land without requiring them to work directly with a lender, yet this program has very low adoption.¹¹ We have also heard from farmers about uneven adoption of the credit elsewhere test, with some FSA offices requiring paper documentation and others not. This creates confusing and inequitable standards for producers.

¹¹In 2019, the National Sustainable Agriculture Coalition reported that only two land contract guarantee loans had been administered by FSA since 2012, <https://sustainableagriculture.net/publications/grassrootsguide/farming-opportunities/contract-land-sales/#action>.

Solutions include additional government resources for coordination and accountability; increased resources to help farmers navigate USDA programs and bring complaints to higher levels of government; and continued funding of programs like the Heirs' Property Relending Program, that provide resources to community-based organizations to serve their members' needs directly.

- **Establish a new office and coordinating position within the FPAC mission area, focused on equitable access to land and centering the needs of small-scale, beginning, urban, Socially Disadvantaged, and Economically Distressed farmers.**

Implement high-level oversight at USDA to ensure there is coordination among departments within the agency as well as with other agencies across the Federal Government so that programs are working together to facilitate transition and access for young farmers.

- **Increase training for FSA office staff.**

Ensure that FSA office staff are receiving robust training on program implementation, specifically around programs that impact young, Socially Disadvantaged, and Economically Distressed producers.

- **Increase support for the Beginning Farmer and Rancher Coordinators.**

Having an identified Beginning Farmer Coordinator in every state and a National Coordinator position in place has been extremely helpful in elevating farmer complaints and challenges, and seeing results in those challenges being addressed. Continued funding and support for these coordinator positions is critical, including increased national-level staffing.

- **Continue funding cooperative agreements with community-based organizations.**

Cooperative agreements with community-based organizations provide critical additional capacity outside of USDA to help farmers access and navigate USDA's programs. In 2020, National Young Farmers Coalition received funding to help conduct outreach about the CFAP 2 program. This program met a serious need among young farmers, yet in our outreach to hundreds of farmers, we learned that 50 percent had not heard of the program. Through our outreach, we helped them apply and receive program funds, increasing the capacity of USDA support to reach farmers. These kinds of outreach efforts around FSA credit programs are particularly important and should continue to receive funding.

- **Provide continued, and increased, funding for the Heirs' Property Relending program.**

Created in the 2018 Farm Bill, this program is a critical step in providing funding to producers to address land and credit challenges through trusted community-based organizations. This adds additional, culturally-appropriate capacity to the USDA's ability to reach producers. Congress and USDA should ensure that the implementation costs these organizations shoulder are eligible under the program and continue supporting them in doing this important work.

Access to housing

Lacking access to affordable farmland and, therefore, the ability to live on-farm, young farmers often rent housing near their leased farm property. Compounded by difficulty accessing land and credit, housing presents a significant challenge for new farm owners as they establish and grow their businesses. For farmers who are not farm owners, the challenge of housing can be especially acute. According to the National Rural Housing Coalition, 60 percent of the estimated three million farmworkers in the U.S. are in poverty—five times the national average.

- **Ensure that the USDA FSA is coordinated with other agencies, including Rural Development, to connect housing, land, and credit access challenges.**

USDA programs should be coordinated and working together to ensure that the various programs and loan products available to farmers can help address the interconnected challenges of access to land, housing, and credit.

Starting and growing a farm operation

Access to capital is critically important, but debt is a burden that requires careful management. Farmers just starting out are faced with the need to invest in multiple aspects of their operations at once—with land often being the highest cost and priority. The Federal Government can help them by providing capital that considers their operations and needs holistically.

- **Scale up existing programs to expand support for “wrap around capital” that combine business technical assistance with affordable financing.**

It is critical that farmers have assistance in demonstrating a strong business plan in order to access credit. This is particularly true for farmers who have been denied funding.

- **Review the ability of FSA borrowers to build their credit score as they are borrowing.**

As Julia pointed out in her testimony, despite repaying Federal student loans and making payments on two current FSA loans, she still did not have a credit score. She learned that apparently Federal credit debt does not contribute to credit scores. This means that regardless of her good standing on her loans, if she were to go to a traditional lender, they may be unlikely to lend to her, or they may offer her the highest interest rate on the least favorable terms. This should be reviewed and addressed so that young farmers can build credit while they are paying back FSA loans.

- **Ensure that farmers who pay off their FSA loans early are not required to graduate from FSA loan programs.**

Young, Socially Disadvantaged, and Economically Distressed borrowers should still have the opportunity to access FSA's favorable interest rates even if they are able to pay off one of their loans early. Early payment indicates building momentum towards financial stability and success, something FSA programs should continue to foster and encourage rather than shutting the door on.

Support beyond credit

Congress must make pathways to finance more widely accessible to young farmers and ranchers who have invested their time in building their farming skills rather than their net worth. We urge reframing the Federal Government's role in access to credit as an investment in the next generation of farmers, rather than simply lending funds that must be paid back. Above all, we urge Congress to think about how it can support young farmers holistically—credit is part of the answer, but not the entire solution. While debt can be an investment, it can also be an incredible burden.

- **Direct significant funding to a new initiative that would make USDA funding available to eligible entities, including Tribes, municipalities, nonprofits, and cooperative entities with priority for projects led by, and benefitting, Socially Disadvantaged and Economically Distressed farmers and ranchers.**

This new initiative will be the first farm bill program to be designed from the start to invest in secure, equitable access to land for farmers. This will make funds available to community-led projects that create equitable land access outcomes and secure access to land for farmers who are growing food for their communities. This program may take the form of a long-term forgivable loan that incorporates support for housing, infrastructure, farmer training, and land stewardship practices. This funding should enable entities to act quickly in the real estate market by having preemptive access to funds.

As the average age of existing landowners and farmers increases and we face an impending transition of millions of acres of agricultural land, it is critical that Congress take action now to make this transition equitable and support the next generation of farmers and land stewards. The focus of the next farm bill must be on policies that enable equitable land access and transition, and access to credit is at the heart of this issue.

Young Farmers would like to thank Chairman David Scott, and Ranking Member Glenn 'G.T.' Thompson for convening this hearing to discuss the state of credit for young, beginning, and underserved producers, and for your consideration of this statement for the hearing record.

Sincerely,

HOLLY RIPPON-BUTLER,
Land Campaign Director,
National Young Farmers Coalition.

SUPPLEMENTARY MATERIAL SUBMITTED BY WILLARD TILLMAN, MEMBER OF THE
BOARD, RURAL COALITION/COALICIÓN RURAL

Insert 1

Ms. KUSTER. You had referenced the appeals process, and I just wondered if you would describe that and if there is anything that we need to do to fix that in the upcoming farm bill.

Mr. TILLMAN. The appeals process?

Ms. KUSTER. Appeals for denials of loans.

Mr. TILLMAN. Yes. There needs to be some type of structure there in the appeals process. A lot of times—

The CHAIRMAN. If I may, Mr. Tillman, the lady's time has expired, but if you would not mind submitting that in writing the really good idea you were about to express to—

Mr. TILLMAN. I would appreciate that. That I would appreciate.

The process to file an appeal is outlined on the National Appeals Division is outlined on their website: <https://www.nad.usda.gov/content/file-appeal>, including the following required information listed there:

“What your appeal request needs for processing:

1. *A copy of the adverse decision from the Agency that is the basis for your appeal (if available).*
2. *A brief description of why you disagree with the Agency's decision.*
3. *Appeal must be personally signed by the participant(s) identified in the adverse decision; it does not need to be notarized.*
4. *File your appeal request within 30 calendar days of receipt of the Agency's adverse decision.*

Appeal Request Form: *An appeal request form can be downloaded here.”*

Significantly, the Appeal Request Form includes the following statement:

“Reminder: *You waive your right to appeal an adverse decision if an appeal request is not filed within 30 calendar days of the date you received the adverse decision.”*

Thus, many producers may have already lost their right to appeal a decision if they did not act almost immediately, before they may have been aware of the right to appeal.

The process for review of appeals is outlined here: <https://www.nad.usda.gov/content/common-appeal-related-questions>.

The review is supposed to take place in less than 3 months but often takes longer. NAD does not have authority to enforce their decisions; this is left up to the agencies. In the case of operating loans, even if a farmer should win an appeal, and if even if FSA implemented that decision within 30 days, FSA has regulations that prohibit using information more than 90 days old, meaning the producer will have to resubmit an application, meaning that producer initially denied a loan due to agency mistakes is unfairly penalized for those mistakes, including being unable to get the loan until the next growing season.

Adding to the complexity is the fact that NAD does not have authority to address civil rights complaints, or complaints that fall under the jurisdiction of the inspector general. There are filing time issues related to each type of appeal or complaint, and there is no clear guidance comparing the processes, the purposes of each, the timelines and deadlines for each, and how the processes relate to each other.

Responses to complaints filed with the Assistant Secretary for Civil Rights or to the Inspector General are even slower, and in the latter case, a finding of fraud by the Inspector General may result in penalties for whomever committed fraud but does not provide a remedy to the producer injured by the fraud.

Thus, historically underserved and socially disadvantaged producers in particular, are provided little timely and clear guidance into how to resolve they many barriers they continue face. These processes are long, and rarely result in a positive result for the producer. We urge the Committee to hold a fuller hearing on the intersection of these process.

Most of all, we urge Congress to require annual reports that summarize the number of appeals and civil rights complaints annually filed, with a summary of how many were resolved and how many in favor of the agency, and how many in favor of the producer, and how promptly remedies were delivered.

Please see *Appendix 1* for a fuller discussion on the much wider list of factors that should be considered when evaluating the fairness of the lending process.

Insert 2

Mrs. HAYES. Well, thank you so much for that. And I want to be respectful of the time, but I will ask one last question if you could submit it, anybody on the panel. I am particularly interested in how Congress can reduce barriers for underrepresented farmers, for young BIPOC minority farmers. I am from the State of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, we have just some really creative things going on in the state that have not been accounted for in this industry. So anything you can offer in that area for how Congress can help, I would appreciate it.

With that, Mr. Chairman, I yield back.

The timely access to credit at the time a farmer needs it is essential to the success of almost any farming operation. Producers also need timely and fair access to the full range of related USDA programs for farmers as these programs help producers manage viable and sustainable operations and cash flow their loans.

Yet participation in the full range of USDA programs for farmers remains elusive for the majority of historically underserved producers. The data to fully understand and address the disparities in program access and service delivery remains a primary barrier to measuring and implementing accountability for fair access to service.

The largest number of discrimination claims settled with in the past 2 decades related to the discouragement of applications for USDA programs. To address this issue, in 2014 Farm Bill, Congress made mandatory the provision of a **receipt for service** to farmers to record all their requests for service and the agency response to their request, including an agency instruction on follow-up needed by the producer.

The USDA National Appeals Division recognizes that FSA's employees have a greater understanding of program requirements. Administrative Law Judges recognize and understand that "while a program participant is responsible for exercising due diligence in understanding the requirements of a program, NAD case decisions recognized that it is not reasonable to expect a program participant to have greater understanding of program requirements than FSA's own employees.["] This is why receipt for service is so critical to understand what farmers are told by FSA staff. It is also important to note that the receipt for service reveals what the farmer was not told in terms of program benefits and services. It is also possible through receipts for service for the agency to ascertain how this treatment is the same or different from what other farmers were told at the same time.

However, to this day, agencies routinely fail to provide the receipt for service to producers and discourage requests for this receipt. **This Committee should review the use of the Receipt for Service and adopt new measure to assure compliance by all local offices that serve farmers.**

The fact that a minority farmer participates in a private or Federal loan program does not automatically equal meaningful, fair participation. Some farm credit transactions run afoul of consumer credit statutes and we can attest to such examples evincing lending irregularities and discrimination. Therefore, participation in harmful discriminatory lending transactions is more detrimental economically than straight forward credit denial, especially when the loan is over collateralized, and a personal residence security interest is mandated but is unnecessary to secure the loan in question. Minority farmers understand that agriculture is a high economic risk industry and their reliance on fairness in credit transactions must be guaranteed by the lenders offering various credit options.

Farm lending, especially when directed by the government or guaranteed by the government, should be a consistent and evenly applied farm risk management toll. In accordance with 7 CFR 1779.63 and 7 CFR 4279.281 the U.S. Department of Agriculture and the Small Business Administration must make sure that lending irregularities and discrimination is not a part of any loan guaranteed by the government. Minority farmers confront the same floods, droughts, and market fluctuations as non-minority farmers. Inequities and irregularities within farm lending sector should not be held in the same farm risk category as natural disasters.

Preventing irregular and discriminatory lending practices—The current appeals and civil rights processes do not include a full review of critical loan transactional components that we have commonly found such as (a) excessive collateral requirements, (b) unwarranted late disbursement of loan funds, (c) misapplication or calculation of actual or average farm production, (d) evaluation of loan applications based the association of credit risk identified with third party non applicants, (e) directing or requiring borrowers to purchased equipment or inputs from entities related to the transactional lender, (f) suggesting or requiring under-funded or over

funded annual crop loans with the intent to gravely impact repayment ability, (g) appraisals that either low ball or high ball the value of land, and which are conducted at times by parties or for who are not disinterested in the transaction, (h) denying or forcing loan servicing options that diminish annual farm operations and loan repayment ability and (i) forced graduation from FSA loans. While not exhaustive, this list is a compendium of discriminatory or irregular lending conduct that is prohibited by the Equal Credit Opportunity Act, the Fair Housing Act, and the Dodd Frank Unfair Deceptive and Abusive Practices Act. The appeals and civil rights processes must be amended to allow the full range of deceptive and discriminatory practices are considered in the investigation and consideration of appeals and complaints.

The rising cost and low availability of land at present leaves historically underserved and beginning farmers and ranchers at a very vulnerable position in accessing they credit they need to enter farming, transition between generations, or to adapt their farming operation to change market and climate conditions. A loan provided early in the season, rather than after April each year, can make all the difference. Even the slow walking of completing an application, can leave a producer with the credit needed to secure a property, or to buy the inputs needed for a success production year.

Insert 3

Ms. PLASKETT. . . .

* * * * *

So I wanted to ask the witnesses, do you find your current application process to be timely, allowing individuals to pursue their goals having land within a year's framework? I was going to ask that question to Mr. Willard Tillman or Ms. Daña Davy, if you all have found any information about this.

The application process for credit is often very challenging for producers and does not allow timely pursuit of goals or accessing land within a year's framework, particularly in areas where land is quickly rising in prices. Incoming producers, and especially historically underserved producers, are often hit with excessive collateral requirements, and many other irregular or discriminatory practices noted above. An inequitable funded loan will imperil the producer for years to come.

Insert 4

Mrs. BUSTOS. . . .

* * * * *

Okay. I am going to move on to the whole panel then. Do you see ways for crop insurance and ag credit to work better for young and beginning and underserved producers? That is to the whole panel.

At present, many historically underserved producers produce crops poorly covered by existing crop insurance programs. A new microinsurance product is worth review. Producers are much more likely to use NAP or Livestock Indemnity which are critical to help the farmer pay loans in times of loss, or in the case of Livestock Indemnity, to replace collateral such as cattle when they are lost. Problems in the loss adjustment processes need to be addressed, including when loss of cattle washed away in flooding cannot be documented. An alternate process is needed. However, many times, the amounts paid out barely replace the cost of the insurance, also making the sale of products less beneficial to a crop insurance agent.

APPENDIX I

March 3, 2019

Hon. GENE L. DODARO,
Comptroller General,
 U.S. [Government Accountability] Office,
 Washington, D.C.

Re: SEC. 5416. GAO Report on Credit Service to Socially Disadvantaged Farmers and Ranchers

Dear General Dodaro:

I. Introduction

As the [Government Accountability] Office prepares to fulfill its duties under Section 5416 of Public Law 115-334, the 2018 Farm Bill, the undersigned organizations representing the agriculture lending interests of minority and socially disadvan-

taged farmers and ranchers encourage the adoption of methodologies that examine and evaluate farm lending policies having a negative impact on minority farmers and ranchers. The study's methodology should examine, from our perspective, and evaluate certain "unique" lending patterns, practices and policies that reliable sources, academic and legal, verifiably document as contributors to farm loan default, acceleration and foreclosure within the minority farming community.

The undersigned organizations over the years have reviewed thousands of loan documents and assisted hundreds minority farmers with loan servicing options. Before and after *Keepseagle, Love, and Garcia Pigford* Farmer settlements, the undersigned organization labored with minority and socially disadvantaged family farmers and ranchers in the areas of farm credit applications, collateral requirements, and loan servicing. As a collective of over 100 years of experience in family farm foreclosure prevention and farm wealth transition, we know firsthand the consequences of late loans, disparate treatment and disparate impact in loan servicing and other hidden farming lending discriminatory policies and procedures.

A history of loan service to our farmers gives us the knowledge and credibility to offer suggestions that *will accommodate efforts to determine other appropriate details of the study's methodology*. As you develop a methodology to gather and organize reliable report data to present to the House and Senate Agriculture Committee, consider farm loan practices from our practical and historical perspective. As delineated herein, our methodology suggestions find general acceptance in 7 U.S.C. 1983c which authorized the Secretary of Agriculture to implement pilot loan programs when there is a finding of loan program irregularities. This study is much needed as it will point out farm lending irregularities for the purpose of improving credit for all farmers. Farmers appreciate the fact that the legislative language mandates a product completion within 120 days of December 18, 2018, the execution date of the 2018 Farm bill.

II. Legislative Requirements

The statutory language requiring of the study is general and purposely vague. We point out the vagueness of the language, not as a criticism, but to augment the necessity of a broader methodology that captures real irregularities faced by minority farm borrowers.

Essentially, Section 5416. of Title V of the 2018 Farm Bill requires the Comptroller General of the United States to conduct a study to (A) assess the credit and related services provided by agricultural credit providers to socially disadvantaged farmers and ranchers; (B) to review the overall participation of socially disadvantaged farmers and ranchers in the services described in subparagraph (A); and (C) to identify barriers that limit the availability of agricultural credit to socially disadvantaged farmers and ranchers. Title 5416, Sec. 5416 of Public Law 115-334.

The language's general reference to terms like access, participation rates and barriers by implication suggests that the functionality of the methodology encompasses the time, place, manner of access, and foreclosures that may violate Federal laws if the irregularities are found to be within the consumer protection prohibitions of statutes like the *Equal Credit Opportunity Act (ECOA)—15 U.S.C. 1691-691f*; *Fair Housing Act (FHA)—42 U.S.C. 3601-3631*; *Dodd Frank Unfair Deceptive and Abusive Practices Act (UDAP)—12 U.S.C. Section 5531(d)*.

Even though not specifically mentioned, it is permissible that the study's methodology must be comprehensive to the extent that access, participation and barriers will be quantitatively and qualitatively articulated by examining or evaluating lending irregularities and discriminatory practices against relevant regulatory guidance of relevant consumer protection statutes. If a plain meaning interpretation of Section 5416 applies without permissible considerations, the data could be limited to the number of minority farm loans granted and denied and miss critical data on key issues such as lending patterns, policies and practices that have a disparate impact or serve as disparate treatment. Missing the real issues of farm loan irregularities and discriminatory terms and conditions may cause further extractions of land wealth from minority farmers while denying the same or similar viable, economically appropriate lending risk management tools offered to non-minority farmers and ranchers. We understand that not every aspect of a farm loan transaction can be studied. But critical irregularities must be studied. The Congressional intent of Section 5416 reveals that the results must inform and guide policy makers and practitioners on how to create program efficiencies while ensuring fair farm lending.

Reviewing overall farm lending participation rates does not address associated issues of barriers to participation such as fair and equitable participation. The fact that a minority farmer participates in a private or Federal loan program does not automatically equal meaningful, fair participation. Some farm credit transactions run afoul of consumer credit statutes, and we can attest to such examples evincing

lending irregularities and discrimination. Therefore, participation in harmful discriminatory lending transactions is more detrimental economically than straight forward credit denial, especially when the loan is over collateralized, and a personal residence security interest is mandated but is unnecessary to secure the loan in question. Minority farmers understand that agriculture is a high economic risk industry and their reliance on fairness in credit transactions must be guaranteed by the lenders offering various credit options.

Farm lending, especially when directed by the government or guaranteed by the government, should be a consistent and evenly applied farm risk management toll. In accordance with 7 CFR 1779.63 and 7 CFR 4279.281 the U.S. Department of Agriculture and the Small Business Administration must make sure that lending irregularities and discrimination is not a part of any loan guaranteed by the government. Minority farmers confront the same floods, droughts, and market fluctuations as non-minority farmers. Inequities and irregularities within farm lending sector should not be held in the same farm risk category as natural disasters.

III. Irregular and Discriminatory Lending Practices

The data collected for analysis, under Section 5416, must include loan transactional components such as (a) excessive collateral requirements, (b) unwarranted late disbursement of loan funds, (c) misapplication or calculation of actual or average farm production, (d) evaluation of loan applications based the association of credit risk identified with third party non applicants, (e) directing or requiring borrowers to purchased equipment or inputs from entities related to the transactional lender, (f) suggesting or requiring under-funded or over funded annual crop loans with the intent to gravely impact repayment ability, and (g) denying or forcing loan servicing options that diminish annual farm operations and loan repayment ability. While not exhaustive, this list is a compendium of discriminatory or irregular lending conduct that is prohibited by the Equal Credit Opportunity Act, the Fair Housing Act, and the Dodd Frank Unfair Deceptive and Abusive Practices Act. These aspects must be studied.

IV. Develop a Methodology from Applicable Consumer Credit; Civil Rights; Farm Credit Statutes and Regulations

The goal of this study is to collect data on access to fair credit since the lack of access to fair credit is the same as a barrier to credit. *We recommend that the study examines 8 (eight) standards.*

- (a) **Effects Test.**—The Equal Credit Opportunity Act and its implementing regulations found at 15 U.S.C. 1691, and 12 CFR 1002, Regulation B, may prohibit certain credit practices that are discriminatory in effect because the practice or policy has a disproportionately negative impact on a prohibited basis such as race, age, gender, *etc.* Under the effects test, the policy or practice of the creditor does not have the intent to discriminate. The lending practice, under the effects test, appears to be neutral on its face. It is the application of the policy or practice that presents the irregular, discriminatory disparate impact or disparate treatment problem for the minority or socially disadvantaged farmer borrower. For example, the lender informs non-minority similarly situated farm loan borrowers on the best and lowest price seed, tractors or fertilizer. Or the non-minority borrower may get detailed information on where to find low priced farmland for rental. In contrast, the minority farmer does not get the same “best source to purchase” advice. Another example is appropriate as is the “best source to purchase” example. Consider a lender loan requirement specific to the minority farmer where a refinance of personal residence using a USDA guaranteed loan is mandatory for the closing of a farm operating loan. Under the “effects test” a disparate impact problem arises where, in contrast, the non-minority, similarly situated farm borrower is not required to refinance his personal residence and or use the personal residence as collateral for a farm operating loan. It is easy to see that the minority farmer, in these examples are subjected to disparate treatment. Granted, some lender policies or practices will pass muster if it meets a legitimate business need of the lender that cannot reasonably be achieved as well by means that are less disparate in their impact. *See Regulation B, 12 CFR Section 1002.2(c), (m), (n), (t) and (z).*
- (b) **Deceptive and Abusive Lending.**—Although less frequently, a lender may subject a farm loan borrower to terms and conditions that are designed to put the farmer out of business. A farmer may be subjected to coercive tactics whereby a farmer can be lured into a farm loan that is not affordable or guaranteed to result in foreclosure. Lender decisions to such abusive or deceptive tactics in loan making or terms and conditions may violate the Dodd Frank

Unfair Deceptive and Abusive Practices Act (UDAP). In the farming area, like other consumer credit, a UDAP claim can be successful only when the lenders conduct shows the following: “(1) materially interferes with the ability of a consumer to understand a term or condition of a consumer financial product or service; or (2) takes unreasonable advantage of—(A) a lack of understanding on the part of the consumer of the material risks, costs, or conditions of the product or service; (B) the inability of the consumer to protect the interests of the consumer in selecting or using a consumer financial product or service; or (C) the reasonable reliance by the consumer on a covered person to act in the interest of the consumer.”^[7] ***Dodd-Frank Wall Street Reform and Consumer Protection Act, 12 U.S.C. Section 5531(d)***.

- (c) **Residential Real Estate.**—In order to obtain a farm operating loan, a farmer may be required to offer his personal residence as collateral for such loan. On its face the offering of a personal residence can be a lender requirement that is based on the credit risk of the particular loan. However, Civil Rights statutes and implementing regulations such as 24 CFR Section 100.130 (a) prohibit a lender from imposing different terms or conditions for the availability of loans or other financial assistance because of race where the transaction is secured by residential real estate. ***See 42 U.S.C. 3604(b); 24 CFR Section 100.130 (a); and 24 CFR Section 100.130(b)(1)(2)(3)***.
- (d) **Excessive Collateral Requirements.**—Whether minority farmers are required more frequently than non-minority farmers to tender excessive collateral in order to receive a farm loan or to acquire meaningful loan servicing through workout and loan modifications. ***See Regulation B, 12 CFR 1002.6(b)(4); Regulation B 12 CFR 1002.2(n)***.
- (e) **Discriminatory Loan Terms and Conditions.**—Whether minority farmers more frequently than non-minority farmers receive loan funds after April of any given crop year. Under the guidance of 12 [CFR] 1002.6(b)(4) a lender cannot provide two different systems of credit application, loan pricing or loan servicing. ***See Regulation B, 12 CFR 1002.6(b)(4)***.
- (f) **Third Party Influence.**—Whether minority farmer loan application packages and lending decisions are unduly influenced by third party entities such as equipment dealers, agricultural input suppliers and or processors and millers of raw agricultural products. ***See Regulation B, 12 CFR 1002.2(c); 12 CFR 1002.4(a)(b); and Unfair Deceptive Abusive Practices Act—12 U.S.C. Section 5531(d)***.
- (g) **Lender Control Over Farmer Operations.**—Whether farm lenders more frequently exert control over the daily management of minority farmer operations in terms of acreage planted and equipment purchased. ***Unfair Deceptive Abusive Practices Act—12 U.S.C. Section 5531(d)***.
- (h) **Intentional Lender Mistakes.**—Whether certain lender decisions are implemented with intent to cause irreparable damage to the economic viability of minority farm operations. ***Unfair Deceptive Abusive Practices Act—12 U.S.C. Section 5531(d) (UDAP)***. We do not infer that every farm loan, whether USDA Direct or USDA guaranteed, is made and designed with the intent to defraud or damage the farming operations of minority operators. But, history and experience, nevertheless, inform us that such problems like this do appear occasionally and have the intended effect of causing harm and failure to minority farmer operations. Again, we stress that these practices do not happen every day, but our farmers tell when they exist, and the farmers tell us when lenders make lending mistakes—intentionally or not. Having made a compelling argument to the U.S. Congress during the 2018 Farm Bill debate, the House and Senate Agriculture Conference Committee, responded proactively to provide a provision of “equitable relief” for farm loan borrowers in those circumstances where a FSA farm loan employee makes a mistake—knowingly or unknowingly—and that mistake causes a borrower to be in non-compliance on a USDA direct loan. Section 5304 of the 2018 Farm Bill conference report gives the Secretary of Agriculture the authority to offer a farm loan borrower a provision of “equitable relief” when a decision of a farm loan officer causes the borrower to be out of compliance with the loan program. Noncompliance with a loan term or provision can lead to default, acceleration, and foreclosure. The “equitable relief” provisions of Section 5304 are far afield from the fraud prevention provision of the UDAP. ***12 U.S.C. Section 5531(d)***. Lender mistakes whether intentional or not will cause economic damage to farm business operations. We mention the presence of “equitable relief” in Section 5304 to highlight the existence of a problem and the neces-

sity that the GAO study look into irregular lending practices having a flavor of mistake or fraud. **Sec. 5304 of Public Law 115-334.**

V. Industry Specific Credit Transactions: Sugar Cane and Contract Poultry

Although not often implemented by the U.S. Department of Agriculture, 7 U.S.C. 1983c permits the Secretary of Agriculture to conduct pilot loan programs in areas of lending irregularities, such as those endemic to industries such as contract poultry and sugar cane production. The existence of pilot loan programs under 7 U.S.C. 1983c provides additional credibility to the research questions and methodologies that we suggest be made a part of this study. Our suggested approach makes a valid attempt to explain farm lending irregularities whether they be historical and race based or neutral loan making business decisions that have a disparate impact on minority farm loan borrowers. Upon the general applicability of 7 U.S.C. 1983c, we urge a methodology that informs the Secretary of Agriculture of the benefits of frequent, effective utilization of 7 U.S.C. 1983c when presented with a petition by a farm group showing that an area, or group of farmers are defaulting on loans on a consistent and increasing rate with a similar pattern or practice of lending or loan servicing. Under 7 U.S.C. 1983c, a petition from a farm group requires the Secretary to create a farmer Loan Pilot Project designed to prevent and restructure loans in the area of concern. FSA direct and private guaranteed lending in the contract poultry industry presents a good example of consistent farm lending irregularities. For example, in the years 2004–2007, approximately, we worked with Hmong organizations and producers, holding focus groups and other reviews of the difficulties faced by Hmong farmers who had relocated to northwest Arkansas near Fayetteville, to purchase poultry operations. We reviewed practices and called these to the attention of the Secretary of Agriculture. Many of the families included parents who entered the U.S. as refugees, and children who had worked in fields such as engineering. A group primarily from Wisconsin began to move to northwest Arkansas at the recommendation of respected people, who had served in public positions within USDA and elsewhere. They had some resources, and it appears the local real estate industry worked in cooperation with the banks to secure guaranteed loans to buy out poultry operations that were not economically viable for their former owners. The producers showed us that in many cases identical or nearly identical farm and home plans were submitted to the banks for approval, and farmers were told they could secure certain conservation benefits used by previous owners. The prices of the farms rose as more producers moved in, and in most cases the families were not aware of the additional costs they must incur before the integrators would allow them to enter production. The loans provided were proving highly risky, and many of the new producers lost their operations. The “solution” recommended at the national level after Rural Coalition and many other groups called for action, was to pressure the Natural Resources and Conservation Service to engage trainers from groups who worked as farm advocates to teach producers how to better meet the requirements of the poultry integrators. The GAO should review the loan portfolios in that region over the past 15 years to examine lending practices. Producers told us that the bankers, the real estate agents, and many others benefited. The producers are left with debts most likely still held by the Farm Service Agency.

Minority and socially disadvantaged farmers and ranchers are often subjected to lending irregularities deemed “nonbusiness credit risk” loan terms and conditions. The following terms and conditions are deemed “non business credit risk” terms and conditions: (i) lender loan servicing mandate to sell borrowers existing income producing collateral and use the sales proceeds to buy new replacement collateral from a single tractor equipment source identified by the lender; (ii) farmer requirement to purchase a piece of farm harvesting equipment and immediately lease the equipment to a third party business; and (iii) consideration of the past bad debt of a parent or other family member. The outgrowth of these and related lending irregularities *fosters* barriers to meaningful access to farm credit for minority farmers.

VI. Effective Complaints Processing and Settlement

We further note that the Farm Credit System lacks a specific system or methodology to act on civil rights complaints consistent with ECOA and related requirements and that one needs to be developed and implemented in order to assure fair implementation of guaranteed programs.

We have attached correspondence* that we conducted with the Farm Credit Administration on behalf of a young African American producer in South Carolina, and

* **Editor’s note:** this attachment did not include any attached correspondence. It has been reproduced herein as submitted.

correspondence between he and FCA in 2014. We also have correspondence and many documents on the case of a Hmong woman who had an operation in Missouri with her husband, and how she lost her operation after he passed away. In these cases and many others, producers come to us at a point when it is very difficult to save their operations.

What is similar in all the cases we have mentioned is that there is substantial confusion not only for the guaranteed loan borrowers we have encountered, but also on the part of advocates, on how to secure the rights provided these borrowers under the Equal Credit Opportunity Act. The Farm Credit Administration has not included equal credit opportunity under the protected rights it lists on its website, and to file a discrimination complaint, producers are told to write to the FCA Office of Congressional Relations and Public Affairs. The questions asked and responses provided indicate there is no formal process to investigate claims under ECOA. There do not appear to be any statements or other information to tell farmers how to secure their rights. We urge you to review these attachments. The GAO study should examine what system FCA and the banks that make guaranteed farm loans should have and how producers should be informed of and assured their rights. Thus, producers who encounter unfair treatment lose valuable time trying to figure out the avenues of protection they do have. The GAO should consider what measures are necessary to correct these deficiencies and assure guaranteed lenders abide by ECOA in loan making and loan servicing.

The study methodology should also take a look at the specific minority farmer lending practices within certain crops or industries such as poultry in Arkansas, North Carolina and elsewhere, vegetable crops in South Carolina and sugar cane crops in Louisiana. The study will be much more valuable if it examines the lending practices in these industries as related to African American, Hispanic, Hmong and other Asian Pacific American, and Native Americans borrowers. A specific portion of the inquiry should address how the details of loan transactions may have caused or contributed to the exodus of minority and socially disadvantaged farmers from specific farm industries in specific areas, and who benefited and who lost in these areas.

VII. The Need for a System of Compliance Monitoring

Our Coalition has worked on the issue of compliance monitoring in direct lending and on the issue of equitable access to all Federal programs for farmers and ranchers for many years. In particular, we have worked to assure the data is available to understand patterns and barriers that interfere with the assurance of equitable access and opportunities. Since 1987, we have worked to secure authority for the collection and analysis of program participation data by race, gender and ethnicity at the national, state and county levels. The Agriculture Credit Act in 1987 required the calculation of target participation rates for lending to the county level for direct and guaranteed loans. Farm Service Agency and its predecessor, the Farmers Home Administration, has done so for years. These data are available to guaranteed lenders and the Farm Credit System. Over the years, in each farm bill we have added other authorities for data and documentation. Following the 2012 Census of Agriculture, we urged the National Agriculture Statistics Service to provide data to the county level on the demographics, economics and crop produced by race, gender and ethnicity. They complied, and this data is now available at https://www.nass.usda.gov/Publications/AgCensus/2012/Online_Resources/Race_Ethnicity_and_Gender_Profiles/index.php.

We have seen no evidence that the Farm Credit System and other guaranteed lenders have any system to evaluate their lending to minority producers as compared to other producers, or that they collect the data they would need to proactively monitor their compliance with ECOA.

In 2011, Farm Credit Administration released for public comment a *Proposed Operating and Strategic Planning Rule*, 76 FED. REG. 101 (May 25, 2011). Its recommendations were based on marketing practices related to addressing “diversity” in the marketing practices of the Farm Credit System Institutions, while avoiding the more central issue of compliance with ECOA. The following is an excerpt from our comments:

The Rural Coalition, and other undersigned partners and allies, submitted detailed recommendations with respect to the proposed rule, which we share with you now as they are pertinent to the current report and merit re-examination for the outcomes achieved following the issuance of this rule:

The Final Rule Should Require the Federal Credit System Institutions to Engage Historically Underserved Farmers and Community-Based Or-

ganizations that Serve Socially Disadvantaged and Limited Resource Farmers in the Development of Their Marketing Plans.

According to Section 618.8440(b)(8), the marketing plans of Farm Credit System institutions would have to include, at a minimum, a description of the institution's chartered territory by geographic region, types of agriculture practiced and market segment and the strategies and the actions to ensure the institution's products and services are equally accessible by all farmers, with an emphasis on outreach to historically underserved farming communities. Furthermore, the proposed rule advises institutions to use an array of demographic information, down to the county level, to identify the characteristics and market segmentation of its territory (i.e., Websites of the Census of Agriculture, the U.S. Census Bureau, and the United States Department of Agriculture's Economic Research Service).

In addition to these sources, the Farm Credit System institutions should also engage their state National Agricultural Statistics Service (NASS) Directors to generate data specific queries in order to obtain a deeper understanding of the farmers that the institutions are mandated to serve.

Additionally, institutions should also specifically work with the USDA to obtain the annual application and participation rate data mandated in Section 14006 of the 2008 Farm Bill, including numbers and percentages, for each county or parish and state in the United States, organized by race, gender and ethnicity, from USDA's Farm Service Agency and Rural Development programs. The Farm Credit should also look at this authority and other more recent authorities to generate their own data on participation in their programs.

Section 618.8440(b)(8), also advises that the "marketing plans of institutions include grassroots outreach activities and education efforts that market to underserved populations regarding business and financial planning and leadership and loan programs for persons who are creditworthy and eligible to borrow." Although outreach to underserved farming communities is an essential component of an institution's marketing plan, the unique perspective and reality of the underserved farmer should be incorporated in the developmental process of the institution's marketing plan. Accordingly, the final rule should require institutions to include historically underserved farmers and community-based farming organizations that serve socially disadvantaged and limited resource farmers in the developmental process of the institutions' marketing plans.

In preparing our Coalition's comments to this proposed rule, we spoke to several members about the Farm Credit System and there exists a universal perception that the Farm Credit System institutions are not accessible to the underserved farmer and have failed to conduct outreach to these communities to educate them regarding the institutions' programs and services. In the words of a long-time Latino farmer and advocate, "the Federal Credit System is further beyond the reach of the farmer than a commercial bank, we never felt this was a source of assistance."

Moreover, institutions should work to develop meaningful relationships with the USDA Minority Farms Advisory Committee authorized in the 2008 Farm Bill and now established, community-based organizations that serve socially disadvantaged and limited resource farmers, 1890 and 1994 Land-Grant Colleges and Universities, and grantees under the 2501 Outreach and Technical Assistance Program, as well as identify persons from these committees, institutions and organizations to assist in the development of marketing plans. Furthermore, the Farm Credit System Diversity Workgroup should also identify members from the aforementioned committees, institutions and organizations to assist in the development of its programmatic efforts to reach historically underserved farming communities. The development of such relationships is essential if progress is to be made in expanding credit to this growing market.

As required by Section 4.19 of the Farm Credit Act, Farm Credit System associations and institutions should continue to tailor credit programs and services to address the needs of Young, Beginning, and Small farmers and ranchers. Although these programs do not have the explicit objective of advancing customer diversity and inclusion, these programs should be used as essential outreach portals to socially disadvantaged farmers and ranchers. As mentioned in a previous section of these comments, the current participation rate data of the USDA Beginning Farmers and Ranchers Program serves as a cautionary illustration of how well-intentioned programs can neglect the needs of historically underserved farming communities, especially if these communities are not included throughout the program development process.

Moreover, the final rule should emphasize the importance of allowing institutions to use discretion in determining whether farmers are creditworthy and eli-

gible to borrow. If the Farm Credit System institutions want to make significant strides in serving historically underserved farming communities, these institutions must recognize that their credit requirements should not be rigidly enforced and should allow for case-by-case exceptions (i.e., waiver or lowering of collateral requirements). The language “creditworthy and eligible to borrow” should not be interpreted or implemented in such a manner to undermine the spirit of the proposed rule, which is to make the institutions more responsive to the needs to historically underserved farming communities.

The Final Rule Should Include Revisions to the Proposed Rule’s Working Definition of Diversity

Throughout the proposed rule, diversity is purported to be achieved through the inclusion of all individuals of varying race, ethnicity, sexual orientation, age, disability, social class, religious and ideological beliefs and not through a list of demographic criteria.

This working definition of diversity is problematic and provides a loophole for institutions to avoid implementing a marketing plan that actually promotes diversity and inclusiveness within the institutions’ borrower base. Demographic criteria should be given equal weight in determining whether institutions are in fact providing equal access to credit to all farmers.

Consequently, an institution’s commitment to diversity and inclusion cannot be ascertained by an institution’s lofty mission statement (as suggested by the Farm Credit Administration’s Request for Comments) **rather by the institution’s actions and achievement of assessment benchmarks.** The final rule should include a revised definition of diversity to address these concerns and should also assure that the diversity includes actual borrowers or potential borrowers from the socially disadvantaged community who actually understand the issues, the history and the complexity of small rural communities and their racial, ethnic and gender dynamics and history.

The Final Rule Should Require the Farm Credit System Institutions and Diversity Workgroup to Make Their Final Marketing Plans and Participation Rate Data Public

The Farm Credit System Diversity Workgroup was established in 2006 to increase diversity awareness, promote understanding of inclusiveness, and serve as a diversity resource within the Farm Credit System. Since its inception, the Diversity Workgroup is purported to have sponsored a diversity conference, several trainings workshops, speakers, outreach and communications. Despite the laudable efforts of the Diversity Workgroup, the effectiveness of the Workgroup’s efforts to achieve a more inclusive workforce and borrower base must be evaluated through various assessment and accountability benchmarks. For example, some pertinent questions that must be addressed by the Diversity Workgroup [and at the current time by the Farm Credit System and lenders in General]:

- (1) How many farmers from historically underserved farming communities have applied for and received loans from Farm Credit System institutions;
- (2) Are the institutions’ borrower base reflective of the market segmentation of their chartered territories? If not, what specific steps has the Workgroup recommended to the institutions to ensure they adhere to their mandate of providing equal access to credit to all farmers.

The final rule should require the Farm Credit System institutions and Diversity Workgroup to make their marketing plans as well as their assessment and accountability findings public. Moreover, if there are egregious shortcomings in the marketing plans efforts to respond effectively to the needs of historically underserved farming communities, these plans must be revised to address these gaps in services. In essence, the institutions should view their marketing plans as fluid plans that can be amended as necessary to be more responsive to the institutions’ diverse borrower base.

... Farm Credit System institutions should take affirmative steps to ensure that data systems are in place to record the important demographic and participation rate data of all borrowers to allow comparisons and track progress.

The Final Rule Should Require Farm Credit System Banks and Associations Board of Directors to Appoint Directors From Historically Underserved Farming Communities or Community Based Organizations that Serve Socially Disadvantaged and Limited Resource Farmers

Reiterating Farm Credit Administration Bookletter BL-009, the proposed rule encourages all Farm Credit System Institutions’ Board of Directors to appoint directors to serve on the Board that would further the aim of facilitating diver-

sity, when feasible. Again, the discretionary language of the proposed rule (i.e., “encourages”) will not bring about transformative change in the corporate culture of the Farm Credit System institutions. In order to bring about substantive change in the corporate culture of these institutions, the final rule should mandate that at least one appointment to the institution’s Board of Directors be a member from a historically underserved farming community or a community-based organization that serves socially disadvantaged or limited resource farmers.

Now in 2019, we further recommend a review of racial, ethnic and gender diversity among the directors and staff of the lending institutions of the Farm Credit System.

While some statutes have been updated since our recommendations in 2011, we see no evidence FCA has changed their systems to comply with ECOA and to assure fair service to all borrowers and potential borrowers. The GAO report should address these fundamental issues of the ability of the Farm Credit System and guaranteed lenders to assure fair service to all producers, as ECOA requires them to do.

VIII. Conclusion

The results and findings of a comprehensive study could assist lender and government agencies with the legal mandate to offer the same loan products and loan servicing options offered to each and every farmer regardless of social status. The success of highlighting irregular farm lending patterns, and lack of systems to address these patterns, will be instructive to all farmers, lenders and reduce the overall costs of farm lending transactions while preventing questionable or unlawful family farm foreclosures.

SUBMITTED QUESTIONS

Response from Nathan S. Kauffman, Ph.D., Assistant Vice President, Economist, and Omaha Branch Executive, Federal Reserve Bank of Kansas City, Omaha Branch

Questions Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question 1. How can Congress reduce barriers for underrepresented farmers—for young, BIPOC, minorities farmers. I’m from the state of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, and some really creative things going on in the state that have not been accounted for in this industry. How can Congress help these unique, nontraditional operations?

Answer. Agricultural production in the United States includes a diverse representation of industries and farmers, many of which have differing goals, needs, and business models. The structure of large operations specializing in the production of standardized commodities, for example, may differ from the structure of smaller or non-commoditized operations. Likewise, the needs of producers with varying backgrounds and experiences, including underrepresented farmers, may be unique relative to others in the industry. These differing structures and backgrounds can give rise to alternative perceptions of risk and, accordingly, the availability of credit. Understanding the differences across producers and operations, and how these differences may affect the availability and terms of credit support, may be a useful consideration for future policy.

Question 2. Your testimony pointed out that land prices are rising in the Kansas City Fed Region. Would increasing the cap on FSA loans adequately address rising land costs? Should Congress look at adjusting regional equity in the upcoming farm bill to address the uneven cost of land in the United States?

Answer. In recent years, farmland valuations in the Kansas City Fed region, and throughout the country, have increased significantly. In general, these increases have occurred alongside a sharp rise in agricultural commodity prices and gains in farm income. Regionally, farmland valuations also differ dramatically based on the returns generated by the land. The increases in incomes and wealth in recent years have placed borrowers in a strong financial position to make further investments in their operations, including the acquisition of land. Some borrowers, however, including young and beginning farmers, may not have sufficient resources to acquire farmland through traditional financing mechanisms, particularly in regions with highly productive farmland. Should Congress seek to address potential barriers to farmland ownership, particularly for segments of agricultural producers who may have fewer resources to acquire farmland, considering the limits on FSA loans may

be a potential option. However, it may be important to consider other options that also facilitate entry into farming that do not require the purchase of farmland.

Response from Dãnia C. Davy, J.D., Board Representative, Socially Disadvantaged Farmers and Ranchers Policy Research Center, Alcorn State University; Director of Land Retention and Advocacy, Federation of Southern Cooperatives/Land Assistance Fund

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question. How can Congress reduce barriers for underrepresented farmers—for young, BIPOC, minorities farmers. I'm from the state of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, and some really creative things going on in the state that have not been accounted for in this industry. How can Congress help these unique, nontraditional operations?

Answer. Black and other historically discriminated against and institutionally underrepresented producers (“HDAIU”), young producers, and diversified production operations have been consistently excluded from Federal farm policies which only further perpetuate the barriers these producers encounter in securing access to credit and markets and achieving competitive scale. To create policies that more adequately meet the needs of Black and HDAIU producers, Congress must continuously seek to better understand the challenges they face while simultaneously employing methods that improve the viability of their operations. With the increasing average age of producers, growing concerns about the climate, and increasing costs of growing and buying food, Black and HDAIU producers will continue to be critical first responders to the demands of their communities and the environment.

To eliminate barriers experienced by Black and other HDAIU producers, Congress should improve the recognition of cooperatives in strengthening these operations’ competitive market access, support the development of financial institutions owned and controlled by these groups, invest in HDAIU producer-centered research, and support the training and employment of a new generation of HDAIU technical assistance providers.

Cooperative Recognition

Cooperatives continue to be a critical business model for Black and other HDAIU producers because they are uniquely designed to address numerous challenges these groups face in terms of size, infrastructure, and access to production resources. Unfortunately, many USDA agencies still do not fully appreciate the role of cooperatives in agribusiness success for Black and HDAIU producers. Congress should improve the recognition of cooperative farm, fish, and forest businesses in all government programs to help Black and other HDAIU producers democratically own and control infrastructure, secure inputs, and access markets necessary for competitiveness in their respective industries.

Similarly, institutionalizing and investing in Black and other HDAIU producers’ cooperatively owned financial institutions, comparable to the Farm Credit system, would dramatically increase credit access for these groups and drive competition in the agricultural lending industry which has historically proven ineffective at meeting the needs of Black and other HDAIU producers. Black and other HDAIU producers need control over the lending practices reflecting their unique histories, business needs, and diversified operations to increase the overall credit access and best lending practices to these groups.

HDAIU Producer-Centered Research

Black and other HDAIU producers have been the subjects of many research projects; however, these producers have not always been involved in the design of these research projects or the implementation of the recommendations emerging from this research. This is, in part, why the Socially Disadvantaged [Farmer] & Rancher Policy Center (“Policy Center”) was established at Alcorn State University. The Policy Center has prioritized critical research needed to support HDAIU groups’ access to credit—the bedrock of strong businesses. Congress should continue to support the Policy Center in these efforts by supporting funding for HDAIU producer-centered research. Further, Congress should strengthen its support for the implementation and institutionalization of the resulting research recommendations by supporting HBCUs, 1890 Land-Grant Universities and Community-Based Organizations with long-standing relationships with Black and other HDAIU producers to continuously improve outreach and education on best agricultural practices to help these producers make effective business decisions.

Increasing Black and HDAIU Technical Service Providers

A byproduct of investing in HBCUs, 1890 Land-Grant Universities and Community-Based Organizations to conduct research on the needs and successes of these Black and HDAIU producers will be the increase of well-trained, technical service providers that reflect the communities that are being researched and served by this research. Investments in the training of Black and HDAIU technical service providers will also help reverse the trend of out-migration from farming, fishing and forestry communities by creating additional professional pathways to support the overall economic stability and success of Black and HDAIU producers and their communities.

Question Submitted by Hon. Salud O. Carbajal, a Representative in Congress from California

Question 1. Ms. Davy, It sounds like there is a history of some local Farm Service Agency offices abusing their powers.

There is clearly reason for farmers and ranchers, particularly those who are of color, newcomers to the industry, or underserved to distrust these offices.

How can Congress help build credibility and trust in USDA programs designed to benefit Young, Beginning, and Underserved farmer and ranchers?

Answer. Congress can support the credibility and trust in USDA programs designed to benefit Young, Beginning, and Underserved Producers by ensuring adequate resources and requiring processes that highlight accountability, tracking critical data, and supporting partnerships with community-based organizations and HBCU institutions.

Accountability Breeds Trust

Without acknowledging or creating a robust accountability process, distrust towards the Agency will likely persist. Identifying shortcomings in the Agency's Civil Rights Administrative processes, creating meaningful accountability practices, and implementing these accountability mechanisms are a necessary step in restoring public trust in the Agency.

Accountability does not necessarily mean termination or loss of government employment benefits, although that should not be eliminated from available options for illegal behavior; instead, accountability might require institutional changes. For example, if numerous Civil Rights complaints are filed against a particular FSA office or agent, accountability could look like increased Civil Rights oversight from the Federal Agency for a period of 6 months to 1 year. This increased oversight could help the Federal Agency identify ongoing agent/leader development training needs and implementing a meaningful action plan for improving an office or agent's practices.

Comprehensive Data on Farm Service Agency Practices is Critical

Better tracking of local FSA agent practices is critical for improving the access Young, Beginning and Underserved Producers have to USDA programs and loans. While FSA offices are required to provide every producer a receipt for service for any encounter with the office, this system has not rooted out problematic behaviors that continue to be reported against local FSA offices and agents.

One solution is to develop "Customer Satisfaction Surveys" to accompany each encounter between a producer and their local FSA office. These Customer Satisfaction Surveys should capture, at minimum, the date, time, and location of the encounter; name, race, and gender identity of the FSA agent; name, race and gender identity of the prospective applicant; the loan/program the prospective applicant was seeking; the forms or documents they received; a rating the quality of assistance the prospective borrower received; any decision that was made by FSA on the application; if the producer withdrew their application, an explanation for their withdrawal; the length of time from initial encounter with FSA to receipt of loan/program approval/denial decision; and the length of time from loan/program approval to receipt of the funds/program benefits. These criteria would help identify the FSA Agents and offices that are employing the best practices in serving Black and other HDAIU producers and those that are not. This data will help identify trends in racial inequities and critical interventions at the local level that can improve services to Black and HDAIU producers and their communities.

CBO/HBCU Partnerships

USDA has announced several recent partnerships and cooperative agreements with community-based organizations, HBCUs and other institutions who have long-standing relationships with Black and HDAIU producers. Leveraging the existing relationships between community-based organizations and HBCUs can help the Agency identify best practices for fostering favorable relationships with Black and

HDAIU communities, identify shortcomings in Agency policies, and begin to support improved services being delivered to these groups.

Question 2. Would more educational opportunities and resources on applying for loans through the Farm Service Agency be welcome? If so, would this be better received by USDA or nonprofits who work on these issues?

Answer. Improved and Additional Educational Resources on Applying for Farm Service Agency Loans Appear Warranted

Additional and improved educational opportunities and resources on applying for Farm Service Agency loans will always be welcome especially to the new and beginning farmers, ranchers, forest, and heirs' property landowners may not have had any interactions with Farm Service Agency ("FSA"). However, it should be noted that many producers, Black and other historically discriminated against, institutionally underrepresented producers ("HDAIU") continue to report discrimination in the current FSA loan application processes. These reported experiences of discrimination persist despite the reporting Black and HDAIU producers participating in relevant workshops, trainings and technical assistance programs on FSA loan applications. Thus, despite increased education on the FSA loan application process, the reports of perceived and actual discrimination persistently plague the reputation of the FSA loan application and servicing that occurs at local offices.

Community-based Organizations, HBCUs and Cooperative Extension Programs Appear Best Positioned to Design and Deliver Educational Programs on Applying for Farm Service Agency Loans

The community-based organizations, HBCUs, and cooperative extension programs that have the longest standing relationships with Black and HDAIU communities have consistently shown an ability to overcome many of these concerns by providing Black and HDAIU farmers, ranchers, forest, and heirs property landowners the necessary technical assistance to submit successful farm loan applications. Partnerships and cooperative agreements between the Agency and these institutions can leverage the strong relationships these institutions have developed with these communities that may serve to overcome unpopular reputation the Agency has in many Black and HDAIU communities.

Response from Julia Asherman, Owner, Rag & Frass Farms, LLC; on behalf of National Young Farmers Coalition

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question. How can Congress reduce barriers for underrepresented farmers—for young, BIPOC, minorities farmers. I'm from the state of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, and some really creative things going on in the state that have not been accounted for in this industry. How can Congress help these unique, nontraditional operations?

Answer. Thank you for the question, Representative Hayes. As you point out, what a farm might look like can vary tremendously. Building and changing food systems that reflect the needs of young farmers is going to require many different policy changes as many different levels of government. The more policy can be written to be flexible and inclusive, and put itself in the shoes of farmers, the better.

Though the challenges facing young farmers are significant, many like me feel incredibly rewarded and fulfilled in growing food for our communities and stewarding natural resources. I'm a member of the National Young Farmers Coalition (Young Farmers). Through their latest National Young Farmer Survey report, *Building a Future with Farmers 2022*,^{1*} they found that by and far, the majority of young farmers named that one of their farm's primary purposes for existing is stewarding and regenerating natural resources. In the report, Young Farmers names many policy proposals that center BIPOC farmers and would help uplift the next generation of producers as a whole. These policies are where you should look to for guidance.

Reducing barriers for farmers like me could look like many things:

- Free farming education and more targeted and applicable technical support (including business, financial, and legal support for farmers).
- Investing in the tools and technology we will need in the future, including smaller and more sustainable mechanization (for example more sustainable tillage equipment found commonly in Europe and the amazing specialized tools found in Japan—nearly impossible to find in the USA).

¹<https://www.youngfarmers.org/22survey/>.

* **Editor's note:** the report is retained in Committee file.

- Safety net programs especially tailored for us, not excluding us.
- Helping our farms be more efficient.
- Helping us upgrade more food-safe infrastructure.
- Supporting markets of all sizes.
- Rewarding us for good stewardship of our land or combating climate change.
- Creating protections for farms when we can't find or afford the labor it takes to farm, similar to how there are crop subsidies to protect farms from failing when the price is low.
- Investing in research, farmer round tables and think-tanks specifically to assess what farmers that are left out need.
- Investing in programs that help make land affordable, and that incentivize keeping farmland for farming.

It is also worth considering what 'success' in farming might look like. More and more I see farmers (especially full-time farmers without off-farm income) define this in the most basic terms: a good life with basic needs met (education, healthcare, family time, mental well-being, ability to 'weather the storm', *etc.*). This tells me that farmers face much deeper needs than just growing and selling; it is a question of weighing the personal sacrifice. Since it takes decades to build a farm and nearly the same to learn the skills, it is a pretty huge commitment to even get decent at farming. Reducing barriers could simply mean using policy to create a culture where farmers are valued, celebrated, resourced, supported, and aren't being forced to choose between farming and our basic quality of life. It is very telling that a huge majority of American farmers rely on off-farm income or a spouse's health benefits to get by. What if policy helped create a safety net for *the farmers* themselves, not just for the crop or the price?

I am not a BIPOC farmer, so I don't speak as a person of color, but my personal belief is that institutional racism (specifically the history of slavery and colonialism) is so completely linked to land and agriculture in this country that I do not see that any single policy will fix such deep and longstanding institutional inequity. I fully support programs that aim to specifically support BIPOC farmers, and alongside these policies at some point there needs to be larger accountability for hundreds of years of oppression and disenfranchisement in pursuit of the nation we have today.

Wealth (especially land) is often inherited and passed generation to the next, and there has been an obvious ripple effect of inequity through the generations of black and indigenous people reaching back to before the founding of the country. To repair this legacy within agriculture, the policy must also reach deep into the nooks and crannies of all the issues that touch farming and land ownership: land access, property ownership, rural access, credit, food insecurity, health, education, wealth distribution, incarceration, and violence. Perhaps this is naive, but I would like to see reparations, or what I would consider basic 'Federal accountability,' as a bipartisan American concept.

There are two specific areas where I would like to provide more detail in my recommendations for how the government could help small-scale, diversified farmers like me—designing FSA programs with us in mind; and improving relationships between farmers and their FSA offices.

Design FSA programs with small, complex farms in mind

A 'small' farm may gross \$75,000+/acre on less than 10 acres and employ a bunch of local people, or a 'large' farm could gross <\$2,000/acre on 500 acres, and employ no one (other than the farmer). Both could be profitable, or neither could be. One may be 'small' and the other 'large' but they can both have a significant impact on the local economy or supply chain. They are both critical and deserving of support. Size alone does not describe what is at stake.

Often the smallest farms can be the most complex on paper, growing many different crops in a small area. Small can mean double and triple cropping systems, season extension, and complex rotations. This can make the farm plan especially tricky to translate to FSA program rules and software.

One way that the government could help smaller farmers access programs, and help loan officer's ability to assist and deliver in a timely way, is to **find a way to make the 'translation' into FSA application software more applicable for small scale farms** (by being able to group crops, adjust units from acres to row feet or square feet, *etc.*).

Improve relationships between farmers and their FSA offices

The relationship between a farmer and their local USDA office is extremely important to navigating programs, or even knowing about them. Yet, large-scale farm-

ers and farming models, primarily operated by white farmers, have been more heavily supported by USDA than others. This can help shed light on why young, BIPOC, and small-scale farmers are systematically left out, and more in need of support than ever.

Farmers who are relying on crop insurance and subsidies are navigating those processes through close contact and reporting to local branch officers. Most smaller and diversified farmers, however, have zero crop insurance and get no subsidies or ‘deficiency payments’ if the market fluctuates or yield is low (I am only this week learning I could be eligible for NAP insurance, and overall I consider myself fairly up to speed on USDA programs). These farmers who are outside the crop insurance/subsidy system are not reporting to FSA/USDA, and are not necessarily on the radar of a local USDA office, let alone forming a relationship with them. USDA, without having reason to interface, track, and understand these operations, can become very unaware of the extent to which these farms exist and have unmet needs.

This not only means those farmers are operating with unmitigated risk, but any current or future program in which eligibility relies on producing commodity crops or showing crop insurance damages (most natural disaster relief, first round of pandemic relief) often excludes smaller, diversified, niche, and direct market producers outright, even if we are suffering losses too.

Conclusion

To answer your question fundamentally, Representative Hayes, all farmers (but especially underrepresented farmers) need *you*, our government, to invest in us and our success. As you named, young farmers are out here innovating around, over, and under the challenges in front of them. It is critical that this next farm bill makes a historic investment in land access, market access, and access to credit. USDA recently announced \$300 million in funding, with a broad eligibility framework, to support projects that will improve access to land, credit, and markets. We need more of this type of creative and flexible investment, to resource the people on the ground doing the hard work of trying to solve these challenges with the limited resources we have at hand. We need a farm bill that clearly sees and addresses these issues—most importantly land access.

Question Submitted by Hon. Salud O. Carbajal, a Representative in Congress from California

Question. Ms. Asherman, It was great to hear your story. I admire your determination in continuing to work towards building up your own farm despite obstacles and setbacks.

What you said about student loans really stuck out to me. Beginning farmers are not alone in the burden of student debt but we should not allow this burden to restrict opportunities for farmers.

Would some sort of program similar to Public Service Loan Forgiveness that forgives the student debt of farmers be beneficial to attracting more young people to this profession?

Answer. Thank you for the question, Representative Carbajal, and for further consideration of this issue. I couldn’t agree more with you, with one exception—I believe we are very much contributing to the nation’s food supply. One of the effects of this pandemic is that the fragilities in our food and farming systems have been laid bare, exposing the critical need for more local and regional food sheds that are thriving and contributing to the health of served communities.

But yes, to your specific question, a program of Federal debt forgiveness for farmers would be extremely beneficial, both for existing farmers who are struggling with student debt, and for future farmers who would see student debt as a barrier and not pursue agriculture as a result. There is a powerful incentive in debt forgiveness, this could certainly help illuminate the path towards farming for some, while signaling an increasing acknowledgement of farmers that is powerful.

I believe that farming is a public service, as we are contributing to the public good by providing healthy, fresh, high-quality food and stewarding natural resources. I know that there are efforts to add farmers to PSLF, as well as to address the functional problems with this program. I support these legislative efforts. At the same time, I believe that we should do much more, and eliminate Federal and commercial student debt for all current borrowers.

We also need more ways for young farmers to develop their knowledge and skills. We need more creative agricultural workforce development support from USDA, DOL, and from the states. Above all, I would recommend that any such program for farmers be re-imagined to be more tailored to farmers’ needs and circumstances.

For example, farmers are generally not government workers or employees of a nonprofit. We are often self-employed or in partnerships, and are often working reg-

ular ‘for profit’ businesses. Some farmers work on ‘family farms’ but are not always W2 employees. Farmers are notoriously independent and will likely want to maintain this freedom to work for oneself, so a policy to include farmers in Federal student debt forgiveness will need to accommodate this to be successful.

In farming terms, 10 years to wait for debt forgiveness is an extremely long time. Many new farmers would have a difficult time starting farms let alone getting them to 10 years while making school debt payments. Those first few years of farming are when money is the tightest, capitalization is most intense, and the operation is extremely fragile. A 10 year waiting period would seem to defeat the purpose of supporting new and beginning farmers.

I have heard that there are programs to relieve rural veterinarians of school debt, to encourage more people in this industry to practice in rural communities. I imagine this same concept could be extended to doctors and farmers both to aid in rural development and quality of life, and to incentivize people to choose to work where work needs to be done. Debt forgiveness programs for farmers can have the double benefit of alleviating a common barrier to entry (and success) and encouraging people to consider the career path over others.

Response from Hon. Adam Brown, Owner, B&B Farms; on behalf of Illinois Farm Bureau

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question. How can Congress reduce barriers for underrepresented farmers—for young, BIPOC, minorities farmers. I’m from the state of Connecticut. Not all of our farms are on large land. We have fish farmers, we have small urban farmers, and some really creative things going on in the state that have not been accounted for in this industry. How can Congress help these unique, nontraditional operations?

Answer. August 31, 2022

Honorable Congresswoman Hayes,

I truly appreciate your interest pertaining to the barriers to entry for young, beginning, and small (YBS) farmers. Please find attached the complete set of recommendations from the USDA’s Advisory Committee on Beginning Farmers and Ranchers (ACBFR) to Secretary Vilsack. I’ve enjoyed the pleasure of serving on this committee over the past few years and had the privilege to chair the Transition Working Group in crafting these suggestions. Particularly applicable to your question may be the section addressing the definition of a YBS being revised (Page 1) and the designation of the State Beginning Farmer and Rancher Coordinator as a full-time employee (Page 2). After building out these two administrative foundations at USDA, the remainder of the ACBFR’s recommendations can be pursued. Some of these can be addressed administratively at the USDA, but others will entail Congressional action. Please know that I would be thrilled to continue to walk with you as we pave a more sustainable path for all YBS farmers. Feel free to contact me for any clarification or assistance. Thank you again for helping tomorrow’s ag producers.

All my best,

ADAM.

ATTACHMENT

Goal 1. Increase USDA’s Ability to Effectively Service and Support the Beginning Farmers and Ranchers.

1. Recommendations

Designate Beginning Farmers and Ranchers as a top USDA priority. As the critically important next generation of agriculture, Beginning Farmers and Ranchers (BFR) face unprecedented challenges and unparalleled opportunities. It is imperative that BFRs have a strong network of resources and support available to them to ensure their success. USDA should establish clear Department-wide priorities, divert resources, and establish specific initiatives to guarantee the success of the next generation of farmers. We urge the USDA to designate BFRs as a national priority across the Department and deliver a clear message not only to the next generation of farmers and ranchers, but also USDA staff, policymakers and stakeholders that supporting BFRs is a central part of their work. Identifying an action plan and establishing clear metrics for monitoring to ensure BFRs are fully accessing USDA programs is critical. It is also equally important to embed this work within the USDA’s priorities focusing on advancing racial equity and addressing climate

change, and we urge the Department to explicitly include BFRs in these other key priorities and corresponding initiatives.

Develop a standard definition for a beginning farmer and rancher (BFR) that can be applied consistently across USDA programs and agencies. As members of the Advisory Committee on Beginning Farmers and Ranchers (ACBFR), we come from a wide variety of background and experiences. We sincerely appreciate the Departments commitment to helping new and beginning farmers and ranchers.

We recognize and have heard testimony from the various USDA agencies regarding the many different programs and opportunities available to assist BFRs. However, one of the concerns that we have heard is that new and beginning farmers and ranchers are not aware of these programs and opportunities and that there are some inconsistencies from field office to field office, state to state, or agency to agency. It is partially because of these concerns that we are proposing the U.S. Department of Agriculture adopt a universal definition that can be applied unilaterally across agencies, states, and field offices. Ideally the definition is clear and concise enough to prevent varying interpretations and simple enough to allow an individual or entity to self-certify.

Our intent is not to eliminate individuals from qualifying for USDA programs, grants, or other opportunities, but rather to give them an equal benchmark for competition. With that in mind the ACBFR has proposed the following definition for a New and Beginning Farmer and Rancher.

Recommended Beginning Farmers and Ranchers definition: A beginning farmer or rancher is an individual who is actively engaged in management of a farm or ranch for not more than a cumulative of 10 years since their 18th birthday.

The term “actively engaged” was discussed at length in our committee due to its significant impact on limiting potential new and beginning farmers and ranchers from being eligible for USDA eligibility. For the purpose of this definition, we will defer to the current definition as defined by Congress in the 2014 Farm Bill (*Federal Register* 7 CFR Part 1400 RIN 0560–AI31, <https://www.federalregister.gov/documents/2015/12/16/2015-31532/payment-limitation-and-payment-eligibility-actively-engaged-in-farming>).

While our hope is that the above definition helps to clarify what a BFR is, we also acknowledge that a new era of agriculture is emerging in the United States and that a one size fits all option may not fit our beginning farmer and ranchers. The ACBFR has discussed a variety of subcategories and would encourage the Department to develop funding opportunities, programs, and grants to target the

Designate the State Beginning Farmer and Rancher Coordinators as full-time positions, provide additional resources to ensure success, and establish accountability mechanisms. Section 12304 of the 2018 Farm Bill establishes BFR Coordinators both at the national and state level to provide outreach and technical assistance to assist BFRs to participate in USDA programs. These positions carry a significant burden in helping USDA to improve outreach and targeted assistance to BFRs. Given the broad scope of these positions as directed in the farm bill: coordinating technical assistance; developing a State Plan to improve coordination, delivery, and efficacy of USDA programs; overseeing implementation of the State Plan; working with USDA outreach coordinators to coordinate outreach efforts to BFRs throughout the state; and coordinating partnerships and joint outreach efforts with other organizations serving BFRs; it would be difficult to effectively serve the needs of BFRs by staff designated as collateral duty.

Additionally, developing a directive on Beginning Farmers and Ranchers would guide agencies toward action. The directive should establish coordinated policy for BFR outreach initiatives. If applicable, require agencies to formalize a working group representative and through the working group each agency would identify key program performance indicators to be included in a USDA annual plan.

We also recommend that both the National and State Coordinators are provided sufficient resources to be successful and the full engagement of USDA Leadership to reinforce the importance of the work of these coordinators. Coordinators should establish and monitor performance metrics in their states, and clear action plans for improving BFR participation for under-performing states.

Continued education and mentoring for Beginning Farmers and Ranchers. Currently the Beginning Farmer and Rancher Development Program has provided grants to organizations for education and mentoring of BFR's. We recommend a look at the programs and how they are being utilized to see where continued improvements can be made. We recommend a renewed focus of education and mentoring for BFR's in their third plus year of farming or ranching. Once BFR's overcome the challenges of startup they face the next phase of business growth and sustainability. Continued business education, resources and mentorship is critical in

the development of building businesses that can be adaptable to withstand the volatility and unpredictability of agricultural markets.

Continue to Utilize Virtual Tools to Better Serve Beginning Farmers and Ranchers. Over the past year, our entire country has faced the challenges of doing business in the face of the ongoing COVID-19 pandemic. USDA has been successful in adapting technology to better serve farmers and ranchers in the era of social distancing by allowing employees to be available virtually, to offer document signing virtually and to communicate program availability across different platforms. Throughout the pandemic, USDA program sign ups were easily accessible and the use of virtual tools simplified the application process.

We recommend that USDA continue to utilize and further develop virtual tools to help BFRs access information and allow for a more streamlined, timely and flexible application processes. In the past, there has been a stigma that working with USDA is a complicated and lengthy process. By utilizing more virtual tools, beginning farmers and ranchers can have access to the necessary information at their convenience and in a simplified format.

Additionally, some farmers and ranchers continue to feel underserved and uncomfortable working with specific offices or specific USDA staff, usually after a negative interaction, or worse, explicit, or overt discriminatory treatment. By allowing virtual tools, including the ability of farmers to work with USDA staff beyond just their designated county office, farmers and ranchers would have access to necessary information and it may allow opportunity for a more comfortable working relationship. To increase the use of technology effectively and efficiently, we recommend continued investment for technology improvements on local levels to ensure employees have access to the needed technology in the field (laptops, cell-phones, secure broadband, *etc.*).

Continuous Stakeholder Input. We also recommend that USDA continue the use of virtual listening sessions to reach as many BFR as possible and to ensure a robust and regular opportunity for stakeholder input and feedback into USDA programs and policies. We recommend that each State Beginning Farmer Coordinator convene regular listening sessions with farmers in their states or regions and that each Coordinator establish a state Beginning Farmer Working Group or Advisory Committee, comprised of BFRs, to ensure BFR concerns are embedded into state plans and USDA activities at the local level.

Increase Data Collection and Performance Metrics to Monitor Beginning Farmer and Rancher Participation. We would like to recommend that there be a renewed focus on data analytics and metrics regarding the impact of BFRs on U.S. Agriculture and how to better serve BFRs. There is much diversity in scale of business, commodities, race and socioeconomic status of BFRs. We recommend a continued focus on collecting data to better analyze the effectiveness of programs, the implementation of new programs, how to better serve the underserved and how to improve program reach. We recommend more data reports focused on BFRs that can be shared with stakeholders.

Develop a Comprehensive Digital Strategy for Connecting with Beginning Farmers and Ranchers. Currently the website *www.farmers.gov* and *www.newfarmers.usda.gov* are being utilized with a focus being streamlined towards *www.farmers.gov*. We recommend a focus on website analytics and a long-term digital strategy that includes an action plan to collaborate with other organizations to link websites and social media to better reach BFRs on different platforms.

Goal 2. Reduce Beginning Farmer and Rancher Capital Related Obstacles

2. Recommendations

Improve the Beginning Farmer and Rancher customer experience as follows:

- Create or purchase both an app and online platform to provide the following to applicants and guaranteed lenders:
 - A full description of each program offered to BFRs inclusive of a detailed description of all items needed to constitute a complete application for each loan, grant, or cost-share type.
 - Allow applicants to submit all required data through the applicable app or platform while also showing any remaining items needed to allow the application to be complete. If there are timetables required for submission based upon the applicant type (direct borrower, standard eligible lender, preferred lender, *etc.*), please have those timetables displayed within the portal for the customer.

- Ensure the applicant (whether direct borrower or guaranteed lender) is contacted in no more than four (4) business days from the submission of the initial request to ensure all parties are aware of what is needed to satisfy all remaining needed items.
- Establish an estimated timeline to closing that could be communicated to the borrower or guaranteed lender once all required documents are provided. Going forward, monitor and periodically update these estimated timelines based upon all data obtained from actual loan closings.
- Allow all documents to be electronically signed via Docu-Sign or other similar software.
- Enable future required financial information to be entered into a portal in the Moody's system utilized by the Farm Service Agency (FSA) to then be uploaded by the applicable FSA employee.
- Enable tax returns and other similar documents to be scanned and uploaded to the FSA portal within the Moody's system.
- It is acknowledged the implementation of the above items would require dedicated funds. It is respectfully requested Congress be asked to allocate the needed monies to enable the improved BFR experience.
- Implement "Customer Experience Group" initiatives with farm loan employees nationwide to ensure equitable and quality service and product knowledge are provided to BFRs.

Encourage a cultural change to minimize the inconsistency of program understanding levels within the various FSA offices. Encourage the utilization of "expert" knowledge as a reference for specific crops to allow specialized FSA employees to cover larger areas in instances where the local knowledge may be limited for that commodity. Promoting collaboration with extension offices and similar local expertise can most effectively serve the customer. Additionally, timelines from loan application to closing should be used as a metric to determine where greater knowledge or efficiency may exist for the purpose of improving training.

Establish procedures to ensure all personnel are trained in both current and emerging agricultural loan programs, both direct and guaranteed, specifically designed to serve all potential BFR applicants. Capture and analyze demographic information from each applicant willing to provide information to better understand future training opportunities.

Utilize the implementation of Recommendation 1, Recommendation 2 and Recommendation 3 only for the Beginning Farmer and Rancher programs initially to learn where the strengths and weaknesses may lie. This should allow for a more structured future roll-out for all FSA loan programs. This could also then be utilized for any non-FSA related programs benefitting the BFR group.

Create a program whereby the student loan debt for farmers could be forgiven or restructured. Participants in the BFR program for a minimum of five (5) consecutive years could be forgiven or restructured at a 1% interest rate with any restructured debt having a 100% government guarantee.

Goal 3. Better Facilitate the Transfer of U.S. Ag Land and Operations to BFRs

3. Recommendations

Increase knowledge, capacity, and capability of FSA staff to administer all available programs consistently throughout the country. FSA provides a plethora of valuable program offerings and loan products to BFRs across the country. However, access to these programs is not always consistent between regional offices and states. For example, the Land Contract Guarantee Program is inaccessible in California and used in other states. USDA needs to ensure that field staff are aware of and trained in administration of programmatic offerings, including BFR loans which have been made accessible universally across all states and regions.

Allow USDA contract transferability to farms that are changing structure or ownership, in which a BFR is party. As NRCS and FSA provide valuable conservation programs through EQIP, CSP, and CRP, these environmental contracts should be allowed to roll into new BFR ownership when the entirety of the controlled land is transferred, for instance, when the ownership goes through a structural change (*i.e.*, Partnership of a father and son to Sole Proprietorship of the son) or the farm's ownership is bought (*i.e.*, a new FEIN number as a father's business is sold to his daughter). While the new BFR owner would have to opt-in to the contract, two major advantages are present: the land would remain enrolled in a USDA

conservation program that is benefitting the public good, and the new owner would not have to standby for the next application period.

Distribute grants to qualified nonprofits to be used for succession planning services and educational programs. As the average age of the American farmer/rancher steadily increases, we note the importance of assisting BFRs as they delve into production agriculture. We further acknowledge that capable, qualified entities exist and are ready to support BFRs. Therefore, we recommend that the USDA award succession planning grants to these third-party entities, which can consult on farmland and operation transfers.

Goal 4. Facilitate the Access of Land by Beginning Farmers and Ranchers

4. Recommendations

Retain stepped-up basis clause for intergenerational land transfers. Maintain the Federal capital gains tax rate at 20% or whatever level is broadly applicable across the country for a given intergenerational land transfer. Capital gains taxes are based on the change in the value of an asset, such as farmland, livestock, or timber, when that asset is sold compared to the value when the asset was acquired by the current owner. Retain the step-up in basis for capital gains tax at death and carryover of basis for intergenerational transfers of productive agricultural land. To reduce the capital gains tax expense, farmers and ranchers use stepped-up basis, which provides a reset for the basis during intergenerational transfers. In effect, upon the transfer of assets following a death, the basis is reset to the market value at the date of death. Following the adjustment, taxes can be levied only on gains realized by the individual during his or her ownership, not on gains realized prior to the step-up in basis. Given that the asset values in agriculture have appreciated significantly in recent years, when farmland is inherited, without a step-up in basis, BFRs would face significant capital gains taxes which could undermine the financial viability of the BFR inheriting the farmland.

Any change in capital gains tax policy that eliminates, or scales back stepped-up basis could result in a massive tax burden on the agricultural sector. Any such changes should be carefully evaluated in terms of its impact on BFRs and accommodations made to reduce the impact of such changes on BFRs.

Create a mechanism to help BFRs compete with reopened Conservation Reserve Program enrollment with higher rental payments. The recent reopened 2021 CRP enrollment with modified higher payments will make it difficult for BFR to compete with the government for land access. An alternative approach would be to use Working Lands Conservation Programs with BFR incentives for conservation practices to accomplish conservation goals on BFR ground. Another approach could be to provide reduced interest rates for loans under BFR loan program for implementing conservation practices.

Incentivize Land Access

- Forgive or drastically reduce the capital gains tax if an experienced farmer agrees to sell farmland to a BFR at a discounted market value that would be equal to the capital gains due.
 - The goal would be to lower the cost of land for the BFR by offering the experienced farmer seller a break on the capital gains he would normally be required to pay.
 - The incentive would be that an experienced farmer would not pay capital gains if they sold to a BFR. Typically, experienced farmers work for decades to get to the point where they can finally afford to sell or find it advantageous to sell, only to see the government take a portion of the land appreciation to a point it is not advantageous, ends up being too costly to sell, or is too costly for BFR to purchase.
 - Additional benefit via tax credit or other financial incentives to landowners who seek socially disadvantaged farmers and farmers who belong to communities of color, such as Black and African American, Hispanic and Latino, Native American, Alaska Native and Indigenous, Asian American, Native Hawaiian and Pacific Islander, Middle Eastern, and North African persons as a successor for purchasing the farm.*
- Incentive to landowner to lease to BFR with additional incentives to socially disadvantaged farmers and farmers who belong to communities of color.*
 - Lease terms would require a minimum 5 year commitment.*

*Note—Eligibility for these recommendations would require BFRs and landowners to be considered “actively engaged farmers” under the 2018 Farm Bill definition.

- Potential for subsidized lease executed via landowner who **would see** subsidy to minimize risk associated with leasing to BFR.*
- Create an incentive in the IRS Section 1031 Like-Kind Exchange code for an experienced farmer who sells a farm to a BFR then re-invests the proceeds of a sale into a similar-nature property to receive deferred capital gains tax.
 - The seller would be granted 2 years, as opposed to 180 days in regular sales, to find the next property for which the Like-Kind Exchange would be used.
 - This could potentially be budget neutral, depending on the increase in market prices and the loss of the use of the money during the 2 years, given the capital gains would be deferred into the second property but would eventually be paid upon the sale of the second property.
- Utilize and promote current incentives to broaden land access to BFRs from underrepresented communities to build greater diversity in the BFR population.
- Interest rate subsidy for seller financing who sell to BFR with additional incentives available to landowners who sell to a socially disadvantaged farmer or farmer who belongs to a community of color, as a buyer.*
- Land Contract Program is not administered in California.*
- More dedicated funding for nonprofit land-link/farm-link state organizations, similar to state block grant implementation, that are building these connections and incentivizing finance structures that enhance land access. Money dedicated to operation expenses and technical assistance providers.*
- Enhance the role of farmer cooperatives for incentive-based land access models, particularly when it comes to farmer cooperatives' ability to access land programs and eligibility for qualifying programs.*

A 2022 REVIEW OF THE FARM BILL
(STAKEHOLDER PERSPECTIVES ON TITLE XI CROP
INSURANCE)

WEDNESDAY, JULY 20, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON GENERAL FARM COMMODITIES AND RISK
MANAGEMENT,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 9:31 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Cheri Bustos [Chair of the Subcommittee] presiding.

Members present: Representatives Bustos, Craig, Carbajal, O'Halleran, Lawson, Austin Scott of Georgia, Allen, Rouzer, Mann, Miller, Thompson (*ex officio*), and Baird.

Staff present: Lyron Blum-Evitts, Carlton Bridgeforth, Kelcy Schanuman, Joshua Tonsager, Patricia Straughn, Trevor White, Erin Wilson, Samuel Rogers, and Dana Sandman.

**OPENING STATEMENT OF HON. CHERI BUSTOS, A
REPRESENTATIVE IN CONGRESS FROM ILLINOIS**

The CHAIR. This hearing of the Subcommittee on General Farm Commodities and Risk Management entitled, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on Title XI Crop Insurance*, will come to order.

Welcome, and thank you for joining today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today. We also will have a virtual component just so our witnesses know that.

I want to thank all of you for joining us this morning. As co-chair of the Congressional Crop Insurance Caucus, I am excited to hold this hearing, which continues the Committee's work to gather input on how programs in the 2018 Farm Bill have been functioning.

A month ago, we held a hearing with a panel of ag economists on farm programs and crop insurance. And at the time, many farmers in the Upper Great Plains were still trying to finish planting, given the extremely wet conditions. And farmers in the Southern Plains have mostly wrapped up winter wheat harvest, which is in full force in the Central and Upper Plains today. We continue to

hear from producers about the impacts of high input costs and commodity price volatility in recent weeks.

In addition to the hearings and meetings here in Washington, we have also been holding farm bill listening sessions out in the field, including ones hosted by Representative Tom O'Halleran in Arizona—Ranking Member Scott and I went out for that—and also by Congressman Jim Costa in California. And there are upcoming field listening sessions; one hosted by Congresswoman Kim Schrier in the State of Washington. She has one on Friday. And then we have one in Minnesota next Monday hosted by Congresswoman Angie Craig.

The economic and growing conditions that farmers are experiencing are ever-changing, and they vary across the country. And that is why these sorts of hearings and other meetings are important to the work we are doing to understand what is happening on the ground for producers. Our attention today is specifically on the Federal Crop Insurance Program. This hearing will gather input on how risk management provisions in the 2018 Farm Bill have been implemented and how crop insurance programs have functioned for producers.

Throughout the last two farm bill reauthorization processes, the message I heard loud and clear was, “Do no harm to crop insurance.” The program has been and continues to be central to risk management for producers across the country, and it has continued to grow and evolve to address the challenges and risks our producers are facing.

We have a well-rounded panel that will include testimony from an approved insurance provider, a crop insurance agent, a developer of new products, and two producers with experience with the program. I want to thank all of our witnesses here today, both in person and virtually, for the testimony you will be providing.

[The prepared statement of Mrs. Bustos follows:]

PREPARED STATEMENT OF HON. CHERI BUSTOS, A REPRESENTATIVE IN CONGRESS
FROM ILLINOIS

Thank you to our witnesses and my colleagues for joining us this morning.

As a co-chair of the Congressional Crop Insurance Caucus, I am excited to hold this hearing, which continues the Committee's work to gather input on how programs in the 2018 Farm Bill have been functioning.

A month ago, we held a hearing with a panel of ag economists on farm programs and crop insurance, and at the time many farmers in the Upper Great Plains were still trying to finish planting given the extremely wet conditions.

And farmers in the Southern Plains have mostly wrapped up winter wheat harvest, which is in full force in the Central and Upper Plains today.

We continue to hear from producers about the impacts of high input costs and commodity price volatility in recent weeks.

In addition to hearings and meetings here in D.C., we have also been holding farm bill listening sessions out in the field, including ones hosted by Representative Tom O'Halleran in Arizona and by Congressman Jim Costa in California. And there are upcoming field listening sessions hosted by Congresswoman Kim Schrier in Washington on Friday and one in Minnesota next Monday hosted by Congresswoman Angie Craig.

The economic and growing conditions farmers are experiencing are ever-changing and they vary across the country, and that is why these sorts of hearings and other meetings are important to the work we are doing to understand what's happening on the ground for producers.

Our attention today is specifically on the Federal Crop Insurance Program. This hearing will gather input on how risk management provisions in the 2018 Farm Bill

have been implemented and on how the crop insurance program has functioned for producers.

Throughout the last two farm bill reauthorization processes, the message I heard loud and clear was to do no harm to crop insurance. The program has been and continues to be a central risk management tool for producers across the country, and it has continued to grow and evolve to address the challenges and risks our producers are facing.

We have a well-rounded panel that will include testimony from an Approved Insurance Provider, a crop insurance agent, a developer of new products, and two farmers with experience with the program.

Thank you to each of our witnesses for the testimony you will be providing today.

The CHAIR. I would now like to welcome the distinguished Ranking Member, the gentleman from Georgia, Mr. Austin Scott, for any opening remarks he would like to give.

**OPENING STATEMENT OF HON. AUSTIN SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

Mr. AUSTIN SCOTT of Georgia. Thank you, Chair Bustos, for convening this important hearing to discuss the Federal Crop Insurance Program.

Today, crop insurance stands as the cornerstone of the safety net for many of our producers, but the program as we know it did not come about overnight. The various forms of Federal crop insurance date back to the 1930s. It wasn't until 1980 when critical reforms were made to create a public-private partnership that the foundation was laid for the program we have today. By leveraging the private-sector and incentivizing competition among companies, producers now have access to a dynamic system that provides our farmers with the highest level of service. Additional reforms in 1994 and 2000 further accelerated the growth of the program and collectively increased insurance acreage liability and coverage levels to where they are now.

While crop insurance has been remarkably successful, it is not perfect. I hear from producers in the Southeast that higher levels of coverage are often too expensive to justify the cost. And many fruit and vegetable farmers in my area do not have crop insurance policies available to them, leaving them Non-insured Crop Assistance Program, or NAP, as their only risk management option. I believe that in the next farm bill, one of the best investments this Committee can make is further enhancements to the crop insurance system that provide producers affordable options to increase coverage. Multiple policies such as Supplemental Coverage Option, Enhanced Coverage Option, Stacked Income Protection for upland cotton, Hurricane Wind Index, and margin protection are all geared toward helping farmers reduce the incredibly high deductible for insurance.

We need to thoroughly examine these policies and determine if they are doing an adequate job of filling this gap. If not, what tweaks might be needed to provide higher levels of affordable coverage? Since 2017, Congress has provided additional assistance to producers in the form of *ad hoc* disaster aid. This aid has been a critical lifeline for many farmers in my district, particularly after the devastation caused by Hurricane Michael in 2018. However, the inefficiencies in delivery, the delay in funding and payments, and the uncertainty of if or when Congress may act underscores the benefits of the importance of having well-functioning insurance

programs. Crop insurance delivers timely assistance in the wake of a disaster and provides a level of protection that farmers and their lenders can depend on.

It is important to note that approximately 90 percent of the country's food supply comes from 12 percent of our farmers. At a time of instability and economic turmoil throughout the world, it is crucial that this Committee does everything it can to assist farmers and ensure they are around to put food on our tables.

I am looking forward to hearing from our witnesses today. Their insights as part of the delivery system, product development, and use of the programs will provide valuable perspectives of the crop insurance industry. I want to say thank you to them for taking time out of their busy schedules to be with us here today.

And, Madam Chair, I yield back.

The CHAIR. Thank you, Mr. Scott.

The chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony and to ensure that there is ample time for questions.

We are pleased to welcome five witnesses today. Our first witness is Mr. Bob Haney, the Chief Executive of AgriSampo, based in West Des Moines, Iowa, and he is testifying on behalf of the Crop Insurance and Reinsurance Bureau and the American Association of Crop Insurers.

Our second witness today is Ms. Kathy Fowler, the owner of the Fowler Agency in Memphis, Texas, who is testifying on behalf of the Crop Insurers Professionals Association.

Our third witness joining us today is Mr. Alex Offerdahl, the Crop Insurance Division Head of Watts and Associates in Billings, Montana.

And our fourth witness is Mr. Tom Haag, the First Vice President of the National Corn Growers Association and a farmer from Eden Valley, Minnesota.

And to introduce our fifth and final witness, I would like to yield to the distinguished Member from Georgia, Mr. Allen.

Mr. ALLEN. Thank you, Madam Chair. And good morning, everyone. It is my pleasure to introduce my constituent and friend Lee Cromley. Lee is a sixth-generation farmer along with his brother Charlie in Brooklet, Georgia, right outside of Statesboro, Georgia—where they have farmed 2,500 acres of cotton and peanuts since 1983. He graduated from the University of Georgia, Go Dawgs, national champions, with a degree in agricultural and environmental sciences and has served on the Georgia Cotton Commission's Board since 2011. Along with Georgia Cotton Commission, he serves as a board member of Bulloch County Farm Service Agency and the Farmers and Merchants Bank of Statesboro, a committed community servant. Lee is also currently the Chairman of the Southern Cotton Growers and serves on the board of directors for the National Cotton Council of America. He and his wife Ann reside in Brooklet, and have three children. And, Lee, we look forward to your testimony here today. Thank you.

The CHAIR. Thank you, Mr. Allen.

Welcome again to all of our witnesses. We will now proceed with your testimony. You will each have 5 minutes. The timer should be visible to each of you, and it will count down to zero, at which point

your time has expired. If you can please honor that, that would be great.

Mr. Haney, we are going to start with you when you are ready.

STATEMENT OF ROBERT "BOB" HANEY, EXECUTIVE CHAIRMAN, AGRI SOMPO, CHIEF EXECUTIVE OFFICER, AGRI SOMPO NORTH AMERICA, SOMPO INTERNATIONAL HOLDINGS LTD.; MEMBER, BOARD OF DIRECTORS, AMERICAN ASSOCIATION OF CROP INSURERS, WEST DES MOINES, IA; ON BEHALF OF CROP INSURANCE AND REINSURANCE BUREAU, INC.

Mr. HANEY. Thank you, Chair Bustos, Ranking Member Scott, and Members of this Subcommittee. Thank you for allowing me the opportunity to testify today on the importance of crop insurance and the vital role it plays in providing risk management to farmers and ranchers across the country. My name is Bob Haney, and I am currently the Executive Chairman of AgriSompo, one of the 13 approved insurance providers that sells and services crop insurance to farmers and ranchers across the country.

I have been in the business since 1981, and our current company has a national footprint, serving the farmers in every state represented on this Subcommittee today. And we are committed to protecting the livelihood of the American farmers and ranchers so that they may help feed the world.

I believe that crop insurance is the best tool available to farmers to protect against the natural perils that our farmers face because crop insurance provides a rapid response to natural disasters. Private companies like ours typically are able to deliver indemnity payments to farmers in fewer than 30 days after a loss occurs. And the private-sector delivery of crop insurance also means that farmers get to choose the company and the local agent that can provide them and their family with the best service.

Now, crop insurance is also a very big tent. Our industry protects farmers of all types and sizes and covers over 130 different commodities, including the major row crops, specialty crops, organic crops, as well as dairy and livestock.

The cost-share component with the Federal Government helps to keep crop insurance affordable for most farmers, while also ensuring the program is fiscally responsible. Over 40 years ago, a commission of public- and private-sector visionaries conceived the concept of protecting the farmer, wherein the farmer had skin in the game via a deductible and a paid premium discounted by the taxpayer and deploying the private-sector to capitalize on its innovation and competitive nature, all in the name of a secure national food supply. This three-legged-stool concept is the key to the success of the crop insurance program.

Another key feature is that crop insurance is flexible. Farmers can tailor their coverage to fit the needs of their specific operations. And if a farmer or commodity organization doesn't believe there is an existing policy that works for their farm, those farmers can utilize what we call the 508(h) process to develop a product that does.

Now, today, I would like to address three topics as we look ahead to the 2023 Farm Bill. First, I would like to begin, as the Committee continues to evaluate the intersection between agriculture

and climate change, it is important to note that a farmer's first line of defense against climate change is crop insurance. There have been studies conducted that show that farmers who purchase crop insurance are more likely to undertake climate-smart agricultural practices than those who do not.

As this Committee looks ahead to the farm bill, I would like to share the criteria by which we evaluate proposals in this area. First, it is critical that any intersection between climate-smart ag and crop insurance, that it maintain the actuarial soundness of the program. This is the underlying tenet of the program that maintains its integrity. Second, intersections between climate and crop insurance should be incentive-based and not place additional mandates on our farmers and ranchers. And finally, new climate initiatives should be funded on their own terms and not take money away from the core of the crop insurance program.

In terms of meeting these criteria, we believe the 508(h) process is one tool that, when used responsibly, can enhance the intersection between climate and crop insurance. This process involves grower input, can lead to better coverages and possibly lower premiums, and is required to be, again, actuarially sound.

Now, shifting gears to crop insurance and disaster assistance, the last several years have seen an increase in *ad hoc* disaster payments as unprecedented crises have hit our rural America. It is only prudent for this body to be looking at the next farm bill for ways to plug these gaps in our safety net. Our ask of this Committee is that you consider crop insurance as the primary tool for helping to fill those gaps where appropriate.

Regarding disaster proposals, we would discourage the creation of any disaster program that would disincentivize farmers from purchasing crop insurance or that would directly compete with existing crop insurance products or products that are currently available in the private-sector. We actually don't want to see the creation of a program that would double pay farmers for the same loss. This would indirectly discourage the purchase of crop insurance and possibly lead to changes in farming practices that could lead to potential instances of fraud, waste, and abuse. And we would oppose the creation of a disaster package that is funded by cuts to the crop insurance program.

Finally, given the multiple mentions in the testimony relative to 508(h), I would be remiss not to mention that we are working actively with the Risk Management Agency to ensure transparency and timeliness in the rollout of future products submitted through the 508(h) process. Our goal is to have a functional process to bring innovation to crop insurance and for the process to be as consistent with sound business practices that ensure that we continue to be stewards of the taxpayer dollars and in the crop insurance program.

In conclusion, I would like to thank this Subcommittee for your support of crop insurance and for your willingness to learn more about the perspective of our industry. We stand ready to work with each of you as we head into the next farm bill.

[The prepared statement of Mr. Haney follows:]

PREPARED STATEMENT OF ROBERT “BOB” HANEY, EXECUTIVE CHAIRMAN, AGRISOMPO, CHIEF EXECUTIVE OFFICER, AGRISOMPO NORTH AMERICA, SOMPO INTERNATIONAL HOLDINGS LTD.; MEMBER, BOARD OF DIRECTORS, AMERICAN ASSOCIATION OF CROP INSURERS, WEST DES MOINES, IA; ON BEHALF OF CROP INSURANCE AND REINSURANCE BUREAU, INC.

[Chair] Bustos, Ranking Member Scott, and Members of the General Farm Commodities and Risk Management Subcommittee—thank you for allowing me the opportunity to testify today on the importance of crop insurance and the vital role it plays in providing risk management to farmers across the country.

My name is Bob Haney, and I am Executive Chairman of AgriSompo North America, one of the 13 Approved Insurance Providers that sell crop insurance policies to farmers and ranchers across the country. I’m also a farmer in Iowa. I’ve been in the crop insurance industry for more than 40 years and retired once, only to come back to lead AgriSompo and to continue work in an industry that I love and that I believe is of critical importance to American agriculture. Our company has a national footprint, so we serve farmers in every single state represented on this Subcommittee today. AgriSompo is also a member of the Crop Insurance and Reinsurance Bureau, the American Association of Crop Insurers, and National Crop Insurance Services.

The Federal Crop Insurance Program was initially created in the 1930’s, but it wasn’t until the development of the public-private partnership and the positive changes made by Congress in the 1990’s and 2000 that the program really became the cornerstone of risk management on the American farm. Farmers in 1980’s and 1990’s faced numerous challenges that were met by years of unreliable, untimely, and unbudgeted *ad hoc* disaster assistance. After spending billions in unbudgeted dollars, Congress decided that it was time to find a better way to help farmers across the country, so this body worked to make crop insurance more widely available and affordable to farmers and ranchers.

One of the things that is critical to the success of this program is its “three-legged stool” design. The risk of these policies is shared by crop insurance companies such as AgriSompo, the farmers who pay a premium for the policy, and the Federal Government that helps to reduce the premium paid by farmers and helps to underwrite part of the risk for the policies. Each player has skin in the game, which helps to ensure the success of the program over the long-term.

As an Approved Insurance Provider, we underwrite crop insurance policies—which means we share in bearing the risk of policies, so the taxpayer is not solely responsible for covering losses. We hire agents to sell policies and adjusters to assess and confirm losses. We invest in technology, training and services to ensure the highest integrity of the program. This investment helps to ensure one of the lowest improper payment rates amongst USDA programs.

Crop insurance is a big tent. Our industry protects farmers of all types and sizes and covers 130 different commodities, including a significant number of specialty and organic crops. For those crops without individual policy coverage, Whole Farm Revenue insurance is available. And more recently, the program has been expanded to include dairy farmers and a more robust option for livestock producers.

We believe that crop insurance is one of the best tools available to farmers to protect against Mother Nature because crop insurance is a rapid response solution to disasters and is a farmer’s first line of defense against climate change. Private companies like mine are typically able to deliver indemnity payments to farmers in fewer than thirty days after a loss occurs—not months or years later. The private-sector delivery of crop insurance also means that farmers have a choice in who they do business with, and this choice ensures that a farmer is able to find an agent and a company that can provide them with the best service for their operation.

The cost-share with the Federal Government helps to keep crop insurance affordable for most farmers, while also ensuring that the program is fiscally responsible. Although Federal crop insurance has been around since 1938, it wasn’t fully utilized until almost 60 years later. During this time, natural disaster management typically came solely in the form of *ad hoc* disaster bills, which were slow in delivering assistance, very costly, and relied completely on taxpayers to fund. It was the legislation created in 1994, 2000 and 2014 that helped kick start involvement from the private-sector, made the program more actuarially sound, encouraged participation, and improved availability of coverage. With the continued bipartisan support for the public-private partnership crop insurance provides, farmers are able to receive a reliable and cost-efficient safety net to protect both themselves and the future of farming.

Crop insurance is also flexible. Farmers can tailor their coverage to fit the needs of their specific operation. The program is continuously evolving and improving to meet the needs of America’s farmers and ranchers. Some recent advances have

included cost-conscious hurricane endorsement policy to assist farmers who have been impacted by increasingly severe storms as well as an endorsement for farmers who choose to split-apply nitrogen on their field.

If a farmer or commodity organization doesn't believe there is an existing policy that works on their farm, the Federal Government will actually provide significant reimbursement to them to develop a product that does through the 508(h) provisions in the Federal Crop Insurance Act. And most changes don't require a farm bill or any other legislation. It just requires an interested party to be willing to work with the Federal Crop Insurance Corporation Board to design a better product in an actuarially sound and marketable way.

We know that crop insurance has not solved every problem that America's farmers have faced in recent years. The program simply isn't designed to address every type or cause of extreme loss. The program is also, by statute, prevented from covering some losses—such as those that occur after the harvest of a crop. But for those losses that can be appropriately covered by crop insurance—such as in-season commodity price decreases, yield losses due to Mother Nature, and even squeezes in farmer margins—there is no better way to get assistance into the hands of farmers in a timely fashion than through crop insurance.

The bottom line is that the crop insurance program is successfully meeting the needs of thousands of farmers who can tailor their risk management needs to serve them best with the help of a local agent. This protection also represents a good value for America's taxpayers when compared to other alternatives for addressing losses incurred by American farmers.¹

Crop insurance complements climate-smart agriculture

As the Committee continues its work in evaluating the intersection between agriculture and climate change, it is important to note that a farmers' best tool in defense against climate change is crop insurance. Crop insurance and climate-smart agriculture intersect in positive ways. For example, in order to be eligible for crop insurance, farmers must follow Good Farming Practices, as defined by local agronomic experts. Farmers who follow those Good Farming Practices that help mitigate climate change—like no-till farming and planting cover crops, for example—can see lower production costs, better soil health and increased yields, all of which can lower their crop insurance premiums and increase their production guarantees in an actuarially sound way. By promoting Good Farming Practices that can help lead to lower premiums, crop insurance helps complement healthy soil and improve conservation efforts. The *Journal of Environmental Management* published a peer-reviewed study that credited crop insurance with encouraging the adoption of conservation practices. In fact, one key takeaway from that study is that farmers who purchase crop insurance are more likely to undertake climate-smart agricultural practices than those who do not.

The 508(h) process is another tool that can be used to enhance the intersection between climate and crop insurance. 508(h) allows for individuals or groups who would like to add additional insurance products into the marketplace a pathway for getting those products considered and approved by the Federal Crop Insurance Corporation Board of Directors. Products considered under this process are farmer-driven, actuarially sound, and follow sound insurance principles. Recent examples of products approved by the FCIC Board, which highlight the effectiveness of the 508(h) process in driving adoption of climate-smart agriculture practices, include a policy to support split-application of nitrogen and the Sprinkler Irrigated Rice Endorsement, with other climate-related policies currently under consideration.

When Congress considers legislative proposals addressing the intersection between climate and crop insurance, we would like to share the criteria by which we will evaluate such proposals.

- If additional intersections are going to be explored, these intersections should provide farmers with incentives, rather than mandates or regulation, to adopt climate-smart agriculture.
- Incentives must be designed so that insurance policy premiums continue to be set at appropriate rates for the integrity and success of the crop insurance program.

¹More on the structure and benefits of crop insurance can be found in the attached one-pagers that are utilized by the Crop Insurance Coalition. This Coalition consists of a variety of farm organizations, agricultural lenders, ag input organizations, the crop insurance industry and conservation groups that support protecting and preserving Federal crop insurance.

- By statute, crop insurance premiums must align with the risk associated with the policy, and because of the self-correcting nature of crop insurance, premiums adjust to reflect farmers' individual risk and production.
- The methodology for setting premium rates inherently takes climate into account. For example, premium rates are determined from more recent years of loss experience, thereby reflecting changes in weather and weather patterns. The program performs well, with premiums continuing to match indemnities paid to farmers, thereby ensuring the financial stability of the program for farmers, taxpayers, and the private-sector providers of policies.
- Agronomic data is critical to making changes to total crop insurance premiums, whether those premium changes are for climate-smart agriculture practices or other reasons.
- Lawmakers seeking to reward farmers for climate-smart practices should first look to the flexible 508(h) process that offers potential for new and creative solutions for addressing the intersection of climate change and risk management. It is important that farmers be incentivized in the adoption of Good Farming Practices that are climate-smart and that the crop insurance program not be turned into a policing mechanism for these practices. If incentives are created, they should be evaluated to ensure that they do not encourage practices that could harm yields and that there are appropriate incentives available for varying regions and crops.
- New climate initiatives should be funded on their own terms and not take money away from the crop insurance program.
 - Crop insurance is vital to America's farmers and has been working well for them for over 80 years. It is a critical tool for farmers as they adapt to the changing climate pressures. Weakening the program in any way will do more harm to farmers coping with climate change and will only increase the need for *ad hoc* disaster programs.
 - The program must be adequately funded in order to continue to provide this timely and effective risk management tool for farmers.

Crop insurance and disaster assistance

Crop insurance provides certainty to farmers and their lenders and it is targeted directly to actual losses incurred by a farmer. If a farmer has a loss, they will typically receive a crop insurance payment within 30 days of a claim being finalized through an efficient private-sector delivery system. By contrast, other types of assistance can often take a year, or oftentimes more than a year, after a disaster before a farmer receives a payment. Farmers get to choose their level and type of coverage, which provides a predictable financial backstop for lenders in times such as these where input costs are rising rapidly, and farmers are borrowing more to purchase these inputs.

The last several years have seen a drastic increase in *ad hoc* disaster payments as unprecedented crises have hit rural America. As an industry, we are continuously evaluating where the gaps in the program exist and what we can do to help more farmers better manage their risk through the Federal crop insurance program. This has been particularly true in the last few years of turbulence. For example, as *ad hoc* assistance was required to address increasingly intense hurricanes, the Risk Management Agency developed and the industry implemented a simple, inexpensive coverage for hurricanes that is based on wind speed and can help to address the concerns of many southern farmers who have often felt that more traditional coverage is too expensive for their needs.

Policies have also been developed to assist micro farms that are contributing to the diversification and strengthening of our supply chains and better options for our nation's livestock producers have been implemented. Existing margin insurance policies are also being evaluated to ensure the best coverage possible for farmers during these tumultuous times.

This is not to say that crop insurance can solve every problem. However, if this Committee considers a permanent disaster program, this legacy of improvement should lead the Committee to pose several questions during the development of the next farm bill. Where are there gaps in the safety net? Can and should these gaps be filled by crop insurance? What gaps would not be appropriate to cover through the crop insurance program? How do you prevent overlap in payments between crop insurance and other programs? How do you ensure that any new programs that are created do not compete with the efficient and already-successful program that is crop insurance?

Regarding any proposals considered by this Subcommittee and the full House Agriculture Committee, we:

- Discourage any disaster assistance program that would disincentivize farmers from purchasing crop insurance. Often crop insurance and disaster programs work together through purchase requirements to ensure that crop insurance participation is encouraged. However, even the existing *ad hoc* programs created by USDA and authorized by Congress, as they are designed today, discourage farmers from purchasing the highest levels of coverage available to them.
- Oppose double paying farmers for the same loss. In addition to indirectly discouraging crop insurance purchases, a duplicative policy design is not in the best interest of the taxpayer or the farmer over the long-term.
- Oppose any disaster package that is funded by cutting crop insurance.
- Encourage the use of the 508(h) process for the creation of additional policies that can better address existing gaps. The predecessors on this Committee understood the ever-changing agricultural landscape and designed mechanisms within the crop insurance program, including 508(h), that would help agriculture adjust to changing times. These processes should be protected and utilized moving forward.

Improvements to 508(h)

Given the multiple mentions in this testimony of 508(h), I would be remiss not to mention that we are working actively with the Risk Management Agency and look forward to working with this Subcommittee to ensure transparency and timeliness in the rollout of future products submitted through 508(h) process. In the past, companies have been faced with the implementation of new crop insurance products at such a late date and with so little information that it has been difficult to support a successful product launch for our farmer customers. When new products are rolled out, we want to see successful product launches, and the best way to ensure success is to have transparency with the companies that will be responsible for underwriting, selling and servicing the product.

For example, we recently implemented a 508(h) product that was released 2 months after our training programs were completed and just weeks before sales closing date. We spent hundreds of thousands of dollars to rework our IT systems and rushed to put out information on the product to our internal team, our agents, and our farmer customers. But because the product was rushed and companies, agents and our farmer customers were not comfortable with the product, we only sold 17 policies this year.

Ultimately, we want what is in the best interest of our farmer customers and the program, and we believe more transparency and timeliness in the 508(h) process is critical to those interests.

Concluding Remarks

Crop insurance is the premier risk management tool for the American farmer. A number of factors combine to make crop insurance the cornerstone of many farmers' financial and risk management plans: the ability to tailor coverage to their own operation at a meaningful level and affordable price, the comfort of working with a local and trusted insurance professional and the knowledge that losses will be covered in a timely manner and before the banker comes to collect. Throughout time, these crop insurance benefits have accounted for the success and acceptance of the program and will continue to do so well into the future.

Again, thank you for having me here today and for your continued support of the crop insurance program. I look forward to answering any questions you have, and I am happy to be a continuous resource for you during the upcoming farm bill discussions.

[Crop Insurance 101]

Protect, Preserve & Improve Crop Insurance

In the coming year, we urge Congress to protect, preserve and improve the program:

- **Keeping crop insurance affordable to farmers.**
- **Maintain the size and diversity of the risk pool by keeping farmers of all sizes in the program.**
- **Maintain the efficient and effective private-sector delivery of crop insurance.**

- **Work with farmers, agents, AIPs and USDA to identify potential actuarially sound improvements to crop insurance.**
- **Crop insurance protects when disaster hits.**
 - In 2019, a record setting number of acres were not planted due to flooding and excess moisture. As the nation's premier risk management tool for farmers, crop insurance protected farmers from losses associated with not being able to plant their crop. Approved Insurance Providers (AIPs) have already paid out almost \$4.6 billion in indemnities, with more payments expected in the coming months.
 - In 2018, more than \$7.2 billion in indemnity payments were made for disasters including hurricanes and drought, all while some farmers are still waiting on their *ad hoc* assistance dollars to arrive.
- **Crop insurance is a successful public-private partnership, and unlike other farm programs or *ad hoc* disaster assistance that is 100% paid for by the taxpayer, crop insurance losses are shared by farmers, private-sector companies, and the government.**
 - Premium rates are set by the government and farmers cannot be refused a policy.
 - *Crop insurance is a rapid response solution to disasters.* Private-sector delivery typically allows farmers who have losses and have met their deductible to receive indemnity payments in less than thirty days. *Ad hoc disaster assistance cannot be relied upon by lenders and isn't delivered in a timely or precise manner.*
- **Crop insurance is purchased by farmers** to protect against yield and revenue losses due to natural disasters and single-year declines in prices. It is the only safety net available to all types and sizes of producers in all regions.
 - *Crop insurance is a cost-share* with farmers where farmers pay a discounted rate for their crop insurance premiums, which total \$3.5 to \$4 billion each year.
 - *On average, farmers meet a 27% deductible* before they receive a crop insurance indemnity payment.
 - *About 30% of crop insurance policies pay an indemnity in an average year.* It is not unusual for farmers to pay their crop insurance bill for years without receiving an indemnity payment.
- **Crop insurance is critical to the rural economy. Without crop insurance most producers simply cannot qualify for the operating loans needed to plant a crop.**
 - Due to the extremely tight margins and incredible risk in agriculture, regulators examining ag lending portfolios typically *insist borrowers have crop insurance to ensure repayment of loans.*
 - *Increasing the cost of farmer-paid premiums or disqualifying some farmers from participating in the crop insurance program will force farmers to decrease coverage,* making it more difficult to qualify for operating capital and loans in the current ag economy.
 - *Crop insurance protects jobs, both on and off the farm.* Crop insurance enables farmers to rebound quickly after disaster and allows producers to pay credit obligations and other input expenses, such as fertilizer or farm equipment.
- **By statute, crop insurance is actuarially sound. That means a large and diverse risk pool is needed to make premiums affordable. Removing some farmers from the crop insurance risk pool via means testing will impact the rates for every single farmer still participating in crop insurance.**
- **Crop insurance has environmental benefits.**
 - Conservation compliance measures, including wetlands protections and highly erodible lands protections, are a requirement for receiving a discount in the purchase of crop insurance.
 - The 2018 Farm Bill included language to clarify that planting soil-nurturing cover crops is allowed under crop insurance policies.
- **Crop insurance is nimble.**
 - Crop insurance improves each year to meet the needs of all types of farmers.

- Where there are gaps in the program, USDA, stakeholders and the private-sector have mechanisms available to fill these gaps with meaningful risk management tools.

ATTACHMENT 2

[Premium Discount Cuts to Crop Insurance]**Oppose Cuts to Farmer Discounts for Crop Insurance**

There have been various proposals to cut the discount farmers receive when purchasing crop insurance. These proposals vary in the details, but are fundamentally flawed, regardless of how the cuts are structured.

- **Any reduction in the discount for crop insurance will increase the cost of crop insurance to farmers.** Premium support does not go to crop insurance companies or agents—it simply keeps crop insurance affordable for farmers. According to a national public opinion poll released in May 2016, nearly 80 percent of Americans said they supported giving farmers discounts on insurance premiums and the vast majority agreed that the current premium and deductible amounts absorbed by farmers were appropriate.
- **The alternative to affordable and viable crop insurance for which farmers pay about \$3.5 to \$4 billion per year in premiums is ad hoc disaster assistance that is 100% paid for by the taxpayer and may not arrive until more than a year after the disaster.** Crop insurance is the only component of the farm safety net that farmers can literally take to their banker, thereby supporting the rural economy and protecting jobs on and off the farm.
- **Any increase in the cost of crop insurance will decrease demand for the product and increase the likelihood for calls for ad hoc disaster assistance.** Economists can debate how much of a decrease in demand will result from an increase in cost, but the fundamental fact remains: if you increase the cost of crop insurance for farmers, they will buy less crop insurance. This is particularly true in the current environment of historically low farm income and increased market volatilities.
- A recent study by Keith Coble and Brian Williams from Mississippi State found that farmers are willing to pay out-of-pocket no more than four percent of the expected value of their crop on crop insurance. So, as the cost of insurance increases, purchase levels will decrease.
- As commodity prices decline and farmers' budgets tighten, an increase in the cost of crop insurance is only more likely to result in a decrease in crop insurance purchases. Recent analysis found that reducing the aggregate subsidy rate by 14 percentage points could decrease the acres covered by crop insurance by 17%, potentially further increasing the pressure for *ad hoc* disaster assistance.
- As a reference point, recent analysis has shown that a ten percentage point decrease in premium assistance would increase the bill a typical Midwest grain farmer pays by 50% for a policy at the 70% coverage level. On a policy with an 80% coverage level, the farmer's bill would increase by over 30%.
- To gauge the impact of a reduction in the discount for crop insurance, we have history to guide us. Premium discounts were increased in 2000 with passage of the Ag Risk Protection Act (ARPA). Prior to ARPA, both premium discounts for farmers and crop insurance participation levels were much lower than they are today.

	1998 Crop Year	2018 Crop Year
Acreage	181 million	369.9 million
Total Premium	\$1.8 billion	\$10.0 billion
Farmer Paid Premium	\$929 million	\$3.8 billion
Premium Assistance	\$946 million	\$6.2 billion
Insured Liability	\$27.9 billion	\$104.1 billion

Means Testing and Crop Insurance

Federal crop insurance is, *by statute*, required to be actuarially sound. Over the long-term, every dollar of indemnities (payments to producers for losses) must be equal to the assigned premium. So when adjusted gross income (AGI) limits or pre-

mium support caps are proposed for farmers, what does that mean for farmers and crop insurance?

- ***Every single producer who purchases crop insurance will be impacted.*** It might only be a small number of farmers who are directly impacted by a premium subsidy cap or an AGI limit, but don't be fooled—every single producer in the program will be indirectly impacted. As limitations are placed on the discounts for crop insurance, farmers will buy less crop insurance or not buy it at all. The impact will be largest for lower risk farmers, crops and regions. That will change the “risk pool.” As the pool becomes more risky, the premiums for every farmer in that risk pool are likely to increase.
- ***GAO analysis shows that a \$40,000 premium support cap would have affected 26% of total insured liability in the crop insurance program in 2011.*** So while a premium subsidy cap might only impact a small number of producers, it would put a very large portion of crop production at risk.
- ***USDA has called a cap on premium support “ill advised,” noting regions with high-value crops, large-acreage farms, and/or a higher risk of crop loss would be especially hard hit.*** High-value crops would include such things as fruits and vegetables and organic crops. Arizona, California, Georgia, Hawaii, Louisiana, New Mexico, North Carolina, North Dakota, South Carolina, South Dakota and Utah have all been identified by USDA as shouldering disproportionate effects under a cap on premium support.
- ***Whole-Farm Revenue Protection will also be disproportionately affected.*** The average premium subsidy nationwide for 2017 was \$38,000, indicating that many policies would be above a \$40,000, or even \$50,000 cap. In nine states, the average premium subsidy is above \$50,000 (California, Delaware, Florida, Georgia, Louisiana, North Carolina, New Jersey, South Carolina, and Texas).
- Any means testing proposal, whether an AGI limit or a premium support cap, that has significant budget savings directly translates into an increase in cost to farmers. ***A dramatic increase in premium costs on a large percentage of acres would inevitably lead to decreased participation in crop insurance.***
 - To be clear, *reduced participation in crop insurance impacts every producer.* Because crop insurance is required by law to be actuarially sound, as the risk pool changes, premium rates must change to reflect the risk. Reduced coverage on a large number of acres will change the riskiness of the overall pool, thereby altering rates for everyone in the program. It's critical to remember that in looking at risk pools it is not the number of farmers impacted, but the number of acres impacted that will alter premiums.
 - *Reduced participation can only lead to an increase in calls for ad hoc disaster programs* as farmers no longer have the critical protection of crop insurance.

ATTACHMENT 4

Oppose Cuts to the Private-Sector Delivery System for Crop Insurance

- ***Crop insurance is a successful public-private partnership.*** The program is federally regulated and delivered by the private-sector.
 - Federal regulation ensures that farmers cannot be refused protection and that companies cannot raise premiums or impose special standards on any individual producer. Premium rates are set by the government and are based on actuarial soundness.
 - Losses are shared by farmers, private-sector companies and the government. The government, and therefore taxpayers, also share in any gains.
 - Private sector delivery allows farmers who have losses and have met their deductible to typically receive indemnity payments in less than thirty days, whereas *ad hoc* disaster assistance or other government safety net programs can take a year or more to provide assistance to farmers.
 - According to a national public opinion poll released in May 2016, voters agreed by a 20 point margin that farmers and taxpayers were better served by private companies delivering crop insurance instead of the government.
- ***The private-sector delivery system has already absorbed significant cuts through the 2008 Farm Bill and administrative actions taken in 2011.*** These cuts are estimated to be \$12 billion over a 10 year window.

- One such Administrative change already decreased the targeted rate of return for crop insurance companies to 14%.
- This target rate is *neither a guarantee nor a profit for crop insurers*. Profits are significantly lower than the target rate of return.
- As in farming, the crop insurance sector will have good years and bad years. The good years are particularly important to help sustain the sector during the bad years.
- ***Proposals to cut the private-sector delivery system would harm the rural economy and negatively impact service and timely delivery of payments when there is a disaster.***
 - In order to deliver timely service, the crop insurance industry employs thousands of professionals in rural America. More than 20,000 licensed agents, certified claims adjusters and company staff are committed to getting farmers who have sustained losses and met their deductible back on their feet quickly.
- ***Former USDA Farm and Foreign Agricultural Services Under Secretary Michael Scuse*** might have said it best during the devastating drought of 2012: “To this day, I have yet to have a single producer call me with a complaint about crop insurance. This is a testament to just how well your agents, your adjusters, the companies, and the Risk Management Agency worked together in one of the worst droughts in the history of this nation.”

ATTACHMENT 5

Crop Insurance Myth vs. Fact: Beginning Farmers and Ranchers

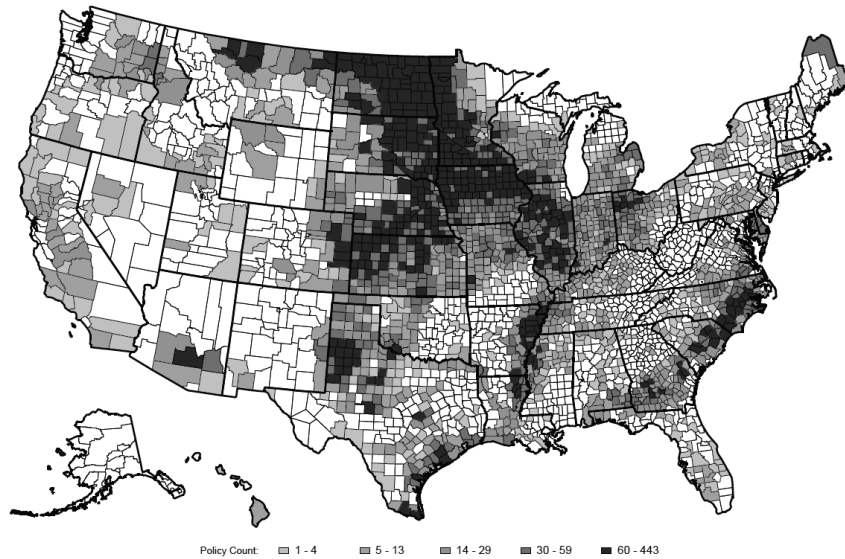

Myth: Crop insurance makes it more difficult for beginning farmers and ranchers to enter the farming business.

Fact: The 2018 Farm Bill maintained and expanded provisions to make crop insurance an even better risk management tool for beginning farmers and ranchers.

More than 17,000 farmers used the beginning farmer and rancher benefits in crop insurance in reinsurance year 2021

- These farmers insured more than 5.2 million acres of farmland.
- The beginning farmer and rancher benefits include a higher premium discount and assistance in building a yield history more quickly that is in line with what the land produced before being operated by a beginning farmer or rancher.
- Almost every state already has beginning farmers and ranchers utilizing these benefits.
- The ability of beginning farmers and ranchers to purchase crop insurance can be linked to their ability to obtain credit as well.

Beginning Farmer and Rancher Policies by County Reinsurance Year 2021

Source: Risk Management Agency, USDA.

ATTACHMENT 6

Crop Insurance Myth vs. Fact: Conservation

Myth: Crop insurance encourages farmers to tear up ground.

Fact: Overall, acres in production and erosion have decreased. Additionally, the 2014 Farm Bill expanded the conservation compliance provisions and Sodsaver provisions to apply to crop insurance.

Farmers must comply with highly erodible land conservation and wetland conservation provisions. They must certify that they will not:

- Produce an agricultural commodity on highly erodible land without a conservation system;
- Plant an agricultural commodity on a converted wetland; or
- Convert a wetland to make possible the production of an agricultural commodity.
- These compliance provisions have been linked to the ability to receive commodity programs since 1985, but the 2014 Farm Bill relinked those provisions with eligibility for premium support paid under the Federal Crop Insurance Program.
- In addition, the 2014 Farm Bill expanded a Sodsaver provision which reduces the Federal crop insurance premium discount available to landowners by 50 percent for 4 years on any lands they convert from native prairie to cropland.
- The 2018 Farm Bill explicitly deemed cover cropping a “good farming practice” when paired with an approved termination date for the cover crop. The purpose of the provision was to ensure that crop insurance would not discourage farmers from adopting cover crop practices.
- A peer-reviewed study in the *Journal of Environmental Management* found that crop insurance can actually be complementary to the adoption of conservation practices. Adoption rates of conservation practices like cover crops and no-till are higher amongst growers who utilize crop insurance *versus* those who don’t.*
- The charts below tell an entirely different story than the myth suggests. The number of acres covered by crop insurance has almost tripled since the 1990s—

*Crop insurance: A barrier to conservation adoption?—ScienceDirect (<https://www.sciencedirect.com/science/article/pii/S0301479720311488?via%3Dihub>).

from fewer than 85 million acres to more than 240 million acres today, while overall crop acreage has decreased. Over the same period, USDA's Natural Resources Inventory shows cultivated cropland has dropped from 349 to 329 million acres. In addition, erosion has decreased significantly over that period.

Total U.S. Cropland Compared to Cropland with Buy-Up Crop Insurance

ATTACHMENT 7

Crop Insurance Myth vs. Fact: Crop Insurance and the Budget

Myth: Crop insurance is over budget.

Fact: Crop insurance costs are currently well below budget.

Annual crop insurance costs peaked in 2013 at \$11 billion, mainly due to the devastating 2012 drought combined with the high value of crops at the time.

- According to the first CBO estimates provided after the passage of the 2014 Farm Bill, the actual cost of crop insurance has been around \$11 billion *under* budget between 2014 and 2020.

Cost of Federal Crop Insurance

Source: Congressional Budget Office.

- Crop insurance has consistently been under budget, but a couple of clarifying points on the budget:
 - First, there are several farm programs that are not crop insurance. Crop insurance is, by statute, an actuarially sound program that farmers pay for out of their own pockets and is delivered efficiently and effectively by the private-sector.
 - The cost of crop insurance is driven not only by disasters but by the cost of commodities. Like with any insurance, the more valuable the item is, the more expensive the insurance will be. As the value of commodities rise and fall, so too will the cost to insure them.
 - The overall cost of crop insurance can also be reduced by underwriting gains achieved by the government in years of good performance with lower losses.
 - The forward-looking budget estimates for the cost of crop insurance, by and large, remain consistent from year to year, as the Congressional Budget Office does not attempt to make predictions about what Mother Nature will do in any given year.

ATTACHMENT 8

Crop Insurance Myth vs. Fact: Crop Types

Myth: Crop insurance is only for big corn, soybean, wheat and cotton farmers.

Fact: Crop insurance is available for more than 125 crops and to farmers of all sizes and in all 50 states.

The number of acres of fruit, vegetables, and other specialty crops covered by crop insurance increased from 7.7 million acres in 2009 to about 10 million acres in 2020. That's an increase of 30% in just eleven years.

- Many specialty crops are insured at rates similar to row crops such as corn, soybeans, wheat, and cotton. For example, 70% of apple and 71% of almond acres are insured, as well as 77% of cranberries.*

* **Editor's note:** there is a discrepancy in the submitted one-pagers by Mr. Haney and the corresponding one-pagers on the Crop Insurance and Reinsurance Bureau, Inc. advocacy website *Crop Types* (<https://cropinsurance.org/wp-content/uploads/2022/05/2022-Crop-Insurance-Myths-v.-Facts-Crop-Types.pdf>) and *Disaster Assistance* (<https://cropinsurance.org/wp-content/uploads/2022/05/2022-Crop-Insurance-Myths-v.-Facts-Disaster-Assistance.pdf>). The chart entitled, *Federal Crop Insurance Program Growth for Specialty Crops* follows the chart entitled, *Specialty Crops with the Highest Total Liabilities, 2020*. In Mr. Haney's consolidated submission this chart is embedded in the *Disaster Assistance* one-pager's second bullet.

ATTACHMENT 9

Crop Insurance Myth vs. Fact: Disaster Assistance

Myth: Farmers don't need crop insurance, because when disaster strikes, they can simply turn to *ad hoc* disaster assistance.

Fact: Crop insurance provides certainty to farmers and their lenders that *ad hoc* disaster assistance cannot provide because, by definition, *ad hoc* assistance is never a certainty and can change from year to year. Crop insurance is the timeliest component of the farm safety net, with payments made immediately after a loss is incurred.

- If a farmer has a loss, they will typically receive a crop insurance payment within 30 days of a finalized claim through an efficient private-sector delivery system. Other types of assistance can often take a year or more after a disaster before a farmer receives a payment.
- Crop insurance payments are tied directly to the loss incurred by a farmer and the coverage level purchased by the farmer. The deeper the loss, the higher the indemnity payment a farmer will receive.
- Crop insurance can provide coverage to more than 125 commodities every year and covers various types of losses. Whole farm revenue protection is also available for those crops that do not have an individual policy available. This gives crop insurance more breadth and depth than any other component of the farm safety net.

- Crop insurance is created to be flexible to meet the changing needs of America's farmers and ranchers. Crop insurance has the regulatory flexibility to make certain adjustments mid-season to address extreme weather events. New policies can be continuously developed to fill gaps identified in the program's protection.
- Often, crop insurance and *ad hoc* disaster assistance work together for farmers who purchase insurance to be eligible for higher *ad hoc* assistance payments. Crop insurance purchase requirements are also typically included in Congress's *ad hoc* disaster assistance bills.

ATTACHMENT 10

Crop Insurance Myth vs. Fact: Farm Income

Myth: Most agricultural production comes from large farms that can manage their own risk.

Fact: Farmers of all sizes use crop insurance, and crop insurance provides meaningful collateral to lenders when farmers seek operating capital.

- Crop insurance enables farmers, both big and small, to manage their risk in a way that helps them invest in and improve their operations. Many farmers would not be able to afford to do this if they were forced to self-insure and could not qualify for loans.
- Including farms of all sizes in the crop insurance program diversifies the risk of the program across a greater number and variety of farms, which improves the actuarial soundness of the overall program. This soundness is a benefit to all, including taxpayers.
- During these uncertain times, crop insurance is even more important to farmers looking to lenders for the operating capital required to continue to farm. Lenders look at crop insurance as a form of collateral for an operating loan, and it can enhance a prospective borrower's capacity to qualify for a loan.
- Although crop insurance payments are a small percentage of some farmers' overall household income, in times of crop loss and economic downturn, receiving a crop insurance indemnity payment can make the difference between being able to continue farming for another year or not.

"We utilize crop insurance when incidents happen that are completely beyond our control. And we are thankful we have it because it's saved our lives. Crop insurance has helped my dad sleep better at night."

ALICIA ABENDROTH (New York Apple Farmer).

ATTACHMENT 11

Crop Insurance Myth vs. Fact: Harvest Price

Myth: Harvest price coverage eliminates all risk from farming and is unnecessary.

Fact: Even with the harvest price coverage, farmers must meet a deductible for loss and pay a premium for harvest price coverage. Risk still exists for these farmers. The harvest price coverage simply provides these farmers with the replacement value for their lost crop.

The harvest price coverage in crop insurance policies provides protection on lost production at the higher of the price projected just before planting time or the price at harvest.

- There are two very practical and common scenarios in agriculture that make harvest price coverage a critical risk management tool.
 - *Harvest price coverage is critical to farmers who use forward contracting as another means of mitigating their risk.* If there is a natural disaster that results in a large drop in the production of a commodity, the price of that commodity is likely to increase sharply. Many farmers enter forward contracts before harvest to sell a portion of their production at a set price. Usually, these contracts pay the farmer for the production they deliver after harvest based on harvest prices. If the farmer loses the crop, they are still obligated to deliver under the forward contract. But since the crop is lost, the farmer would have to buy the commodity on the open market at the harvest price or financially settle at the harvest price to meet their contractual obligations. The purpose of harvest price coverage is to provide the farmer with sufficient funds to settle the forward contract. Without the harvest price coverage, the

farmer’s loss would be indemnified at the lower price projected at the start of the season.

- *Harvest price coverage is critical to livestock producers who grow their feed.* Harvest price coverage ensures these farmers will have the funds to afford the higher feed costs when they need to purchase feed.
- Caleb Ragland, a farmer from KY, said, “Harvest price coverage in crop insurance proved its importance during the 2012 drought on my farm. Having forward contracted much of my expected corn production, I was forced to buy back all my contracts, so I had enough corn to feed my hogs. Without the harvest price option, I would have faced a devastating choice between selling my hogs or paying the \$2 a bushel difference in my contracts and the current market price from my operation budget.”
- Think of harvest price coverage like the replacement value for car insurance, as explained in a popular insurance commercial: *
 - “You totaled your brand-new car. Nobody’s hurt, but there will still be pain. It comes when your insurance company says they will only pay ¾ of what it takes to replace it. What are you supposed to do? Drive ¾ of a car? Now, if you had . . . new car replacement, you’d get your whole car back. I guess they don’t want you driving around on three wheels. Smart.”

ATTACHMENT 12

Crop Insurance Myth vs. Fact: Improper Payment Rate

Myth: Waste, fraud and abuse are rampant in crop insurance.

Fact: According to the Risk Management Agency (RMA) at USDA, the improper payment rate for crop insurance for fiscal year 2021 was 1.41percent, which is less than the average rate for all government programs (4.67 percent). Actual fraud is only a small fraction of improper payments in the program.

All participants in crop insurance—farmers, agents, crop insurance companies, re-insurers, and taxpayers—are dedicated to detecting and eliminating fraud, waste, and abuse in the program.

- Crop insurance uses data mining to identify potential improper payments and also uses spot-checking of the work of insurance agents and adjusters.
- Because private crop insurance companies have money at stake with every policy written, these companies also spend money on training and monitoring.
- Actual fraud rates in the program are even lower than the improper payment rate reported by RMA. Improper payments are defined as over-payments, under-payments, and simple errors such as inadequate documentation. The improper payment designation does not necessarily include the existence of any intent to defraud the government.

Classification of Improper Payments Fiscal Year 2020

Types of Errors	% of Improper Dollars	Reason for Improper Payments
Production Reports—Support Units	26%	Production evidence did not support unit structure certification.
Production Records—Acceptability	20%	Unacceptable, unverifiable, and/or missing Production records.
Audit of Actual Production History	18%	Production evidence did not match the actual yields certified.
Were Insurability Conditions Met	16%	Insurability criteria was not met, did not meet the definition for insurability.
Share	8%	Incorrect share reported, records do not support reported share.
Production/Revenue to Count	4%	Transcription errors, production to count not determined correctly, allocation errors.
Uninsured Causes	2%	Adjuster did not follow correct procedures for assessing uninsured causes of loss.
Certification Form	2%	Incomplete certification form, certification form not completed.

* Liberty Mutual, 2016 <https://www.youtube.com/watch?v=5twuX-zoOv4>.

Classification of Improper Payments Fiscal Year 2020—Continued

Types of Errors	% of Improper Dollars	Reason for Improper Payments
Application Signature	2%	Application not signed timely, not signed by someone with proper authority.
Additional Error types	2%	All other errors.

ATTACHMENT 13

Crop Insurance Myth vs. Fact: Indemnity Payments

Myth: Farmers get crop insurance indemnity payments every year, and the program is so rich that farmers farm the program instead of the ground.

Fact: Farmers can pay crop insurance premiums year in and year out without receiving a single indemnity payment. In fact, on average, only about 30 percent of policies pay an indemnity in any given year. Any farmer who tries to make a living “farming” crop insurance isn’t going to be in business very long.

Since 1989, crop insurance policies have covered nearly \$2.1 trillion in liabilities to guard against losses. During that same time, total premiums* for crop insurance were \$189 billion, and farmers were paid \$157 billion in indemnities. By statute, the loss ratio must be equal to or less than 1.0.

- Indemnity payments are made to farmers only when production or price disruptions result in crop yields or revenues below those guaranteed by the insurance contract. When production or revenues are above those guaranteed by a crop insurance policy purchased by a producer, an indemnity payment is not made, but the farmer must still pay the premium due to the insurance provider.
- Similar to weather risks, the cost of indemnities paid vary from year to year. In 16 of the last 20 years, total crop insurance premiums have exceeded indemnities paid to farmers.

Policies Earning Premium Compared to Policies Receiving Indemnity

Source: Risk Management Agency, USDA.

Total Premium Compared to Total Indemnity

Source: Risk Management Agency, USDA.

*This includes farmer paid premium as well as the premium discount.

Crop Insurance Myth vs. Fact: Means Testing

Myth: Means testing, such as adjusted gross income (AGI) limits and premium assistance caps, will keep large, wealthy farmers from receiving assistance they do not need.

Fact: Reducing participation from any group of farmers will change the premiums for *all* farmers because it will change the risk pool. Crop insurance is, by statute, an actuarially sound program, which means more participants and more acres in the program, the more the risk will be spread—keeping premiums and costs down for all participants.

- USDA has called a cap on premium support “ill-advised,” noting regions with high-value crops (such as fruit, vegetable, and organic crops), large-acreage farms, and areas with a higher risk of crop loss would be hit especially hard. USDA has noted that North Dakota, South Dakota, Texas, Minnesota, California, Arizona, Mississippi, Utah, and Hawaii would all bear a disproportionate share of the effects of a cap on premium support.
- Keith Coble and Brian Williams, economists with Mississippi State University, found that “large farms are a less risky sub-population in the insurance pool. Average per acre indemnities decline rapidly for both corn and soybean acres as the size of the insurance policy increases.” Removing the less risky farmers from the risk pool would drive up the costs for everyone who remains in the program.
- Even though crop insurance opponents note that only a small number of farmers would be affected by an AGI limit, it’s important to keep in mind that these farmers often farm a large number of acres. *It is the acres impacted by an AGI limit, not the number of producers, that will drive changes to premiums for all farmers.*

Distribution of Farms, Value of Production, and Farm Assets 2018

Source: Economic Research Service, USDA.*

* **Editor’s note:** there is a discrepancy in the submitted one-pagers by Mr. Haney and the corresponding one-pagers on the Crop Insurance and Reinsurance Bureau, Inc. advocacy website *Means Testing* (<https://cropinsurance.org/wp-content/uploads/2022/05/2022-Crop-Insurance-Myths-v.-Facts-Means-Testing.pdf>) and *Multiple Risk Management Strategies* (<https://cropinsurance.org/wp-content/uploads/2022/05/2022-Crop-Insurance-Myths-v.-Facts-Multiple-Risk-Management-Strategies.pdf>). The chart entitled, *How Risk Pools Work* follows the chart entitled, *Distribution of Farms, Value of Production, and Farm Assets 2018*. In Mr. Haney’s consolidated submission this chart is embedded above the *Multiple Risk Management Strategies* one-pager’s first paragraph.

How Risk Pools Work

Means Testing works against the law of large numbers, not just harming those excluded but all American farmers.

Reducing the risk pool would raise premiums for all farmers, potentially reducing coverage further as farmers opt out to avoid higher costs. In turn, taxpayer liability would increase with the return of the specter of ad hoc disaster assistance, the very problem our modern crop insurance system was designed to solve.

ATTACHMENT 15

Crop Insurance Myth vs. Fact: Multiple Risk Management Strategies

Myth: Crop insurance discourages farmers from using other risk management tools such as market hedging, cover crops and off-farm income. The use of these other risk management tools without crop insurance would be enough risk management for farmers.

Fact: Farming is risky, so farmers use a multitude of risk management strategies to manage the enormous hazards they face every year when they plant a crop. However, crop insurance is the only risk management tool that farmers can literally take to the bank to prove their ability to pay back annual operating loans required to keep the farm going.

Because each farm is unique, each farm's types of risk management strategies can vary, but crop insurance is a critical tool in a farmer's toolbox. Here are a few examples of the other risk management tools utilized by farmers:

- The use of **market hedging** has increased significantly since 2000, and approximately $\frac{1}{4}$ of all corn, soybeans, and wheat are hedged.* Additionally, farmers of other commodities often utilize **production or marketing contracts** to lock in prices for their goods. USDA estimates that more than $\frac{1}{3}$ of the value of all agricultural production is grown under contract, with this risk management tool being most utilized in livestock, dairy, sugar beets, fruit, and processing tomatoes.
- Most farms in the United States already rely heavily on **off-farm income** to maintain their operations and carry the enormous risk that comes with farming. According to USDA, recent increases in total farm income "largely reflect greater income from off-farm sources, where the majority of farm households earn most, if not all, of their income."
- **Cover crops** were planted on more than 20 million acres of U.S. farmland in 2020,† a nearly 33 percent increase from 2017. The 2018 Farm Bill also clarified the ability to plant cover crops on acres that are insured through the Federal crop insurance program. Planting cover crops can help manage risk in a variety of ways, including the improvement of soil health and an increased ability of soil to hold moisture in dry regions. Cover crops are gaining popularity among producers as information on benefits spread and carbon sequestration contracts become more prevalent.
- **Conservation tillage** practices are utilized on approximately 70 percent of soybean, 65 percent of corn, 67 percent of wheat, and 40 percent of cotton acres in the United States. These practices help manage risk by reducing topsoil erosion and improving soil health.‡
- *Clearly, the existence of crop insurance is not keeping farmers from utilizing other risk management strategies. However, cover crops and conservation tillage are not going to be enough for lenders who are looking to pencil out operating loans.*

* Economic Research Service, USDA.

† 2019–2020 National Cover Crop Survey, SARE, USDA.

‡ Economic Research Service, USDA.

Crop Insurance Myth vs. Fact: Market Distortions

Myth: Crop insurance is market distorting and discourages farmers from following market signals.

Fact: **Markets do not respond to crop insurance; crop insurance responds to markets. Crop insurance uses current-season market prices to determine coverage, losses, indemnities and premiums.**

- Crop insurance policies do not use an artificial price to determine coverage, losses, indemnities, or premiums. As designed today, crop insurance uses real-time tools such as various commodity exchange prices to determine coverage, losses, indemnities, and premiums. In other words, *markets do not respond to crop insurance; crop insurance responds to markets.*
 - For example, if corn prices are comparatively higher than soybean prices, crop insurance will reflect that market dynamic. Crop insurance is a reflection of the market and is available for all crops.
- *Crop insurance is available to all types of farms in all parts of the country, so the availability of crop insurance for one commodity and not another is also not a determining factor when farmers make planting decisions.*
 - More than 125 commodities are covered with individual crop policies, from corn to cantaloupe to cotton. There are more than 127,000 crop and county combinations for policies across the United States, providing multiple options to farmers.
 - For commodities that do not have a commodity-specific policy available in a given county, the 2014 Farm Bill created a Whole Farm Revenue Policy that allows all farmers of all commodities to have a crop insurance option.
- All crops get the same premium discounts for policies, so crop insurance does not artificially incentivize the production of one commodity over another commodity.
- Per the 2014 Farm Bill, new crop insurance products proposed for sale *must go through a consultation process specifically to assess if there would be a detrimental impact on the marketing and production of a commodity if a new policy is approved.*
 - The process for approving new crop insurance policies requires approval by the Federal Crop Insurance Corporation Board, which includes the Chief Economist at the USDA, whose mission is to advise on the economic implication of agricultural policies and programs.
- New technologies, data mining algorithms, and extensive training and education programs for agents and adjusters are all used to ensure crop insurance is being used properly as a risk management tool and to identify fraudulent claims. *These rigorous checks on the program also help to ensure that farmers are not farming for the program itself but for the market.*

The CHAIR. Thank you very much, Mr. Haney.
Ms. Fowler, please begin when you are ready.

STATEMENT OF KATHY FOWLER, OWNER, FOWLER AGENCY, LLC, MEMPHIS, TX; ON BEHALF OF CROP INSURANCE PROFESSIONALS ASSOCIATION

Ms. FOWLER. Good morning, Chair Bustos, Ranking Member Scott, and Members of the Subcommittee. My name is Kathy Fowler. I am a crop insurance agent from Memphis, Texas. I grew up on a farm and have been actively engaged in agriculture all my life. I am passionate about what I do, and I believe in the products that I sell to farmers and ranchers.

I am grateful and honored to be in this room today testifying and proud to talk about the amazing success that crop insurance has had. I am testifying today on behalf of CIPA, an organization of crop insurance agents with a presence in each of the 50 states. CIPA's mission is to continue to improve crop insurance because we

know the vital importance of U.S. agriculture. Agents talk to producers every day and they see firsthand the challenges that confront our farm and ranch families that we serve.

Agriculture has always been a tough business, whether it is adverse weather conditions, volatile markets, or bad actors on the broad scene that plague our farmers. It is even tougher today. Actually, the stakes have never been higher, and the margins are tighter and tighter. I talk about trade wars, the pandemic, inflation, and other very real challenges. But what is far more real to me is when I sit down across from my desk and talk to a young farmer, who is distraught about the drought situation that we are enduring today and how do I figure out how to make a crop.

Farmers and ranchers all across the regions consistently say we couldn't do without crop insurance. Crop insurance does more than just cover losses. It enables the producer to secure credit, to better market their crops, and to make the needed investments to improve their farm and ranch and build their soils. This is especially true for young and limited-resource farmers.

So let's just take a look at some of the stats with the crop insurance. Since 2000, the farmer-paid premium has increased six-fold. We now insure 130 crops. The acres insured have risen from 200 million to 450 million acres, and the total protection has shot up from \$35 billion to \$200 billion. With this growth, our performance has remained consistent. The average loss ratio is well into the statutory requirement of 1.0, actually meaning that this process and program is actuarially sound. A&O monies that are allocated for delivery have sharply declined as a percent of the total premium written.

So what does this all really tell us in what we are doing? I think it proves two things. Number one is we have a really good product, and kudos to RMA and this Committee who have worked on this program, and also our delivery system through AIPs and crop insurance agents for taking care of business. These are great stats, and we are proud of our efficiency.

But also we want to be clear where some problems exist. CIPA noted flawed design on the A&O cap and the disproportionate impact that it had on the specialty crop area. Thankfully, the issue has been addressed in the House ag approps bill, and I want to thank Chairman Bishop and Ranking Member Harris and many of you for working to patch these holes.

With that, I want to respectfully present some dos and don'ts that might serve as a guide as you prepare for the 2023 Farm Bill debate. Don't be tricked into pay limits and AGI means-testing on crop insurance under the idea that this will help small farmers because it won't. It will hurt them by raising their premiums and removing the good risk from the risk pool. Don't cut premium cost-share. Increasing premiums would move the crop insurance program backwards. Don't permit *ad hoc* disasters or permanent disasters to undermine crop insurance. You don't want to discourage producers from using their own risk tools. Don't try to mix policy objectives like climate into crop insurance. Crop insurance is meant to protect the farmer's profitability. When profitable, good conservation will follow.

Let's talk about the dos. Do have high expectations of crop insurance and work with us in building the program to achieve even more. We certainly want you to support the 508(h) process which meets these changing needs. Do work to help farmers purchase higher levels of insurance. They need more coverage. Do fix the problem facing specialty crop areas and improve the use of crop insurance data for the benefit of farmers.

Last, in closing, please make sure that we make a case for additional funds for the next farm bill. The *ad hoc* disaster was certainly needed, but the money can be better used. Write a budgeted investment. You can strengthen the farm safety net and crop insurance to benefit farmers, ranchers, and taxpayers. Thank you for what you do for this great nation, and I look forward to your questions.

[The prepared statement of Ms. Fowler follows:]

PREPARED STATEMENT OF KATHY FOWLER, OWNER, FOWLER AGENCY, LLC, MEMPHIS, TX; ON BEHALF OF CROP INSURANCE PROFESSIONALS ASSOCIATION

[Chair] Bustos, Ranking Member Scott, and Members of this Subcommittee, thank you for the opportunity to provide testimony today concerning the cornerstone of the farm safety net: Federal Crop Insurance.

My name is Kathy Fowler, and I am an independent agent and business-owner from Memphis, Texas. The Fowler Agency was started in 1988, and heading into our 35th sales year, we serve approximately 350 farm and ranch families across roughly 40 counties primarily in Oklahoma and Texas. The Fowler Agency has served some farm families now for three generations and has more young farmers and ranchers than ever before.

I am here today on behalf of CIPA—the Crop Insurance Professionals Association—the nation's top crop insurance agents. CIPA works hard every day to bring together all segments of the industry and our nation's farm and ranch families in order to improve, promote, and protect Federal Crop Insurance.

CIPA agents write crop insurance in all 50 states, and we take great pride in our work. Our goal is to walk alongside our farmer and rancher customers, helping them through all of their critical financial and risk management decisions. While our job is certainly to counsel our farmer and rancher customers about risk management options under crop insurance, we believe our duty goes beyond this: at CIPA, we take a very holistic approach to helping our producers with all of their financial and risk management needs.

Our focus and pride, individually and collectively as an organization, is doing our job the right way—fully knowing our customer's needs and the risk management options available to them and doing so with the highest ethical standards in order to meet each season's needs and to advance crop insurance for the future.

I am honored and humbled to be here today. The role that our farm and ranch families play in providing for our country's basic needs is a vital one. And, in turn, the policies crafted by this Subcommittee and the full Committee on Agriculture that support our producers are also essential.

It is a bit overwhelming for this farm kid from Memphis, Texas to appear before this important Subcommittee but I hope my testimony—based on my 35 years of experience as an agent and a lifetime of experience as a producer interacting with hard working farm and ranch families—will be a help as you prepare for the upcoming farm bill debate.

Importance of the Farm and Ranch Sector and the Growth in Crop Insurance

We have come through a lot in the last few years.

Through a period of extreme market volatility resulting from trade wars and the global pandemic, most Americans have become much more aware of the interconnectedness of the world—and the extraordinary importance of safeguarding fundamental sectors, including agriculture.

U.S. farmers have endured this incredible volatility in amazing ways—carrying on and boosting productivity as a “critical industry” even when much of the world was shutting down.

And, now, with a relatively poor crop in the Southern Hemisphere and the war in Ukraine threatening a global food crisis ahead, there can be no doubt that U.S. farm and ranch families will be called upon once again to step up to the plate and do all that we can to feed a growing and hungry world, while also clothing and fueling many both at home and abroad.

[Chair] Bustos, Ranking Member Scott, and Members of this Subcommittee, I submit to you that Crop Insurance is the most important tool that our farm and ranch families have at their disposal for making the kinds of investments and taking on the level of risks that we all need them to in order to meet the growing demands the country and the world place on them and to carry on the legacy of their family farms and ranches.

Crop Insurance empowers farm and ranch families to purchase equipment and inputs, to plant the seed, to nurture and harvest their crops, to raise their livestock, and to get to market with confidence because they have something as basic as insurance—something they would not have without Federal Crop Insurance. We have Federal Crop Insurance today because the risks of farming and ranching are so great that multiple peril crop insurance available to all comers would otherwise be prohibitively expensive and therefore unavailable.

Very notably, crop insurance fills the role of providing collateral to agricultural lenders. Without crop insurance, agriculture would likely have to return to asset based lending which contributed to the farm financial crisis of the mid-1980s. We certainly do not want to repeat that crisis which impacted the economies of even the largest U.S. cities. Crop insurance is especially vital to young and beginning farmers and ranchers, socially disadvantaged producers, producers farming new crops, and producers farming or ranching in areas that frequently experience drought.

Crop Insurance offers producers the ability to be more nimble and dynamic in dealing with a highly volatile market and in the face of an increasingly mercurial Mother Nature. Thanks to crop insurance, the American farmer and rancher is much better positioned to meet the challenges ahead in feeding, clothing, and fueling the country and a great many around the world.

Crop Insurance's vital importance has not grown overnight. It has developed over time thanks in no small part to the steady leadership and stewardship of this Subcommittee and the full Committee on Agriculture.

From its inception in 1938 until 1980, Federal Crop Insurance barely limped along.

But, in 1980, when the House Agriculture Committee led the way to creating a public-private partnership with private companies and agents selling and servicing policies and private claims adjusters settling claims, crop insurance began its meteoric rise.

The 1994 crop insurance reforms, advanced by this Committee, and the approval of revenue insurance by the Department of Agriculture in the mid-1990s continued to propel crop insurance forward.

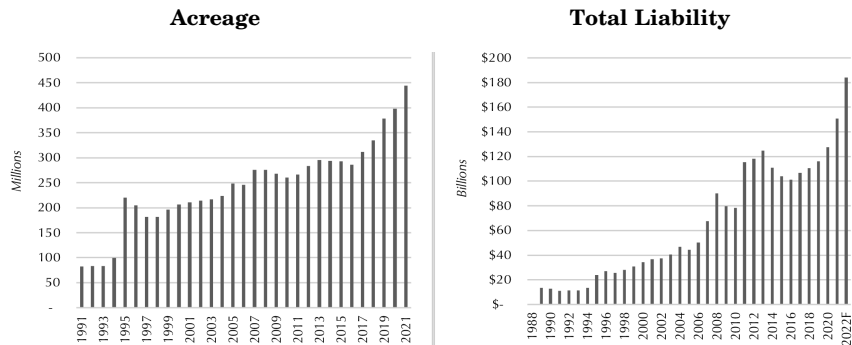

And, finally, the 2000 crop insurance reform legislation, also advanced by this Subcommittee and the House Agriculture Committee, became the legislative capstone of the remarkable achievement that Federal Crop Insurance is today.

As I noted earlier, I am from Memphis, Texas which is also the childhood home of a former Chairman of the House Agriculture Committee, Rep. Larry Combest, who, along with the Ranking Member, Rep. Charlie Stenholm, worked hand in glove in leading the effort to develop and pass the 2000 crop insurance reform—making crop insurance more dynamic so it could better meet the ever changing needs of producers as they work to meet the ever changing needs of the country and the world.

When that bill—the Agricultural Risk Protection Act of 2000—passed, total premium under crop insurance was just over \$2 billion, with 200 million acres insured and with total coverage or liability at around \$35 billion.

This year, farmers and ranchers will spend more than \$6 billion out of their own pockets, to insure more than 450 million acres with what is now approaching \$200 billion in total coverage or liability. Thank you all so much for serving on the Subcommittee and the Committee that made this happen. You are a part of a legacy that has saved millions of American farm and ranch families.

The charts below illustrate this remarkable growth. It is something we, as CIPA—your boots on the ground—take a great deal of pride in. I hope it is also something that you will take great pride in and continue to steward this success story, going forward.

Total Premium

A couple of final points before I leave my introductory remarks. First, while indemnities in crop insurance are an important measure of protection and support provided to farmers and ranchers in their time of need, and while a timely and efficient indemnification of losses is also fundamental to companies and agents competing for producer business through exceptional service, it is not a good measure of the economic value of crop insurance to the farm sector or to our nation as a whole. Indemnities grossly understate the value of crop insurance to producers and the country.

Nevertheless, I do provide the following chart that illustrates the nationwide indemnities paid, as well as the loss ratios over time. This chart illustrates that crop insurance has responded well in times of need, while also balancing out the needs of particular regions in any given year in order to meet the statutory loss ratio of 1.0 which is designed to protect the taxpayer who is also investing in crop insurance.

Yearly Indemnities and Loss Ratio

But, again, this illustration is a low bar in terms of measuring crop insurance’s overall value to producers and the country. The best measure of the actual full value of crop insurance is the broader economic impact of the producer investments protected and dollars leveraged in order for producers to sustain and improve their operations. This has value well beyond the farm to communities across the country.

While CIPA does not currently have a quantitative assessment on this broader value, we believe economic analysis to measure the full effect of covering, through crop insurance, nearly \$200 billion in producer investment that is at risk would be very useful indeed. What precisely has this protection done for agriculture in terms of advancing technology adoption, implement and storage sales, investment in conservation, and so on? We are confident that, in the end analysis, a powerful return on taxpayer dollars invested would be evidenced. As we near the 2023 Farm Bill debate, CIPA will work to ensure that the full benefit of crop insurance is quantified through expert economic analysis.

Second, again, while not a good measure of the overall value or economic value of crop insurance, indemnities paid are a good measure of efficiency. Here, we believe it is remarkable that total indemnities paid consistently exceed total taxpayer cost.

The following table compares total indemnities paid per year to the total Congressional Budget Office (CBO) costs associated with crop insurance (including premium cost-share, financial risk-sharing with private-sector companies, and administrative and operating (A&O) expense reimbursement over the past 10 years).

(Dollars in Millions)	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	Total	Average per Year
CBO Cost	\$4,810	\$13,734	\$8,244	\$7,280	\$4,157	\$4,208	\$6,445	\$12,290	\$9,358	\$4,591	\$75,117	\$7,512
CY Indemnities	\$17,490	\$12,108	\$9,146	\$6,345	\$3,934	\$5,445	\$7,336	\$10,682	\$9,181	\$9,586	\$91,254	\$9,125

Thus, under crop insurance, we have a tailored risk-management tool that leverages investment in the farm and ranch and which, on a national basis, is consistently paying 20 percent more than the total taxpayer investment in the program. This is a remarkable record of success.

Third, it is important to note the direct impact our crop insurance delivery system has on rural communities across the country. Based on industry data, more than 20,000 people are employed in the sales and servicing of crop insurance nationwide—including another 12,000 in office staff; some 5,000 claims adjusters; and more than 2,000 staff among the 14 current companies. This workforce dots the small- and mid-sized communities throughout the United States. These are folks who keep rural communities economically viable not only by keeping farm and ranch families—who are often the economic lifeblood of rural communities—in business but by directly paying good salaries and wages, and good benefits, to thousands of employees.

The data on crop insurance delivery also shows a remarkable positive trend toward greater efficiency. The chart below shows total A&O costs per acre and as a percentage of premium paid overtime. There are some problems in this area that simply must be addressed and addressed quickly—including the punitive impact of the 2011 cap on specialty crop policy A&O—but in the big picture it should not be overlooked that the agents, loss adjusters, and companies that deliver crop insurance to farmers and ranchers are doing so with incredible efficiency.

Total A&O Per Acre

Total Premium and Total A&O

Key Reasons for the Success of Crop Insurance

As the Committee takes stock of the needs of producers and the policies that serve them, I want to briefly lay out three unique qualities of crop insurance that we, as CIPA, believe are critical to its success and serve as important guideposts for the future.

1. Crop insurance coverage is highly relevant to each farm and ranch. When farmers or ranchers buy insurance, they tailor coverage to the needs of the farm or ranch, and they know they can rely on that contract. Crop insurance policies are financial risk management tools that provide security and peace of mind unique to each family farming or ranching operation so that producers can take care of their land and crops and make investments that will allow them to farm or ranch better each year. Crop insurance is all-inclusive, serving all farm and ranch families. Coverage is based on each producer's own history and risk profile, and producers control how much risk, and which risks they want to cover. By including all comers into Federal Crop Insurance and by avoiding arbitrary restrictions on participation, the crop insurance risk pool is vastly improved and this, in turn, results in lower premiums paid by all producers. Policies such as pay limits and adjusted gross income (AGI) means testing on crop insurance may, at first blush, sound favorable to smaller producers but such policies result in the loss of good risk in the risk pool, resulting in higher premiums for all producers who are left in the pool. In the end analysis, this would harm small farmers and ranchers.

2. Crop insurance is dynamic, changing to meet the needs of producers. As of 2021, Federal Crop Insurance policies were available on 130 crops, often with multiple kinds of insurance options available relative to these crops. These options are owing to the good work of a very high quality Risk Management Agency (RMA) staff in Washington and Kansas City and to the private-sector which has brought forward, through the 508(h) process, many new and important risk management products. Across Republican and Democratic Administrations, the Office of Management and Budget (OMB) has recommended ending the risk management development process. This would be a terrible mistake that would hurt every farmer and rancher in the country, especially those seeking to improve the quality of their coverage. Thankfully, Congress has time and again shown the greater wisdom in rejecting OMB's recommendations. Without such a process, we would not have revenue products, area-based products, margin coverage, special endorsements that cover unique perils, and many other products—especially for specialty crops—that might otherwise have no coverage at all. As the law is currently written, crop insurance is able to continue to adjust in order to better meet needs of all producers, regions, and crops. This has long been and should remain the goal.
3. The delivery system is responsive. As an agent, I compete for business with other agents in my area, some of whom are fellow CIPA agents who may be listening to this hearing today. Generally, we all are on a level playing field—selling the same products at the same price—and so our means of competing for market share are purely based upon service. Thus, the delivery system, whether among agents or among the companies, is highly focused on providing the best service and always improving—including through better understanding of customer needs, better information on what is available to address those needs, better technology, and better flow of data that ultimately redounds to the benefit of the producer customer. Congress has never had to allocate dollars for system upgrades for crop insurance delivery because the private-sector does this. Because of the competitive nature of the business, we have continually implemented upgrades to better meet the needs of more and more producers. This model has worked so well that now crop insurance data is being used in the delivery of Farm Service Agency (FSA) programs, and is even being used as farmers participate in carbon markets to reduce greenhouse gas emissions. In short, this public-private partnership in Federal Crop Insurance, that was first established by Congress back in 1980 and which makes the industry compete for the trust of the producers we serve, has proved to be highly, highly successful and it is a model that is worth building upon.

However, as briefly noted earlier in my testimony, there is a very urgent and serious problem in the structure of A&O for specialty crop policies that must be addressed. This flawed structure has resulted in deep, deep cuts in A&O relative to specialty crop policies in 2021 and very likely in 2022 even as workload relative to specialty crops has increased dramatically. This problem is further explained in a one-pager that is attached to this testimony.

We are very pleased that targeted relief to address this problem was included in the House version of the Agriculture Appropriations bill for FY 2023 with the strong, bipartisan backing of Chairman Sanford Bishop (D-GA) and Ranking Member Andy Harris (R-MD) and many Members of the Agriculture Appropriations Subcommittee and of the House Committee on Agriculture. Thank you very much for your strong support of specialty crop farmers and the agents and loss adjusters who serve them.

Marva Ulleland, a CIPA Board Member and agent with Northwest Farm Credit based in Spokane, Washington, was originally supposed to testify today, but a conflict prevented her from making the trip.

Marva works among agents who write insurance on hundreds of crops throughout the western United States. Insuring specialty crops is complicated, and the labor and time involved to cover such a book of business is very intensive. Many of these customers are smaller, more specialized, and historically underserved producers. Yet, because of the flawed design of the Standard Reinsurance Agreement's cap and its disproportionate impact on specialty crop A&O, the crop insurance policies for these producers and crops are being deeply cut—beyond levels that are sustainable.

In my agency, where we are mainly writing policies for larger row crops, the cuts in A&O per policy are at least mostly offset by rising overall premiums that translate into higher gross A&O before the deep factor (40% reduction in 2021—anticipated 55% reduction in 2022). We are still facing cuts but nowhere near the cuts being felt on specialty crop policies where prices and overall gross premium have

not kept pace. If left unaddressed, I fear these cuts to specialty crop policies will greatly undermine the risk management delivery system for specialty crops and the producers who grow them. It is worth noting that overall A&O has been frozen at 2015 levels, despite inflation, meaning crop insurance is doing more and more for less in terms of real dollars.

This is why CIPA has made it a priority to address this problem facing specialty crops. This is why we worked with Chairman Bishop, Ranking Member Harris, Rep. Jimmy Panetta (D-CA), Rep. Kat Cammack (R-FL), and other Members on a tailored fix that simply puts specialty crop A&O back to its 2020 levels, before the run up in row crop prices. And this is why we are so grateful to Chairman Bishop and Ranking Member Harris for including the provision in their legislation. If this provision becomes law, it will provide a bridge to the next farm bill.

Needs Looking Forward to the 2023 Farm Bill

As we look beyond the basic structural qualities of crop insurance, and more at the particular needs of producers and how we might meet those needs in the most constructive ways, we would first turn to the question of supplemental disaster assistance and the prospects for a standing disaster program, going forward.

It is and always has been the policy of CIPA that the producer comes first. The whole reason we are able to participate in Federal Crop Insurance is based on the need to support and provide meaningful risk management tools to our nation's farmers and ranchers. Therefore, on matters of how and whether to provide supplemental assistance, we are deferential to the wisdom of Congress, and simply want to be available to assist in the design and delivery of any program.

With that said, however, CIPA firmly believes that of the options available to Congress in the next farm bill—providing *ad hoc* disaster assistance, authorizing a permanent disaster program, or further strengthening crop insurance to increase participation rates at higher levels of coverage in order to close deductibles—history has shown that strengthening crop insurance is the best route for the farmer, rancher, and the taxpayer.

In regard to recent *ad hoc* programs, CIPA appreciates that the 2017 Wildfire and Hurricane Indemnity Program (WHIP), the 2018 and 2019 WHIP+, and 2020 and 2021 Emergency Relief Program (ERP) have all generally been crafted to build upon crop insurance and rely on crop insurance data rather than disincentivizing or undermining participation in crop insurance, though there is always room for improvement here.

My agency staff has spent countless hours with our farmers and ranchers helping them understand the calculations and put together the paperwork needed to receive all that they qualified for. This is true of all agents who have worked cooperatively with local FSA staff to help get the job done. This is not the job we are paid to do as crop insurance agents, nor do we receive any compensation or liability protection for our work in this area, but it is part of the service that agents provide to the farm and ranch families we serve because we feel it is our duty to help wherever there is a need. Similarly, during the pandemic, when most offices were shutting down, agencies remained opened to help producers make decisions under crop insurance and to navigate program rules for pandemic-related assistance.

In any event, *ad hoc* disaster programs have evolved over time, and some iterations have been better than others. The recent and ongoing ERP implementation has had its share of anomalies, but since its roll-out in late May the general consensus among farmers and ranchers has been positive in that their experience is that the ERP implementation has been much smoother than that of WHIP+. Here, too, however, there are some exceptions which Senators John Thune (R-SD) and Amy Klobuchar (D-MN) lay out well in their recent letter to the Department of Agriculture. We hope that these issues can be addressed to avoid unintended and inequitable outcomes for producers. Out of all of the *ad hoc* programs approved by Congress since 2017, the best administered was the prevented planting top-up program in 2019 where crop insurance simply used our own data and delivery system to make the additional payments.

CIPA understands there are complications with each approach, and we certainly understand the importance of program integrity and ensuring the data and payments are correct. We also appreciate the trend toward using crop insurance data and delivery systems for the implementation of disaster programs, and would only ask that we be consulted in future deliberations as to how efficiencies and better accountability can be achieved.

As to whether additional *ad hoc* support should be provided, CIPA would note that the political response by Congress in providing additional aid in response to natural disasters is consistent with what we perceive as a real need of producers on the ground.

The business of farming and ranching is increasingly involving higher and higher stakes and tighter and tighter margins. With increasing frequency of severe weather and market volatility, most farmers and ranchers very much wish to reduce their deductibles with higher levels of coverage. Crop insurance is making great strides in this area with products such as the Supplemental Coverage Option, Enhanced Coverage Option, Stacked Income Protection Plan, Margin Protection, Hurricane and Wind Index, and so forth. And, one of the greatest areas of growth in crop insurance is coverage for our dairy farmers and livestock producers. Building anything worthwhile takes time and effort and this is true in the case of crop insurance. But CIPA believes strongly that continued investment and growth in crop insurance to optimize coverage for all producers, all crops, and all regions of the country is the best path forward for farmers, ranchers, and taxpayers. History demonstrates that this approach provides eminently greater certainty and control to producers in managing their risk than *ad hoc* disaster or even a permanent disaster program. Crop insurance is simply the fastest, most efficient way of indemnifying producers for their losses and ensuring that the indemnification is precisely tailored to those losses. Maintaining and strengthening premium support and the development of new and innovative policies to mitigate unique risks are two avenues to achieving stronger crop insurance.

CIPA understands that funding will be a limiting factor in the next farm bill, just as it has been with every farm bill in the past. But we also believe that the cuts made in the 2014 Farm Bill that carried into the 2018 Farm Bill have rendered U.S. farm policy incapable of meeting the needs of U.S. producers.

For this reason, CIPA supports strengthening the farm safety net to ensure that the 2023 Farm Bill is up to the task of supporting our nation's farm and ranch families—and the national security interest of food, fiber, and fuel independence.

We support a strong Crop Insurance Title that helps farmers weather what Mother Nature and market volatility unleash. We support a stronger Commodity Title that provides a safety net to mitigate the impacts of high and rising foreign subsidies, tariffs, and non-tariff trade barriers. And we support a strong Conservation Title that provides conservation cost-share assistance to help producers continue to advance soil health, water and air quality, wildlife and wildlife habitat, and other important natural resource and conservation objectives. In regard to conservation, it is worth noting that farmers and ranchers must be profitable in order to carry out important conservation initiatives. Crop insurance is vital in this regard. There is from time to time a temptation to blur the lines between an actuarially sound Federal Crop Insurance and certain public policy objectives, such as promoting conservation. The prudent route is to keep crop insurance as purely insurance and address other public policy objectives separately. For instance, climate initiatives fit best within the conservation title to the farm bill. It is best not to mix program purposes because, in the end, it could weaken both mission areas rather than strengthen them.

All titles to the farm bill are very important. However, combined, these three titles provide the basic safety net for farmers and ranchers, a safety net that still accounts for less than ¼ of 1 percent of the total Federal budget. We believe our nation's farm and ranch families are a worthy investment and we would certainly support additional investments in these areas. A fully budgeted investment in these programs could very well obviate the need for future *ad hoc* assistance.

The following chart demonstrates this budget reality, showing our average per year assistance to farmers in the past 5 years compared to the budget baseline going forward.

In the case of Title [I], we believe a portion of the *ad hoc* dollars that were spent under the Market Facilitation Programs and the Coronavirus Food Assistance Programs could be allocated toward strengthening the Commodity Title. And, by the same token, we believe the roughly \$3 billion per year that has been spent under the *ad hoc* programs of WHIP, WHIP+, and ERP could provide better, more equitable, and more reliable assistance if used to strengthen crop insurance.

Budget Baseline Reality

Finally, moving beyond the topic of disaster assistance, we want to briefly touch on a few areas within crop insurance that we believe merit attention. These are outlined in the following bullets, and we look forward to working with you on these issues.

- We would specifically request that **Whole Farm Revenue Coverage** be expanded. The current limit on coverage is too narrow for the high-value specialty crops that use this product. If the limit is maintained, it should be allowed to be a band of coverage that can be placed at a lower level of deductible.
- Relative to **Prevented Planting (PP)** coverage, many improvements have been made but it still has problems. Care must be taken to ensure the assistance is meaningful when needed, but not excessive. It must work in prolonged drought conditions (like those in CA currently) and in flooding conditions alike with appropriate planting windows and dates.
- Regardless of budget allocations, we would encourage Congress to continue to support a robust **508(h) submission process**. The 508(h) and other product development authorities should be aggressively used to craft policies that provide all producers, crops, and regions with optimal coverage, including opportunities to close deductibles by purchasing higher levels of coverage.

Conclusion

Thank you again for this opportunity to offer testimony as you prepare for the 2023 Farm Bill.

Again, I want to offer my sincere thanks for your careful stewardship and support of policies that support our nation's farm and ranch families.

Please know how much we appreciate what you do.

On behalf of all CIPA agents from all corners of our country—thank you and we look forward to working with you on strengthening Crop Insurance and U.S. farm policy.

Crop Insurance for Specialty Crops is At Risk

The Problem: Crop insurance needs of specialty crop producers are growing—but resources to service specialty crop producers are plummeting. Crop insurance is the only safety net for specialty crop producers—but their closest advisors helping them manage rising risks are struggling to stay in the business. If left unaddressed, the squeeze is going to harm specialty crop producers because with diminished A&O the sales, servicing, and adjustment infrastructure will be badly damaged.

Specialty Crop A&O

Background:

- The problem is the result of a flawed design in the **2011 cap** on administrative and operating (A&O) expense reimbursement that affects the entire system.
- When commodity prices for major crops like corn, wheat, soybeans, or cotton, go up, the **factor** used to squeeze A&O under the cap goes down, affecting all crops and *disproportionately affecting specialty crops*.
- Specialty crop A&O decreased \$31 million in 2021, even as premium and acres covered increased. It is expected to decrease an additional \$23 million in 2022—a 2 year decrease of 37%.
- In the near-term, this is harming the small businesses that deliver crop insurance to specialty crop producers, who face rising fixed costs. While year-to-year marginal changes are expected, sharp downward swings like the current one are extremely difficult to manage in a single year and impossible to manage over a sustained period of time. For 2021 and 2022, the average agency serving specialty crop clients would have grown roughly 5% in sales and volume, but had their compensation slashed by 37% only because of the flawed design of the A&O cap.
- In short, *the volatility marked by steep decreases for specialty crop areas is not sustainable and needs to be fixed*, especially in the midst of current inflation.

Yearly A&O Savings from the Cap**The Solution:**

- Legislation is needed to stabilize specialty crop A&O back to the 2020 benchmark level. This is a targeted fix that will not affect other crops or parts of the crop insurance industry.
- This legislative solution will not reopen the Standard Reinsurance Agreement (SRA), nor cause any disruption to the business of crop insurance.
- The solution will claw back a tiny fraction of the savings achieved by the cap since 2011 to fix the disproportionate negative impact the cap is having on specialty crops.
- This solution will not make anyone whole—but it will help save a vital risk management tool for specialty crop producers and the thousands of people who advise specialty crop farmers, help them manage risk, and adjust their claims.

The CHAIR. Thank you very much, Ms. Fowler.

Mr. Offerdahl, please begin when you are ready.

**STATEMENT OF ALEX OFFERDAHL, CROP INSURANCE
DIVISION HEAD, WATTS AND ASSOCIATES, INC., BILLINGS, MT**

Mr. OFFERDAHL. Thank you. Thank you for this opportunity to discuss farmer-driven innovation in the Federal Crop Insurance Program through a feature referred to as the 508(h) process. I am the managing partner at Watts and Associates, and we are an agricultural economic research firm that specializes in crop insurance and analysis tools for farmers.

W&A has been one of the most active participants in the 508(h) process since its inception. We work primarily with farmer producer groups to develop new insurance programs tailored to their needs, their crops, and their regions. We are proud to have developed a sizable number of the 508(h) programs that have become important components of the overall 508(h) program. Federal crop insurance has succeeded because its unique design is a partnership between government and private industry. And 508(h) is a perfect example of this partnership.

The 508(h) process was first added to the Federal Crop Insurance Program in 1993 as a special avenue through which farmers could propose new ideas that could be directly incorporated into the insurance program. Innovation through 508(h) is not a peripheral

element of the program. Today, 86 percent of the crop insurance policies that are sold originated as 508(h) proposals. Revenue insurance for example, the largest component of the current program, originated as a 508(h) experiment in the 1990s. Margin insurance, which adds coverage for shifting input costs, a program that already exists today, started in 2014 as a 508(h) experiment. Important coverages for dairies, for hurricanes, for cottonseed, pulse crops, hemp, livestock, and countless enhancements to the program to meet specific changing needs for producers all began under 508(h).

The 508(h) process has several steps. To initiate a new product, a producer group or a crop insurance company will partner with a well-qualified team of developers to create a new program that is designed to solve a problem that the current program does not address. The proposed program has then been carefully vetted by the talented staff at the USDA Risk Management Agency to address any of the critical flaws that might be present in the design that could make it vulnerable to fraud, waste, and abuse. These have to be stamped out before a product can be put on.

Underwriting, premium rates, and compliance are all subject to rigorous technical review, including review by independent outside actuaries, agronomists, and underwriters with experience in crop insurance design. The Federal Crop Insurance Corporation's board then meets with the submitters to quiz them on any outstanding issues before voting on whether or not to approve a new program. We, as submitters, acknowledge that the approval process can be difficult and complex, and there have been many adjustments, including in the 2018 Farm Bill, to improve this process and to make it more accessible for more producers. What you have done is working.

We also need to respect the fact that the FCIC board has a special fiduciary responsibility to taxpayers, and their judgments on program design can affect the fairness to farmer customers and the stability of the agricultural markets we are looking to protect. If a proposal is approved by FCIC and it is implemented in the field, submitters are eligible for reimbursement of their expenses within reasonable bounds. This feature was added in 2000 to try and make it easier for producer groups to engage in this process and to solve their own problems proactively to make the program more adaptable to change. And it is working. Even under this system, if a product is never approved, the developers and the producer groups behind them are responsible for bearing the costs of development themselves.

The 508(h) process is not perfect, and we will have some suggestions for improvements as this process proceeds. But overall, it has been a tremendous success, and some minor adjustments to an overwhelmingly successful program is certainly a nice place to be.

So crop insurance today is a critical part of the agricultural safety net. It is relied on by farmers, by lenders, and by rural businesses in every part of the country. No USDA program reaches more farmers and more crops in more counties than crop insurance. Innovation through the 508(h) process has been a major factor in that success. Please continue what is working.

[The prepared statement of Mr. Offerdahl follows:]

PREPARED STATEMENT OF ALEX OFFERDAHL, CROP INSURANCE DIVISION HEAD,
WATTS AND ASSOCIATES, INC., BILLINGS, MT

Thank you for the opportunity to provide testimony to the Committee regarding the Federal Crop Insurance program and the important role that farmer-driven innovation plays in it through a unique Federal Crop insurance Corporation (FCIC) feature referred to as the 508(h) Process.

Watts and Associates, Inc. (W&A) is an agricultural economic research firm based in Montana, specializing in risk management solutions for American farm producers. We develop products for FCIC, insurance providers, and farm producer organizations. W&A has been one of the most active participants in the 508(h) Process since its inception. We work primarily with farm producer groups to develop new insurance programs tailored to their needs, crops, and regions. We are proud to have developed in a sizeable number of 508(h) programs that have become important components of the overall FCIC program. (See list, *attachment A*)

Federal Crop Insurance has succeeded because of its unique design as a partnership between government and private industry. The government, through the USDA Risk Management Agency (RMA), assures that farmers are offered crop insurance coverage under fair and consistent terms, and FCIC provides a financial backstop through both subsidy, to make participation more affordable, and reinsurance, to protect against extraordinary losses in bad years. Private companies share in the financial risk and compete to provide the highest levels of service to farmers. Together, this system harnesses what government and business each do best.

The 508(h) Process was first added to Federal crop insurance in 1993 as a special avenue through which farmers could propose new ideas that, if they satisfied rigorous technical standards and met important risk management needs, could be incorporated directly into the FCIC system. Innovation through 508(h) is not a peripheral element of the crop insurance program, but rather has become part of its essential mainstream, giving Federal crop insurance a vitality and responsiveness central to its success. About 86% of the policies sold for coverage offered today began as, or have direct roots in, original 508(h) proposals. Revenue insurance, for instance, today the largest single type of FCIC coverage, began in the 1990s as a 508(h) experiment. Margin insurance, which adds coverage for shifting inputs costs, was likewise developed and approved under the 508(h) process in recent years. Important new coverages for dairies, hurricanes, cotton seed, pulse crops, hemp, livestock, and countless enhancements for specific grower needs, all began under 508(h).

The 508(h) process has several steps. To initiate a new 508(h) product, a producer group or crop insurance company will partner with a well-qualified team of developers to create a new policy to solve problems that current offerings do not address. The development team creates all elements of the new program and presents it for consideration to the FCIC Board of Directors. The proposal is then carefully vetted by the Risk Management Agency's staff to assure there are no critical flaws in program design that would make it vulnerable to fraud, waste, or abuse. These experts assure that the proposal can be appropriately implemented with existing infrastructure, and that the premiums charged to producers are fair and reasonable. Underwriting, premium rates, and compliance are all subject to rigorous technical review, including review by independent outside actuaries, agronomists, and underwriters with experience in crop insurance design. The FCIC board then meets with the submitters to quiz them on any outstanding issues, before voting on whether to approve the new program for implementation.

We, as submitters, acknowledge that the approval process is too long, difficult, and complex, despite many adjustments made along the way to improve it. But we also respect the fact that the FCIC Board has special fiduciary responsibilities where taxpayer funds are involved and where their judgments on product design can affect fairness to farmer-customers and the stability of related agricultural markets. We take these responsibilities very seriously and understand that their care and analytic rigor are an important benefit of the program.

If a proposal is approved by FCIC and implemented in the field, the submitters are then eligible for reimbursement of reasonable development and maintenance costs. This feature was added by Congress in the 2000 Agricultural Risk Protection Act to encourage farm organizations to play a larger role in 508(h) by assisting them in bearing the financial risk of product development. Even under this system, if a product is never approved, the developers and the farmer-partners bear the loss of their development costs. Total reimbursement for development and maintenance costs in 2020 was about \$2.8 million, or about $\frac{3}{100}$ of 1 percent of the \$9.8 billion in premiums generated that year, of which some 86% was written to policies rooted in 508(h) submissions.

The 508(h) Process is not perfect. The high data standards imposed by the review process can make it difficult to create new policies for specialty, minor, or emerging crops. FCIC has imposed strict limits on the reimbursement of costs for maintaining and improving products after they are launched, making it difficult for developers to continue to invest in their ongoing success. Development teams could do a better job of engaging with crop insurance companies and with stakeholders to make them aware of forthcoming products and embrace their valuable input. Every new product introduces additional complexity and costs; when a new product is introduced and fails in the marketplace, there should be a clearer process to sunset it. Each of these challenges are worthy of consideration, but they represent minor adjustments to an overwhelmingly successful program.

Crop insurance today is a central part of the agricultural safety net, relied on by farmers, lenders, and rural businesses in every part of the country, and reaching more crops and farmers than any other USDA program. It is a public and private partnership that has grown and evolved, continually innovating to better meet farmers' needs, and 508(h) is the proven driver of that innovation. Again, I thank you for the opportunity to address the Committee and I will be happy to take any questions.

ATTACHMENT A

Selected Products Developed by Watts and Associates

Product (Offer Period)	Acres	Liability	Premium	Indemnity	Cumulative Loss Ratio
Margin Protection (2016–2021)	6,902,261.00	\$4,724,770,131	\$281,226,341	\$41,355,130	0.147
Popcorn Revenue (2012–2021)	1,966,185.00	\$1,213,365,478	\$87,753,003	\$72,610,363	0.827

*W&A developed additional programs not represented in these data. Specialty Corn and Canola programs were ceded to RMA for operation. Malt Barley Endorsement and Cottonseed Endorsement are both inexorably linked to underlying policies and therefore should not be represented as in insurance experience as if they are distinct. W&A's role in other product developments are contributors or as developers under contract to USDA Risk Management Agency are omitted from this listing.

The CHAIR. Thank you, Mr. Offerdahl.
Mr. Haag, you are now recognized for 5 minutes.

**STATEMENT OF TOM HAAG, FIRST VICE PRESIDENT,
NATIONAL CORN GROWERS ASSOCIATION, EDEN VALLEY, MN**

Mr. HAAG. Chair Bustos, Ranking Member Austin Scott, and Members of the Subcommittee, thank you for the opportunity to testify today. My name is Tom Haag. I am a fourth-generation family farmer in south central Minnesota where my son and I grow over 1,700 acres of corn and soybeans.

Federal crop insurance is a major pillar of risk management for the vast majority of corn farmers. Simply put, the public-private partnership of crop insurance works and plays a significant role for agriculture in the wake of natural disasters. As growers sit down with their lenders and make plans for the upcoming crop year, we spend a good amount of time discussing our cost of inputs, crop rotations, and making our market strategies. We also work through the Federal crop insurance coverage options with our lenders and our crop insurance agents in order to purchase the policies that work best for our farms.

In 2021, corn farmers bought more than 587,000 Federal crop insurance policies, insuring over \$52 billion worth of liabilities. Nationwide, there was coverage on 83 million acres of corn with an additional 10 million acres that had companion endorsement policies. In my home state alone, Minnesota, were over 42,000 policies,

which covered 8 million acres of corn. The bulk of corn growers purchase revenue protection, which protects lost revenue due to production loss, changes in price, or both. Built into these policies is important coverage against prices rising at harvest time. Corn growers also have access to Supplemental Coverage Option, the Enhanced Coverage Option, margin protection policies, and Whole-Farm Revenue Protection.

Implementation of the farm bill has been very smooth. The Crop Insurance Title allowed for the enterprise units to include land across county lines and the creation of multi-county enterprise units. Corn growers are pleased with the increased coordination between USDA agencies, including the Farm Service Agency, aligning deadlines for commodity programs with the crop insurance sales closing dates, and RMA working with the Natural Resources Conservation Service to allow cover crops as a qualifying good farming practice.

The 2018 Farm Bill included direction for RMA to research and develop new policies, including the quality loss option. While it has not solved many of the issues that growers face when confronting quality losses such as vomitoxin and low test weights, we appreciate that the option is available. In 2020, RMA released the Hurricane Insurance Protection-Wind Index policy, which provides coverage on over 70 crops, including corn.

Since the 2018 Farm Bill, agriculture has faced multiple weather patterns. During the planting season this year, growers across the Northern Plains had delays due to cold weather and wet weather. For many producers, droughts continue to be a major cause for concern this year. Approximately 30 percent of corn production is within an area experiencing drought conditions.

When widespread disasters strike crop insurance companies are generally able to provide timely loss adjustments and to quickly process the bulk of indemnity payments. While individual growers are not made whole, crop insurance provides the tools and ability to recover and continue operating into the next year. NCGA and affiliated state associations continue to lead and partner with other entities for the creation of new risk management tools. We have been successful in developing policies, including the widely adopted trend-adjusted yield endorsement and the recent endorsement for corn growers who split-apply nitrogen.

Last week, NCGA held our Corn Congress summer fly-in. Corn Growers stressed that our number-one priority for the farm bill is to protect crop insurance from the harmful budget cuts and reforms. The result of our nationwide survey shows that corn growers overwhelmingly choose the Crop Insurance Title as the most important, and that cuts to the Federal crop insurance would negatively impact our farming operations.

In closing, we are grateful that the Agriculture Committee prevented attempts at harmful reductions to crop insurance. We appreciate your consideration of our views and the need for our producers to have effective and affordable risk management tools. Thank you.

[The prepared statement of Mr. Haag follows:]

PREPARED STATEMENT OF TOM HAAG, FIRST VICE PRESIDENT, NATIONAL CORN
GROWERS ASSOCIATION, EDEN VALLEY, MN

Chair Bustos, Ranking Member Austin Scott, and Members of the General Farm Commodities and Risk Management Subcommittee, thank you for the invitation and opportunity to testify today.

My name is Tom Haag. I am a fourth-generation family farmer in south-central Minnesota where my son and I grow more than 1,700 acres of corn and soybeans.

I currently serve as the First Vice President of the National Corn Growers Association (NCGA). Founded in 1957, we are a farmer-led trade association that works with our affiliated state associations to help protect and advance corn growers' interests. The NCGA mission is to create and increase opportunities for corn growers and our vision is to sustainably feed and fuel a growing world.

On behalf of the nearly 40,000 dues-paying corn farmers nationwide and more than 300,000 corn growers who contribute to corn promotion programs in their states, thank you for your public service and dedication to agriculture, rural America, and the farm economy.

This morning, I will focus on the importance of Federal crop insurance to corn growers, highlight successes from the 2018 Farm Bill, and provide some early thoughts on the development of the next farm bill.

Importance and Use of Crop Insurance for Corn

Federal crop insurance is a major pillar of risk management for the vast majority of corn growers. Simply put, the public private partnership of crop insurance works and plays a significant role for agriculture in the wake of natural disasters.

Every year across the country, growers sit down with their lenders to strategize and make financial plans for the upcoming crop year. While we spend a good amount of time discussing the costs of inputs, crop rotations, and our marketing strategies, we also work through our coverage options under Federal crop insurance coverage.

The role and responsibility of crop insurance agents in delivering the program is immense. We value the advice from our agents, who compete solely on service, as we purchase the policies and endorsements that best work for our farms and our risk profiles.

These individual farmer, lender, and agent conversations about risk management add up. According to the Risk Management Agency (RMA) Summary of Business, in 2021, corn farmers bought over 587,000 Federal crop insurance policies, insuring over \$52 billion in liabilities. Nationwide, these purchases meant that there was much needed Federal crop insurance coverage on over 83 million acres of corn, with an additional 10 million acres that had companion and endorsement policies. In my home state of Minnesota alone, last year there were over 42,000 corn policies sold covering more than 8 million acres of corn.

The bulk of corn growers purchase revenue protection, which protects against loss of revenue due to a production loss, change in price, or a combination of both. In 2021, revenue protection policies alone covered over 76 million acres of corn. Built into these policies is important coverage against prices rising at harvest time, which is critical coverage for farmers who forward sell their corn and other crops, as well as livestock producers who produce their own grain. As producers make decisions on their policies, they can choose to exclude harvest price protection. However, less than 600,00 acres of corn were covered under this type of exclusion last year. Yield protection policies, which protects against a production loss, covered an additional 4 million acres of corn in 2021.

Corn growers also have access to many endorsements and options including several area wide policies. In 2021, over 4.4 million acres had coverage through the Supplemental Coverage Option (SCO) and 3.5 million acres had coverage through the new Enhanced Coverage Option (ECO). The policies are optional endorsements where growers can pay for additional area-based coverage for a portion of their underlying crop insurance policy. While not at the scale of these revenue, yield, and area wide policies, corn growers also purchase margin protection policies, whole-farm revenue protection (WFRP) and the new hurricane insurance protection—wind index (HIP-WI).

Implementation of the 2018 Farm Bill

During development, passage, and implementation of the 2018 Farm Bill, NCGA's top priority has been to maintain support for a robust crop insurance program. Both the House and Senate Agriculture Committees were able to defeat attacks to the program and also found ways to strengthen Federal crop insurance. Thank you for providing the certainty and predictability of this proven program.

Overall, implementation of the farm bill and the crop insurance title in particular has been fairly smooth. RMA continues to be a great partner with producers and commodity organizations. Agency leadership and staff have open lines of communication with stakeholders and regularly engage with producer groups.

A key provision in the crop insurance title is the allowance for an enterprise unit to include land across county lines and the creation of multi-county enterprise units. Corn growers advocated for these changes which enhanced program integrity and resulted in savings for the taxpayer and farmer. We were pleased that RMA immediately implemented these provisions.

Corn growers are also pleased with results stemming from increased coordination between USDA agencies. The 2018 Farm Bill allows for producers to have an annual election between the major commodity programs, Agriculture Risk Coverage and Price Loss Coverage. Starting in 2021, the annual election deadline for these Farm Service Agency (FSA) programs are now aligned with majority of crop insurance purchase deadlines for row crops. The unified decision deadline and sales closing date of March 15 each year helps ease implementation for USDA, crop insurance agents, and ultimately producers.

RMA has also continued to improve coordination and policies with the Natural Resources Conservation Service (NRCS). The crop insurance title specified that cover crops qualify as a good farming practice if the grower follows NRCS guidelines. This provision and successful implementation have resulted in decreased barriers, both real and perceived, for growers implementing this important conservation practice.

USDA should be commended for their efforts to further reduce the reporting burden on producers. Corn growers appreciate the agencies' efforts to allow farmers to submit additional information electronically, which may reduce the number and length of in-person visits to crop insurance agents and FSA county offices. For example, during implementation of the recent Emergency Relief Program, FSA was able to use crop insurance data that was previously submitted to the department in order to streamline applications for phase one of the program.

Unfortunately, data transfer and compatibility issues between USDA agencies continue to exist and can cause headaches and inequities for producers. NCGA supports the continuation of the Acreage and Crop Reporting Streamlining Initiative (ACRSI) and similar efforts to improve the farmer customer experience and create greater efficiency for multiple program delivery. The agencies are already working closer together and should continue to find additional ways to share common data, while maintaining strict producer confidentiality protections. For these efforts to be successful, USDA should also continue to work with external stakeholders including approved insurance providers, crop insurance agents, extension professionals, and producer groups.

Quality Losses and Hurricane Coverage

The 2018 Farm Bill included direction for RMA to research and develop new policies including coverage for quality losses and hurricane coverage. Under certain abnormal circumstances, weather related challenges can cause and exacerbate quality issues for corn and other commodities that result in market discounts. In extreme cases growers may be unable to sell their grain. Common quality loss issues during corn production and harvest range from mycotoxins, such as aflatoxin and vomitoxin, to low test weights. Historically, crop insurance could compound these issues by reducing a producer's actual production history (APH) despite the farmer having normal or average production in terms of yields, even if a crop insurance indemnity was not triggered.

RMA has developed and implemented the Quality Loss option (QL). Producers that chose the option are able to exclude the quality loss from an Actual Production History (APH) database.

This option became available in 2021 and is offered at an actuarially sound premium rate. While the QL option has not solved many of the non-crop insurance issues that growers face when confronting quality losses, corn growers appreciate the option where it is available.

In 2020, RMA released the Hurricane Insurance Protection—Wind Index (HIP-WI). The policy covers a portion of the deductible of the underlying crop insurance policy when a county is within the area of sustained hurricane-force winds. HIP-WI provides coverage for 70 different crops, including corn, and is available in counties near the Gulf of Mexico, the Atlantic, and Hawaii.

In 2021, corn growers covered 1.5 million acres and \$212 million in liabilities through the HIP-WI endorsement. In the same year, according to the RMA summary of business, there were \$83.7 million in indemnities for all eligible crops. The top five largest indemnities by crop included cotton, rice, sugarcane, corn and soy-

beans. Corn growers are appreciative of the efforts by Congress and the RMA to expand Federal crop insurance coverage to producers who experience these types of events.

Weather Related Disasters

Since the 2018 Farm Bill was signed into law, agriculture has faced difficulties with too much and too little rain, as well as multiple unique weather events. As Congress intended, crop insurance provides farm owners and operators the ability to plan for and respond to weather-related losses outside of their control. Given the size and geographic footprint of corn acreage in the United States, weather related yield losses are likely to impact at least some corn growers each year.

During this year's planting season, growers across the Northern Plains faced delays due to cold and wet weather. In some areas, corn growers were unable to access fields by the crop insurance final planting date. Under existing policies, producers who are unable to plant due to an insurable cause of loss may receive a prevented planting indemnity or receive a reduced insurance guarantee if they plant within the late planting period. Producers also have the flexibility to choose to plant a different crop with a later final planting date. Prevented planting is essential coverage during the critical planting season.

Despite these early challenges with wet weather, most producers were able to plant a crop. USDA's National Agricultural Statistics Service (NASS) latest report on June 30, 2022, estimates that 89.9 million acres of corn have been planted in the United States for 2022. This represents a much smaller reduction to corn acreage than previously forecast by USDA.

For many producers, drought continues to be a major cause of concern and loss. As of July 12, 2022, the U.S. Drought Monitor estimates that approximately 30% of corn production is within an area currently experiencing drought conditions. This includes 98% of corn in Colorado, 96% in Texas, 78% in Louisiana, 76% in Kentucky and 70% in Tennessee.

While many corn producing areas are currently experiencing some level of drought, there are notably areas of D3 extreme drought in Colorado, Nebraska, Kansas, and Iowa. Growers also face D4 exceptional drought in Kansas and Texas.

In 2021, U.S. growers planted 93.4 million acres of corn, which produced over 15.1 billion bushels with a value estimated at \$82.3 billion. Widespread drought and intense heat impacted much of the corn belt during the growing season. Nationwide crop insurance indemnities to corn growers totaled \$1.8 billion.

During the 2020 growing season, corn growers across Nebraska, Iowa, Illinois, and Indiana suffered major losses due to the devastating derecho. The storm and accompanying damaging winds hit millions of acres of highly productive crop land in August before corn harvest could begin. Overall crop insurance indemnities to corn growers totaled \$2.6 billion for the year.

Corn production was also heavily impacted in 2019 by wet weather conditions during planting the season with flooding and excess moisture across the high plains and throughout the Missouri River Basin. The wet spring prevented many farmers from accessing flooded fields. Nationwide, 2019 set a record with over 19 million acres of cropland reported as prevented from being planted. This included over 11 million acres of corn that were reported as prevented from being planted. For 2019, nationwide crop insurance indemnities to corn growers, including prevented planting coverage, totaled \$4 billion.

When widespread disasters like these strike, crop insurance companies are generally able to provide timely loss adjustments and to quickly process the bulk of indemnity payments. While individual corn growers are not made whole from their losses, crop insurance provides the tools and ability to recover and continue operating into the next crop year.

Corn growers also appreciate RMA's responsiveness to producer concerns in the wake of disasters. For example, in 2021 RMA made permanent previous flexibility for producers with crop insurance to hay, graze or chop cover crops at any time and still receive 100% of the prevented planting payment. RMA updated this policy in part to support the use of cover crops, an increasingly important conservation practice if producers are unable to plant a row crop.

Crop Insurance Product Development

Corn growers understand and appreciate that in order to meet the growing list of challenges and demands of tomorrow, Federal crop insurance policies must not be stagnant. NCGA policy on risk management clearly states that we, "support the development of new and innovative risk management products to provide a wide array of tools to help producers manage price and yield risks."

NCGA and our affiliated states continue to lead and partner with other forward-thinking entities for the study and creation of new risk management tools. Whether through Federal research and development or private development and approval of Federal policies, NCGA and our state associations have been successful in developing policies that follow sound insurance principles and are actuarially appropriate. Examples of successful efforts include the widely adopted Trend-Adjusted Yield Endorsement and the recent endorsement for corn producers who split apply nitrogen.

Corn growers and producers of other commodities and specialty crops have all benefited from the ability for the Federal Crop Insurance Corporation Board to authorize and approve development of new products, endorsements, and options.

Future Farm Bill Recommendations

Corn growers appreciate the work by this Subcommittee and the full Committee to review implementation of the 2018 Farm Bill. Last week, corn growers from across the country were in Washington, D.C. as part of our “Corn Congress” summer fly in. Throughout the week, corn growers stressed with their Members of Congress the important role that the farm bill plays in their lives and rural America. Our number one priority for the farm bill is to protect crop insurance from harmful budget cuts and reforms.

The results from our recent nationwide survey of grower members and non-members provided key intelligence that backs up our policy stance. When asked, “which of the farm bill titles are the most important to you?” corn growers overwhelmingly chose the crop insurance title. In the survey work, growers also stressed that cuts to Federal crop insurance, would negatively impact their farming operations.

As a grassroots and member driven association, NCGA and our state affiliates are continuing to do our homework so we can provide additional recommendations as the Committee turns its’ attention to developing and negotiating the next farm bill. Our grower led Action Teams met last week and held discussions on USDA programs and policies as we continue to develop additional recommendations for accessible and defensible risk management tools.

In the ramp up to the farm bill, NCGA continues to engage in multiple broad-based coalitions on potential recommendations. As a steering committee member of the Food and Agriculture Climate Alliance (FACA), NCGA is involved in the FACA’s farm bill working groups. This coalition work includes a working group focused on exploring proposals and limitations of potential climate policy in the crop insurance, commodity, and credit titles heading into the 2023 Farm Bill. NCGA also continues to be involved with the AGree Economic and Environmental Risk Coalition (E2 Coalition) that focuses on recommendations for agriculture data and reducing policy barriers to conservation practice adoption.

While crop insurance continues to be our top farm bill priority, NCGA is also focused on strengthening the producer safety net, supporting voluntary conservation programs, and bolstering the international market development programs. We look forward to sharing more specific NCGA policy priorities and coalition recommendations in the months ahead.

Closing

Hearings like today’s are important opportunities for users of USDA programs to accurately explain and defend the programs to fellow growers, taxpayers, and other interests. We understand that the complexity of the farm economy and Federal policies require constant education of Members of Congress on the importance and structure of the safety net.

NCGA will continue to highlight lessons we have learned from the past, including when some groups and Members have pushed the mistaken belief that crop insurance programs should be significantly reduced or reformed. We are grateful that leaders from the Agriculture Committees have stood up and prevented these previous attempts at harmful reductions to crop insurance.

In closing, NCGA recognizes the difficult task ahead for the Committee to develop the next farm bill. We understand that there will be continued budget challenges and varied approaches to confronting the many current issues impacting agriculture. We appreciate your consideration of our views regarding crop insurance programs and the need for producers to have access to effective and affordable risk management tools.

The CHAIR. Thank you Mr. Haag.

Mr. Cromley, who is with us virtually, you can begin when you are ready.

**STATEMENT OF LEE CROMLEY, GEORGIA STATE CHAIRMAN,
AMERICAN COTTON PRODUCERS, BROOKLET, GA**

Mr. CROMLEY. Thank you, Madam Chair and Ranking Member Scott, for the opportunity to speak to you today. Thank you for all the good work you do for agriculture. I am Lee Cromley from Brooklet, Georgia. I am a sixth-generation farmer, farming with my brother Charlie. We farm 2,500 acres of cotton and peanuts. Our farm is located west of Savannah about 60 miles off the Atlantic Coast, which puts us in the target of hurricanes on a fairly regular basis. I am testifying today on behalf of the members and growers of National Cotton Council.

Crop insurance is an absolute necessity for cotton producers. Improving the risk management options for producers has been a top priority for the cotton industry for many, many years. A key component of crop insurance is the public-private partnership between the government and private companies that offer products, as well as the agents who service these policies.

In the current economic climate [inaudible] essential tools to counteract these challenges is a must for any cotton grower. One of our industry's great achievements was the creation of the Stacked Income Protection Plan for upland cotton. STAX is an essential risk management tool for many producers and should be protected as the upcoming farm bill is developed.

In the fall of 2016, the Southeast received tremendous amounts of rainfall just prior to harvest due to Hurricane Matthew. Many producers in the region experienced substantial quality discounts for lint and seed. We are grateful that in 2018 RMA aligned cotton quality loss calculations with other commodities by changing the deductible to a trigger set at ten percent, thus allowing growers to fully capture the amount of quality loss.

In 2020, excessive rainfall and extended periods of overcast skies caused the splitting of our cotton seed inside the fiber, leading to major quality discounts for Georgia growers. The quality loss adjustment created by USDA Farm Service Agency for 2018 and 2019 was bureaucratic with many implementation challenges. It is vital that when phase 2 of the Emergency Relief Program for quality losses is developed, producers like me and others who suffer quality losses due to seed coat fragments are eligible for this assistance.

Georgia cotton growers lost [inaudible] due to the devastating impacts from Hurricanes Matthew, Irma, and Michael. These producers saw record crops wiped away in an instant due to the powerful forces of Mother Nature. After these storms, RMA created the Hurricane Insurance Protection-Wind Index. This product is an affordable risk management option for many growers who are at risk yearly due to their proximity to the coast.

While we are grateful to RMA for the creation of this new hurricane product, additional improvements are needed to make this more effective. Growers who have suffered losses from tropical storms and depressions are ineligible for the hurricane policy. Tropical storms and other events like this can have damaging winds, while also leaving devastating amounts of rainfall, causing flooding that would decimate a cotton crop, especially near harvest.

RMA should also hopefully create a multi-peril crop insurance product that gives growers credit for the crop that is in the field

instead of only crediting growers for their annual production history. For example, in 2018, growers in Georgia, Florida, and Alabama were expecting record to near-record cotton yields until Hurricane Michael. Unfortunately, growers were only compensated on the APH information well below actual yields on the farm. Growers should have an option to purchase a product that will insure the actual crop value of the farm.

In the past, there have been proposals that would impose an arbitrary means test to crop insurance or limit the amount of premium discount a producer can receive. I strongly urge you to oppose any attempt to implement any proposals along these lines. Limiting access to these products would cause some producers to completely exit the insurance market, which in turn would alter the risk pool and potentially increase the premium rates across the board.

I am grateful for the opportunity to testify today. We look forward to working with the Committee to address the necessary improvements discussed in today's hearings, and I will be happy to answer any questions at the appropriate time. Thank you so much.

[The prepared statement of Mr. Cromley follows:]

PREPARED STATEMENT OF LEE CROMLEY, GEORGIA STATE CHAIRMAN, AMERICAN COTTON PRODUCERS, BROOKLET, GA

Introduction

Good morning, I am Lee Cromley, from Brooklet, GA. I am a sixth generation farmer along with my brother Charlie, and we farm 2,500 acres of cotton and peanuts.

I am also actively involved with the National Cotton Council, a Georgia State Chairman of the American Cotton Producers, Second Vice-President of Cotton Council International, former President and Chairman of Southern Cotton Growers, and Vice-Chairman of the Georgia Cotton Commission.

The National Cotton Council (NCC) is the central organization of the United States cotton industry. Its members include producers, ginners, cottonseed processors and merchandizers, merchants, cooperatives, warehousemen, and textile manufacturers. A majority of the industry is concentrated in 17 cotton-producing states stretching from California to Virginia. U.S. cotton producers cultivate between 10 and 14 million acres of cotton with production averaging 12 to 20 million 480 lb bales annually. The downstream manufacturers of cotton apparel and home furnishings are in virtually every state. Farms and businesses directly involved in the production, distribution and processing of cotton employ more than 115,000 workers and produce direct business revenue of more than \$22 billion. Annual cotton production is valued at more than \$5.5 billion at the farm gate, the point at which the producer markets the crop. Accounting for the ripple effect of cotton through the broader economy, direct and indirect employment surpasses 265,000 workers with economic activity of almost \$75 billion. In addition to the cotton fiber, cottonseed products are used for livestock feed and cottonseed oil is used as an ingredient in food products as well as being a premium cooking oil.

Crop Insurance Overview

Grower access to a strong and fully accessible suite of crop insurance products that producers can purchase to tailor their risk management to their specific needs to address yield and price volatility within the growing season is a critical component to manage yield and revenue risks on the farm. A key component of crop insurance is the public-private partnership between the government and the private companies that offer the products, as well as the agents who service the policies.

Crop insurance is an absolute necessity for cotton producers. Improving the risk management options for producers has been a top priority for the cotton industry for many years. The Council has long supported methods that would make higher levels of insurance coverage more affordable. There is no worse place for a producer to find themselves than having invested in a crop all year only to realize their overall yield or revenue has fallen to a point at or near their insurance guarantee. In the current economic climate of higher input costs, access to the essential tools to

counteract these challenges is a must for any cotton grower. Over the years, with the help of Congress and USDA's Risk Management Agency (RMA), crop insurance participation has grown substantially. In 2021, 10.8 million acres of upland cotton were protected by some form of crop insurance. This represents more than 97% of all upland acres.

Stacked Income Protection Plan (STAX)

Area and county wide policies are also giving producers additional options to manage production risks. One of our industry's great achievements was the creation of the Stacked Income Protection Plan (STAX) for upland cotton. STAX is a crop insurance product for upland cotton that provides coverage for a portion of the expected revenue in a grower's production area, most often your county. STAX may be purchased as a stand-alone policy, or in conjunction with another policy referred to as a "companion policy." Companion policies may include Yield Protection, Revenue Protection, Revenue Protection with the Harvest Price Exclusion, and any of the Area Risk Protection Insurance policies.

STAX remains a critical tool since cotton's reestablishment as a covered commodity through Area Revenue Coverage (ARC) and Price Loss Coverage (PLC) with the formation of the seed cotton program in the 2018 Bipartisan Budget Act. With the passage of the 2018 Farm Bill, cotton producers, beginning with the 2019 crop, were prohibited from enrolling seed cotton base acres in ARC or PLC if STAX was purchased. This option created a choice with most producers choosing to enroll their seed cotton base acres in PLC instead of purchasing STAX. However, there are many growers across the Cotton Belt who do not have historic seed cotton base acres to enroll in PLC and STAX is an effective and affordable option for these producers.

In 2022, with the recent uptick of commodity prices, including cotton lint and cottonseed, many growers with seed cotton base acres declined to enroll in ARC or PLC and purchased STAX. On my farm in Georgia, I have bought STAX every year on farms where there is no seed cotton base. This year, I purchased STAX on all my farms. STAX is an essential risk management tool for many producers and shallow loss programs like STAX should be protected as the upcoming farm bill is developed.

Quality Loss

In the fall of 2016, South Carolina, North Carolina, Virginia, and parts of Georgia, including my farm, received tremendous rainfall just prior to harvest due to Hurricane Matthew. For many of these producers, yields were in line with their annual production history (APH), but the harvested cotton had severe quality issues, resulting in severe market discounts. At the time, cotton's base policy included a quality loss adjustment, but the provision included a 15% deductible and with quality losses in excess of 15% incorporated into the production to count, thus lowering a producer's yield for insurance purposes. Many growers in the Southeast were not familiar with the specific calculations of the quality loss adjustment since it was rarely used. Many producers in this region experienced substantial quality discounts for lint and seed, yet due to the quality deductible and relatively shallow quantity losses, received no benefit from the quality loss adjustment. We are grateful that in 2018 RMA aligned cotton quality loss calculations with other commodities by changing the deductible to a trigger set at 10%, thus allowing growers to fully capture the amount of quality loss.

In addition, in the 2018 Farm Bill, Congress directed RMA to enhance the quality loss provisions. This option became available for the 2021 crop year and allows pre-quality production amounts to be used to establish the APH instead of post-quality production amounts.

In 2020, excessive rainfall and extended periods of overcast skies caused the splitting of the cottonseed inside the fiber leading to major quality discounts for Georgia growers. The Quality Loss Adjustment (QLA) created by USDA Farm Service Agency (FSA) from 2018–2019 was bureaucratic with numerous implementation challenges that placed the responsibility on reporting quality losses on merchandizers and gins. Moreover, restrictive quality loss thresholds as well as prohibitions on producers who had a WHIP+ claim and a crop insurance indemnity from participating made QLA ineffective for many producers. It is vital that when Phase 2 of the Emergency Relief Program (ERP) for quality losses is developed, producers like me and others who suffered quality losses due to seed coat fragments are eligible for assistance.

Hurricane Insurance Protection-Wind Index (HIP-WI)

According to the University of Georgia College of Agriculture and Environmental Sciences, Georgia's cotton growers lost \$1.1 billion due to the devastating impacts

from Hurricanes Matthew, Irma, and Michael. These producers saw record crops wiped away in an instant due to the powerful forces of Mother Nature.

After these storms, RMA created HIP-WI that covers a portion of the deductible of the underlying crop insurance policy when a county, or adjacent county, is within the area of sustained hurricane-force winds. The coverage provided by HIP-WI can be combined with the Supplemental Coverage Option (SCO) and the Stacked Income Protection Plan (STAX) when acreage is also insured by a companion policy.

HIP-WI provided coverage for 70 different crops including cotton and is available in counties in the vicinity of the Gulf of Mexico and the Atlantic, as well as Hawaii. This product is an affordable risk management option for many growers who are at risk yearly due to their proximity to the coast.

While we are grateful to RMA for the creation of HIP-WI, additional improvements are needed to make it more effective. Growers that suffered losses from tropical storms and/or depressions are ineligible for HIP-WI since the product is exclusive to hurricanes. Tropical storms or other events can have damaging winds while also leaving devastating amounts of rainfall causing flooding that will decimate a cotton crop especially near harvest.

RMA should also create a multi-peril crop insurance product that gives growers credit for the crop that is in the field instead of only crediting growers for their annual production history (APH). In 2018, growers in Georgia as well as the Wiregrass region of Alabama and the Florida Panhandle were expecting record to near-record cotton yields until Hurricane Michael, one of the most powerful hurricanes ever to hit the United States. Instead of receiving indemnities on crops that were yielding 1,000 to 1,500 pounds an acre, growers were only compensated on APH information well below the actual yields on the farm. Growers should have an option to purchase a product that will insure their expected crop value.

APH looks back at a grower's history over a 10 year production window to determine the insurable value of the crop. However, producers continue to see annual improvements in their crop yields due to constant improvements in crop technologies and more efficient production practices, many of which contribute to soil health. These improvements often cause the yield data in a grower's APH to lag or underestimate the farm's current yield potential. These continual improvements should be captured in today's crop insurance products.

Oppose Arbitrary Means Testing or Limitations

In the past, there have been proposals that would impose arbitrary means tests to crop insurance or limit the amount of premium discount a producer can receive. I strongly urge you to oppose any attempt to implement any proposal along these lines. While we believe these limits should not apply to any farm program benefits, crop insurance is categorically different. Limiting access to these products would cause some producers to completely exit the crop insurance market. Their exodus from the program would in turn impact all remaining producers who purchase crop insurance by altering the risk pool and potentially increasing the premium rates across the board.

Conclusion

In closing, the NCC is grateful for the role Congress and RMA have played in making crop insurance a functioning and affordable option for the vast majority of U.S. cotton producers. When disasters have arisen or areas for improvement in crop insurance have surfaced, the Agriculture Committees as well as USDA have responded to ensure crop insurance continues to be a critical part of the portfolio for cotton growers for years to come.

We are grateful for the opportunity to testify, and we look forward to working with the Committee to address the necessary improvements discussed in today's hearing. I will be happy to answer any your questions.

The CHAIR. Thank you, Mr. Cromley.

At this time, Members will be recognized for questions in order of seniority, alternating between the Majority and the Minority Members. You will each be recognized for 5 minutes in order to allow us to get through as many questions as possible. As a reminder, please keep your microphones muted whether you are with us virtually or here so we can minimize any background noise and make sure that we pay attention to our business at hand.

I am going to start by recognizing myself for 5 minutes with questions.

Mr. Offerdahl, I will start with you. As a developer who has gathered data, put together product proposals, and gone through the submission process for new risk management options, can you please talk about how the Federal Crop Insurance Corporation reviews proposed products and the sort of considerations they have to make in evaluating and approving those proposals? And just as a follow-up to that, if I can make this a two-parter—you want me to wait till the second part?

Mr. OFFERDAHL. No, ma'am. I will try and—

The CHAIR. Okay, second part, can you also talk about the confidentiality requirements that are in place as products are reviewed and whether you think confidentiality is required?

Mr. OFFERDAHL. Okay. So thank you very much for your question. First, to talk about the data that is required in the submission process, generally, the best ideas for new crop insurance products come from producers themselves. They are the ones who best understand the risks that they are facing and the limitations of the current products. So typically, a new product development process starts with a phone call from a producer who has a specific problem they are looking to solve. From there, the first task is to try to determine if crop insurance is the best way to address this problem. And in a lot of situations, it is not. There are other things that producers can do to manage their risk or to address the problem. But occasionally, it turns out that crop insurance is the best way to address that problem. From there, there is a wealth of data available, whether it be historical data captured by the National Agricultural Statistics Service or ERS or data captured by the Risk Management Agency itself. But in a lot of sources, it is also university data or data from other places. These have to be pulled together and then used to develop a full submission that meets the standard of actuarial soundness. And this is a critical concept within crop insurance because there are private companies that are sharing risk with the Federal Government. It is very important that we can quantify the risk that these policies impose.

From there, it becomes a process of writing insurance contracts and assuring that the purpose of the policy is met with the language that is put into it. The 508(h) approval process involves both presenting to the Risk Management Agency staff, and within the Federal bureaucracy, you will not find a more qualified, talented group of people. And they run us through the rigor of all of the sort of questions and concerns that might come up before we even take the first step in the process.

From there, it is submitted to the Federal Crop Insurance Corporation, a board of experts and farmers, who will consider the merits of the program. If they like what they see, it goes out to expert reviewers. These are usually actuaries or academics who have no incentive to see these programs approved. And they will provide an awful lot of comments and questions and concerns. And not until those are all fully addressed can we go back to FCIC and ask for approval in those programs.

So the process has multiple steps. We talk about it as a process of checks and checks and checks and balances because it is critically important that we not put something out there that changes

people's incentives. Instead, we are looking to improve the program.

So to your second part of your question where you were talking about confidentiality, the program makes provision for confidentiality, and the developers themselves are the ones who choose whether or not that confidentiality is to be maintained. Historically, and clearly, RMA staff and FCIC, everyone within that process maintain strict confidentiality themselves. They absolutely respect the submitter's right to keep a product confidential or not. And that is because a lot of the data and pieces of the program that go in are confidential themselves, and some of this is proprietary information from private companies, and they don't want any individual farmer's information to be distributed.

But when it comes down to the basic concept of the program and what it is looking to achieve, there is a lot of runway required. These companies, these agents, the producers themselves need to understand what the program is, what is coming down the pipe, and what they can expect for future risk management needs. The principal benefit of crop insurance against disaster or other programs is predictability, understanding what sort of coverage can be available to you and how it will operate. And if a program is in development and it is rushed through or if it is released to insurance providers or companies too quickly, unfortunately, they won't be ready to do a good job of servicing it. So my belief is that confidentiality has been taken too seriously by most developers and that a more inclusive development process benefits everyone.

The CHAIR. All right, thank you, Mr. Offerdahl. You know what, I have only got 42 seconds left, and it would require more time than that.

Mr. OFFERDAHL. Apologies. I am sorry.

The CHAIR. No, that is okay. It was very thorough, though. I will give you credit for that.

I will now yield to our Ranking Member, Mr. Austin Scott of Georgia.

Mr. AUSTIN SCOTT of Georgia. Thank you, Madam Chair.

And after Hurricane Michael, I was one of those that met with the different people in the Administration, and the concept of pre-funding disaster relief was actually one of the things that was part of that discussion. And it came because there was a lot of damage in areas where there really wasn't a crop insurance program. Pecan orchards, for example, there was not a program that was affordable. And when we met with the Administration, we were told that the existing Tree Assistance Program, which would provide about \$15 per tree, was adequate, and it simply isn't.

And so when we talk about pre-funding a disaster program, it is not intended to replace crop insurance. There certainly are traditional commodities where crop insurance works quite well, but there are a lot of other groups where crop insurance doesn't work at all. And we saw those significant losses from Hurricane Michael, and had we not had disaster relief, I think a lot of our people wouldn't be farming today.

So it is intended to work in conjunction with the crop insurance system, not *in lieu of* it. And for traditional commodities there has always been the discussion that you would not be eligible for those

funds if you did not purchase crop insurance up front. But we all know there are simply crops out there that there are no insurance programs that work for.

With that said, Ms. Fowler, in your testimony you talked about the adverse impact the cap on administrative and operating expenses is having on agents, particularly on those that primarily sell and serve specialty crop policies. If left unaddressed, what do you believe the impact will be on growers for these agents who write the policies?

Ms. FOWLER. Thank you for your question, Mr. Scott. The specialty crop area, as actually what I have testified earlier, we have now 130 crops. And that is where the crop coverage has really been enhanced is in that specialty crop area. They are very unique. They are very tailored to what the options are in that area. And actually, with the inflation rate, this problem started quite some time ago, and we have moved along. But currently, we need to have some extra inputs in that area just simply so that we can have enough staff, enough agents trained, specialized folks in that area to come across and address these specialty crop needs.

Mr. AUSTIN SCOTT of Georgia. Well, one of my concerns is in the development of new products. If you are developing new products, you probably have some additional expenses in administration as those new products are coming to market, with uncertainty in what it is going to cost to operate.

Mr. Cromley, in your testimony, you mentioned a very staggering statistic. In 2021, 10.8 million acres of upland cotton were protected by some form of crop insurance. This represents more than 97 percent of all upland acres. How did the National Cotton Council work with USDA's Risk Management Agency to increase crop insurance participation?

Mr. CROMLEY. [inaudible] question, Mr. Scott. I think probably the most—my first impression is the high risk in growing a cotton crop. I mean, it is obvious that all growers just about have to have crop insurance in some form to survive in today's environment. So that will be my first comment. Second, National Cotton Council and cotton farmers have for years worked with the organizations that have been mentioned here before. The new products that come online are targeted—

Mr. AUSTIN SCOTT of Georgia. I think we are having a rural broadband issue there. The point is that 97 percent of upland cotton is now insured, and it has not been that high in the past. And I do think that the association, the agents have done a good job of having the growers understand the value of the insurance. I do hope there is a way that, looking forward after 2018, what he testified was absolutely accurate. The yields that were above the ground were significantly higher than the 10 year average had been. And I hope that, as we push forward, we are able to find a way to give producers the ability to step up if you will the coverage to actually reflect the pre-harvest value of it.

Madam Chair, my time is out. We have obviously got some rural broadband to work on in southeast Georgia. And with that, I yield back.

The CHAIR. And a lot of other places as well. Thank you, Mr. Scott.

I will now recognize the gentleman from California, Mr. Carbajal, for 5 minutes.

Mr. CARBAJAL. Thank you, Madam Chair, and thank you to all the witnesses for joining us today.

California has more agriculture production than any other state. A significant amount of this production comes from my district, where some of the most delicious specialty crops are grown, including strawberries, avocados, blackberries, and more.

Whole-Farm Revenue Protection is the only insurance product available nationwide, which ensures the entire revenue of a farm's operation, including specialty crops and livestock. With its unique diversification discount, it is in theory a forward-thinking product for diverse producers and those looking to diversify. However, in practice, the program is inhibited by burdensome paperwork requirements, unclear costs, and disillusionment from both farmers and insurance agents.

Ms. Fowler, is there a role for our Congress to help streamline program access? And how can insurance providers do more to educate agents and the market about this product?

Ms. FOWLER. Thank you so much for your question. And yes, it is an extremely complicated program. And yes, it is very hard to be straightforward with that program. I think we can actually come in and make improvements. I think it is a very, very valuable program for your specialty crop people there in California. But yes, it does need more improvement, and I think we could all work together with RMA. And I know they have overcome several challenges and changing some limits for that product also.

Mr. CARBAJAL. Thank you, Ms. Fowler, and sorry, I might have been inadvertently said mister initially, so I apologize for that.

Ms. FOWLER. It is okay.

Mr. CARBAJAL. It is an indisputable fact that climate change has caused severe weather events across our nation. California knows this all too well with prolonged drought and increasing severe wildfires year round for that matter. Climate change is making it more difficult for farmers to reliably grow our nation's food supply. Thankfully, growers are resilient and not easily discouraged. But the Federal Government must make sure farmers are insured for tough times.

Mr. Haag, where do you see the program going over the next 5 to 10 years, especially given the impact climate change is having on farmers? Are there specific ag sectors that we need to focus on to encourage more participation within crop insurance?

Mr. HAAG. Thank you for that question, Senator. At NCGA, it is always important that we cover our goals that we would like to have for corn, plus to make sure our other crops, no matter if we grow in our state or your State of California that are protected because of how important it is for those individual farmers to have that safety net or the tool in their toolbox. We just got to continue to push forward and making sure that the other politicians that don't appreciate crop insurance, that we can convince them how important it is for the farmers because with our inputs right now, we have to have that safety net or that tool in order to continue farming in the next years. So I would say it is just as a matter of

the commodities we are still working together and pushing forward for a strong crop insurance program.

Mr. CARBAJAL. Thank you, Mr. Haag. And you demoted me by calling me a Senator.

Thank you. Madam Chair, I yield back.

The CHAIR. All right. Thank you very much, Mr. Carbajal.

At this time, I will yield to Mr. Allen from Georgia for 5 minutes.

Mr. ALLEN. Thank you, Madam Chair, and good afternoon, everyone and panelists. And thank you for giving us your time today.

The issue we are discussing obviously is crop insurance, and it has never been more timely. Commodity prices overall are high right now, but for many farmers, the cost of doing business has increased at a faster rate. According to a study conducted in April by Dr. Don Shurley, Professor Emeritus of Cotton Economics at the University of Georgia, while cotton prices are 20 percent higher than 1 year ago, production costs, both variable and fixed, have risen over 30 percent during the same time span. Dr. Shurley has also documented an inflation rate for the price of items used in farming at a significantly higher rate of inflation than the national average.

As we write the next farm bill, we must analyze this problem our farmers have faced in recent years. It reminds me of the early 1980s. Their profit margins are disappearing, the issue is not sustainable, and we must reckon with it.

Ms. Fowler, can you speak to what Congress can do to ensure we are not undermining the current crop insurance program? And is there any way Congress can help promote participation?

Ms. FOWLER. Thank you for your question. Yes, I think so. There are some additional products that we can take a look at, but yes, we need to have greater levels of coverage. We need to be able to participate at a higher level of coverage that is affordable, especially when the margins are so skinny out there at this point in time. And I think if we can look at that and maybe increase the baseline to the budget and be creative in the new farm bill, that would be very helpful to producers for higher levels of coverage.

Mr. ALLEN. Now, for our farmers to be able to borrow the funds necessary for production ag, obviously, you have to have crop insurance. Do you require crop insurance?

Ms. FOWLER. Some lenders do require crop insurance, but actually lenders like crop insurance. I mean, they can see what the crops—they are there with cash flow rather than an asset lending base that we had back in the 1980s.

Mr. ALLEN. Okay. Do we have Mr. Crowley on? Lee, we got to fix our broadband down in rural Georgia, don't we, my friend?

Mr. CROMLEY. Absolutely.

Mr. ALLEN. Mr. Crowley, in your testimony you mentioned the need for higher levels of insurance coverage at a more affordable rate. What ideas have been discussed for a cost efficient coverage program for the benefit of all of our farmers? Have we been in discussions about that through Farm Bureau and the other ag agencies to try to rectify this problem?

Mr. CROMLEY. There have been ongoing discussions about this throughout all the industry, and I think the current situation just underscores the fact that with all the increases that you referred

to, increases in all costs, our fertilizer costs have doubled, seed costs have gone through the roof, fuel and everything that fuel touches. So our margins are just unbelievably small right now.

And the problem that concerns me with crop insurance is with this tight margin, something is going to have to give in order for this to work. [inaudible].

Mr. ALLEN. I have about a minute and 20 seconds left, Mr. Cromley, you attended a farmer roundtable in Statesboro, Georgia, recently, and at that roundtable, I saw a lot of fear in the room not only with what you are having to deal with as far as inflation today but what it is going to look like tomorrow. In other words, as I understood it, it was hard to even tie down a price on fertilizer. And I am hearing the same thing, by the way, in the construction industry, which I was a part of, and other industries. So where are we right now? Are you continuing to see the price of the things you need—and of course, there is some regulatory resistance against the products you use to harvest and to get the yields required. What are you seeing right now?

Mr. CROMLEY. I think you are exactly right in your comments. I think *uncertainty* and *volatility* are probably words that would describe the countryside right now, at least where I am. There is just so much uncertainty about everything, and that goes back to crop insurance a little bit from the standpoint that crop insurance is one thing that can give us some stability, some predictability. And so that is why it is really even more important now than ever. I think some premium discounts always would be something we could look at and other things to make it a little more affordable. As I was saying earlier, I think crop insurance might be one of those things that some people are forced to not participate in as margins get tighter, and I hope that is not the case. But yes, I think it is reaching that point, that level of concern.

Mr. ALLEN. Okay. Well, listen, thank you so much. Thanks to all of our witnesses. And, Madam Chair, I yield back.

The CHAIR. Thank you, Mr. Allen.

I now recognize Mr. Lawson from the State of Florida, who is with us, virtually for 5 minutes.

Mr. LAWSON. Thank you very much, Madam Chair, and to you and Ranking Member Scott for holding this meeting. And I would like [inaudible] all our participants to our meeting today.

Federal crop insurance is an incredibly successful public-private partnership that stands as the primary safety net for U.S. producers. However, among producers and crop insurance companies, we have heard how complicated and time-consuming it can be to insure specialty crops. And we have a lot of specialty crops in Florida with many of these consumers being small and just historically underserved producers. In your testimony, Ms. Fowler, you mentioned that cuts in administrative operation, pro-policy pay method unfairly impacts specialty crop producers. In addition to increasing the A&O to 2020 level, what else can Congress do to address this gap and incentivize crop insurance companies to work with specialty producers?

Ms. FOWLER. I think making those adjustments in the specialty crop area is a start and a great place to be. I would encourage to make it easier for participation with those agents to get staffed up

not only through technology but skilled staff members that can reach out to more people. And also, the specialty crop area is so unique and so driven toward that farmer's own individual operation, and if we can continue to tweak these products and make them more straightforward so they are understandable and you know exactly where you are going to be, I think there is a lot of opportunity to continue to grow that area.

With all due respect, once again, the specialty crop area is an area that has increased tremendously, and there is a lot of work to make sure that you individualize that coverage. So I would look forward to the opportunity to help in that area.

Mr. LAWSON. Okay. Thank you very much. And, here in Florida we always plan for hurricanes. It is hurricane season. Mr. Cromley, you mentioned that how Hurricane Insurance Protection-Wind Index does not provide coverage for losses due to tropical storms even when devastating winds and rain caused damage. Do you believe that tropical storm damage should be included in the protection of a wind index? Is there any different program that you may feel better that needs to cover these losses?

Mr. CROMLEY. Thank you, sir. I think the hurricane product is a good product. I was glad to see it. It is something that, like I say, I am 60 miles from the coast, so it was critical for me to consider this product.

We had an example—I can give you an example in Texas where a grower was a mile or 2 outside the hurricane zone and had tremendous loss because he was that close, but yet he didn't qualify. He had tremendous wind, tremendous rain, tremendous damage, but because it was not hurricane-level damage, he was out. And I don't think that was the intent of the program. I think the program could be changed just a little bit to where damage would be not necessarily wind but actual damage could be measured and determine the level of loss. So I would hope that is something that you would consider. Hurricane winds are devastating and terrible, but there are tropical storms and things that are just as devastating at times.

Mr. LAWSON. Okay. Does anyone else want to comment on that? What about you, Ms. Fowler?

Ms. FOWLER. Yes, the hurricane coverage has been a great product that has come into play. I don't write any of that currently, but I have a lot of agent friends that have written a lot of hurricane insurance coverage. And the producers like that, and it has been good coverage, especially for that certain peril.

Mr. LAWSON. All right. Madam Chair, I yield back.

The CHAIR. All right. Thank you very much, Mr. Lawson.

At this point, I will yield to the gentlewoman from Illinois, Mrs. Miller, for 5 minutes.

Mrs. MILLER. Thank you, Madam Chair and Ranking Member Scott. This is an important topic, and I assure everyone that our number-one priority is protecting crop insurance as our number-one risk management tool.

So I have a question any of the witnesses can answer. Can any of the witnesses explain the dangers of using crop insurance rates as a tool to change farmers' behaviors, likely in the name of climate

change, or incentivize certain practices that have yet unproven yield benefits?

Mr. HAAG. Thank you for that question, Representative. At NCGA that—you mentioned how strong that we want to make sure crop insurance stays right where it is at. I had a tough time understanding a couple of your little points there that you had made because of my older age here. I guess my hearing is not as great as it was once, but could you repeat just the one with crop insurance and maybe some fraud that you were talking about?

Mrs. MILLER. So I am concerned about the danger of using crop insurance rates as a tool to change farmers' behaviors, such as the climate change, and incentivizing certain practices that as of yet have unproven yield benefits.

Mr. HAAG. Okay, right. As of right now, I am not able to talk a lot about that, but I can say as far as NCGA is concerned we want to make sure that we are strong this way, that we are not making farmers change—if there is going to be problems with the new laws with climate change or whatever, that is going to have to be weighed just down the road, I mean, my opinion to see what happens. We continue to look into that. But as of right now, we have not talked an awful lot about changes that way from crop insurance, the way we have it now to where it might be down the road. Maybe I am not helping you, but that is where we see it going right now, that we are not looking that far down the road.

Ms. FOWLER. Thank you, and thank you for the question. Actually, I think I addressed that a bit earlier as far as crop insurance is concerned. Crop insurance was set out to protect the profitability of the farmer. And I think at this point in time that is where we need to stay focused. You don't want to get too strung out on too many different things and then you just water down the crop insurance product. And we need to stick true with the practices that we currently have, and we need to cover the profitability. We have reinsurance contracts out there with real reinsurance companies, and I think they are going to want to understand how to mitigate that risk.

Mrs. MILLER. Thank you. And then, Ms. Fowler, as an experienced crop insurance agent that has seen the program evolve over time, can you speak to the growth of the program and how it has provided you the opportunity to start a business and create job opportunities in a town like Memphis, Tennessee?

Ms. FOWLER. Okay. Thank you once again for the question. But it is Memphis, Texas, with a population of about 2,500, so rural America at its best. But yes, it has been incredible to see this program evolve. It has been incredible to watch producers who have had this crop insurance and have had stability within their family operations. I am now insuring down to the second and third generation with those producers. So it has been great. I have 19 employees in three offices, and we are engaged. We do everything we can. Sometimes it is pretty skinny out there with all the different things that we want to deal with and that we help producers when they come in. But also in turn, we get involved in the community. We get involved with community pieces whether it be with FFA projects, whatever the community might need. And so it is great to see that and have that opportunity.

Mrs. MILLER. That is great. Thank you. And quickly, this is for any of the witnesses. What are the potential impacts if the U.S. were to completely forego the private-sector delivery system, as we have seen proposed by some and revert to a government-run insurance program through FSA? What would you say to someone who champions this type of proposal?

Ms. FOWLER. Once again, I will be glad to step up. We work closely with FSA. FSA has their programs, we have our programs, and quite frankly, we need each other out there and we need to be able to work together. But once again, that program was delivered years and years without a lot of participation, and I think crop insurance has its own absolute track record, the success record that we have today. And one thing is that we can deliver timely payments in order for a producer to have cash flow and get back to the bank and start and go again.

Mrs. MILLER. Thank you so much.

The CHAIR. Thank you, Mrs. Miller.

I will now yield to Mr. Mann from the State of Kansas for 5 minutes.

Mr. MANN. Great. Thank you, Chair Bustos, for having this hearing, you and Ranking Member Scott, and to all our panelists. And we are 14½ months out from this current farm bill expiring. Crop insurance will be my highest priority and I think should be the highest priority so far as production agriculture goes for this Committee.

Kansas farmers have told me repeatedly that as we look at crop insurance in the next farm bill, let's use a scalpel and not a sledgehammer. Let's make some tweaks, let's work to improve it, but let's acknowledge that what we have is a good program and it is a successful public-private partnership that I would argue to my last breath to anyone is good for producers. It is good for rural communities. It is also good for our consumers to have a constant food supply all over this country.

I do also think we need to acknowledge that we are in an era of record high input prices, and the safety net that currently exists, was designed to withstand a fall from, say, 10'. But when you double, quadruple input prices and that same producer is falling from 40', I think we need to really discuss is the safety net the appropriate height off the ground so to speak moving into this farm bill?

I have a handful of questions. I will start with you, Ms. Fowler, and thank you for being here. In my view, one of the key features of crop insurance is the ability for private entities to craft policies to address risks or cover new commodities. The process which you refer to in your testimony, the 508(h) process, is well-supervised and allows the Federal Crop Insurance Corporation Board to control new product approvals without OMB interjection. Can you explain why it is crucial that the FCIC has autonomy over Federal crop insurance?

Ms. FOWLER. Well, the FCIC actually is the background to the crop insurance. That is who actually writes the policies, they write the procedures for the background for the insurance there. But actually, I believe you were visiting about falling the 40'. We really need some additional participation at higher levels, and the extra products that have come from the 508(h) process, whether it be the

SCO, STAX, ECO, all of those products are great products, and they are just beginning to evolve. We have just now started with those products, and I think if we have some additional price support and participation with those, those products will really help us. They are already set in place and can make a timely payment.

Mr. MANN. Great. Well, one last question for you, Ms. Fowler. As you know, up until 2015, the Risk Management Agency adjusted the overall A&O cap annually for inflation, and it has remained stagnant since. Can you discuss what impact that has had on crop insurance agencies across the country?

Ms. FOWLER. Yes, once again, thank you for that question. Yes, we do everything we need to do. We go out, we help farmers, but yet, I am conscious of what those expenses are. And I have a highly skilled staff. And you just don't say walk away for 6 months, and we will see you back. I mean, it takes a year to train any type of staff or team member within my agency. So yes, we try to do more with less. We use technology, we try to be very efficient, we try to be thorough to start with. But yes, I am very conscious of that. And, those folks, we live in rural America, they have home payments, house payments, they got kids going to school, so it is important that I try to stay static and do the best job I can at managing expenses, especially in this year where we are looking at a lot of losses.

Mr. MANN. Yes, and I think we have to acknowledge that the program has to work for the producer, but it also has to work for the insurance agents that are delivering that product and are boots on the ground, so thank you for that.

Last question that is for you, Mr. Haag. As you know, Federal crop insurance policies can be improved with additional product development and innovation such as the trend yield adjustment, which has been very beneficial for corn producers. What are some specific steps that National Corn Growers Association has taken to ensure risk management tools are evolving to continue to meet the needs of producers today and into the future?

Mr. HAAG. Thank you for that question there, Representative. It is important that the core quality that we use right now, the corn maturity is everything, that we are raising that much more corn so that adjustments are very important, going up to make sure that you are covered with the rate, with the other percentage you want to use. So that trend yield is very important because if we have 4 good years in a row, you have 4 good years of a base there, a fifth year, and all of a sudden you have a poor year coming in there, that is going to help you when you have that poor year going—and up there—so you are going to get paid back on respectable money. Yes, it does come down like it has, but in a year or 2, you are going to get back to normal where you don't have that—hope you don't have that drought for 2 or 3 years in a row to do that. So that trend yield, it is important, and that is one of the bigger things I think has had a big plus with corn growers to make sure that they have—to taking crop insurance on, that it is more beneficial for them in the end.

Mr. MANN. Great. Great. Thank you. I see I am past my time. Thank you.

The CHAIR. All right. Thank you very much, Mr. Mann.

Ranking Member Thompson, are you settled in enough for me to yield to you for a second? Sorry to throw this at you so quickly.

Mr. THOMPSON. Absolutely.

The CHAIR. All right.

Mr. THOMPSON. Thank you.

The CHAIR. The Ranking Member of our full Committee, I will now yield to you for 5 minutes.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Thank you very much. Thanks for your patience, Madam Chair. As you know, I like to be here at the beginning, not at the end of these, so my apologies to our witnesses. But thank you so much for testifying and for your written testimony.

Madam Chair, Ranking Member Scott, thank you both for calling this important hearing, and I apologize to you and the witnesses for my tardiness, but I wasn't able to make the 9:30 start time on late notice, so thank you for accommodating me.

Since becoming a Republican leader of the House Agriculture Committee, I have embarked on what I am calling a perpetual barnstorming tour that has taken me to more than 40 states to hear directly from the producers. On these journeys, the most commonly mentioned piece of Federal policy is our crop insurance program. I have heard firsthand from numerous farmers how crop insurance saved them from bankruptcy following a disaster.

But its purpose goes well beyond helping producers in the wake of a loss. Crop insurance provides a base level of reliable risk management that helps keep the economic engine of rural America running in good years and, quite frankly, in bad. Without crop insurance, lenders would not be able to provide the levels of credit to the farmers necessary to operate a farm in today's high-cost environment, and producers would not have the ability to make investments in their operation to take advantage of new technologies and practices. I have even been told that crop insurance is often what stands between us and the 1980-style farm financial crisis, which was so severe it even wreaked havoc on the economies of some of our largest cities because crop insurance provides collateral to lenders and obviates the need for asset-based lending.

The key selling point for me on crop insurance is the framework of the public-private partnership between the government and approved financial providers, agents, and farmers. This partnership allows USDA to set fair prices for coverage, companies to compete on service, and farmers to have skin in the game. The result is a program that is fair to the taxpayer, reliable for farmers, and provides job opportunities in rural communities for agents and loss adjusters.

The numbers tell the success story well. Since the Agricultural Risk Protection Act (Pub. L. 106-224) was passed in the year 2000, insured acreage has more than doubled and the value of crops insured has increased almost six-fold from \$35 billion to nearly \$200 billion. Now I am sure we will—we have heard in discussion today about the *ad hoc* assistance that has been provided outside of crop insurance, and I have been supportive of those efforts in the immediate term to give additional help to farmers suffering devastating

losses. But I do not believe this will remain a viable option for an extended period of time, and we must proactively look at how crop insurance can be improved to cover these losses.

Today's hearing provided a valuable opportunity to solicit the firsthand experiences of farmers on the ground dealing with these losses and the perspectives from those within the industry that can help guide this Committee during the development of the 2023 Farm Bill.

And finally, I want to touch on climate and the push by some to hijack crop insurance program to carry out a half-baked environmental experiment. This must stop before irreparable harm is done to a farmer's most critical risk management tool. Let me be clear. This isn't an ideological concern. I support efforts to expand and improve our conservation work. But crop insurance already provides clear incentives to be good stewards of the land. The more a farmer can increase their yields or mitigate losses, the better their coverage options will be.

And we don't need to cherry-pick certain practices that might only work in specific regions of the country and use crop insurance to try and force all farmers into adopting the practice. We already provide nearly \$6 billion per year in locally led incentive-based conservation programs through title II of the farm bill. That is the appropriate place to have these conversations, not in title XI crop insurance. Now, I am confident if the data supports it and agronomic conditions allow it, farmers will naturally gravitate towards adoption of the practices best for their farms. We don't need to use crop insurance as a carrot, or worse, as a stick to force their hand.

Madam Chair, thank you again for convening this hearing, and thank you to our five witnesses for agreeing to be here this morning.

And I may have come in late, but I got a chance to go through your written testimonies last night, and I do have a few questions. First, let's start with Mr. Haney and Ms. Fowler. Every farm bill cycle we have to battle critics who attempt to impose limitations or means testing on crop insurance. And one of these organizations, the National Sustainable Ag Coalition, just released a report examining the impact of a variety of these proposals that show that they would cut premium assistance by up to 30 percent.

Mr. Haney or Ms. Fowler, could you explain the impact proposals such as these would have on the viability of the program overall? In particular, what impact would this have on specialty crop producers, which are typically ensuring high-value crops?

Ms. FOWLER. Thank you for that—go ahead.

Mr. HANEY. No, go ahead, Kathy, please, by all means.

Ms. FOWLER. Okay. Thank you, Congressman Thompson, for that. I can give it to you pretty short and straight, absolute non-starter. And simply put is that you start taking people out of the risk pool, it takes all of us to keep the loss ratio under the statutory 1.0 percent. And we have been able to manage, and we have been able to do that, but we need all people in the pool, and we need to make sure that everybody's engaged, because otherwise, this program doesn't work.

Mr. THOMPSON. Ms. Fowler, thank you.

Mr. Haney, go ahead.

Mr. HANEY. Thank you, Congressman. And I couldn't say it any better than Ms. Fowler has. At the end of the day from an actuarial perspective, if you start removing those larger bulk premiums at the top end, it will have a dramatic effect on the smaller producers and the smaller premiums. They will have to carry if you will the load of the loss ratios. And Ms. Fowler is 100 percent correct. It will have a dynamic effect if that is done.

Mr. THOMPSON. Very good. I like how she summed it up as a nonstarter.

Mr. Offerdahl, as you are aware, I have expressed an interest in exploring options for a safety net based on margin to address the squeeze producers find themselves in with sky-high input costs. The success of the Dairy Margin Coverage Program is what spurred my interest in this topic. Can you briefly explain how the margin protection insurance policy you developed works? And do you foresee opportunities to expand the availability of that policy in the future?

Mr. OFFERDAHL. Yes, and respectfully from my first answer very briefly, the Margin Protection Program is designed to protect people from decreases in commodity prices, decreases in yield, or increase in input costs. A program has been available for a handful of crops since 2016, and the crops for which it is available are the ones where we had the best data. It is a 508(h) experiment that has been highly successful, but at this point, participation is only about 6,000 policies a year. It is a bit more expensive because it enjoys a lower subsidy rate than other crop insurance programs as an experiment, but there are tremendous opportunities to expand it nationwide rather than just core Midwest states and a handful of crops.

Mr. THOMPSON. Very good. Well, thank you for that. Mr. Haag and Mr. Cromley, could you speak to the relationship you have with your crop insurance agent, and how has the service provided by your agent differed from that of the Farm Service Agency, particularly throughout the pandemic? Mr. Haag, why don't you go first?

Mr. HAAG. I think it is much easier talking with our crop insurance agents. They have a better understanding of what happens out on the farm. The FSA are good people that work in the offices, but they don't get a chance to get out to the farms to see how your operation is running and just get the little technical things about how things work. So working through an agent, in my opinion—and that is what we do—it is much easier. It is much better. He understands our farm program and our farms and we get the best advice from him.

Mr. THOMPSON. Very good. Thank you.

Mr. Cromley, any comments?

Mr. CROMLEY. I would echo that in the sense that our agent is involved in agriculture. He farms some. He is aware of the issues. He knows the challenges. FSA people are great, they are great, but they are not the same level of participation, not the same level of understanding of the challenges we face. So that public-private relationship is just absolutely critical to all of us I believe.

Mr. THOMPSON. Well, once again, I want to thank you for that Mr. Cromley. And, once again, thank you to all of our witnesses,

and thank you to our Chair and Ranking Member for this Subcommittee hearing, much appreciated. And I yield back.

The CHAIR. Thank you, Mr. Thompson. And thank you for being so good at being part of our Subcommittee hearings. We appreciate your attendance and your participation in all this.

I want to thank our witnesses, the three who are here in person, the two who were with us virtually. We have Mr. Haney, Ms. Fowler, Mr. Offerdahl, Mr. Haag, and Mr. Cromley, and we do appreciate it. Thank you also to everybody for accommodating the time change. The First Lady of Ukraine is addressing the House and the Senate at 11 o'clock, so we will be heading over there. And obviously, Ukraine is very, very important from an agricultural perspective as well, so we appreciate you accommodating that.

Before we officially close out, I am going to yield to our Ranking Member, Mr. Scott, for any closing comments he may have.

Mr. AUSTIN SCOTT of Georgia. Thank you, Madam Chair.

You mentioned Ukraine. I do want to bring up the fact that the Russians are actually sending rockets into the wheat fields there and setting them on fire. I think that the world probably for the first time since the 1940s may watch as a ruthless individual in Vladimir Putin uses food or lack thereof as a weapon of war, which reiterates the fact that we in this country need to make sure that we are taking care of our producers.

So while most Americans think about food as a jar of peanut butter or a loaf of bread, those of us on this Committee and in this room realize that it is the peanut farmer and the wheat farmer that actually grows the crop that allows us to go into the grocery store and buy the food that we need.

Ninety percent of our food supply, I will say that, again, 90 percent of our food supply in this country comes from 12 percent of the farmers. The proposals that come before this Committee by groups on the far right and the far left that would effectively disincentivize those farm families to purchase crop insurance are detrimental to the whole ag industry and the food supply in this country. If you take the best risk out of the system—and our farmers, our large farmers are the best risk that we have, they are buying crop insurance—then you are going to raise the premium on everybody else and make it unaffordable.

I hope as we go forward, I look forward to writing the next farm bill and keeping the focus on the food supply of the United States. We do not need to be dependent on foreign sources of food.

With that, Madam Chair, I yield.

The CHAIR. Thank you to our Ranking Member. And again, thank you to all of our witnesses.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions that were posed by a Member.

This hearing of the Subcommittee on General Farm Commodities and Risk Management is adjourned.

[Whereupon, at 10:55 a.m., the Subcommittee was adjourned.]

**A 2022 REVIEW OF THE FARM BILL
(BROADBAND)**

THURSDAY, SEPTEMBER 15, 2022

HOUSE OF REPRESENTATIVES,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Committee met, pursuant to call, at 10:03 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. David Scott of Georgia [Chairman of the Committee] presiding.

Members present: David Scott of Georgia, Adams, Spanberger, Hayes, Brown, Pingree, Kuster, Bustos, Plaskett, O'Halleran, Carbajal, Lawson, Craig, Harder, Axne, Schrier, Panetta, Bishop, Davids, Thompson, Hartzler, LaMalfa, Allen, Rouzer, Bacon, Johnson, Baird, Jacobs, Balderson, Cloud, Mann, Feenstra, Cammack, Fischbach, Flores, and Finstad.

Staff present: DeShawn Blanding, Lyron Blum-Evitts, Emily German, Josh Lobert, Ashley Smith, Michael Stein, Paul Balzano, Caleb Crosswhite, Josh Maxwell, Ricki Schroeder, and Dana Sandman.

**OPENING STATEMENT OF HON. DAVID SCOTT, A
REPRESENTATIVE IN CONGRESS FROM GEORGIA**

The CHAIRMAN. The Committee, of course, now is in order. And I want to welcome and thank everyone for joining us today at our hearing, which is entitled, *A 2022 Review of the Farm Bill: Broadband*. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open for questions.

So, today, we are here to discuss the *collaborative* efforts. And I want to emphasize that word because we will not be successful if all of our combined Federal agencies, our state agencies are all not working together to make sure that the \$65 billion that we have appropriated is sufficiently and effectively distributed and working. And for that effort to be successful, USDA must be able to work with the National Telecommunications and Information Administration, NTIA; and the Federal Communications Commission, FCC, in awarding this \$65 billion in broadband funding and examine the role that these agencies play in achieving our goal of 100 percent full, nationwide connectivity for our rural communities. And rural broadband is so critical for our rural areas, not only in terms of the distribution of the funding, but to finally establish rural broadband it will be a huge economic benefit to our rural communities.

The COVID-19 pandemic highlighted the necessity of reliable broadband as workplaces and businesses migrated online and healthcare facilities and schools have transitioned to telehealth and distance learning. In response, Congress made substantial investments in broadband funding to existing and newly established Federal broadband programs dispersed across multiple Federal entities. That is why I say the key word is *collaborative*, working together. This is the key for success, to finally bring rural broadband to our rural communities.

And of those investments, the bipartisan Infrastructure Investment and Jobs Act (Pub. L. 117-58) made the largest Federal broadband investment in our nation's history, totaling \$65 billion for broadband programs at FCC, NTIA, and USDA, the primary agencies that administer existing broadband deployment grant programs. And as we move forward now toward our 2023 Farm Bill, we must understand how these agencies plan to communicate and collaborate to effectively reach our shared goal of 100 percent nationwide coverage. And this is why we established procedures for interagency coordination among USDA, NTIA, and FCC in the 2018 Farm Bill, and we must continue to engage with each other to ensure effective coordination, evaluate the agencies responding, and address any problems, any barriers that may exist.

Rural broadband will continue to be a major focus of this Committee. We take great pride in being able to finally, as a Committee, make sure that our rural communities have the necessary funding. We previously held a Committee hearing to examine any barriers to our broadband connectivity and solutions and opportunities to overcome any impediments.

Ranking Member Thompson, my good friend, and I also introduced the Broadband Internet Connection for Rural America Act (H.R. 4374), which would make crucial and significant investments in the USDA broadband program to expand broadband in our rural communities. And always, I would like to thank my good friend, the Ranking Member, for his bipartisan cooperation. We did it together, Ranking Member Thompson, and your willingness to work with me on this issue, and I appreciate that, Ranking Member. Thank you.

We are always thankful to be joined by Under Secretary Torres Small, my good friend. We are so delighted to have her. And she is playing a critical role in making sure that we have this coordination, which is the key to our success. And we are grateful to hear from our second panel as well of outstanding witnesses. Your combined experiences and interactions with these agencies will help us get a clearer scope of how broadband deployment is working on the ground. And we look forward to your testimonies. Thank you.

[The prepared statement of Mr. David Scott follows:]

PREPARED STATEMENT OF HON. DAVID SCOTT, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

Good morning and thank you for joining us. Today we are here to discuss the collaborative efforts of the USDA, the National Telecommunications and Information Administration (NTIA), and the Federal Communications Commission (FCC) in awarding broadband funding and examine the role these agencies play in achieving our goal of 100% nationwide connectivity.

Broadband is a critical tool for rural development, but inaccessibility to high-speed internet remains a major barrier for rural communities. The COVID-19 pandemic highlighted the necessity of reliable broadband as workplaces and businesses migrated online, and health care facilities and schools transitioned to telehealth and distance learning.

In response, Congress made substantial investments in broadband funding to existing and newly established Federal broadband programs dispersed across multiple Federal entities. Of those investments, the bipartisan Infrastructure Investment and Jobs Act made the largest Federal broadband investment in our nation's history, totaling nearly \$65 billion for broadband programs at FCC, NTIA, and USDA, the primary agencies that administer existing broadband deployment grant programs.

As we move toward the 2023 Farm Bill, we must understand how these agencies plan to communicate and collaborate to effectively reach our shared goal of 100% nationwide coverage, which is why we established procedures for interagency coordination among USDA, NTIA, and FCC in the 2018 Farm Bill. We must continue to engage with each other to ensure effective coordination, evaluate the agencies' responses, and address any barriers that may exist.

Rural broadband will continue to be a major focus of this Committee. We previously held a Committee hearing to examine barriers to broadband connectivity and solutions and opportunities to overcome those impediments. Ranking Member Thompson and I also introduced the Broadband Internet Connections for Rural America Act which would make crucial and significant investments in the USDA broadband program to expand broadband in rural areas. As always, I'd like to thank the Ranking Member for his bipartisan cooperation and willingness to work with me on this issue.

We are always thankful to be joined by Under Secretary Torres Small and grateful to hear from our second panel of witnesses. Your combined experiences and interactions with these agencies will help us get a clearer scope of how broadband deployment is working on the ground. I look forward to your testimonies.

The CHAIRMAN. And with that, I would now like to welcome my distinguished Ranking Member, the gentleman from Pennsylvania, whom I enjoy so much working with, and we did it together, Mr. Thompson. You are recognized for your opening statement.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, Mr. Chairman, thank you, and thank you for just being a great partner in our work on broadband. And thank you to this Committee, completely unified in advancing the bill that we did that was thoughtful and, quite frankly, would have been very, very effective in bridging the digital divide in rural America. And quite shame on those who control the House floor for not giving us an opportunity to at least have a vote, right? And you and I worked hard to try to get that vote to occur.

The CHAIRMAN. Yes, we did.

Mr. THOMPSON. We were not successful, but I will address the alternative here in just a bit of what was passed, which was insufficient for rural America.

As we have heard across multiple hearings this Congress, the need for better broadband connectivity in rural America is immense. In the past, I have talked about the checkerboard of connectivity in my home State of Pennsylvania, with some communities well-served, while their neighbors, sometimes just down the road, down the street struggled to download their emails.

While broadband access used to be a luxury, today, internet connectivity is essential. It is essential for performing daily activities. Life is increasingly conducted more and more through the internet, and modern living requires constant, reliable internet access to fully participate. Quite frankly, rural America, or as I like

to call it, *essential America*, deserves to have the opportunity to compete for jobs, for economic opportunities, for educational opportunities, for healthcare access, all the things that come when we bridge the digital divide.

So it is unacceptable this quilt patch approach that we have taken for many years. And it was time to stop that—I don't believe what was passed out of the House and was signed into law will do that, but I do believe in what we put together and worked together in a bipartisan way would have accomplished that.

To address this need, the Federal Government has committed tens of billions of dollars once again over the past 15 years to fund new broadband systems across the country. The bipartisan infrastructure bill alone provided a staggering \$42 billion for broadband infrastructure just last summer. It is important to point out, and I think everyone in this room would agree, USDA and RUS in particular is the point to bridge the digital divide in rural America. And for those who don't know and are listening, USDA only got \$2 billion. I don't have a lot of trust in NTIA or FCC. They received significant dollars back under the stimulus in 2010, and they failed to bridge the digital divide. That is just based on facts and observations.

But I am a big, big believer and really thankful for our witnesses we have here today from USDA. Today's multiple Federal agencies, including USDA, NTIA, the FCC, and Treasury, are each individually responsible for distributing billions in broadband aid under their purview. Coordinating the distribution of those funds is essential. Far too often we have seen huge appropriations become insufficient through wasteful spending, inadequate oversight, poor planning, duplicative application where they go in and rebuild things that were built before *versus* reaching out to that last mile. And it will take a concerted effort between USDA—I actually believe it is going to take a better investment than \$2 billion in USDA—and certainly better concerted effort between USDA, NTIA, and the FCC, to ensure these taxpayer funds do not meet a similar fate.

And I remain disappointed that USDA was largely excluded from playing its essential role, and a role that it plays very effectively. We see evidence of that each and every year in more of a piecemeal approach in bringing broadband and its unparalleled understanding and reach into rural communities. It is the best situated agency to help rural providers serve their communities, yet my colleagues in the Senate made a different choice, choosing instead to create a new series of programs that comes with new bureaucracy and, quite frankly, new administrative costs that takes away from actually achieving all the—making that investment in resulting in full connectivity.

And so in addition to focusing on coordination, we must also ensure these new programs are accessible, they are efficient, and they are effective for rural service providers. As these new agencies wade into the difficult work of bridging the digital divide, it is critical they focus on the unique needs of rural communities.

Thank you to Madam Under Secretary for again being with us to talk about rural broadband. I have always appreciated the work the Rural Utilities Service does for our rural Americans. And thank

you to our witnesses on the second panel. I look forward to hearing from each of you.

I would be remiss if I didn't share my utter disappointment and, quite frankly, shock that representatives from the Federal Communications Commission and the National Telecommunications and Information Administration declined the invitation to testify today. Their absence is noted, and it illustrates their indifference towards the needs of rural Americans and our rural communities.

Mr. Chairman, once again, I really appreciate you and our friendship and the work that we have been able to do together to advance good, strong bipartisan legislation to bolster USDA's broadband programs, and I look forward to working with you in the upcoming farm bill to continue our work in strengthening rural connectivity.

With that, I yield back.

The CHAIRMAN. Well, thank you, Ranking Member, I appreciate your comments.

The chair would request that other Members submit your opening statements for the record so witnesses may begin their testimony and to ensure that there is ample time for questions.

Yes, and, Members, please mute yourselves. We have very important business to do. We are asking our agencies to coordinate, and we have to coordinate with the microphone. So please, let's mute ourselves until you come on and are recognized.

And now, I am pleased to welcome our first panelist. And this is a great person who has done great work here in Congress, and now she is the Under Secretary for Rural Development at the U.S. Department of Agriculture, Hon. Xochitl Torres Small. Welcome.

STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.; ACCOMPANIED BY CHRIS McLEAN, LL.M, J.D., ACTING ADMINISTRATOR, RURAL UTILITIES SERVICE, USDA

Ms. TORRES SMALL. Thank you so much, Chairman Scott, thank you, Ranking Member Thompson, and thank you, Members of the Committee. It is a joy to get to speak with you here today.

As you know, high-speed internet is a utility essential to modern life. It is also a cornerstone of rural economic growth. It is not news to rural America, but everyone now knows the ugly truth when it comes to high-speed internet. So far, most of rural America has been left in the slow lane. In the middle of COVID, I got a call from a school superintendent in rural New Mexico, and he was at his wit's end doing everything he possibly could to make sure his rural kids didn't get left behind in the middle of the pandemic. And the truth was that families, hardworking families in Hondo just didn't have the resources they needed, didn't have the internet they needed to keep their kids online. Today, we are all reckoning with that reality.

And because the situation is flatly unacceptable, Congress and President Biden have acted. Now—and we have heard this in your opening statements—agencies across the Federal Government have to work together to do something that is both essential and very difficult, bring connectivity and speed to rural America.

Last month, Secretary Vilsack announced the Department was investing the first tranche of the last round of ReConnect, \$401 million to provide access to high-speed internet, within that were multiple investments in rural places in New Mexico. And once completed, households in that very school district I mentioned will be able to get 100 megabytes per second, symmetrical internet service.

Now, you know as well as I do we can't lay fiber overnight, and the Federal Government can be a slow train. When I was in Congress, the work of agencies, that implementation side of new laws and appropriations, too often felt like a black box. My commitment to you today is that the process of delivering high-speed internet to communities in need will not be opaque. It can't be. I have heard your comments in your opening statements, and I want to inform you on what we are doing with what we have now because it is too important. It has to be a team effort. It is the work of communication, the work of partnerships, the work of coordination. And let's be honest, sharing with one another across government silos hasn't been a strength historically.

That is why USDA Rural Development is proud to serve as a critical coordinator for Federal rural work. Through efforts like the Rural Partners Network, we are making sure that investments like the bipartisan infrastructure law reach rural America. We are working together across Federal Departments to be better partners in place-based work, to build a better front door to the Federal Government, and to make Federal programs easier to access.

When it comes to the historic investment in high-speed internet, coordination must be a way of life. That is why we meet with the FCC, NTIA, and the Treasury on a biweekly basis and, frankly, regularly more often, both to establish a regular cadence of communication and to work through those sticky issues. We are learning to lean in to those sticky challenges.

We are also working with state legislators and state agencies providing trainings, connecting with other agencies and, most importantly, asking questions about how we can be better partners. I promise you, this is much more than a stack of MOUs. We are keenly aware of both the importance of the work and the historic nature of this moment.

We are in the early stages of an economic recovery from a global pandemic, but the promise and the initial work of high-speed internet is already making a difference, delivering speeds that are high enough to be long-lasting. I truly cannot think of a better time to deliver such powerful economic infrastructure to the communities that produce so much of America's food and energy.

Going forward, I ask for your candor, and I will give you mine. I will ask for flexibility when possible, too. We owe our best efforts to the people of rural America because I think we can all agree that when we invest in rural America, we are investing in all of our prosperity. Through this work, especially when we are really working together, Congress and the Biden Administration are sending a message to rural America that we get it. We know the slow lane is unacceptable, and we are here to be true partners in building better futures for our nation.

By delivering on this promise, we are bearing witness that rural matters. Thank you for your time, thank you for your collaboration, and I look forward to your questions.

[The prepared statement of Ms. Torres Small follows:]

PREPARED STATEMENT OF HON. XOCHITL TORRES SMALL, UNDER SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chairman Scott, Ranking Member Thompson, and Members of the Committee, thank you for the opportunity to come before you today to discuss the state of high-speed internet in rural America, and the United States Department of Agriculture Rural Development's role in supporting connectivity across the country. Reliable, high-speed internet is no longer a luxury—it is a utility essential to modern life. It is also the cornerstone of rural economic growth—supporting education and healthcare as well as business and industry.

But, as need for high-speed internet becomes more ubiquitous, between 6 and 12 percent of Americans lack access to high-speed internet, and rural residents are almost twice as likely as urban counterparts to have insufficient access to broadband.¹ This gap widens significantly in communities of color and low-income families—a gap that was impacted particularly sharply during COVID-19 when the pandemic drove school and business online.²

The value of high-speed internet cannot be understated—it has the potential to transform rural life as we know it. High-speed internet strengthens connections within communities, as well as between rural America and the rest of the nation, providing new markets for rural business and giving people the ability to create and sustain rural economies. It allows communities to tap into external markets and regionalize economic opportunity, all while opening doors for rural students, healthcare facilities, and patients. It also helps foster much-needed collaboration in rural areas as communities try to respond and adapt to extreme weather, shifting markets and systemic barriers.

That's why I am grateful for President Biden's leadership and Congress' continued support for high-speed internet in rural America. The Bipartisan Infrastructure Law provides \$65 billion to expand rural broadband, including \$2 billion for Rural Development's ReConnect program. The President's Fiscal Year 2023 budget proposes an additional \$600 million in investment into ReConnect, and I am deeply appreciative that the House has approved \$450 million for FY23. If appropriated, I look forward to partnering with Congress as Rural Development administers these funds and supports high-speed internet in rural America.

Supporting Rural Economies

Broadband is make-or-break for rural America, connecting businesses to both domestic and international markets, and giving communities the tools they need to collaborate and share best practices. High-speed internet also affects local business decisions every day—it significantly impacts the decisions of larger firms considering relocation to a remote area,³ and small local businesses as they work to expand and increase online sales. High-speed internet is also strongly tied to economic development and job growth across the country, benefits that could be felt deeply in rural areas. Independent economic modeling shows that there is a strong correlation between both job growth and GDP when broadband becomes more widely available.⁴

Rural Development, in close coordination with other Federal partners, is working to close the digital divide in rural America, to meet the goal of the Biden-Harris Administration to connect all Americans to reliable, affordable high-speed internet, and to ensure that the opportunities provided by high-speed internet services are available to all. In the first two rounds of funding, Rural Development's ReConnect program has provided more than \$1.5 billion to 181 projects to increase broadband service. These projects will serve nearly 300,000 households nationwide. Part of the success of ReConnect can be attributed to its deep investment in administrative sup-

port for technology and staffing, which broadens the reach of the program to include the least connected communities.

In the Spring, Rural Development closed its largest-ever application window for the third round of ReConnect program funding. This will provide more than \$1 billion in broadband funds to rural communities, including \$401 million in already disbursed high-speed internet funds. Recently, we opened the fourth ReConnect program application window as part of distributing a historic investment in broadband funding provided by the Bipartisan Infrastructure Law for broadband programs operated by Rural Development. These investments are momentous and represent significant strides toward closing the digital divide and ensuring that all rural Americans can participate in the global economy.

Sustaining Rural Communities

The Biden-Harris Administration and Secretary Vilsack strongly support the desire of rural residents to live their entire lives in the place they call home. I hear from rural people that access to healthcare and education are integral to achieving that goal, and high-speed internet can increase access to both.

Health care, elder care, childcare, and behavioral care are critical to rural America, helping families remain in rural areas through all stages of life. Yet, healthcare in rural areas faces significant challenges. Even though approximately 20 percent of Americans live in rural areas, barely $\frac{1}{10}$ of physicians practice there and 61.5% of all Primary Medical Health Professional Shortage Areas in the United States are in rural areas.⁵ COVID-19 brought the critical need for access to care into very sharp focus—lack of access to care costs lives. Telehealth insurance claims rose 8,000 percent, driving a deeper wedge between rural and urban care.⁶ As COVID swept the country, it proved to be nearly twice as fatal for rural Americans as for urban Americans.⁷

To increase access to healthcare in rural communities, Rural Development operates the Distance Learning and Telehealth (DLT) Grant Program and the Community Connect Grant Program. DLT aims to increase the adoption and use of telemedicine technology to provide(?) to offer opportunities for improving rural care in the future. Community Connect provides funding for public entities to get access to high-speed internet service for the purpose of delivering educational, healthcare, and public safety opportunities to their communities. In some cases, applicants have helped place telemedicine carts at rural hospitals, rural health clinics, and rural penitentiaries for healthcare and behavioral healthcare purposes. Paired with the nearly \$2 billion in ReConnect funding through the Bipartisan Infrastructure Law, Rural Development is working to ensure that even the most unserved residents have access to telehealth services in their home.

In addition to healthcare, access to education remains a significant challenge for rural communities. This challenge was exacerbated during the COVID-19 pandemic, as schools shifted to a virtual learning environment. Rural communities also cannot thrive unless families have access to education for their kids, and COVID-19 drove home exactly how critical high-speed internet is to a modern education. During the pandemic, as schools shifted to a virtual learning environment, the already-existing “homework gap” widened dramatically between students with access to high-speed internet and those without. During the pandemic rural students were twice as likely to not have the technology they needed to complete their homework, and those without high-speed internet often resorted to doing coursework in parking lots to avoid falling behind. The repercussions of this learning environment will have consequences beyond the pandemic, especially as schools and institutions of higher education increase their use of digital learning strategies—students without broadband or appropriate technology were roughly a half a grade level behind their peers,⁸ impacting post-secondary success and workforce readiness.⁹

To increase access to education in rural communities, DLT and Community Connect provides support to rural schools to expand virtual learning capacity. DLT helps rural communities use telecommunications to connect to each other and to the world, overcoming the effects of remoteness and low population density. For example, this program can link teachers and in one area to students in another. Community Connect provides financial assistance to applicants, like schools, that will provide broadband service in rural, economically challenged communities where service

does not exist. The impact of both programs is more students connected to the resources they need to learn, advance academically, and complete their education in the place they call home.

Oversight & Coordination

At Rural Development, we understand that high-speed internet cannot be deployed in rural and remote areas without tackling existing challenges. To address these challenges, Rural Development is working in close partnership with other Federal agencies, states, local governments, Tribes, and Congress to ensure seamless deployment of reliable, affordable high-speed internet.

Particularly during the deployment of the Bipartisan Infrastructure Law funds, close and careful coordination is critical to preventing duplication of funding. Although USDA, the Federal Communications Commission (FCC), and the National Telecommunications and Information Administration (NTIA) are the three primary Federal agencies charged with broadband deployment, more than half of the fifteen Federal departments have some responsibility for broadband funding.¹⁰ President Biden has made coordination a top priority, convening standing meetings between agency senior staff to coordinate on access, affordability, and avoiding overbuilding. In addition, last month USDA, Treasury, NTIA, and FCC signed a data sharing memorandum of understanding to develop consistent reporting processes and share yet more information with each other about broadband projects.

It is also essential that Rural Development projects are serving their proposed service territory, that providers are meeting their build-out requirements, and that we continue to monitor broadband deployment to ensure efficient build-out. Once an award is approved, USDA takes a multifaceted approach to monitor the progress of the construction. Award funds are advanced only for specific projects that have been approved for funding. Our national office staff monitors the progress of the advances and ensures that the construction conforms to the approved application. In addition, USDA has a general field representative (GFR) in each region throughout the country who visits the project and inspects construction that is being completed. Awardees are also required to submit reports providing that all proposed premises are actually served and submit a final report when all construction has been completed. The GFR then conducts field visits to make sure that the premises are getting served.

The Rural Development model focuses on funding community-driven projects, awarding funds to providers who do not overpromise and underdeliver, all while bringing affordable high-speed internet to the families and businesses in rural America who need it the most.

Conclusion

These programs demonstrate remarkable success in the drive to sustain and create rural economies in a coordinated and collaborative way. Rural businesses, healthcare providers and schools know what works for them, and Rural Development aims to support their successes and their goals by improving access to reliable affordable high-speed internet.

Rural Development is poised to meet and expand our commitment to high-speed internet deployment in rural America. I look forward to working with this Committee to support this mission.

The CHAIRMAN. And thank you, Under Secretary Torres Small, for your excellent testimony.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. And you will be recognized for 5 minutes each in order to allow us to get to as many questions as possible.

And now once again, please, please keep your microphones muted until you are recognized so that we can minimize background noise and get through our hearing in a very respectful way. Thank you.

And now I recognize myself for our first 5 minutes.

Under Secretary Torres, with this money, this \$65 billion that we have gotten for this program going out through several different agencies, oftentimes these agencies compete with one another. All

¹⁰ <https://www.gao.gov/assets/gao-22-104611.pdf>.

kinds of problems develop that slow down or make an impediment of getting the money out, not only with the Federal agencies having to coordinate, but then you have your state agencies to coordinate as well. Treasury Department, Commerce Department, NTIA, USDA, FCC, I think we about got every letter in our alphabet here. So tell me, what agreements, what procedures need to be put in place to ensure that this broadband \$65 billion in resources across all these agencies are effectively utilized to reach our goal in finally connecting our rural communities?

Ms. TORRES SMALL. Thank you so much, Mr. Chairman, for that question. And it is the big question: \$62 billion is a huge investment, and the only way we reach the places we need to is if we coordinate. I will be very honest with you. It is hard. There are silos. People are used to working within their agencies. But there are also benefits in terms of certain community members are used to working with Rural Development or used to working with FCC or used to working with NTIA, and so we are learning how to reach different people. And it is that required coordination. We are also learning from each other. So, for example, NTIA helped with some of our outreach early on with Tribal communities, and we also helped provide some support in reviewing some of their applications.

One of the biggest challenges we have learned is that our work—one of the hard parts is timing, making sure that our programs and the timing for our windows of application is aligned with timing for other programs. And it is going to become even more of a challenge when we are also working with the states. That is why we are trying to get out ahead of the game when it comes to states. We are meeting directly with state legislators and providing trainings on what ReConnect is so that they can find ways to supplement or do something different from what ReConnect does, and also with state agencies. So those are some of the ways we are trying to work together.

And I will turn it over to Acting Administrator Chris McLean if you have anything you want to add about it.

Mr. MCLEAN. Oh, thank you very much. Thank you. Thank you. The tradition of working across agency boundaries and working with state regulatory agencies is something that is very familiar to the Rural Utilities Service. We have been in the telecommunications finance business since 1949, and we have had to work with leveraging FCC Universal Service support, working with state regulatory authorities through our financing. So we are very proud of working together across agency lines. And, as the Under Secretary said, coordination sometimes is difficult. We have three—Treasury, NTIA, FCC, and ourselves, four different agencies with infrastructure money, and we have four separate statutes. We have to be faithful to our statutes. But we work really hard to resolve any disagreements or de-conflict our investments with each other.

The CHAIRMAN. And let me just ask you, do you have an inter-agency plan of what are the specific roles of each of our Federal agencies, and a plan of connecting and making sure there is a smooth transition of getting the funding down to each of the states?

Ms. TORRES SMALL. This is a really, really good question because what we have are our interagency agreements in terms of coordina-

tion. And with emerging technology like high-speed internet, it does require some flexibility. You have seen in terms of the conversations that we have regularly with Congress about speeds, for example, and different technologies. The flexibility is really crucial there, and it will become all the more crucial when we are coordinating with states as well. So our priorities are regular coordination, that cadence, key guiding posts in terms of what we are doing, and then being flexible with each other.

The CHAIRMAN. Thank you very much. And now, the gentleman from Pennsylvania, Ranking Member Thompson, you are recognized for your 5 minutes.

Mr. THOMPSON. Thank you, Mr. Chairman.

Under Secretary Torres Small, good to see you again. Thank you for your work. Mr. McLean, thank you for your longstanding work as well, much appreciated.

Under Secretary, as you know, USDA, FCC, NTIA, and Treasury entered into this interagency agreement in May of 2022, to collaborate on Federal broadband programming and funding. Can you share any insight on the current collection and reporting of data and metrics related to broadband deployment between agencies? And have you run into any unexpected coordination challenges?

Ms. TORRES SMALL. I appreciate that you asked for the challenges because that is how we learn from these things, right? When it comes to the information collection, I think our different strengths are really well-suited. So Rural Development's specific strength of when there is a conflict with a map, for example, we have to provide directly to each home, we have to make sure that each home within that service area has the ability to access that service. And so being able to identify on the ground whether or not that happens gives us data that we can then share with NTIA for NBAM (National Broadband Availability Map), and then also making sure that FCC has access to it.

We also go the other way, so as we look at different awards, making sure we have the data about where those awards are covering and how that interacts with our programs. So it has to go the other way. And the challenges really do circle around timing. So as we put out our rules, we have to make sure we know what other awards are going to be coming down the pipeline during that time. And for ReConnect 4, I think it was a really good example of how we learned that lesson. So we were very specific on RDOF, for example, and whether entities were ready to authorize, those awards were ready to authorize, which is a key step in the process. And so in ReConnect 4, we specifically said if they were made ready to authorize by this point, we would work to avoid overbuild. But having that clarity was really valuable, and that was a lesson learned.

Mr. THOMPSON. Very good. Well, FCC is—the way they have done their mapping in the past—and maybe that has changed, I certainly hope it has. And I think your part of that and coordination can be a force for good on this. I mean, the FCC by Census zone would make two egregious errors in the past. I am not sure what the current process is. But, if they found that there were one or two entities within a Census zone that had broadband connectivity, they would color the entire map as *served*, excluding everyone else. It may be a hospital, may be a school, a university,

and leaving out the large portion of the district from being eligible from these funds and development. And then the even more egregious one was the wording that said if the conditions exist by which connectivity should be occurring an area is served, despite the fact that no one in that Census zone was served. And that is just two of the errors that I think that the FCC made. So, I am appreciative of the fact that you will be at the table on this because I believe the FCC needs adult supervision and needs supervision of people that understand rural America. I would be much more comfortable if you all were at the tip of the spear on this *versus* in the relationship that you have.

But, as you know, the USDA currently employs nearly 100,000 employees across more than 4,500 locations. Comparatively, NTIA and FCC retain almost 2,100 employees combined. Their resources aren't near as extensive in order to have the penetration into rural America the way our USDA professionals do. However, since 2020, 13 new broadband programs have been authorized and funded by Congress, none of which are administered by USDA. Shame on Congress. Shame on Administrations for allowing that to occur. Can you comment on why USDA's scope and scale really are best suited to deliver broadband programs to rural America? And why is it so critical that USDA remain an integral player in broadband deployment?

Ms. TORRES SMALL. Ranking Member Thompson, thank you so much for lifting up our staff at Rural Development and in USDA. It is absolutely a fundamental piece of who we are, having people living in the communities that we serve. And it is rare across the Federal Government, and that is why we have been asked to lead things like the Rural Partners Network because that takes real connection with community so that we can listen to them and learn from them. And that is why we are a fundamental part of the solution when it comes to high-speed internet because each situation is different. The geography, how do you get behind the nooks and crannies of mountains or how do you lay fiber on the sea floor? And having that specific expertise as well as the partners on the ground is a crucial picture that we bring to the table.

Mr. THOMPSON. Very good. Thank you, Mr. Chairman.

The CHAIRMAN. The gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of the Committee on Agriculture, is now recognized for 5 minutes.

Ms. ADAMS. Thank you, Mr. Chairman, for hosting today's hearing. Thank you as well to the Ranking Member.

Under Secretary Torres Small, it is good pleasure to have you here with us today. Service is the rent we pay, and it gives me great pleasure to know that you are keeping your rent paid up with all of the great work that you are doing.

We have discussed at length the bipartisan infrastructure law, and our last farm bill, to make significant investments in broadband, particularly in rural broadband. In my State of North Carolina, I am proud that our Governor Roy Cooper announced \$206 million in grants from funding that we here in Congress provided to expand internet access for rural communities. Eighty-five thousand households will now have access to high-speed internet. More than 2,000 businesses will also have it.

But it is more than just businesses that need this access. It is our rural schools, too. So, Madam Under Secretary, can you discuss what these investments will mean for our K-12 and institutions of higher education in rural areas?

Ms. TORRES SMALL. Thank you so much, Congresswoman. And it is wonderful to see you and for your focus on education because our kids in rural places are our future, and if we can make sure they have good education, it gives them a chance to build their best opportunities hopefully in the rural communities where they live. And when it comes to high-speed internet, that is fundamental to that. So ReConnect's program, one of the requirements is that within a service area, every address has to be eligible to receive service, so you are not skipping schools or houses, and that is crucial because we certainly hear on the ground stories of internet service lines that go all the way except for that last house that is really hard to reach or that last location. So that is one way that we reach education is by connecting every address within so that both at the school and kids' homes, they can do their homework at home, is possible.

The other way is other programs within Rural Development. So we have the Distance Learning and Telemedicine Program, which helps provide some of the infrastructure, the hardware for using that high-speed internet so that schools, applicants can receive funding to be able to get the best technology that allows their students to learn and prepare for careers in computer science, for example. So there is an in to learn. You can broaden your horizons in a rural place if you can connect with people all across the world.

Ms. ADAMS. All right. Thank you.

Ms. TORRES SMALL. So those are two ways that we are working.

Ms. ADAMS. Thank you. I do agree. And it is absolutely essential. It is life changing.

I have also heard from rural schools what happens when they aren't able to provide powerful internet connections to their students. They miss out on research opportunities, jobs, and a whole lot more. So, Madam Under Secretary, most states have a research and education network that provides high-speed internet access to schools, but not all schools are hooked up to those networks, and during our push to connect rural areas, what do you think we should do to ensure that our rural HBCUs and MSIs and Tribal colleges can access these critical networks?

Ms. TORRES SMALL. That is a great question. And I would love to follow up with you about specific outreach that we can do to HBCUs if they are lacking that high-speed internet connection right now because one of our focuses at Rural Development has been how do we reach out to potential partners? How do we make sure folks know how to navigate the ReConnect process, which can be challenging, and know about the other resources that are available as well? So I would love for us to be able to follow up with you to talk about how we can intentionally reach out to HBCUs.

[The information referred to is located on p. 1528.]

Ms. ADAMS. Okay, great. Well, we will look forward to that. And thank you so much for being here and for your work.

And, Mr. Chairman, I yield back the balance of my time.

The CHAIRMAN. Thank you.

And now the gentleman from California, Mr. LaMalfa, is recognized for 5 minutes.

Mr. LAMALFA. Thank you again, Mr. Chairman.

Under Secretary, welcome. Thank you. Thank you for both attending today. Nice to see you. We wanted to point out that, recently, Rural Development awarded a \$40 million ReConnect grant to the Volcano Telephone Company in Pine Grove, California, just not too far from my own district, but certainly the issues are common to a lot of eastern California and Sierras. It will help boost the high-speed internet in those mountainous areas and help with smoke detection, which is something that is very critical in our state, as well as your home state with so much wildfire.

And so with this technology and with this ability to better detect smoke and its density for health reasons, or an early jump perhaps on fire, what do you think we can do to even better utilize the current programs we have to monitor these disasters as they occur, in order to expedite emergency responses and better warn people about health warnings from dense smoke like that? So, it seems like we are on a good path. What can we do to accelerate this, do you think?

Ms. TORRES SMALL. Thank you so much, Congressman LaMalfa. It is such a pleasure to see you.

And I got the chance to talk with Volcano Telco, and I was so impressed with this fourth-generation private ISP that is located in the community they serve. They talked about being really connected so that if internet service goes down because of a wildfire or other reasons, they have people knocking on their door. I mean, that is how accountable they are, and it makes a real difference. I asked them specifically about speeds because they really are that last, last mile in the frontier, and how important is a high speed for them. And they specifically identified the video monitoring for smoke because that video monitoring in remote areas has to go up to a cloud for storage, so it requires not only download speeds but upload speeds to upload that to storage so they can identify where and keep running where the potential smoke is. So it was really helpful to understand that that speed is really valuable even that far out.

In terms of how we can better utilize this program to do things like that, the other thing they mentioned was integrating—making sure that electric wires, working with rural electric co-ops or other electricity providers so that they know when to shut off the power if they are in danger of wildfire or spreading a wildfire in the case of large winds. So I think that there are some other opportunities there to increase safety through high-speed internet.

Mr. LAMALFA. Yes, the wires are indeed a critical issue in our forested areas like that.

Can you speak a little about how USDA, FCC, and NTIA all have their own data mapping and do not necessarily follow the same methods of collection of that data. So recent legislation that we have passed here that included the Broadband DATA Act (Broadband Deployment Accuracy and Technological Availability Act (Pub. L. 116–130)) to help better simplify this information and require information sharing. And you talked about the cross-pollination between agencies. So how do we ensure that those areas are

mapped correctly since we have these differing methods and then we don't have inaccuracies from the different styles of—are they that much different to begin with?

Ms. TORRES SMALL. There are some differences. I think each iteration is getting better, and we are working together much better as well. I remember when I was in Congress, the Census tract issue was the bane of my existence because out in the West, you have big states, you have big land, and a Census tract is not an accurate area of measurement for whether or not you have high-speed internet. That is changing. It is work, though. We are learning a lot from states and their mapping efforts. And Georgia is a key example where there has been some really exciting progress, and we are sharing that information. So NBAM with NTIA has been really good about sharing information and collecting it. And so frankly, our different ways of collecting information has been helpful with NBAM because we are able to get information in different ways, cross-reference it, cross-check it on a mapping platform.

As we look to FCC and the fabric that they have, as well as the updates, we are working there as well. I mentioned we all have different relationships with different people. They are used to working with different agencies. And so we helped get out the word for the deadline for internet service providers to make sure they were providing information to FCC for the creation of their maps.

Mr. LAMALFA. I am sorry. I am running out of time. Do you have concerns that linking with these other sources could somehow harm your own data mapping? Do you have any concerns about that?

Ms. TORRES SMALL. That is a really good question. I would love to follow up with you to see if there are—just to ask generally to my team. None have risen to me because we are sharing really well and because we are using multiple sources of information, and last, because we have that ground-checking capability so if there are conflicts about the different mapping, we can go on the ground and check to see if that service—but I will get back if we find any others.

[The information referred to is located on p. 1528.]

Mr. LAMALFA. Okay. And also check to see do you have any concerns that might slow down the USDA's current process on its own funding? And then I will just leave that there. So thank you. Thank you, Mr. Chairman.

The CHAIRMAN. Sure.

The gentlewoman from Maine, Ms. Pingree, is now recognized for 5 minutes.

Ms. PINGREE. Thank you very much, Mr. Chairman, and thank you so much for having this important hearing. And thank you, too, Madam Under Secretary. We are so pleased to have you in that position and before our Committee today and working hard on this really important topic to rural states like mine.

Some people don't think about New England being rural, but Maine is considered one of the most rural states in the nation, and we have a lot of distance between internet service providers. We have some of the slowest speeds and lack of availability, so this has

been plaguing us for a long time, and our state is very interested in repairing the problem.

One thing I have dealt with quite a bit are the issues around the ReConnect Program. When you have a small community as we do—and I represent over 100 small communities, many of them under 10,000 people, under 5,000 people—there is rarely the level of staffing that is needed. And what we hear very often is that it is a part-time employee, maybe a volunteer for the town that is trying to deal with very extensive and complicated reporting requirements. So can you talk to us a little bit about technical assistance provisions that are in place and how we can do more or what you are doing now to really give ground-level support to those communities who need to be getting the access to these programs that we are funding?

Ms. TORRES SMALL. Congresswoman Pingree, thank you so much for that question. Technical assistance is one of the key opportunities and, frankly, challenges when it comes to serving rural places. If you have a volunteer mayor or a part-time clerk, it is really hard to apply for all these grants. And then if you catch that car, then you have to drive it in terms of the reporting requirements. So one, we are working to make it more simple; but two, we are also working on technical assistance. And Rural Development is using some of the administrative funds from the bipartisan infrastructure law to increase and to build upon that great staff structure that Ranking Member Thompson mentioned. And that is crucial when it comes to reaching those hard-to-reach places.

Also, in your bipartisan bill to authorize ReConnect, I really appreciate the work that Chairman Scott and Ranking Member Thompson put in for broadband connectors, recognizing the need for continued investment in technical assistance, so we really appreciate that you are continuing to see that. And I will note that NTIA is also investing significantly in technical assistance. We are coordinating to make sure that technical assistance doesn't overlap but rather supports each other. They are focusing mostly on interacting with state agencies and state broadband offices, and our technical assistance is more focused on the providers, the internet service providers.

Ms. PINGREE. I just want to follow up a little bit because it is an issue I have brought up previously. It is an issue we have been hearing about over the years. We have been told that there are some technical assistance people that are called general field representatives that are meant to be there to help and support, but we often get the feedback that there aren't enough, that they are spread over a wide range. I don't know how many states each GFR covers. But again, I feel like every time I have this conversation—and I have great faith in you accomplishing this—we hear like, oh, that is going to come, we are working on it. Can you talk at all about anything else you might need? Should there be more language in the farm bill?

I guess I will just emphasize again if our main goal here—and everybody on this Committee talks about rural America. We are all so supportive of doing more for rural America. But just as you acknowledged in the beginning, and I appreciate that you are talking about small communities that really need on-the-ground kind of

technical assistance and need to have the ability to apply for and then manage these funds in. Do you see this happening in the near future? Do we need to write language in the farm bill? What can we do to just assure it really comes to be?

Ms. TORRES SMALL. Thank you for holding our feet to the fire on this. It is something we need to deliver. And the first thing I will note, the administrative funds in the bipartisan infrastructure law really were helpful in terms of helping us work to set up more technical assistance. We have hired more GFRs as a result of that. But one of the challenges is hiring and creating the right position descriptions and making sure that it truly does result in bringing someone on board, and that is a place where I would like to have a deeper dialogue.

I will turn it over to the Acting Administrator for any additional points.

Mr. MCLEAN. No, thank you very much. And staffing is always an issue for us. We are a remarkably small agency that does a remarkable amount of work. There is at any given time about 100 or 20 telecom staffers that are delivering this massive program. We are very, very proud of that work. We have about 25 or so GFRs in telecom and about 23 or so in electric at any given time, and that is to cover the whole country. So we are not able to have a GFR in every single state, but we try to maximize our outreach. We use contract support. We have had webinars to try to help communities.

[The information referred to is located on p. 1529.]

The CHAIRMAN. Unfortunately, the gentlewoman's time has expired, but that is very valuable information. Please communicate it in writing to us.

Ms. PINGREE. Thank you.

Mr. MCLEAN. Thank you, Mr. Chairman.

Ms. PINGREE. Thank you.

The CHAIRMAN. We are after smooth sailing to get this here, so please get that to her.

And now I recognize the gentleman from North Carolina, Mr. Rouzer, for 5 minutes.

Mr. ROUZER. Thank you, Mr. Chairman.

And, Ms. Torres Small, great to see you and, Administrator, thank you for being here as well. All of my life, I heard about haves and have nots, and I have decided over the last 5 to 10 years that those in the have category have high-speed internet access, and those who are in the have-not category are without it. It bridges racial divides, demographics, and really, it is all geography. Just like many other Members of Congress, I have a lot of communities that have good access, and I have a lot of communities that do not have good access. And it is a critical, critical piece of infrastructure, as we all know.

So quick question, just overall basics, your overall portfolio, how much is—if you look at all the programs, how much is grant, how much is loan, and how much is loan guarantee?

Ms. TORRES SMALL. Oh, that is that is a great question. So in terms of ReConnect, the most recent round, ReConnect 4, \$150 million is available for loans, and the max request is \$50 million. For a 50 percent loan, so 50–50 grant-loan combination, up to \$150 mil-

lion is available for loans, and \$150 million is available for grants. And then there is 100 percent grants. And so there is \$150 million available as a set-aside for all full grant applications, and then there is also a set-aside for Tribes, persistent poverty areas, some have-nots, socially vulnerable communities, as well as Alaska Native corporations. And then there is also a separate set of set-asides of \$200 million for project-serving areas where 90 percent of households lack sufficient access to broadband.

Mr. ROUZER. How much is loan guarantee? Are we doing much in the area of loan guarantee?

Ms. TORRES SMALL. Not in high-speed internet but in other programs it is a fundamental part, so B&I loan guarantee, for example, and facilities.

Mr. ROUZER. Sure. Well, broadband is a tricky subject because technology changes so rapidly. I think fiber is going to be a critical component for some time to come. How do you make your judgments on investments as it relates to very rapidly changing technology?

Ms. TORRES SMALL. That is such a great question. And it is that emerging technology piece that makes it challenging to navigate. We focus primarily on speed, what is the build-out speed that you can get to based on the technology. There is also some statutory limitations, so ReConnect requires us to refer to a law that talks about fixed broadband, terrestrial or wireless, and so that limits some of our flexibility. In the first two rounds of ReConnect, we tried to use as much flexibility as we could in some emerging technologies but didn't have many takers, frankly. So for ReConnect 4, we are focusing on the speed build-out and the technologies where we have had interest. But it is an open dialogue, it is changing conversation, and we would love to continue that conversation with you.

Mr. ROUZER. So with regard to ReConnect, the program has a number of administrative burdens, which make it a little difficult, time-consuming, and cumbersome for some—or actually many providers from what I hear. So the program requires—and this is an example. The program requires the provider to submit significant information regarding non-funded service areas. It also requires all environmental approvals to be obtained in sequential order rather than filed and reviewed concurrently. How are you all working through these burdens? And doesn't it make sense to streamline this and have these objectives reviewed concurrently?

Ms. TORRES SMALL. Thank you so much, Congressman. And I will say a little bit and then pass it over to Administrator McLean. We absolutely have to work to make it as accessible as possible, recognizing that these are big projects that require sophisticated administration. The information about outside areas that aren't funded but are covered helps us support those maps that we were just talking about and make sure we are navigating the overbuild situation, making sure that we are doing as much as we can to leverage what we have to reach the places that are unreached.

When it comes to environmental reviews, there has been a real learning curve. The first two rounds of ReConnect, we were casting a broader net, frankly, than what the law called for in terms of both timing and when it was necessary to do consultation. So we

have shifted the timing there, and we think we have the appropriate match, but there is still work to be done.

In terms of sequential environmental reviews, I will pass it over to Acting Administrator McLean.

Mr. MCLEAN. Thank you very much. And another thing about round 1 and round 2 was the effect of the pandemic, particularly in those early months when it was a total lockdown. Historic preservation offices were closed at Tribal level and state level, so environmental review just elongated. So we worked very hard to try to expedite environmental review as much as possible. But it is it is a point well-taken and—

[The information referred to is located on p. 1529.]

The CHAIRMAN. The gentleman's time has expired. Sorry about that. If you could communicate your thoughts in writing to us it would be great.

Mr. MCLEAN. Thank you.

The CHAIRMAN. And now the gentlewoman from New Hampshire, Ms. Kuster, is recognized for 5 minutes.

Ms. KUSTER. Thank you, Mr. Chairman. I so appreciate the Committee holding this important hearing on access to broadband communication in our rural communities.

Compared to even just a generation ago, the services and tools available to us now with the click of a button are absolutely remarkable and essential. Essential government services, medical check-in, school courses, and job training are all accessible at the time and place of our choosing. Reliable, affordable, high-speed broadband service is what makes those things possible. And while it brings incredible benefits, it also exacerbates the gap for those who do not have access to the service or simply cannot afford it.

We have talked for many years, and I have been a proud Member of Mr. Clyburn's Rural Broadband Task Force. Finally, I am so excited that Congress is matching our words to our actions. In the past 2 years, we have enacted targeted programs and made historic investments to bridge the digital divide. This includes efforts not only aimed at building the physical infrastructure to support broadband networks, but to ensure that this essential service is affordable to our rural, hardworking families. Some of those programs have already begun disbursing funds and connecting communities. The remaining are being stood up now as we speak.

Just last week, I am proud to announce that New Hampshire received \$66 million in broadband funding under the American Rescue Plan (Pub. L. 117-7) Capital Projects Fund, bringing the total to \$122 million to help connect more than 24,000 Granite State homes and businesses to affordable high-speed internet. It will be crucial for the agencies administering these programs to communicate and coordinate so that the investments are effective and efficient and reaching the greatest number of my constituents.

And that is why I am pleased that we enacted legislation in the 2020 Consolidated Appropriations Act (Pub. L. 116-93) to create a new office of the NTIA tasked with tracking and coordinating broadband deployment and funding in programs all across the government. We also required USDA, NTIA, and FCC to enter into a memorandum of understanding to ensure they are sharing data about their respective broadband deployment programs. All this

builds on the progress that we all fought so hard for in the 2018 Farm Bill, boosting grants and loans for broadband infrastructure by \$350 million per year. And as we look ahead to writing the new farm bill next year, I am determined to build upon these critical winds and further enhance USDA's broadband programs.

Madam Under Secretary, great to be with you. You mentioned the Distance Learning and Telehealth Grant Program that is such an important component of expanding broadband. Could you comment—I know you have done a lot of travel and talked to applicants—on the feedback you have heard? Is there anything that we need to do legislatively to help further streamline the process and support applicants [inaudible] pointed out?

Ms. TORRES SMALL. Congresswoman Kuster, I lost the last part of your question, but I think you are asking about how we can streamline programs like the Distance Learning and Telemedicine Program to—

Ms. KUSTER. If you need—sorry to interrupt. If you need anything for us to do legislatively to help you streamline those programs.

Ms. TORRES SMALL. Thank you so much for that question. It is a crucial piece. One of the things we hear regularly across our programs that can be hard and that was done in our high-speed internet funding is providing no match grants when available. It has helped us reach the most socially vulnerable, the persistent poverty counties. It is really crucial, and also allowing us some flexibility in the tools that we provide. But for some specific commentary on the Distance Learning and Telemedicine, I will turn it over to Administrator McLean.

Ms. KUSTER. Thank you.

Mr. MCLEAN. The Distance Learning and Telemedicine Program is one of our most popular programs across the board. We consistently have more applications than we have funding available to be able to meet those needs. And it is always heartbreaking to have to leave projects still on the table. But fortunately, Congress year after year has been able to provide us support, and we do appreciate that.

Ms. KUSTER. Great. One quick question and maybe you will need to submit in writing, but I strongly concur with your sentiments about how access to reliable telehealth services helps ease the provider gap in our rural communities and wondering if you could share insights that you have heard about how USDA broadband programs have opened up new telehealth options.

Ms. TORRES SMALL. Someone even went so far as to say it is a recruitment tool. A nurse who was trying to get other folks to apply to her rural hospital said once they were able to get the technology that worked with high-speed internet to be able to reach more people in their homes, the workforce was just more excited to be there because they could better do their job.

[The information referred to is located on p. 1529.]

The CHAIRMAN. Thank you.

Ms. KUSTER. Thank you. I yield back.

The CHAIRMAN. The gentleman from Georgia, Mr. Allen, is now recognized for 5 minutes.

Mr. ALLEN. Thank you, Mr. Chairman, and thank you for hosting this hearing. And, Madam Under Secretary, thank you for your attendance this morning.

Obviously increasing broadband—well, actually completing broadband to all rural Americans has been my top priority here in Congress. There is nothing that holds back rural America from continued economic development than broadband and cell service.

Since I was first elected, there has been a major broadband build-out, but we saw apparent shortfalls in that during the COVID pandemic, particularly with education, and then the ability for people to actually get the job done when they were in living in rural America.

Right now, for the first time, it appears that funding may not be the most pressing issue. More than \$147 billion in Federal funding has been dedicated to broadband in the last 4 years alone. This is a lot of money, and it is time for us to take account on exactly where in the heck the money is.

To that point, I am disappointed that the Federal Communications Commission and the National Telecommunications and Information Administration are not represented in this hearing today. Of all the committees in Congress, there is no question that the House Agriculture Committee is the one most in tune with the needs of rural America. I urge the leadership of this Committee to convene a separate hearing in the future where we can hear from the leadership of these agencies as well.

I said earlier that I believe at this moment funding is not necessarily the number one concern that Congress should have. Instead, it should be broadband mapping. In July of last year, I led a bipartisan, bicameral group of Georgia lawmakers in sending a letter to the FCC requesting an update on implementation of the Broadband Deployment Accuracy and Technological Availability Act (Pub. L. 116–130), which was signed into law last Congress. Additionally, we requested that they integrate data from the Georgia Broadband Map Program into their new mapping program.

Unfortunately, since Chairwoman Rosenworcel is not represented here today, I cannot ask her about the implementation of the DATA Act (Pub. L. 113–101). Madam Under Secretary, do your agencies rely on FCC maps to distribute broadband funds?

Ms. TORRES SMALL. Thank you so much, Congressman, for making high-speed internet a top priority and for your focus on mapping. It is a crucial part of how we need to coordinate across the Federal Government and, as you mentioned, with states that have had some of the most cutting-edge approaches to mapping.

When it comes to Rural Development, we are intimately involved in providing information for both NTIA's NBAM map, as well as the FCC's map that they are constructing. And we use NBAM to help as part of the process for identifying our service areas for our awards. We have multiple components of the process. So we use the maps for a desktop review, then the second part is allowing service providers to weigh in to say no, actually we cover this area, and here is the data to show that, and then we are on the ground—

Mr. ALLEN. How do you find these maps to be?

Ms. TORRES SMALL. For that I will refer to Acting Administrator McLean.

Mr. MCLEAN. Yes, thank you very much. Well, over time the maps have improved. The reference to Census block mapping didn't provide much granular data, so the mapping material that we have had historically and that we use now, they are informative, they are a starting point, but they are not dispositive for RUS's work. As the Under Secretary said, we have what is called a service area validation process where our applicants will proclaim to the world where they are going to propose service. We will open up a 45 day comment period where we will allow service providers to tell us what they are providing, and we will check that. We will verify that and, if necessary, we will send field staff out to the area to be able to double-check that.

Mr. ALLEN. Well, my home State of Georgia Broadband Map Program is the gold standard in the nation's broadband maps. It precisely maps out the availability of broadband services to every home and business in the state. Other states are following Georgia's lead in implementing similar programs. So we have the maps. We know the needs in Georgia. And of course, Madam Under Secretary, I believe you were in Georgia recently meeting with broadband providers, including my constituent, Steven Milner, with whom I have worked on many broadband rollout projects in my district. Could you provide us an update on how those meetings went and what your takeaway was? And I am out of time. You can submit that answer in writing. I would appreciate that. With that, Mr. Chairman, I yield back.

[The information referred to is located on p. 1530.]

The CHAIRMAN. Yes, thank you.

And now the gentlewoman from Illinois, Mrs. Bustos, who is also the Chair of the Subcommittee on General Farm Commodities and Risk Management, is recognized for 5 minutes.

Mrs. BUSTOS. All right. Thank you, Mr. Chairman.

I know that rural broadband is obviously a very important issue for everybody on this Committee. And I see it this way. Fortunately, Congress has been investing in programs to ReConnect. And so we have been able to deliver under the Under Secretary's leadership and under the Biden Administration these crucial investments. And let me just give you a quick example. We have \$14 million that went to Jo-Carroll Energy, which is a rural electric co-op in the Congressional district that I represent. They have been able to expand their fiber broadband and go into 3,000 additional households. That is a big deal where I am from. They are now able to serve on top of that ten educational facilities and a healthcare facility just with that funding. And so I know USDA recently announced \$1 billion for ReConnect round 4 that comes out of our bipartisan infrastructure law.

So, Under Secretary Torres Small, great to see you. Thank you for being here today. Can you talk about how this new round of the ReConnect Program is different from previous rounds? And in other words, what has changed?

Ms. TORRES SMALL. Thank you so much for that question. And we really are learning things in every stage of ReConnect. We are also trying to build to provide some consistency or at all possible

for our applicants, while applying lessons learned. So one of the places where we have seen a difference in terms of, well, the change from statute for round 4 of ReConnect is the service area. So the statute requires that—it used to require 90 percent being served. Now, it requires 50 percent unserved. And so that is a change that we have made pursuant to the statute.

That being said, Congress also included a set-aside for 90 percent unserved so we can continue to prioritize reaching the hardest-to-reach places. And so we are working hard to get out information about that change. A change that we made specifically was that we work to make sure that not only is their infrastructure in the ground, but that it is affordable. And so we worked to—in the previous round, there were extra points for participating in an FCC Affordability Connectivity Program. Almost everyone who was eligible to receive those points took advantage of it. So we went ahead and made it mandatory this next round, to work with the FCC Affordable Connectivity Program. And so what that means is that in areas where we are helping fund a service, people could get access with a \$30 plan for high-speed internet. And that can be truly transformative.

Mrs. BUSTOS. Yes, let me—because I know we just have a couple of minutes here, and I would like to get onto another topic. I know we are talking about rural broadband, but are you in a position where you can talk about the importance of rural connectivity as it pertains to rural cellular? I can talk about actually my own household, my neighbors, we have a district where we have access to broadband but not necessarily to cell service that allows us to have easy phone conversations on our cell lines. And, it gets in the way of emergency services, precision agriculture, and just household cell service. So wondering if there are activities currently underway at USDA Rural Development to help expand access to rural cell service, and if you can touch on that for our remaining minute and a half.

Ms. TORRES SMALL. I will speak very quickly and then turn it over to the Acting Administrator. The statute does limit—we can't take into account cellphone service when determining whether or not broadband exists. But one part of our priority points include wholesale broadband services, and that can mean building infrastructure that others could use. And so when it comes to building a cell phone tower that requires that backhaul of fiber to then connect to that tower, and so with wholesale broadband services, there is an ability to also invest in both the radio technology as well as cell phone service. Acting Administrator McLean?

Mr. MCLEAN. Yes, thank you very much. In addition, we do have loan authority to finance mobile wireless, and we do have loan authority to finance emergency communications and 911 access, but we don't have a grant program to match that. But the point is very, very well taken. Cellular dead zones are deadly zones when it comes to public safety and emergency communications.

Mrs. BUSTOS. Yes, they really are. My husband is the Sheriff of Rock Island County, which is a little more urban than some of the other counties I represent. And I know our sheriffs talk about these dead zones. And you think about when you need to communicate in a time where there is something tragic going on, you don't want

your deputies out there not being able to communicate with their radio operators or their other deputies. So, we can explore this a little bit more, but I am hoping that we can in the future and make this more accessible.

Thank you very much. I yield back.

The CHAIRMAN. The gentleman from Indiana, Mr. Baird, is now recognized for 5 minutes.

Mr. BAIRD. Thank you, Mr. Chairman and Ranking Member, for holding this important hearing. As you know, and it has already been talked about here today, but precision agriculture really needs and utilizes broadband in addition to telehealth and telecommunication and education, so it is very important that we do this. And so I guess the thing that I would like to ask is, Madam Under Secretary, you did a great job explaining how USDA monitors the broadband deployment and to make sure that we have efficient and complete build-out. So can you explain to me or address how the general field representatives and how important they are to make sure that we get this build-out done efficiently and we have the right kind of information to help our local entities apply for some of these funds?

Ms. TORRES SMALL. Congressman Baird, thank you so much for that question. Our general field representatives are crucial, and they are a unique part of Rural Development. It is people living in the places they serve. Lately, I have had the chance to travel and do outreach to two communities that currently don't have high-speed internet. And when I have a general field representative there, they know the providers that are around the table. They know how to work with communities that—what they know is that they don't have high-speed internet, and they are trying to figure out what that next step is. And so that ability to help navigate these really high-tech, challenging, complicated issues is crucial. And they are working hard, whether it is trying to make sure that the environmental reviews are happening quickly, or whether it is going back and forth. And I was talking to a general field representative just the other day, he is really proud that there has been so many awards in his region, but now he has got to process all of those awards. And because we really care about efficiency, it is reimbursements, so that processing of the award is high touch. It takes a lot of energy. So it is a crucial component of who we are at Rural Development, and it is something that we need to continue to make sure it is a strong part of our identity.

Mr. BAIRD. I think that you just illustrated an important point. If those individuals really understand where the money can come from and the different sources and the requirements who are applying for those, I think it just makes it more efficient and extends your capabilities right out in the rural community. So I am glad that you have those field representatives, and I hope you can train more in case you need them for additional help.

One other area that I would like to mention, I know USDA—and I appreciate it—keeps a close watch on the funds and where they are going, yet I have heard from some of my people and recipients about the frustration in accessing their funds. In fact, sometimes their construction activity has been delayed because they couldn't get access to the funds they have been approved for. So what

changes can Congress or what can we do to better balance the need for robust oversight and yet at the same time make sure we can expedite the construction process?

Ms. TORRES SMALL. That is a great question and one that I would love to continue to work with you to try to resolve because it is a balance, right? How do we make sure that the money is being used effectively and efficiently, while also making it easy and quick for deployment? One of the changes we have made is allowing ISPs to purchase the materials before the environmental review is complete so that they can plan, especially with some of the challenges we are seeing there. But there is still work to do. And another change is in the environmental review process. Again, that coordination, that timing of when we need to be doing outreach, and then also working to make sure that we are communicating that quickly with the ISP.

Acting Administrator McLean, do you want to add anything?

Mr. McLEAN. No, thank you very much. And I appreciate the comments about the general field representatives. They are absolutely the foundation of our work. We had one of our GFRs say that it is not a job, it is a lifestyle. I mean, it is really rewarding to be able to see their work. Yes, environmental review is a challenge. And it is about capacity. It is about having enough staff to be able to process those procedures. And we have to be able to complete the environmental review before we can release funds and before construction can start under the statutes that we have to enforce, the Endangered Species Act, National Environmental Policy Act, and the Historic Preservation Act. And we value and respect those statutes, but we work very hard to be able to get the funds out as quickly as possible.

The CHAIRMAN. Thank you.

And now the gentleman from California, Mr. Carbajal, is recognized for 5 minutes.

Mr. CARBAJAL. Thank you, Mr. Chairman. And thank you to all the witnesses and my friend, Under Secretary Torres Small for being here today.

Broadband access is required to participate in the modern economy. As such, we must make sure every single American has access to reliable high-speed internet. Broadband allows people to access education, healthcare, employment, the online marketplace, and much, much more. Congress has made significant investments over the last decade to expand broadband. Recently, the bipartisan infrastructure law provided \$65 billion in broadband funding. I am heartened to see the progress USDA and other agencies make as they continue to roll out this funding, and I look forward to working with you as we bring more communities online.

Under Secretary Torres Small, can you describe how USDA is doing outreach to communities who lack broadband access and help make them aware of funding opportunities. Within these communities, is the USDA able to provide technical assistance or are more resources needed?

Ms. TORRES SMALL. Thank you so much, Congressman Carbajal. It is wonderful to see you. And it is such a great question, this theme about technical assistance, and how do we make sure we are reaching communities that aren't the usual suspects who already

know how to navigate our programs. One of the things we are doing—and I recognize the irony in this—is webinars, so that way folks can—they don't have to travel to learn about it. And our Innovation Center has been very helpful in making sure we are providing really comprehensive training on those webinars. But you have to have high-speed internet to access that, so we also have our robust staff on the ground, over 450 offices across the United States and folks who are used to going out and traveling.

I just drove 4 hours to visit a Navajo chapter that had not received a ReConnect grant, and we paired them with someone nearby who had and had a conversation about what it was like to take that next step from we know we don't have high-speed internet, what do we do next? So being able to have validators who have navigated a tough process, be able to help walk through an applicant about future opportunities is a great way to do that. That takes time, that takes staff, that takes a lot of travel across really rural places and dirt roads. And that is why investing—that is why our GFRs are so crucial.

Mr. CARBAJAL. Thank you. I would encourage you to also look at natural facilitators that already exist or folks who interface with many of those underserved communities. There are already a lot of vehicles there that could be a win-win by partnering to multiply the education, the information that is being attempted to be disseminated.

Under Secretary, can you also elaborate on the successes of the Community Connect Grant Program and the Distance Learning and Telehealth Grant Program? Do you think these programs can be improved to benefit more people?

Ms. TORRES SMALL. Thank you so much for that. One quick thing on existing facilitators, it is such a crucial point. What it makes me think of is in our water environmental programs, our circuit riders, and then also the relationship we have with RCAP, so other people on the ground who have other relationships, they are trusted partners in the community.

When it comes to distance learning and telemedicine, it is a crucial part of the mix. Having the internet infrastructure on the ground or on the poles is one thing. You also have to have the technology to be able to use it. And one of the places I see that the most is in rural hospitals because you are able to reach people who then don't have to drive miles just to get the healthcare they need. And it also allows opportunities in terms of clinics to do a lot more preventative work. And when I think especially about obstetrics, like what does it mean to start your life in the rural community you want to call home and be able to have that prenatal care, the ability to go directly and provide service directly into a home through—a Distance Learning and Telemedicine Grant can be really powerful.

Acting Administrator McLean, do want to add anything there?

Mr. MCLEAN. Thank you very much. And one of the areas that we have observed growing interest in distance learning and telemedicine has been in telepsychology and teleconsultations and also treatment of addiction or prevention through prescription monitoring. So it is a very exciting technology, and you get better health

results in rural communities because you are able to connect using telemedicine.

Mr. CARBAJAL. Thank you. I also want to draw your attention to maybe an alternative point of view. We oftentimes think of reaching the home, but even if we could connect with one center in their community so they don't have to drive miles away, but they could go to a center that is technologically equipped for them to have those consultations, I would encourage you to look at that as a possibility.

Mr. Chairman, my time has expired.

The CHAIRMAN. The gentleman from Ohio, Mr. Balderson, is now recognized for 5 minutes.

Mr. BALDERSON. Thank you, Mr. Chairman. Thank you for being here today, Madam Under Secretary. It is good to see you again.

During your last visit to the Committee, I expressed my concerns regarding the significant changes to the Infrastructure Investment and Jobs Act made to the ReConnect Program's underserved threshold. As you know, the infrastructure bill only requires 50 percent of households to be underserved instead of 90 percent. Building on that, I am concerned that without using the FCC's maps, a significant amount of ReConnect funding could go to areas that are already considered served or even to areas that will be funded by the FCC's RDOF program or the NTIA's BEAD (Broadband Equity, Access, and Deployment) program. With this in mind, can you tell me specifically how USDA is going to prevent duplication in phase 4 of ReConnect?

Ms. TORRES SMALL. Thank you so much for that question. It is a crucial component, how do we make sure we are leveraging our resources as efficiently as possible? So in terms of—we are following the statute, right, that has a 50 percent unserved, but we are also making sure that we are getting the word out about the set-aside of non-match grant that goes to 90 percent unserved and so prioritizing reaching the most unserved through that means as well.

We talked earlier in this hearing about the importance of timing when it comes to different awards, and so we are working carefully in coordination to forecast when our windows will be open and identify—you mentioned RDOF, for example, what the timing is for when they will declare certain projects ready to authorize. And that is something we have done very intentionally in ReConnect round 4 is say when we will consider an RDOF award and when we will not. And so if it has been ready to authorize by a specific date, then we will not consider an area that is covered by an RDOF award.

Mr. BALDERSON. Thank you. My next question would be you may be aware that in a recent GAO report, ReConnect was identified as one of the 133 Federal programs administering broadband support—excuse me. With all of these new COVID-era programs how do you coordinate with the NTIA, the FCC, and other agencies to ensure ReConnect funds are not duplicated or overbuilding other programs?

Ms. TORRES SMALL. That is crucial to this work. And there are challenges. We talked about the silos and just folks being used to always doing one thing and knowing who to call within their agency, and we have to now change that so that we know who to call

across the agency. The MOUs are of course the foundation for that, but they cannot be the end of it. We have biweekly meetings to set up that regular cadence of communication, but also we are working hard to reach out to each other proactively whenever there is a sticky situation.

We have also worked to reach out for opportunities, too, so combining on webinars for outreach so we can provide information on both programs, sharing staff for review of applications. And to speak a little bit more specifically, I will turn it over to Acting Administrator McLean.

Mr. MCLEAN. Yes, thank you very much. The key is to sharing data in real time. We share our applicant data as well as our award data with our colleagues across the Federal agencies as soon as it is available. Coincidentally, this afternoon, I am having a meeting with my colleagues in NTIA, Treasury, and FCC, so we have regular coordination. And we do work on cases individual to de-conflict applications. None of the Federal agencies want to pay for the same thing twice. Now, there will be cases where we might not be able to de-conflict because we have to be true to our statutes. We are faithful to the laws that this Committee has endorsed, but to the extent we can work with our colleagues in other Federal agencies and eventually across state lines when the BEAD money goes through the states, we will engage fully and be transparent and open with all of our data.

Mr. BALDERSON. Thank you, sir. And thank you, Under Secretary.

I can't see my clock, Mr. Chairman, so I will yield back my time. Thank you.

The CHAIRMAN. All right. Thank you.

And the gentlewoman from Washington, Ms. Schrier, is now recognized for 5 minutes.

Ms. SCHRIER. Thank you, Mr. Chairman.

And welcome, again, to my friend, Under Secretary Torres Small. It is so good to see you again.

I would like to touch on a few issues with you quickly. As you know, my district in Washington State benefits greatly from the rural broadband programs authorized in the farm bill, and I am so happy that we can talk about them today because they are critical, as we have seen during pandemic. We also have a lot of players in Washington State. We have an excellent state broadband office. We have public utility districts who have invested heavily, local municipalities, private partners, and more. And I have heard from those entities but also from several my colleagues today about this concern about the USDA, NTIA, and the FCC all communicating to ensure there is no duplication around programs and that not only can these programs be utilized to their fullest extent, but also that they can be additive and really amplify each other's benefits. And so I was not going to ask a question about this but rather just emphasize what several of my colleagues have pointed out, that that coordination is critical.

I did have a question though about, in addition to the coordination, are there gaps or places where Congress can be helpful in aiding with the streamlining in the upcoming farm bill?

Ms. TORRES SMALL. Thank you so much, Congresswoman Schrier, for that. The coordination is crucial. And the requirement that we share data has been incredibly helpful. And as Acting Administrator McLean mentioned, noting that it is real time and making sure that data is really real time is really valuable. The other piece that we have learned in terms of timing is the announcements of our awards and when windows will be open and working to coordinate better there, so I think it is a place where we would like to have an open dialogue.

In addition, there are opportunities with the fact that we have different players in this space. There are different relationships. There are different people who are used to accessing those streams of funding. But ways that we can better learn from each other is something I am really interested in pursuing.

Acting Administrator McLean, do you have anything to add there?

Mr. MCLEAN. No, I think that was very well stated. In terms of the flexibility is very useful to us. We have multiple programs which we administer, sometimes with year-to-year changes in the requirements, and the ability to transfer funds, we were able to pull some IJA money forward to be able to fund out of round 3. That was a very useful tool. But we are limited to do future pulling forward money because they have different requirements. So that is something I think to bear in mind is the flexibility that the agencies have and the Department has to be able to move money to where it is needed most.

Ms. SCHRIER. Thank you. I think we will have to continue to work on this to make sure we get this right because it is such a big investment and so important in our districts.

Also, I know there have been some concerns about coordination around the ReConnect Program and specifically the middle mile infrastructure to ensure that the rural areas are getting the attention they need both in unserved areas and underserved areas, and having a coordinated approach with shared mapping and accurate mapping would help these efforts. So, Madam Under Secretary, in the time you have remaining, can you talk about how your office plans to incorporate the new FCC map that has been announced as you consider USDA programs?

Ms. TORRES SMALL. Thanks so much. So, as you know, we currently use the NTIA NBAM as part of our desktop review when we determine where service areas are and then of course, we allow ISPs to challenge that and then we, if necessary, get on the ground to determine that. But we are also supporting the FCC in creating their map, which NTIA will later rely on to distribute the BEAD money. So I have just made an announcement in multiple venues with ISPs because the deadline for their time to submit information for the creation of map was coming up, and I was just saying, please don't forget, this is why it is important and so leveraging our relationships to make sure that they are doing that. So that mapping collaboration is crucial.

You also mentioned middle mile, and this is absolutely true. I was just in a meeting with multiple rural electric—or telco cooperatives, and they were talking about, well, ReConnect doesn't fund middle mile. But sometimes if you create the service area in a way

where you are connecting two places, you can build-out where you otherwise wouldn't. That being said, there are places where you need middle mile and you can't ultimately reach a final house. And so we have been forecasting that to state agencies because—sorry.

The CHAIRMAN. Thank you. I am sorry. We are trying to get everybody in.

Ms. SCHRIER. Thank you.

The CHAIRMAN. Votes are going to be coming up quickly. We have a second panel. We want to accomplish it all.

Ms. SCHRIER. I yield back.

The CHAIRMAN. The gentleman from Kansas, Mr. Mann, is recognized for 5 minutes.

Mr. MANN. Thank you, Mr. Chairman. I will turn that down a little bit.

I represent the First District of Kansas, 63 primarily rural counties in the western central part of the state. In my part of the country, we greatly rely on broadband to connect our communities to one another and to the rest of the world with telehealth, a lot of things we talked about this morning, precision agriculture, and a plugin to global markets, which is what our producers are dealing with every single day.

So many Americans and Kansans are still unserved and underserved, and we should make sure our taxpayer dollars are being spent judiciously on existing programs and that the goals set by the USDA and/or the FCC must be realistic and be able to be met with by providers. What checks are in place to ensure that the USDA implements its programs as efficiently and cost-effectively as possible? And do you feel like we are stretching these dollars as far as we possibly can to reach as many people as we possibly can?

Ms. TORRES SMALL. It is so important. Because this is a historic investment, we have to make sure it goes in the right places. And Rural Development is unique in this work. We were talking earlier about that delicate balance of—because we are a reimbursement program. It is unlike other programs out there. We reimburse for existing expenses, and so that makes sure that we are applying it efficiently and that we are truly documenting that every house and address within that service area can be served. But it does mean you have to administer that award in a different way, and that is that is time intensive. So that is one of the balances were walking.

The other point you mentioned was what is realistic, right, in terms of the speed? I am guessing you might be thinking of in ReConnect round 3, we changed the threshold to 100 down, 20 up, which is higher than it was previously, and then the build-out to 100 megabytes per second symmetrical. We talked about some of the reasons why that is valuable, right, that upload speed so that rural people can be creators as well as users, and also for things like precision ag or smoke detection, being able to upload to the cloud.

We also found that it was desirable. We had more applications in ReConnect round 3 than in both other two rounds combined. So we are seeing ISPs really step up to this challenge, and it is exciting.

Mr. MANN. Great, thank you. Second question for you again, Madam Under Secretary. We have heard from numerous stake-

holders how difficult it is to provide broadband services. And, as you know, USDA, FCC, NTIA all have their own data mapping. And we talked about this a little bit earlier. And they don't necessarily follow the same collection methods. This is near and dear to me because when I was lieutenant governor of our state, the FCC produced a map that was inaccurate. We then had to go and partner with the Farm Bureau to challenge their bad work product and show them how it was inaccurate when they are the ones that produced the bad work product in the first place. Of course, we talked about this earlier; but, Congress has passed the Broadband DATA Act to help better simplify the information, require information sharing. How does RUS ensure that those communities are mapped correctly in the first place and that the data is integrated into the broader FCC maps? I know you talked about that a little bit earlier, but could you expand upon how do we do a better job of making sure that we have accurate maps in the first place?

Ms. TORRES SMALL. It is such a good question, and I would—it is two parts. It is making sure that the awards that we administer truly reach the people that need it and making sure that from those awards that truly reach those, that information gets to the maps because the maps are crucial in terms of deciding where you could create a plan or you could plan to serve in the future, right? It is the vision of what is possible. So we have a desktop review that right now uses NBAM as well as other mapping tools to identify whether or not the claimed service area is right. Then we allow internet service providers to challenge that. If they say, hey, actually, we serve that and then we wade through their challenges to see if they are providing the data to back that up. And then if there is still a conflict, we will go on the ground and prove it up. And then we send that information to NTIA for NBAM to continue to improve their mapping.

To talk about the fabric and the FCC, I will shift briefly over to Acting Administrator McLean.

Mr. MANN. Yes.

Mr. MCLEAN. I encouraged the trade associations and our borrowers to engage with the FCC on their mapping process to make sure that the data is accurate. And we are moving in the FCC's mapping initiative to what they call the challenge portion where there can be a dialogue back and forth between community service providers about where the service is to make that map as good as it can be. But again, at RUS we look at the best information that is available, but then we go further by providing opportunities for service providers to comment, we validate those comments, and then, if necessary, we will send people to the field to look.

The CHAIRMAN. The gentleman from California, Mr. Panetta, is recognized for 5 minutes.

Mr. PANETTA. Thank you, Mr. Chairman. I appreciate this opportunity to talk about such an important area with such an educated and intelligent witness as the Under Secretary. Thank you very much for being here, Under Secretary, again, as well as appreciate your visit out to the district recently as well.

Obviously, as you saw in my district on the Central Coast of California, access to reliable broadband internet is an absolute necessity for our students, for our farmworkers, for our patients, for

our businesses, especially in districts like mine but also districts all across rural America. And I think, unfortunately, you have seen a lot of challenges.

Now, fortunately, this Congress and your Administration has begun to take action. The American Rescue Plan funded localities and local ISPs with projects for broadband in rural communities. We created the Emergency Broadband Benefit, now the Affordable Connectivity Program to subsidize the cost of service for families. And most notably, we passed the bipartisan Infrastructure Investment and Jobs Act, which is going to make a huge investment in broadband, including \$42.5 billion just in broadband infrastructure.

Now, there are issues, though, in getting that funding to rural communities, as you have heard about and as you know well about. And one of the main issues that really complicates things is that there are over a dozen Federal definitions of *rural*. This becomes an issue when these definitions are also used to distribute these types of resources. As you heard my colleague Ms. Schrier talk about the ReConnect Program as one of those programs that uses the *rural* definition to determine eligibility, but that is kind of difficult in districts like mine because what we have seen is that none of those Federal dollars that we continue to fight for gets down into our communities, especially my community, which, as you know, is a rural community. And that has got to change. And hopefully looking ahead to the next farm bill, we can think carefully about standardizing eligibility for Rural Development programs in a way that is more inclusive for the needs of rural communities like yours and mine.

There is obviously frustration, especially at the local level, because sometimes they are counted as rural, sometimes they are counted as non-rural. And the complexity of those definitions can lead to wasted time for our local leaders who are seeking very thoroughly in checking the boxes, filling out the applications, funds for these types of programs. What is the USDA doing to address this issue that is very frustrating for all of us at all levels? And what can Congress start to think about in looking at the 2023 Farm Bill to bring clarity to these types of issues when it comes to the definitions of *rural*?

Ms. TORRES SMALL. That is such a good question. And one of my favorite parts of this job is getting to see the whole—what *rural* looks like in different places all across the country. And it is very different. It is very diverse. And our regulations and statutes don't always acknowledge that diversity across rural America.

As we have conversations about how we make it simpler to navigate, but also whether we change the rules of eligibility for what *rural* is, and we are happy to provide technical assistance with that, we have also got to recognize that changes in eligibility would also impact who is applying for the loans and grants and that the vast majority of our programs are oversubscribed. So conversations about eligibility also mean who is competing for already limited funds.

But it is a huge need, and we see it. I remember when I was a staffer for Senator Udall and we were trying to help out a rural place, we got this rubric of all of Rural Development's programs. And it is, which one—are you rural in this one *versus* this one

versus this one, right? And it can be hard, especially if you have a volunteer mayor or not the resources.

So the other way we are trying to address this is through technical assistance and navigators. So I think we have to have a dual approach here, which is advancing with what we have right now and making sure that we help navigate the complex programs, but then also trying to simplify them as much as possible.

Mr. PANETTA. And then in our role coming up here in the farm bill, is there—I mean, besides continuing these types of conversations, is there anything that we should be tracking in your expertise?

Ms. TORRES SMALL. For that, the big thing is, as we consider eligibility, what does that mean for oversubscribed programs? In addition, I will turn it over to Acting Administrator McLean if you have anything else to add.

Mr. MCLEAN. Yes. And I think what is *rural* is almost a metaphysical kind of question because—

Mr. PANETTA. Please don't respond that way to my local mayors.

Mr. MCLEAN. But we look at the statutes that Congress enacts as resource allocation decisions, and they direct us in those populations.

The CHAIRMAN. Unfortunately, the gentleman's time has expired. Now, the gentlelady from Minnesota, Mrs. Fischbach, is recognized for 5 minutes.

Mrs. FISCHBACH. Thank you, Mr. Chairman. I appreciate the opportunity. And thank you for being with us today, Madam Under Secretary. And I just got a question. The FCC recently rejected long form applications for the biggest winners of the agency's recent RDOF program round. Numerous areas in my district have held large tracts of Census blocks that were initially approved for build-out under the RDOF program that were later rejected. But Todd County in my district in particular had broad swaths of areas sectioned off for build-out that many months later are now back to square one due to the recent announcement. Can you speak to the importance of properly vetting applicants to ensure that they can deliver on the promises that they make while applying for taxpayer funding?

Ms. TORRES SMALL. Thank you so much, Congresswoman. And, this is some of the timing challenges that we were talking about before in terms of coordination, but it also is an opportunity, right? As you mentioned, we have to make sure that the investments that we make truly can be delivered. And we certainly have seen that the RDOF awards from the previous Administration, there are multiple steps. And that last step of—or the next step of being ready to authorize is a crucial one to make sure that a promise is truly deliverable in terms of the time frame that is allowed within the RDOF component.

The way Rural Development does it is by being a reimbursement-based service. So as they are implementing, that is when they receive the award. And again, there is a balance there to make sure that it is as easy to administer as possible and as unburdensome as possible for the recipient. But that is how we currently navigate that, making sure that a recipient is able to deliver on their promises. We also have a 5 year build-out, which I think

is a realistic build-out time that also recognizes the urgency of the situation.

Mrs. FISCHBACH. And thank you for that answer. And for rural areas, including Todd County and many other counties in my area, this broadband development is necessary for the modernization and development of their community, and it helps bring families back to the areas, it helps attract businesses, it helps farms create efficiency in their operation, and it really helps spur infrastructure development. Broadband development, in essence, is about building strong rural communities.

And I am sorry about the buzzing.

Can communities concurrently be eligible for USDA assistance under the ReConnect Program while a long form RDOF application is pending?

Ms. TORRES SMALL. That is a really good question. And this is again the timing piece that we were talking about earlier. So recognizing that RDOF awards have multiple stages, including ready to authorize, and that is the step that we have paid the most attention to. The timing for the ReConnect round 3 took some coordination in terms of figuring out how to disburse those awards. For ReConnect 4, we have been really clear. There is a lesson learned there, and specifically said if a project was not declared ready to authorize by a specific date, we would consider those areas.

For any additional information, I will give it to Acting Administrator McLean.

Mr. MCLEAN. Yes, I mean, that is exactly the point is where do we draw the line and we are drawing the line on the opening of the application window. If you are ready to authorize, you are taken care of by RDOF, but we don't want to pull all those territories off of the map for opportunities. We also make our applicants commit, that if they are an RDOF recipient and an RUS recipient, that we don't pay for the same thing twice. We can level up those RDOF awards, and we work carefully, again, to de-conflict. But, I would encourage those communities to apply to round 4 because I think it is an extraordinary opportunity.

Mrs. FISCHBACH. All right. Well, thank you. And maybe we will follow up with more specifics with you at a later time. But thank you both for your perspectives, and there is certainly information and lessons to be learned from that. So thank you very much.

And with that, I yield back, Mr. Chairman.

The CHAIRMAN. The gentleman from Georgia, Mr. Bishop, is recognized for 5 minutes.

Mr. BISHOP. Thank you, Mr. Chairman. Thank you for being here today, Under Secretary, and for the Department's recent investments in both rural healthcare, as well as the new round for ReConnect funding.

We have heard of issues with the system for management award or the general application intake system. What improvements has the Department made to streamline and improve the application intake and the review of applications to get resources to communities in a timely manner? I know that Ms. Pingree had asked about staffing needs earlier, and I think that she was cut off in that answer, but if you could address that with also the additional resources? What changes have been made in personnel, presumably

staffing, or what changes do you plan to make to address the increased workload? And finally, we have heard some aspects of the application process that can be burdensome, for example, of the submission of all of the financial documents for very large providers, which overburdens them. What changes have been made, what changes are being considered to address these burdens or the issues that we have heard from our applicants?

Ms. TORRES SMALL. Thank you so much, Congressman Bishop. It is wonderful to see you, and I really appreciate your in-depth questions. When it comes to the online platform, ReConnect was established in 2019, and we have created an online platform from there that continues to be improved. There were some bugs at certain points that we had to work through, and so we are working through that. In fact, we adjusted the schedule so that there would be reliability in terms of the application portal for this current round that is open. So we feel positive about where we are now. And in talking with recent applicants, we got good feedback on the maps that are integrated into the online portal. They said it was actually much easier than in previous rounds in terms of identifying where their proposed internet service area would be. So we are making improvements, and there are still improvements to be made.

Do you have anything you want to add in terms of the online portal?

Mr. MCLEAN. No, I just want to say that this highlights where those administrative dollars have been so valuable to us because we have been able to create the most modern of IT systems with the ReConnect funding. And we walk through the applicants step by step, and it makes it difficult to proceed to the next step if you don't do the first step right. And so that reduces errors.

And I am very, very proud to report that between rounds 3 and rounds 4—I mean, rounds 2 and rounds 3 of our ReConnect awards, we experienced a 39 percent drop in review times and a 33 percent drop in failed or incomplete applications, in part because of that outreach that we have done and trying to create a system that prevents you from making mistakes and submitting an incomplete application. So we are making progress. We are learning, as the Under Secretary said, from each one of these experiences and trying to apply in each rounds continuous process improvement.

Mr. BISHOP. Are you increasing your staffing?

Ms. TORRES SMALL. Yes. So again, to the administrative funds that were included in the bipartisan infrastructure law, that made a huge difference because we were able to both bring on contractors immediately to help address some of the environmental review challenges and opportunities and then also think longer-term about how we bring people on. And being able to do both at the same time is really crucial. We have a large portion of our workforce, 38 percent, that is eligible to retire, and so we have to think about succession plans. How do we make sure we are bringing people on who can learn from these experts in the field—

Mr. BISHOP. Let me ask you—excuse me. My time is expiring—what Congress can do, the authorizing Committee and the Appro-

priations Committee, to help continue to improve the program moving forward?

Ms. TORRES SMALL. Continued support of our robust staff in Rural Development that includes state and area offices, as well as the support in the national office and headquarters is crucial, and help in hiring issues.

Mr. BISHOP. Thank you very much for that succinct answer. My time has expired, and so I yield back, Mr. Chairman, 16 seconds.

The CHAIRMAN. The gentleman from Iowa, Mr. Feenstra, is recognized for 5 minutes.

Mr. FEENSTRA. Well, thank you, Chairman Scott and Ranking Member Thompson. And, Under Secretary Torres Small, thank you so much for your testimony. Thank you for being here. Again, I greatly appreciate it. I remember your comments from the last time you were here, and I am very grateful that you took the time out to be here again.

I think just listening to your testimony and your questions and answers, broadband is largely technical, and there are a lot of technical issues that happen. There are also innovations that are happening in this technology space. My district is the second largest rural district in the country. It is very, very big, very vast, and a lot of small communities and so forth. And when you talk about telehealth, this is very critical. Also, precision farming is really gaining a lot of ground. So how do we look at the next farm bill and what innovations can we do or would you say, hey, we should address as we move forward in this sector?

Ms. TORRES SMALL. That is such a great question because to me it speaks to the need to connect high-speed connectivity to the equipment that we use to leverage that. I would also add that it is an opportunity to invest more in place-based work because as we look at what are the unique factors of a rural place that make it the perfect place for precision ag or the perfect place for this type of manufacturing that requires this connectivity, it needs to be based in the community where it exists. And so looking at—place-based work requires strong technical assistance, requires strong presence in the field, and I think those are some of the opportunities we have to collaborate on in the future.

Mr. FEENSTRA. Do you see, as we move forward with the different grants that are out there, and we talked about a lot of them, ReConnect and stuff, that we should put a bigger or a larger emphasis on—you talked about upload and download speeds earlier. Do you think that we should put more emphasis on that because we just see that is the future? My great fear is, is that we are putting things, whether it be fiber in the ground and stuff like that, that that could be problematic, and it could be, I mean, on upload and download speeds, if we look 5 years out and stuff like that. I mean, what are your thoughts there?

Ms. TORRES SMALL. Yes, future proofing is really hard with an emerging technology, right? We have to kind of guess where the puck is going. That is why we have been very intentional about the 100 up, 100 down symmetrical speed. But we also need to have an open dialogue about technologies and about necessary speeds. The thing that is helpful when it comes to—we are technology neutral, but when it comes to fiber specifically is that you can build upon

it. Different technologies can often leverage on it. But we need to continue to have a dialogue there.

Mr. FEENSTRA. So just switching lanes just a little bit. So we have a land-grant university in my district, Iowa State University, that does great outreach, extension outreach and things like that. Is there an avenue that we could promote or push programs or the agenda through extension, through land-grant universities, and things like that?

Ms. TORRES SMALL. Absolutely. There are a few things that immediately come to mind in terms of the Swiss Army knife that is all the programs that Rural Development has. The Rural Innovation Stronger Economies Program is a really exciting one for how we integrate education and workforce opportunities with outreach in a specific community.

Also, I think in terms of working with land-grant institutions, I think there are always opportunities for them to participate in or to apply for Community Facilities Grants and Loans, for example, as well as the Distance Learning and Telemedicine.

Mr. FEENSTRA. Yes, I would agree. I mean, there are a lot of things that we can do there. I have one final question. And I am not sure if you know this or not. So in March 23, 2020 obviously, we passed the Broadband DATA Act, and there was obviously, we had to create the maps. You talked about the maps earlier. Do you have any sense of when those maps will be completed? There is a lot of discussion out there right now and everybody sort of like I would love to know the maps. And do you have any idea on that?

Ms. TORRES SMALL. The information I have on it is that the window for when the ISPs had to provide information to the FCC ended earlier this month, I think September 2 was the date, and we were helping push to get that done. The next phase is a really important phase where internet service providers can challenge that information so that we can ground truth it a bit. And that is the information that I have in terms of where they are at.

Mr. FEENSTRA. Okay. Well, Under Secretary, I appreciate your time and thank you for your input, I am very grateful. Thank you again. I yield back.

The CHAIRMAN. The gentlewoman from Iowa, Mrs. Axne, is now recognized for 5 minutes.

Mrs. AXNE. Thank you, Mr. Chairman. And thank you, Under Secretary Torres Small. We are so thrilled to have you here. And thank you, Mr. McLean, for being here. Your work is greatly needed in states like Iowa. You just heard from my colleague, and of course this is very important for our state, so thank you for all the work that you do.

And, Under Secretary, thanks for coming to Iowa. I know you know our state and how important it is to make sure that we have that last mile connected. I have been working on this issue since I was in state government under three different governors, and we are trying to close in, in Iowa, so I am going to ask you a little bit about the mapping, how we are working on that nationally, but also how we are coordinating with other states because so many of our states have been working on these things for so long, but we seem to just have the little bits and pieces we can't figure out. And that is the part that really is where the rubber hits the road.

So Representative Feenstra just brought up mapping. And I know we are making some progress there. You mentioned that. Because this week the FCC is finally taking challenges to the improved maps Congress asked them to do under the Broadband DATA Act, and those maps should help. And the challenge process is key to getting community input on where they do and don't have service, of course. But one of the issues I have heard about is there is just a wide range of different maps that we are using for different programs. And I know those FCC maps aren't complete yet, but once those challenge processes are done that you just mentioned, how are you at the USDA planning to work with the FCC and the NTIA to make sure all these Federal programs are aligned, that we are using the best possible information, and we are working together to target that funding?

Ms. TORRES SMALL. That is such a great question. And it is a challenge when it comes to the different maps and making sure that we are staying on track, that we are using the best thing we have right now as we try to create the next best thing. And that is part of what we are doing when it comes to Rural Development, but right now we use NBAM, which provides a lot of information and incorporates a lot of information from state-based maps, for example, for that desktop review. But the way that we are also working to make it better is when we get better information from the challenge process that we have or the on-the-ground testing that we have that goes back into that map to improve it for the future.

We anticipate, as FCC develops its map, recognizing that that challenge process is really crucial, and there will be information that has been gleaned from NBAM to inform that challenge process, that we will continue to collaborate to provide more information to improve all of the mapping resources that we have.

I will go ahead and pass it to Acting Administrator McLean.

Mr. MCLEAN. Yes, thank you. [inaudible].

Mrs. AXNE. Well, thank you for that. And I couldn't agree with you more because those telcos have done a great job. And my goodness, they are consistently upgrading services to ensure that their rural customers get exactly what other folks are getting. So I am glad to hear this is being worked on. We absolutely need to make that happen.

Let's move to the state. As you know, in Iowa and many other states, but we got \$200 million of the American Rescue Plan to use that funding for broadband expansion in the state. The money is going out now. We are starting to work on that, right? I know the state is going to be getting even more money from the infrastructure law. So we have funding, it is coming, and we are going to make this last step happen.

In light of that, though, we talked about the Federal coordination. What is happening to coordinate with the states and the telcos and everything that we have in a great state like Iowa?

Ms. TORRES SMALL. That coordination is crucial. I have been at a state broadband conversation in Alabama talking to state legislators. We have been doing outreach specifically to state legislators as they think about how they create their programs, specifically talking about what ReConnect does so we can look at ways that they could complement it. And one of the big things that they have

talked about is middle mile because ReConnect doesn't specifically do that.

We have learned, too. A state broadband agency contacted us, and the first time they contacted us, they had a little bit of trouble. Finally, we were connected thanks to Congress, to their Representative. And through that, we realized, oh, we also have to do outreach to broadband agencies. And so now we are doing trainings with broadband agencies. So it is a learning process, but it has gotten much better.

Mr. MCLEAN. Thank you. And I would encourage the state agencies to use the data that we put out. We try to be as transparent as possible. All of our applications through the service area validation process are publicly available, so they are seen, they are open. And then all of our awards are well-known, so that is contributing to that information. We would look forward to working with the states to make sure that we can coordinate our programs together.

Mrs. AXNE. Thank you.

The CHAIRMAN. The gentlelady from Florida, Mrs. Cammack, is now recognized for 5 minutes.

Mrs. CAMMACK. Well, thank you, Mr. Chairman. And thank you to all of our witnesses and the Ranking Member for hosting this very, very important hearing today. I feel like this is one of the areas where we can come together as Republicans and Democrats and really work to deploy this critical broadband across America.

So I will just jump right in to a series of questions here. Madam Under Secretary, we have heard from numerous stakeholders about how difficult it is to provide broadband service to areas when mapping and data accuracy are inefficient and insufficient. As you know, USDA, FCC, and NTIA all do their own data mapping and do not necessarily follow the same collection methods. The same could be said for the states as well. Congress has passed legislation, including the Broadband DATA Act, to help better simplify this information and require information sharing. How does RUS ensure that these communities are mapped correctly and that the data is integrated into the broader FCC maps?

Ms. TORRES SMALL. Thank you very much for that question. We are a ready helper in this work. So although we have a separate process for validating our awards to ensure that for our mandate that area of service can truly connect to each address within them, we also are working to make sure that we are getting that information to NTIA and FCC. One of the ways that we are doing that is we have the desktop review of NBAM, and as we get information about the accuracy of that, we send it back directly to them, so it is real-time updates.

We are also working hard to make sure that the service providers are helping strengthen those maps, too, so for the FCC map that is the fulfillment of the legislation you mentioned, we were out on the road, the Acting Administrator and I, reaching out to all of our contacts, all of the ISPs saying, don't forget the deadline, the deadline is coming up. And now that we are in that challenge part of the phase, that is crucial because that is how you ground truth, those claims about service. And so we are getting out the word again about the importance of making those challenges. So we will continue to work carefully and continue to provide feedback about

what we are seeing on the ground to strengthen mapping writ large.

Mrs. CAMMACK. Well, and as a follow-up to that, the State of Florida, for example, has their own mapping initiative underway. How is the Federal Government working to pair up and match up with these maps that the states are producing, as well as private providers, and what are some of the other issues that you may have or concerns or challenges in linking the USDA broadband programs with other agencies like FCC and NTIA and these state maps? And how is this slowing down the USDA's current process in administering broadband funding?

Ms. TORRES SMALL. So I don't want to overstep our role at Rural Development when it comes to the inputs for the maps. But I will state that the work, for example, that has happened in Georgia for mapping that has really showed a great improvement in terms of knowing what is on the ground has helped inform the Federal work that is being done now for mapping.

When it comes to Rural Development specifically, I think we have been able to leverage the multiple types of information that we have really well because we have that desktop review that utilizes all of that information. But we also just don't take that for granted. We allow folks to challenge it. And then, if it is necessary, we ground truth it as well. That can be a long process, so I suppose in the future if information was perfect, we could shorten that process. But until then, it is really important. And frankly, we don't always ground truth if we can resolve the information from the get-go, and that has allowed us to be more efficient. But that being said, our priority is having that right information, and so when there is a conflict, we spend that extra time to make sure we are delivering the money as efficiently as possible.

Mrs. CAMMACK. So, to that point, and this will be my final follow-up because I am running short on time, I hear continuously from various stakeholders, and we have heard in past hearings that the lengthy process, the approval process for broadband loan applicants, it is too long. So how long is it taking on average for broadband funding to get out the door once the application window closes? And what can we do to expedite those funds getting out the door?

Ms. TORRES SMALL. This is the balance that we have been talking about. So we have a 5 year build-out, and that is the main—and just to answer your question quickly, the main thing is that ReConnect has a 5 year build-out. But we reimburse for expenses so that—

[The information referred to is located on p. 1530.]

The CHAIRMAN. Yes, if you can follow up, that is a good question, with Mrs. Cammack in writing.

And now the gentleman from Arizona, Mr. O'Halleran, for 5 minutes.

Mr. O'HALLERAN. Thank you, Mr. Chairman and Ranking Member Thompson, for hosting today's hearing on rural broadband. I want to also thank Under Secretary Torres Small and the witnesses for being here today.

First of all, I would like to start off by giving a special thanks to the Under Secretary for her recent visit out to the district. We

really enjoyed having you out there. I am glad we share the same goal of 100 percent connectivity that all Americans, no matter their ZIP Code, deserve high-quality and reliable broadband. Connectivity ensures access to essential services, making it easier for patients to receive the care they need, students to participate in online learning, and small businesses to compete in the increasingly digital and global marketplace.

Broadband is essential for rural communities to thrive in the modern economy, which is why it is so urgent that we bring broadband to the hardest-to-reach and underserved areas. And Re-Connect has been a successful program, and we look forward to more of that.

I want to go back, though, to some of the issues. We have been working on mapping now, went through the whole process of getting it moving along a few years ago. And now we are at a point in time when we—the last number of Members have identified mapping as a continuing issue. I am very concerned that we have an enforcement mechanism to not go back to the times when we didn't have mapping kept up to date.

I also have a big concern that the agencies and how they are coordinating this process are going to do that. And the ground truthing piece of this, we can't move ahead unless we have enough availability to go out into that field and identify clearly that this is what is happening and enforce the companies to be able to do this in an appropriate way so we don't go through this time and time and time again.

So, Under Secretary, could you comment on that, please?

Ms. TORRES SMALL. Thank you so much, Congressman. It is a pleasure to see you. And thank you for your advocacy for underserved areas. You represent some of the most rural places in the country, and I know that ground truthing is exceptionally important in the places that you serve. That is why Rural Development's field structure is so crucial. I love how many times we said GFR, or general field representative, in this hearing because they are the folks who are making sure that the maps are accurate and that we are truly reaching the people who don't have access to high-speed internet right now, the people in the farthest-flung places across our country.

So continuing to invest in that structure is crucial. The administrative funds as part of the bipartisan infrastructure law was crucial for that. And it provides that accountability piece that you mentioned, Congressman, about making sure that the maps continue to be updated and are reflecting the reality on the ground.

Mr. O'HALLERAN. Thank you, Under Secretary. A follow-up to that, we know that it didn't work in the past. What have we learned from that? And do you have the personnel to be able to address these issues and the coordination with the FCC and others to be able to overcome the mistakes of the past?

Ms. TORRES SMALL. I think we have all learned that Census blocks aren't the accurate description of the reality. And so having people on the ground, being able to verify when necessary, is really valuable.

Staffing continues to be a challenge for Rural Development, both in terms of the hiring process, in terms of the funding for staffing,

and then also in terms of finding qualified people. Now that there are so many people working in high-speed internet, it is a competitive field, and so that is a challenge as well. So those are the lessons that we are learning and the challenges that we are trying to navigate to continue to be better at reaching the hardest-to-reach places.

Mr. O'HALLERAN. Thank you very much. I also want to emphasize the importance of outreach to our local communities. You mentioned that a little bit. And I know you have stressed that time and time again. That is why you have been out in the field so much. But the underlying aspects of this are real. And people right now—we, as Congress, should be able to be out there all the time, making sure we are educating the public as much as possible. But what type of programs can we anticipate on a large scale for the public to be able to understand not only the programs but the timing mechanisms and all the other planning that is going to go into that?

Ms. TORRES SMALL. The outreach is crucial. That is why President Biden's Rural Partners Network is really exciting, focusing efforts in places that need it most.

Mr. O'HALLERAN. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. Could you please respond in writing? The gentleman's time is up, and we have a hard stop with votes coming.

[The information referred to is located on p. 1530.]

The CHAIRMAN. The gentleman from Florida, Mr. Lawson, is now recognized for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman, for you and Ranking Member Thompson for having this hearing, Under Secretary Torres Small, for joining us today. I appreciate your staff working diligently with our office on a number of Rural Development projects, and I look forward to hosting you in the district real soon.

Under Secretary, on September the 6th, the winner for the fourth round ReConnect funding opened for grant application submission until November 2. Once this round of ReConnect funding closes, how long do you expect it to take for USDA to review and then award grant funding for applications?

Ms. TORRES SMALL. Thank you so much for that question and for your advocacy for rural America. I really appreciate the chance to get to work with you.

When it comes to the awards process for ReConnect, we are making great strides in terms of getting awards out as quickly as possible. And you can look at ReConnect 3 as an example of that. We are releasing awards on a rolling basis as quickly as we can so that projects can start running. And that is why we are releasing that information in tranches. Also, we have been able to get out money quicker because we intend to make awards with the bipartisan infrastructure law through ReConnect this year, this fall, which is very exciting.

When it comes to ReConnect round 4, we anticipate having that same track of releasing those awards as soon as we have. Now, we spent a lot of time talking about this three-step process where we have the desktop review of an area in terms of eligibility, then it is the challenge process, and then, if necessary, the ground truthing. That does take some time, and that is why being able to

announce projects on a rolling basis is a helpful way to let folks know as quickly as possible when an award has been made.

Acting Administrator McLean, do you want to add anything to that?

Mr. MCLEAN. Yes, thank you. And, of course, to be very honest, we will know once we get the application window closed as to how many applications we receive because that is a big driver of how long it takes to be able to go through the applications. As the Under Secretary mentioned earlier, round 3 of ReConnect attracted more applications than round 1 and round 2 combined. And so it was a big task, but yet we were able to accelerate our record of approval and our pace of approval. And we look forward to replicating that for round 4.

Mr. LAWSON. Well, that is really great news when you talk about round 3, what is really happening, so that means the word is getting out. And so I think that my next question will be with over a dozen agencies in the program charged with program development and interagency communication it is essential, how did the USDA—what are they doing to enhance communication coordination with the different programs and agencies?

Ms. TORRES SMALL. Yes, coordination with this many agencies and this level of unprecedented investment just has to be a way of life. And so that means reflecting on those MOUs and making sure they are integrated into all of the work that we do, whether that is talking about timing for getting out our programs, whether that is navigating awards and service areas, or whether that is navigating how we do technical assistance, for example, with NTIA's upcoming investment in technical assistance. It is also a chance to learn from each other, and that is what we are learning on the ground as well, using each other's networks to reach new partners and also each other's expertise to better administer our programs.

Mr. LAWSON. Okay, my colleague Mr. O'Halleran was talking about some of the mapping, and so I just wanted to say how will USDA Rural Development use the new maps to better allocate Federal funds in order to limit over-building and ensure connectivity for all rural residents?

Ms. TORRES SMALL. For that, I will allow my Acting Administrator to respond.

Mr. MCLEAN. Yes, well, thank you very much. I think our highest priority is—and our scoring matrix focuses our resources on those areas that need it the most. And that is where we are putting a great deal of energy and outreach. And I think that this round of funding has some of the most advantageous scoring criteria for underserved areas, and we are looking forward to a robust response in round 4.

Mr. LAWSON. Okay, thank you very much. Great to see you guys again.

And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you very much. And, Under Secretary Torres Small, thank you. And, Acting Administrator McLean, thank you for joining us today. And having concluded all our questions for the first panel, you are now excused. And the Committee will take a brief 2 minute recess here to allow our first panel to

leave and our second panel of witnesses to take their seats. Thank you.

[Recess.]

The CHAIRMAN. The Committee will come to order. And without objection, question time for Members for our second round will be 3 minutes to allow us to get to as many Members as possible before votes are called. We have a hard stop when votes are called on the floor, and we appreciate your cooperation.

Let me introduce our first witness for our second panel. And this is Ms. B. Lynn Follansbee—I got that right, thank you—who is the Vice President of Strategic Initiatives and Partnerships for USTelecom.

And our second witness is Hon. Tarryl Clark, who is the First District Commissioner in Stearns County, Minnesota. And she is testifying today on behalf of the National Association of Counties.

And our third and final witness for this panel is Mr. Garrett Hawkins, who is the President of the Missouri Farm Bureau and is testifying on behalf of the American Farm Bureau Federation.

Welcome to all of our witnesses. And you will each be recognized for your 5 minutes, and the timer should be visible to you. Once the yellow button comes on, that is caution. You will have a minute left and will count down from the 3 minutes, at which point your time will have expired.

So let us get started. Ms. Follansbee, please begin when you are ready.

**STATEMENT OF B. LYNN FOLLANSBEE, J.D., VICE PRESIDENT
STRATEGIC INITIATIVES AND PARTNERSHIPS, USTELECOM,
WASHINGTON, D.C.**

Ms. FOLLANSBEE. Chairman Scott, Ranking Member Thompson, and other distinguished Members of the Committee, thank you for the opportunity to testify today. My name is Lynn Follansbee, and I am Vice President of Strategic Initiatives and Partnerships for USTelecom, the national trade association representing network providers, innovators, suppliers, and manufacturers committed to connecting the world through the power of broadband. Our diverse membership ranges from large publicly traded corporations to local regional companies and cooperatives.

The COVID-19 pandemic clearly illustrated that high-speed broadband is the cornerstone of American life, connecting people to education, healthcare, employment, and virtually every aspect of our daily lives, while also ensuring our nation's economic security. USTelecom members actively participate in all Federal programs that support the deployment of broadband, including the Rural Utilities Service's ReConnect Program. We applaud the Committee for holding today's hearing. This is an important discussion as we look closely to how items adopted as part of the 2018 Farm Bill have impacted the deployment of rural broadband. It is also important to review how the U.S. Department of Agriculture works with other Federal agencies towards achieving one of our nation's top priorities, closing the digital divide.

In order to do this interagency coordination among all Federal agencies that touch the broadband space is an absolute necessity. The Infrastructure Investment and Jobs Act programs provide a

significant amount of money for broadband deployment, and there is a clear need for close coordination across all agencies involved.

USTelecom recommends that policymakers require early reporting by states that administer broadband funding programs, particularly those funded by NTIA, and that data should be included in the FCC's broadband data collection maps. Similarly, agencies such as RUS should be sharing with the FCC their data about where they have provided grants and loans so that all agencies have complete information about all currently funded broadband projects, whether completed or not in order to avoid duplication and avoid government waste.

USDA and other agencies must also align on the current definition of *broadband*. Having different deployment programs utilizing different speed minimums creates an inconsistent standard for broadband deployment. In the same vein, USDA must work directly with all Federal agencies to ensure consistent requirements related to supply chain, including the application of Buy America requirements.

In addition to coordinating with other agencies, there are improvements RUS should be making to its ReConnect Program to create clear processes so there is greater transparency. Despite some changes, there also continue to be rules in place that limit participation by some applicants. USTelecom urges RUS to consider alternatives to its current rules on liens affecting collateral. Aligning with other Federal broadband programs and requiring a letter of credit would enable more carriers to participate, particularly larger companies who serve the most rural and remote customers in the nation.

Although the ReConnect Program has admittedly evolved and had multiple successful rounds of its grant program, curiously, the ReConnect Program is still operating as a pilot program. In the upcoming farm bill, Congress should consider whether it intends to formalize the program, and if so, consider the program's current role in conjunction with available funds at other agencies.

I also have the privilege of serving as the Vice Chair of the Mapping Working Group for the FCC's Precision Ag Task Force, which provides advice and recommendations to the FCC and USDA on how to assess and advance deployment of broadband on unserved and underserved agricultural lands. The task force working groups have done extensive research and developed recommendations that address current challenges. I applaud this Committee for its role in the creation of the Precision Ag Task Force as part of the 2018 Farm Bill. The task force is in its second 2 year term and has already made some excellent recommendations, which will no doubt have an impact on the advancement of precision ag.

Key recommendations adopted thus far include compiling the FCC's broadband data collection effort with NASS, or the National Agricultural Statistical Service cultivated land data, so farmers can know where there is both fixed and mobile providers serving the ag and rural domains, including Native American ag lands.

Increase incentives and subsidies at the local and national level to substantially increase connectivity, enhance both download and upload high-speed standards to meet the applications used in precision ag, improve collaboration between Federal agencies, and re-

move regulatory barriers and align their existing and individual file management, increase digital access to education and training for individuals engaged in farming, and place a priority on developing precision ag cybersecurity. These thoughtful and detailed recommendations reflect only a sliver of the hard work volunteer members of the task force are doing on a weekly basis.

USTelecom and our members stand ready to work with the Committee, Congress, and Administration to connect all communities once and for all and close the digital divide.

[The prepared statement of Ms. Follansbee follows:]

PREPARED STATEMENT OF B. LYNN FOLLANSBEE, J.D., VICE PRESIDENT STRATEGIC INITIATIVES AND PARTNERSHIPS, USTELECOM, WASHINGTON, D.C.

Introduction

Chairman Scott, Ranking Member Thompson, and other distinguished Members of the Committee, thank you for the opportunity to testify today. My name is Lynn Follansbee and I am Vice President, Strategic Initiatives and Partnerships for USTelecom, the national trade association representing network providers, technology innovators, suppliers and manufacturers committed to connecting the world through the power of broadband. Our diverse membership ranges from large publicly traded communications corporations to local and regional companies and cooperatives—all providing advanced communications services to urban and rural communities and everywhere in between.

The COVID-19 pandemic clearly illustrated that high-speed broadband is a cornerstone of American life, connecting people to education, healthcare, employment and virtually every aspect of our daily lives while ensuring our nation's economic security. USTelecom members actively participate in all Federal programs that support the deployment of broadband, including the Rural Utilities Service (RUS) Rural eConnectivity (ReConnect) Program. And under the current contributions system, our members provide a significant portion of the funds for the Federal Communications Commission's (FCC) Universal Service Fund (USF) programs. USTelecom welcomes the opportunity to provide thoughts on how interagency coordination can best foster efficient use of all broadband deployment funding while maximizing governmental efforts to close the digital divide. We also appreciate the chance to offer some suggestions for improvement to the ReConnect program itself.

We applaud the Committee for holding today's hearing. This is an important discussion as we look closely at how items adopted as part of the 2018 Farm Bill have impacted the deployment of rural broadband. It is also important to review how the U.S. Department of Agriculture (USDA) works with other Federal agencies toward achieving one of our nation's top priorities—closing the digital divide. Addressing challenges related to the deployment of broadband infrastructure is critical to connecting all communities, especially in rural areas.

Interagency Coordination is a Necessity

USTelecom and its members strongly support the cross-agency effort to ensure that all Americans have access to high-speed broadband, and agree that coordination of all Federal agencies' programs is crucial to achieving this goal.

The Infrastructure Investment and Jobs Act programs provide a significant amount of money for broadband deployment and there is a clear need for close coordination across all agencies involved. To ensure the best use of these critical funds, USTelecom recommends that policymakers require early reporting by states that administer broadband funding programs, particularly those funded by NTIA. This information on the areas that will be served by the funded projects will help avoid duplication or overbuilding and should be included in the FCC's Broadband Data Collection ("BDC") maps.

In adopting the Broadband DATA Act, Congress expressed a clear intent to ensure there is good data showing where there is service and where there is not—not only to close the digital divide, but also to ensure that scarce government resources are not spent on overbuilding. The recent agreement between the FCC, NTIA and USDA further advances this objective by requiring those agencies to share information about broadband availability and "consider basing the distribution of funds for broadband deployment . . . on standardized data regarding broadband coverage."¹

¹47 U.S.C. § 1308(b)(3).

As we move forward to fully connect the nation, it is essential that all Federal and state agencies that support broadband deployment initiatives should align goals and rely on the BDC maps.

Unfortunately, RUS has not always included FCC deployment data when making grants under the ReConnect program which has led to some wasteful overbuilding. With the Broadband Data Collection maps nearly completed, we are on the verge of having much more accurate data to guide these critical government investments. USTelecom urges the USDA, and all other agencies distributing funding, to prioritize policies that ensure government resources are coordinated and targeted to avoid spending funds on the same project.

USDA and other agencies must also align on the current definition of broadband. Having different deployment programs utilizing different speed minimums creates an inconsistent standard for broadband deployment. Finally, to further support a coordinated effort to connect all Americans, USDA must work directly with all Federal agencies administering broadband funding to ensure consistent requirements related to supply chains for broadband equipment across all programs, including the application of Buy America requirements.

The ReConnect Program Should Be Improved

All state and Federal Government broadband programs, including ReConnect, should narrowly direct resources to those communities that the BDC maps identify as having no service. Ensuring precious broadband funding is not wasted on overlapping projects is the only way we can reach 100 percent connectivity. Specifically, RUS should create clearer processes for both its applications and coverage challenges so there is greater transparency. Often, the results of coverage challenges are vague, or never made known at all, leaving providers wondering whether to proceed with a new build or upgrade to an existing network.

Additionally, despite some changes, there continue to be rules in place that limit participation by some applicants. For example, USDA's current rules require the grant to be superior to all other liens affecting the collateral. USTelecom urges RUS to consider alternatives, such as a letter of credit in the event there are liens on the underlying property or portions thereof. Such a change would enable more carriers to participate, particularly larger companies who serve the most rural and remote customers in the nation. Likewise, Section 7.4 of the RUS Grant Agreement does not allow an awardee to make distributions without RUS's consent while it is receiving grant funds. This appears to prohibit public companies from making distributions to its shareholders, thereby potentially limiting the company's ability to exercise its usual business practices and/or meet obligations to its shareholders. RUS should either clarify that this is not the case or change its rules to allow publicly held companies to participate.

Although the ReConnect program has admittedly evolved and had multiple successful rounds of its grant program, curiously ReConnect is still operating as a "pilot" program. In the upcoming farm bill, Congress should consider whether it intends to formalize the program and, if so, consider the program's current role in conjunction with available funds at other Federal agencies.

Precision Agriculture Task Force

I also have the privilege of serving as Vice Chair of the Mapping Working Group for the FCC's Precision Ag Task Force which provides advice and recommendations to the FCC and USDA on how to assess and advance deployment of broadband on unserved and underserved agricultural land. The Task Force's working groups focus in greater detail on specific issues related to Precision Agriculture, including Accelerating Broadband Deployment on Unserved Agricultural Lands; Mapping and Analyzing Connectivity on Agricultural Lands; Examining Current and Future Connectivity Demand for Precision Agriculture; and Encouraging Adoption of Precision Agriculture and Availability of High-Quality Jobs on Connected Farms. Each of these working groups has done extensive research and developed recommendations that address current challenges.

I applaud this Committee for its role in the creation of the Precision Ag Task Force as part of the 2018 Farm Bill. The Task Force is in its second 2 year term and has already made excellent recommendations to the Commission which will no doubt have an impact on the advancement of Precision Agriculture which helps farmers have more successful crops that ultimately feed all of our families.

The report adopted by the Task Force in its first term had recommendations to:

- Improve Federal broadband maps and consistently validate user experiences by building on the FCC's Broadband Data Collection effort to combine it with existing agricultural maps such as the NASS Cultivated Land data should be used to determine the base map extent for determining Cultivated Land area for the

continental U.S. to reveal for farmers where there is both fixed and mobile providers serving the agricultural and rural domains, including Native American agricultural lands;

- Increase incentives and subsidies at the local and national level to substantially increased to drive deployment of connectivity, with an overarching goal of deploying future-proof networks and enable Precision Agriculture deployment in to new areas of technology;
- Enhance both download and upload high-speed standards to meet the technology needs in agriculture and identify, implement, and/or strengthen policies to facilitate use of low, mid, and high-band spectrum for Precision Agriculture applications;
- Improve collaboration between Federal agencies and remove regulatory impediments to implement a common set of performance targets and standards that reflect the specific needs of Precision Agriculture, including build-out requirements for croplands and ranch lands. Multiple performance targets tailored for specific Precision Agriculture use cases—specifically USDA, NASS, Farm Service Agency (FSA), Risk Management Agency (RMA), Natural Resources Conservation Service (NRCS) and other agencies should align their existing and individual file management systems to have the capability to receive electronic data layers that are commonly created through the normal course of farm operations.
- Increase digital access to education and training for individuals engaged in farming to meet the increased demand for skilled workers that will result from the continuing adoption of Precision Agriculture; and,
- Place a priority on developing Precision Agriculture cyber security specialists by the USDA, and Department of Homeland Security in recognition that agriculture is critical and essential infrastructure and malicious acts should be treated accordingly.

These thoughtful and detailed recommendations reflect only a sliver of the hard work volunteer members of the Task Force are doing on a weekly basis to bring technology to crop lands and ranches to enhance the success of American agriculture workers.

Conclusion

The challenges associated with rural broadband connectivity require an enduring private and public sector commitment and partnership. Thank you for holding this hearing today and for the opportunity to share some thoughts with you today. USTelecom and our members stand ready to work with the Committee, Congress, and the Administration to connect all communities and, once and for all, close the digital divide.

The CHAIRMAN. Thank you very much, Ms. Follansbee.
And now, Commissioner Clark, please begin when you are ready.

STATEMENT OF HON. TARRYL CLARK, COMMISSIONER, FIRST DISTRICT, STEARNS COUNTY, MINNESOTA; CHAIR, TELECOMMUNICATIONS AND TECHNOLOGY POLICY STEERING COMMITTEE, NATIONAL ASSOCIATION OF COUNTIES, ST. CLOUD, MN

Ms. CLARK. Thank you, Mr. Chairman, Ranking Member Thompson, and distinguished Members of the Committee. I appreciate the opportunity to testify today. My name is Tarryl Clark, and I serve as First District County Commissioner for Stearns County, Minnesota. I am also representing the National Association of Counties in my role as the Chair of the Telecommunications and Technology Committee.

Counties play a major role in broadband deployment efforts within our communities, especially those in rural regions. We serve key roles as partners, funders, policymakers, data aggregators, and conveners for promoting high-speed internet access and broadband deployment across our communities. The lack of reliable broadband

in our rural communities is a major economic barrier and an issue of socioeconomic equality. Without access to high-speed internet, many of our rural and underserved communities are becoming increasingly isolated and left behind. For those in small communities, broadband can serve as a lifeline, connecting students to their homework, as well as gaining degrees, connecting sick patients to medical consultation locally unavailable, and having important business opportunities, including precision agriculture.

I am here today to underscore the central role that counties play in broadband deployment and accessibility efforts and how a strong intergovernmental partnership and collaboration will help us continue to work together to close the digital divide.

As we have witnessed, COVID-19 exacerbated the already dire digital divide in rural America. We urge Congress to continue to fund broadband deployment geared specifically to rural communities. To be clear, we have seen great progress so far. Counties applaud the efforts in the American Rescue Plan Act to fund the deployment of high-speed internet access across the country. We also appreciate and continue to engage with the U.S. Department of Agriculture's ReConnect Program, whose goal is to target much-needed broadband access to rural communities. These historic Federal investments show the need for Federal support in broadband investments for unconnected and rural communities continues to be a top priority for America's counties.

Beyond ARPA, the bipartisan infrastructure law also is offering vital resources to ensure access to high-speed internet to local governments. However, a continued focus on broadband infrastructure grants programs that are accessible, flexible, and respectful of the local decision-making authority is needed to connect rural America.

Given the elevated Federal role in broadband deployment efforts, counties appreciate the increased coordination and collaboration across multiple Federal agencies. As we review the progress we have made so far and keep an eye on the future, we believe the following principles can help to continue to steward broadband deployment efforts across the country.

First, streamline the grant application process, which is especially crucial for rural counties that may not have the personnel or fiscal resources when applying for grants that support broadband deployment.

Second, programs should support broadband investments that prioritize high-speed internet that will provide dependable internet access for the long run. High-speed internet access continues to constitute a character providing reliable, affordable, and accessible service for our rural communities to benefit the most.

Third, prioritize communities with no access to infrastructure, which includes areas that have yet to receive final approval for Federal funding in regards to building a viable broadband network in order to continue to proactively address the lack of connectivity in rural America.

Finally, leverage local expertise and resources, which offer an unparalleled level of knowledge when setting requirements and parameters in Federal programs. This includes quantitative and qualitative data, mapping efforts, and community testimony. We urge

our Federal partners to consider and value these resources for assisting in determining the level of need for our rural communities.

Moving forward, we want to ensure we meet our collective goal of 100 percent connectivity across rural America, which is not only vital to the success of these communities, but also our nation. A strong Federal-state-local partnership is needed. We believe in consultation with counties, the 2023 Farm Bill provides a unique opportunity to further address the dire connectivity needs of our nation's rural counties to ensure they are resilient and future-ready communities.

We appreciate your attention. I want to thank you again for this invitation and look forward to working together to close the digital divide faster and more efficiently.

[The prepared statement of Ms. Clark follows:]

PREPARED STATEMENT OF HON. TARRYL CLARK, COMMISSIONER, FIRST DISTRICT, STEARNS COUNTY, MINNESOTA; CHAIR, TELECOMMUNICATIONS AND TECHNOLOGY POLICY STEERING COMMITTEE, NATIONAL ASSOCIATION OF COUNTIES, ST. CLOUD, MN

Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee, thank you for the opportunity to testify on the importance of broadband and high-speed internet connectivity in our rural communities, and the role of county governments in helping to connect our most unserved and underserved residents across the country.

My name is Tarryl Clark and I serve as the First District Commissioner in Stearns County, Minnesota and Chair of the National Association of Counties Telecommunications and Technology Policy Steering Committee. Stearns County is home to approximately 160,000 residents who rely daily on the availability of high-speed internet to connect to remote work, education and telehealth services. Across our county, we boast a community whose backbone is the work of our rural communities and farmers, who depend on high-speed internet for uses as wide ranging as precision agriculture to modern participation in online commerce. Yet as demonstrated most recently by the COVID-19 pandemic, we are witnessing a connectivity gap that has left our rural residents out of reach from high-speed internet infrastructure and critical services. This lack of reliable broadband is a major economic barrier and an issue of socioeconomic equality.

Counties play a major role in broadband deployment efforts within our communities. We serve key roles as partners, funders, policymakers, data aggregators, and conveners for promoting high-speed internet access and broadband deployment across our community. As partners and funders, counties work to connect our residents to high-speed internet services through strong public-private partnerships and the utilization of Federal grant opportunities. We rely on a system of intergovernmental coordination with our Federal and state counterparts to achieve the collective mission of closing the digital divide.

As a testament to this role, and through the passage of the American Rescue Plan Act (ARPA) and implementation of the Coronavirus State and Local Fiscal Recovery Fund (Recovery Fund), counties have invested direct funds into critical broadband infrastructure and services through the ARPA Recovery Fund. Counties have also directly addressed issues of internet affordability and the "homework gap," through direct aid and support for our residents ranging from public WiFi and hotspots to outreach efforts that support expanded collaboration with community anchor institutions.

Counties also play a critical role as policymakers of broadband deployment within our jurisdictions. As stewards of public rights-of-way and other public property access points, counties work together with internet service providers on a regular basis to streamline broadband deployment and access for our residents, while retaining local authority for public assets that are held in trust to benefit the local community. Counties support smart policies such as "dig once" and "future-proofing" broadband infrastructure and deployment efforts to ensure that our residents have access to ongoing and reliable high-speed internet services.

Finally, counties serve as data aggregators and conveners in broadband deployment efforts. Counties across the country have engaged in efforts to collect quantitative and qualitative data at the local level to determine the true state of

connectivity and demonstrate community need for investments in high-speed internet connectivity. We also convene public partners and community stakeholders on a regular basis.

The role of broadband in rural communities today cannot be overstated. In fact, “broadbandification” of the country can be seen as very similar to the rural electrification movement of the 20th century, where the Federal Government played a critical role in serving our rural communities when the economic incentive to extend the grid was not present. There is a large opportunity for intergovernmental partnerships and coordination to continue with the different USDA broadband programs currently under review ahead of the 2023 Farm Bill.

As Congress begins negotiations around the 2023 Farm Bill, counties urge lawmakers to include provisions that will continue to advance our shared goals of closing the digital divide across America and providing rural communities with the resources they need to be resilient and future-ready in the 21st century. America’s counties agree on the following recommendations:

- **COVID-19 exacerbated the already dire digital divide in rural America, and counties urge Congress to continue to fund broadband deployment geared specifically to rural communities.**
- **The Bipartisan Infrastructure Law (BIL) is offering vital resources to ensure access to high-speed internet to local governments. However, a continued focus on broadband infrastructure grant programs that are accessible, flexible, and respectful of local decision-making authority is needed.**
- **To ensure we meet our collective goal of 100 percent connectivity across rural America, counties support a stronger Federal-state-local framework.**

COVID-19 exacerbated the already dire digital divide in rural America, and counties urge Congress to continue to fund broadband deployment geared specifically to rural communities.

Our lives and futures have become inextricably tied to technology. Without access to high-speed internet, many of our rural and underserved communities are becoming increasingly isolated and left behind.

The COVID-19 pandemic laid bare the digital divide in our country for rural communities, who are at a particular disadvantage in receiving adequate broadband service due to their remote location and lower population density. For these rural communities, broadband can serve as a lifeline, connecting students to online degrees and connecting sick patients to medical consultations locally unavailable.

Congress made historic investments into America’s counties with the passage of the American Rescue Plan Act (ARPA) and Bipartisan Infrastructure Law (BIL). Combined, both vital pieces of legislation have bestowed counties with the flexibility to invest in infrastructure networks targeted toward unserved and underserved households across the country. Counties have a large role to play in helping to steward these Federal resources and ensuring local communities receive access to high-speed and reliable internet service.

As these historic Federal investments show, the need for Federal support for broadband investments in our unconnected and rural communities continue to be a top priority for America’s counties. Both ARPA and BIL are offering vital resources in the form of direct fiscal aid to local governments. However, coupled with provisions in the farm bill, specifically resources through the U.S. Department of Agriculture’s ReConnect Program, counties have been able to take major and necessary steps to close the digital divide. Counties urge that the focus on rural connectivity in the current farm bill be carried over into the 2023 iteration to support our continued efforts in broadband infrastructure.

The Bipartisan Infrastructure Law (BIL) is offering vital resources to ensure access to high-speed internet to local governments. However, a continued focus on broadband infrastructure grant programs that are accessible, flexible and respectful of local decision-making authority is needed.

The Bipartisan Infrastructure Law (BIL) is currently offering the nation an unparalleled opportunity to close the digital divide and provide accessible and affordable internet access for all rural Americans. The BIL’s devotion of \$65 billion towards broadband deployment, digital equity and internet affordability initiatives provides the opportunity for well-guided Federal dollars to reach every unserved and underserved community across the country.

Counties are actively executing the mission of BIL’s broadband goals by working with our state partners to implement the Broadband Equity, Affordability, and Deployment (BEAD) program, promote the Affordable Connectivity Program (ACP) to

eligible households and communities within our jurisdictions, and developing digital equity plans in coordination with states to ensure our communities have the digital skills and support needed to thrive in a 21st century society.

As we continue to focus on connecting our rural communities to high-speed internet, the farm bill's existing broadband infrastructure programs stand as significant opportunities to close the digital divide. Specifically, in our experience when implementing these Federal programs related to broadband, counties offer the following recommendations:

- **Streamlined application processes:** To ensure that rural communities can and will participate in broadband infrastructure grant programs, a streamlined application process is needed. Counties play a large role in helping local providers apply for Federal dollars, and the farm bill can continue to support rural communities by providing as many on-the-ground resources as possible to support grant applications and streamline application requirements while ensuring projects meet the goals of delivering high-speed internet service.
- **Prioritizing high-speed internet:** To best meet the needs of rural residents, Federal programs should encourage broadband deployment projects that offer technological solutions that best fit a community's needs, while also prioritizing projects that promise the most reliable and high-speed service. This balance will ensure that communities retain the utmost flexibility to utilize the technologies that best meet the geographic and topological conditions of a particular community while ensuring that all broadband projects provide reliable and ongoing service that sufficiently constitutes high-speed internet.
- **Prioritizing communities with minimal access to broadband services:** Counties support Federal funding being allocated to areas with no broadband infrastructure, including areas that do not currently have projects with final approval to use Federal dollars to deploy broadband infrastructure that meets the minimum definition of high-speed internet. Our rural communities cannot miss this palpable moment to connect every unserved resident to high-speed internet that will be accessible and affordable for the foreseeable future.
- **Leveraging local expertise and resources:** Using local tools, such as community broadband mapping, can play a large role in helping our Federal partners identify where broadband is most needed. This unique data will help shed light on the true state of connectivity across the country, especially in rural regions. Counties, along with the Federal Communications Commission (FCC), will be able to adequately adopt the new national standard and utilize these findings to address our nation's connectivity issues.

To ensure we meet our collective goal of 100 percent connectivity across rural America, counties support a stronger Federal-state-local framework.

As important partners in the intergovernmental process, county leaders are most interested in serving in all capacities necessary to help close the ongoing digital divide in our rural communities. Counties that represent our rural residents recognize acutely that the ongoing divide leads to an unacceptable outcome for rural Americans, and the farm bill offers a unique opportunity to bring broadband infrastructure into focus for our rural communities.

As prudent stewards of Federal dollars and diligent collaborators with internet service providers, counties can help play a central role in the implementation of Federal broadband programs geared towards rural America.

This work to close the digital divide in counties across the country is ongoing and is truly a joint goal among Federal, state and local partners. For example, in my state of Minnesota, we have developed our Border-to-Border Broadband Development Grant Program initiative, which prioritizes high-speed internet services for our most unserved communities across the state. This state initiative requires robust coordination with local government partners to ensure we are meeting our residents' needs.

Another example of this intergovernmental partnership is with the authorization of ARPA. In Stearns County, we have dedicated over \$16 million to connect our residents to broadband that will ultimately provide fiber-to-the-premises to almost every household in our county. This project will ultimately require leveraging the efforts and funds from every township within our jurisdiction as well as ready-and-willing internet service providers in our county to drive this project to completion.

These are just two examples of how the intergovernmental partnership is critical in solving the technology divide in our nation. As important ground-level partners in our nation's intergovernmental system, counties can deploy the resources needed to make meaningful progress on rural broadband expansion, with a strategic focus on supporting rural communities.

Conclusion

Chairman Scott, Ranking Member Thompson, and distinguished Members of the Committee, thank you again for the opportunity to testify today.

Counties recognize that today, reliable, fast and affordable high-speed internet is a fundamental part of ensuring our residents can achieve healthy, safe and fulfilled lives.

We appreciate the efforts that have been brought forward thus far to address the current lack of connectivity in our rural communities and look forward to working with you to achieve our shared goal of closing the nation's digital divide.

The CHAIRMAN. And thank you, Commissioner Clark.

And now, Mr. Hawkins, please begin when you are ready.

STATEMENT OF J. GARRETT HAWKINS, PRESIDENT, MISSOURI FARM BUREAU, JEFFERSON CITY, MO; ON BEHALF OF AMERICAN FARM BUREAU FEDERATION

Mr. HAWKINS. Good afternoon, Chairman Scott, Ranking Member Thompson, and Members of the Committee. My name is Garrett Hawkins. I am a fifth-generation farmer and a cattleman from Appleton City, Missouri, which is about an hour and a half south of Kansas City. Agriculture runs deep in my family's roots as our extended family raises everything from livestock to row crops to dairy production. I am also a husband and father and I am proud to serve as the President of the Missouri Farm Bureau and certainly appreciate the opportunity to provide input on rural broadband deployment across rural America.

Deployment of this technology is critical for stimulating and revitalizing the rural economy. It is essential to modern agriculture, to the farmers and ranchers who grow our food, and for the quality of life for rural Americans. I see the need for broadband every day in rural communities as I travel all across the state. One family I was with the other night shared with me that they live just 1 mile past the city limit of a very urban area here in Missouri and still don't have access to high-speed internet. Other families I know use the technology not just for precision agriculture but for basic online marketing, as well as education.

I recently visited with another fellow farmer from southern Missouri, who was thrilled to see fiber optic line being run just a few miles from his farm. Maybe, he said, they will come my way in a year or so.

In Missouri, we have taken action to bring more broadband to rural communities. In 2017, Farm Bureau convened the Missouri Broadband Working Group. This group was comprised of over 120 stakeholders from all industries that formed recommendations that were taken to our governor and Congressional delegation. As a result, our governor established the Office of Broadband within our Department of Economic Development. This happened because of collaboration.

In addition, we have advocated for the Missouri Broadband Grant Program, which provides financial assistance to providers who are seeking to deploy broadband in underserved and unserved areas. Over the years, the program has grown, and Missouri recently approved a \$265 million investment into the grant program via our state's share of the American Rescue Plan Act funds.

Although we have made significant strides, the work is far from finished. Our state is already laying the groundwork for a success-

ful rollout of the Broadband Equity Access and Deployment Program, which was passed as a part of the IIJA. As an organization, we continue to advocate that our state direct adequate funding for the deployment of broadband to our unserved ag areas.

Knowing where adequate services exist is critical to crafting sound policies related to deployment. Missouri's Office of Broadband will be addressing this challenge head on by allocating our Federal dollars for a statewide mapping initiative.

I also have the privilege of serving on the FCC's Precision Agriculture Connectivity Task Force. Today's farmers and ranchers, we use precision ag techniques to make decisions that impact everything from fertilizer to the amount of water that is needed for our crops to the amount and type of herbicides that are applied. These are just a few examples of how farmers are using connectivity to bump yield, improve environmental impact, and increase profitability. Beyond specific on-farm needs, rural communities need access for healthcare and government services, education, and business opportunities.

The upcoming farm bill is an important opportunity for this Committee to continue the work that USDA is already doing in the broadband space, including but not limited to the ReConnect Program. In fact, the reason why I am not in Washington, D.C., today is because our friends at Rural Development are hosting a ReConnect workshop here in the Farm Bureau building in Jefferson City.

In the 2018 Farm Bill, Congresswoman Hartzler worked with us to pass an amendment to set the minimum build-out speed for USDA-funded broadband programs. We appreciate the Committee's work as well to better direct coordination and interoperability among programs administered by USDA, the FCC, and NTIA, and we want this cooperation to continue moving forward.

As more precision equipment becomes available, we must make sure that we are prioritizing the build-out of projects that will take us into the future. Truly, that is what this really needs to be about is building a network, a system that will be future-proof for those of us in agriculture in rural America.

Farm Bureau appreciates the Committee's interest in rural broadband. Thank you again for the opportunity to testify on this important issue on behalf of our farmers and ranchers, and I look forward to your questions.

[The prepared statement of Mr. Hawkins follows:]

PREPARED STATEMENT OF J. GARRETT HAWKINS, PRESIDENT, MISSOURI FARM BUREAU, JEFFERSON CITY, MO; ON BEHALF OF AMERICAN FARM BUREAU FEDERATION

Good morning, Chairman Scott (D-GA), Ranking Member Thompson (R-PA) and Members of the Committee. My name is Garrett Hawkins, and I am a fifth-generation farmer from Appleton City, Missouri, and the third generation in my family to own and operate the farm on which we live today. Agriculture runs deep in our extended family and spans livestock, row crop, and dairy production. I am a proud husband and father, and I serve as President of Missouri Farm Bureau (MOFB). I appreciate the opportunity to provide input on the necessity of rural broadband deployment and its importance across rural America.

Deployment of broadband technology is a critical link in stimulating and revitalizing the rural economy. Rural broadband is essential to modern agriculture, the farmers and ranchers who grow our food and the quality of life for rural Americans. While most Americans take broadband for granted, according to the Federal Communications Commission (FCC) nearly 19 million Americans lack access to

broadband. This is not distributed evenly, 17% of rural Americans lack access to broadband, compared to only 1% of urban Americans. Keep in mind that the statistic referenced above is only an estimate, as FCC's data collection and mapping processes are viewed as unreliable by many experts in the broadband field. Regardless, the number of people in rural America that lack access to broadband is discouraging. Farm Bureau members have recognized the urgent need to deploy broadband in rural communities and have elevated broadband access and affordability as a priority due to its impact on their daily lives.

In Missouri, we have taken strong action to bring broadband to more rural communities. In 2017, Missouri Farm Bureau convened the "Missouri Broadband Working Group." This group was comprised of over 120 stakeholders from all industries that formed legislative and regulatory recommendations that were ultimately taken to our Governor and Congressional delegation. As a result, Missouri's Governor established the Office of Broadband within our Department of Economic Development. This office is responsible for keeping their finger on the pulse of all things broadband in Missouri. The creation of this office would not have been possible without the collaborative efforts of Farm Bureau, our state Departments of Agriculture and Economic Development, and the University of Missouri.

In addition, we successfully advocated for the Missouri Broadband Grant Program, which provides financial assistance to providers who are seeking to deploy broadband in underserved and unserved areas. Over the years, this program has grown, and in 2022 Missouri legislators approved a \$265 million investment into the grant program via the State of Missouri's share of the American Rescue Plan Act (ARPA). This program would fund new broadband projects across the state in unserved and underserved communities, which the bill defines as areas lacking 25/3 Mbps. Additionally, in 2020, the Missouri legislature passed legislation supported by MOFB that would allow our Department of Economic Development's Community Improvement District and Neighborhood Improvement District programs to be used to facilitate broadband deployment within special districts.

Although we have been able to make significant strides in our state, the work is far from finished. Farm Bureau continues to advocate for strong investment to support broadband deployment in rural communities. Our state is already laying the groundwork for a successful rollout of the Broadband Equity, Access & Deployment (BEAD) program and the Digital Equity Act (DEA), which were passed as part of the Infrastructure Investment and Jobs Act of 2021 (IIJA). Missouri Farm Bureau, Missouri's Department of Economic Development, and other partners such as the University of Missouri Extension will be engaged in a full statewide tour and plan to hear from local communities to address real world challenges as we deploy programs. As an organization we are advocating that the state direct adequate funding for the deployment of broadband internet service to unserved agricultural areas.

Knowing where adequate broadband services do and do not exist is critical to crafting sound public policies related to broadband deployment in rural areas. Missouri's Office of Broadband will be addressing this challenge head on by allocating recently approved ARPA funds for a statewide mapping initiative.

The ability of the Federal Communications Commission (FCC) and all other relevant agencies to utilize accurate broadband coverage maps is crucial. Last Congress, Farm Bureau advocated for the passage of the Broadband Deployment Accuracy and Technological Availability Act (Broadband DATA Act). This bipartisan and comprehensive bill improves the accuracy of broadband coverage maps and better directs Federal funds for broadband build-out. Specifically, it requires the FCC to improve the accuracy and granularity of its maps by establishing a serviceable location fabric, which will serve as a baseline for served, underserved and unserved broadband areas, an outcome that Farm Bureau policy supports. We are pleased to see the FCC is making progress on these new maps and look forward to their expected release by the end of the year.

Farmers and ranchers depend on broadband just as they do highways, railways and waterways to ship food, fuel and fiber across the country and around the world. Many of the latest yield-maximizing farming techniques require broadband connections for data collection and analysis performed both on the farm and in remote data centers. However, 18% of U.S. farms have no access to the internet, according to the USDA report, "Farm Computer Usage and Ownership, 2021."

I serve as part of the FCC's Precision Agriculture Connectivity Task Force Accelerating Broadband Deployment on Unserved Agricultural Lands Working Group. America's farmers and ranchers embrace technology that allows their farming businesses to be more efficient, economical and environmentally responsible. Today's farmers and ranchers are using precision agricultural techniques to make decisions that impact the amount of fertilizer they need to purchase and apply to their fields, the amount of water needed to sustain crops, and the amount and type of herbicides

or pesticides needed. These are only a few examples of how farmers use broadband connectivity to achieve optimal yield, improve environmental impact and maximize profits.

Beyond specific on-farm needs, rural communities need access to health care, government services, and educational and business opportunities. For many rural communities, access can only be gained by using broadband services and sophisticated technologies that require high-speed connections. The coronavirus pandemic only exacerbated and made more apparent the need for broadband in rural communities as employees shifted to working from home, school districts closed and resorted to distance learning platforms, and patients sought health care through telemedicine platforms.

The upcoming farm bill is an important opportunity for this Committee to continue the good work that USDA is already doing in the broadband space, including but not limited to the ReConnect Program. In the 2018 Farm Bill, Missouri Farm Bureau successfully worked with Congresswoman Vicky Hartzler (R-MO) to pass an amendment that set the minimum build-out speed for USDA-funded broadband programs at 25/3 Mbps. We also appreciate the Committee's directive in the last farm bill to better coordinate interoperability among broadband programs administered by USDA, FCC, and NTIA.

Precision agricultural equipment requires a wireless broadband connection for data collection and analysis performed both on the farm and in remote data centers. As more precision equipment becomes available, farmers and ranchers cannot take full advantage of technologically advanced equipment if they do not have access to wireless broadband in the field and on the ranch. A 2021 study, "The Future of American Farming: Broadband Solutions for the Farm Office, Field, and Community," released by the Benton Institute for Broadband Society and sponsored by the United Soybean Board, found that to meet the growing demand among farmers for both upstream and downstream speeds, networks must be capable of 100/100 Mbps service. Upload speeds are sometimes more important to farmers and ranchers since they often need to upload data at faster speeds than they need to download items.

As the Committee and agencies contemplate future broadband needs, MOFB and the American Farm Bureau Federation recommend the agency coordinate closely with the USDA Rural Utilities Service as well as the FCC Precision Agriculture Connectivity Task Force to support the interests of rural communities and agriculture.

As Congress and the Administration implement programs that support the deployment of broadband to rural communities, please consider the following principles.

- **Improve Data Accuracy & Mapping:** We continue to advocate for additional mapping and the use of more granular data sets when determining which areas are eligible for Federal (and state) funding.
- **Plan for the Future:** When awarding broadband projects, we should consider speeds that account for teleworking and remote education needs, rather than just recreational use of broadband.
- **Foster Local, State, and Federal Partnerships:** Close working relationships between local, state, and Federal partners are critical to maximize the use of funds available for broadband deployment. Various entities that deploy broadband should work together in order to ensure the needs of rural America are being met.
- **Focus on Precision Agriculture:** Too often, Federal programs do not take into account the specific needs of agriculture and rural America when developing programs that incentivize deployment. Agriculture as a whole has the potential to be a strong beneficiary of rural broadband services, and it will be important to take these needs into account. Access to broadband and data services can result in more data-driven decisions on the farm, if the technology is available.

Farm Bureau appreciates the Committee's commitment to expanding broadband to all of rural America. Broadband is essential to modern agriculture, the farmers and ranchers who grow our food and the quality of life for rural Americans. Thank you again for the opportunity to testify on an issue so critically important to the individuals Farm Bureau represents. I look forward to answering any questions the Committee has on this important matter.

The CHAIRMAN. And thank you very much. And to each of our very distinguished three witnesses, we want to thank you for your excellent testimony.

At this time, Members will be recognized for questions in order of seniority, alternating between the Majority and Minority side. You will be recognized for 3 minutes each in order to allow us to get in as many questions as possible before votes are called on the floor.

And also as I remind our Members, please keep your microphones muted until you are recognized in order to minimize background noise.

And now I recognize myself to start with 3 minutes.

And Ms. Follansbee and Commissioner Clark, as you well know, our 2018 Farm Bill established the FCC Precision Agriculture Task Force of which you both are members. And the task force adopted a series of recommendations, including improving Federal broadband maps, interagency collaboration, and prioritizing development of precision agriculture, cybersecurity specialists at USDA, among many others. Following the task force adoption of this report and its recommendations, let me ask you, have you all received any updates of the status of those recommendations? And have the agencies been working to implement those recommendations?

Ms. FOLLANSBEE. I will go first. Thank you very much, Congressman, for your question.

The CHAIRMAN. Yes, please.

Ms. FOLLANSBEE. As a current member of the task force, I can't speak for the FCC and USDA on their behalf, but I can let you know that the task force is ongoing and it is actively working on a weekly basis. There are groups meeting weekly to work on additional recommendations and encourage further development of ideas that can improve precision agriculture.

The CHAIRMAN. Okay. And Commissioner Clark, I believe, next.

Ms. CLARK. Thank you, Mr. Chairman. I would have to second what Ms. Follansbee just said in terms of the committee, but as it relates to the work we are doing at NACo, each of those in the groups that you referenced have been working with us, and we appreciate that ongoing commitment to doing so.

The CHAIRMAN. Very good because we have so many agencies involved. And this is the greatest part of our challenge. If we are able to keep our agencies working in collaboration with each other, it is going to smooth this process. And so I am glad to hear that you all have received an update on it and that you are working to improve those areas.

And I see that my time is rapidly closing. And so now I recognize the gentlewoman from North Carolina, Ms. Adams, who is also the Vice Chair of our Committee on Agriculture. You are recognized for 3 minutes.

Ms. ADAMS. Thank you, Mr. Chairman, again, for hosting this hearing, and to our witnesses, thank you for your testimony.

Ms. Clark, in your testimony, you discussed how COVID-19 exacerbated the digital divide, particularly as it pertains to the homework gap. As an educator for over 40 years and a Member of the Education and Labor Committee, I am committed to ensuring that each and every student can access the internet at home so we can close this homework gap once and for all. So, Ms. Clark, can you discuss the role that local governments play in deploying high-

speed internet and what a more robust Federal-state-local framework might look like?

Ms. CLARK. Mr. Chairman and Congresswoman Adams, thank you. Thank you for your commitment and your work on that. Certainly, as a mom and now a grandmother, I very much appreciate those efforts.

This has been a really critical area. We saw it in particular in rural communities, but we also saw it in historically underserved urban areas as well. So most counties, many counties across the country have utilized, whether it was CARES Act (Pub. L. 116-136) or ARPA (Pub. L. 117-7) funds, have worked with school districts to try to help with making sure that they have the tools for the students to be able to do the homework the way they need to and while they have been doing remote learning to do that as well. Unfortunately because so many areas still don't have sufficient broadband, it can be really hard. Like I was thinking about one of my county's childcare providers who has kids of her own and they have an egg business as well, and they just can't get enough speed so as to be able to have everybody doing it at the same time. Or in my district where we have a large number of immigrants and refugees, if you have several kids that are trying to do homework at the same time, you need a high enough speed.

So counties right now across the country are partnering with those districts and utilizing and trying to leverage resources so that we can get that high-speed affordable internet to as many of our school kids as quickly as possible. But your continued help is needed on that front, so thank you.

Ms. ADAMS. Well, thank you very much. You actually answered my second question I have for you in terms of any roadblocks you may have. But Mr. Hawkins, do you have any information on about why we need to ensure that all farmers can make use of the precise technologies? I only have a few seconds.

Mr. HAWKINS. For us to compete in today's global marketplace, we need access to technology. And truly as I think about how to bring the kids home to the farm, Congresswoman, technology is the key. Technology is key to opening up more markets on the farm, better access to technology. But clearly in our rural communities I can't bring my kids home if the community has died around us. And so truly broadband is that thread of life through the community out to [inaudible].

Ms. ADAMS. Thank you, sir. Thank you, and I yield back.

The CHAIRMAN. Thank you very much. And now the gentleman from Indiana, Mr. Baird, is recognized for 3 minutes.

Mr. BAIRD. Thank you, Mr. Chairman and Ranking Member. I really appreciate the opportunity to visit with these witnesses today, and I really appreciate their expertise.

Mr. Hawkins, I really appreciate your interest in cattle and being a farmer and then I think you really touched on something that is important. The only way we are going to get these young people back to the farm is if we got high-speed internet and the technology so they can get on the phone or whatever they need to do.

But in that vein, I wanted to ask you what you thought about what the upload speeds need to be for an average family in rural America, and does this need to change for farmers utilizing preci-

sion agriculture? So just a quick idea of what your thoughts are for download/upload speeds.

Mr. HAWKINS. Well, thank you for the question, Congressman. It is hard to wrap your arms around what is the ideal speed. What we continue to say is that the bandwidth has to be reliable and robust from the standpoint of being future-proof. In agriculture, as we look at the incorporation of precision technology, we need the ability to upload massive amounts of data in very rapid fashion.

Just the other day at our agritourism conference here in Missouri, a young farmer displayed a drone and how he uses the drone to map his agritourism operation, as well as to use it for a chemical application to control weeds as well as pests. And again, as he thinks about cameras and his ability to scan and monitor the farm, you got to be able for that data to be able to transfer quickly, especially when we are working with third parties.

I would also say anecdotally, I am looking at exploring and using a new innovative forage technology on the farm that one of the keys will be that I have connectivity in a robust fashion so that the company that is providing this forage technology can monitor to make sure the equipment is working effectively. And so truly, the farm of the future has to be connected, and truly, the future is now, sir. So truly, at least 100 is what we say megabit per second is truly what we need to be shooting for. My rural hospital says the same thing, that they need 100 up, 100 down in order to do telemedicine in a way that is truly a good experience for the provider as well as the patient.

Mr. BAIRD. Thank you for that insight. And, Tarryl, I see you nodding your head, but we are about out of time, so I assume that means you think that is an appropriate speed, too. I got to tell you that at one time in my life, I was a County Commissioner as well and I enjoyed that time very much.

Ms. CLARK. Yes, sir.

Mr. BAIRD. I appreciate what you are doing. I yield back.

The CHAIRMAN. Thank you. The gentlewoman from Ohio, Ms. Brown, is recognized for 3 minutes.

Ms. BROWN. Thank you, Chairman Scott, for holding this incredibly important hearing on the future of broadband.

While access to reliable and affordable broadband internet has long been the standard for many across the U.S., there are still millions of people, including my constituents in Ohio, who continue to struggle with unreliable connections and unaffordable rates. As workplaces and classrooms migrated online during the pandemic, the digital divide became apparent. I am proud that my colleagues and I passed legislation this Congress that included broadband funding to address the digital divide. The broadband appropriations in the bipartisan infrastructure law are one of the largest Federal broadband investments in history, and I look forward to building on our success.

So my question is for Ms. Follansbee. In your testimony, you spoke to the value of factoring in user experience as we work to bring broadband access to all corners of the country. Can you explain why that is important for policymakers and those administering these programs to consider?

Ms. FOLLANSBEE. Yes, thank you, Congresswoman, for your question. The user experience is essentially the customer experience, right? And we are trying to close the digital divide. We are attempting to make sure that everybody has the same type of service in the sense that folks have access to education, they have access to telehealth, they have access to precision ag applications. All of that is important. So we need to ensure that all of the country has at least some broadband and focus on the need to future-proof that network so that, going forward, the speeds can build. It is a scalable situation. Obviously, our members are building a lot of fiber with the BEAD money that is coming through NTIA, and we believe that will bode well for the future.

Ms. BROWN. Thank you for your answer. Commissioner Clark, as a former county council member myself, I know the important role that the county governing bodies play in the success of programs like these, especially where there are smaller municipalities within their jurisdiction. Can you speak to the partnership between county governments and USDA and other agencies, and are there areas for improvement?

Ms. CLARK. Thank you so much. Yes, actually, the FCC, USDA, NTIA, and others have been coming and working with us to help with the educational process but listening to the barriers, a number of which Members have talked about today. You brought up some of our most rural areas as well, and I can tell you using my county as an example, almost all of our townships are also leveraging their ARPA funds with ours, while we then also try to go apply for state and Federal funds to keep growing it so we can get all those areas covered. So really that local, state, Federal components are just critical, and we just need to keep working at it.

The CHAIRMAN. Thank you.

Ms. BROWN. My time has expired. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Ms. Brown.

And now the gentleman from Pennsylvania, our distinguished Ranking Member Thompson, is recognized for 3 minutes.

Mr. THOMPSON. Well, Mr. Chairman, thank you so much. My apologies. I had to step out of the hearing room, but my appreciation to the second panel for their local service and everything that they do, especially in the space of bridging the digital divide.

So I have a question for Mr. Hawkins. As you may know, last July, this Committee passed unanimously H.R. 4374, the Broadband Internet Connections for Rural America Act, which consolidates the ReConnect Program in the 2018 Farm Bill rural broadband programs. As we approach the next farm bill, how can we make these rural broadband programs more efficient and more effective for rural America?

Mr. HAWKINS. Well, thank you, Ranking Member Thompson, for the question and your continued leadership in this space along with the Committee.

I have a couple of thoughts. Something that we would love to see more of in Missouri is more cooperation across territories to make sure that service is getting provided. And maybe in some cases it may be a rural electric co-op that then works with an investor-owned utility where their service areas butt up against each other. And maybe the co-op is providing broadband but the IOU has no

interest in it. We want to see incentives for out-of-the-box thinking and cooperation to make sure that these dollars are stretched as far as they can and that service is provided in an efficient manner, so let's be creative.

And then I would also say, an experience or a concern that we have had is the accountability on the back side. Once awards are made, making sure that those providers who are receiving these dollars are held accountable to provide the service that they said they are going to provide and do it in a timely fashion. So we have communicated, for instance, to the FCC that when a provider doesn't follow through, that maybe they need a second-in-line approach, that whoever was next in line, they have the second-best application, maybe those dollars should go there. Or if a state has shown leadership and established an Office of Broadband and has processes in place to handle those dollars, maybe those dollars should be given to that state to then allocate to make sure that those unmet needs are taken care of. But certainly, those are a couple of items that I would consider and hope you consider during the next farm bill.

Mr. THOMPSON. Very good. Well, I will just encourage any of our witnesses that would want to weigh in, in writing. Obviously, the ReConnect Program is still operating as a pilot. And I would love to hear from you why it is important for USDA's broadband programs to be statutorily authorized, the importance of that certainty, going forward.

But in the consideration of time, I will ask a reply from that, a future reply.* And, Mr. Chairman, I yield back.

The CHAIRMAN. Thank you, Ranking Member.

And now the gentleman from Florida, Mr. Lawson, is recognized for 5 minutes.

Mr. LAWSON. Thank you, Mr. Chairman.

The CHAIRMAN. Three minutes.

Mr. LAWSON. Thank you, Mr. Chairman. You said 5 or are you saying 3?

The CHAIRMAN. I say 3.

Mr. LAWSON. Okay.

The CHAIRMAN. Thank you.

Mr. LAWSON. Thank you.

In my home State of Florida, 96 percent of our population has access to broadband and only about seven or eight percent of Floridians in the rural areas have that access. The numbers are even lower in the rural counties in north Florida in Gadsden County. My home county was only about 13 percent of the residents have broadband while 89 percent of the households could receive it.

The question is to the panel—when Congress is considering broadband funding legislation for counties like Gaston, why is it necessary that Congress not only fund projects that expand connectivity and infrastructure for broadband but also fund projects that address affordability, barriers of residence? And that is for the whole panel.

* **Editor's note:** the responses to the information referred to are located: for Ms. Follansbee, p. 1531; Ms. Clark, p. 1531; and Mr. Hawkins, p. 1532.

Ms. FOLLANSBEE. I will start. Thank you, Congressman, for your question. Yes, there are several pieces to the deployment of broadband. There is access, which is what you are talking about, the initial ability to get broadband, and then there is affordability. And there is also something called adoption, which is getting folks to sign up for it. Fortunately, in the IIJA there are funds to not only increase deployment but also they created the Affordable Connectivity Program, which has been very successful in expanding the ability of folks with low incomes to be able to afford their broadband service. And adoption also is part of the program and will require additional work, but I think all three of those things have been addressed, and we look forward to seeing the programs implemented to achieve those goals.

Mr. LAWSON. Did anyone else want to speak to that?

Ms. CLARK. Sure, Mr. Chairman, and, Congressman. This is a really big issue. The ACP is going to be a big help. We are working actually on bringing providers who are going to receive funds through our county and can show that they are having that program available to residents. But in addition, we are finding a fair amount of rural areas that are experiencing something that one of our residents talked about, which is I am now paying for satellite. It is \$120 a month. They say it is unlimited, and yet we start getting metered and shut down and my child can't even get homework and I can't run my business. We are hearing these kinds of stories around the country. So that affordability piece needs to be actually available to folks. So we want to keep working to have the ACP available throughout the country and for it to be real for all of our residents.

Mr. LAWSON. Thank you, Mr. Chairman. Do I still have a minute?

The CHAIRMAN. No, I am afraid we are out. Thank you, Mr. Lawson.

Mr. LAWSON. With that, I yield back.

The CHAIRMAN. Yes. And now the gentlelady from Minnesota, Mrs. Fischbach, is recognized for 3 minutes.

Mrs. FISCHBACH. Three minutes? I will have to talk quick. Thank you, Mr. Chairman.

Well, you know what, then I will go first to Commissioner Clark, who actually I was honored to serve with in the Minnesota Senate. And I will resist calling you Senator Clark but Commissioner Clark. You mentioned in your written testimony Minnesota's Border-to-Border Grant Program, which continues to be widely popular among providers and local governments, and you and I have both worked on this program, I am sure, in our time in the Senate for both state and local governments. But what lessons can we learn from this program, and what can we bring to the next farm bill reauthorization?

Ms. CLARK. Thank you, Congresswoman, for that question and for your work. It is an easier program for our internet service providers to apply for. It has been an easier program for counties and other local governments to also approach. So streamlining, streamlining processes is part of that, making it easier. Particularly you brought up Todd County earlier, for our smaller counties to actu-

ally be able to get in the door and have an opportunity to receive these funds.

One of the approaches that we think is important would be to have kind of a single entry point, and so trying to figure out which place to go to federally or which program, streamline the application, make it so you can come in a portal and you really can be able to access the funds that meet your county's needs so that a county like Todd, who is really unserved, can actually deal with that, right? So the Border-to-Border Program we are hearing from smaller internet providers is that actually is a pretty doable program to approach. Let's make that happen on the Federal level, too.

Mrs. FISCHBACH. Thank you very much. And maybe if any of the other panelists would want to just add. I have a minute left if anybody wants to add to those thoughts? All right. I don't hear anyone. So, Mr. Chairman, I will yield back my 49 seconds. Thank you.

The CHAIRMAN. Thank you very much.

And Mrs. Flores is recognized for 3 minutes if she is connected. We have been able to get her connected. Okay. Mrs. Flores, are you able to get connected? Okay. If she does, you can interrupt me on my closing. And you can also, Mrs. Flores, submit your questions in writing, and we will make sure we get to you.

I really appreciate everybody's cooperation here. We have votes pending. I appreciate everybody cooperating with the shortened time. And we appreciate our witnesses taking the time to really give us some valuable information. And thanks once again.

But before we adjourn and I give my closing statement, good to have you back here in person. The Ranking Member got here in person.

Mr. THOMPSON. Good to be out of the virtual world and back in the real world.

Why, Mr. Chairman, thank you so much, once again, for your overall partnership as we advance the issues facing rural America or, as I like to say, essential America and specifically on the topic of broadband. I thought we had great witnesses today. I was very disappointed with the first panel once again, that NTIA and the FCC were so disrespectful to the people of rural America where they did not accept the invitation to testify today since they have a significant outreach.

But I think we heard a lot of good things. I think it reaffirmed the great work that we as a full Committee, unified, had done in terms of, we heard about the need for a circuit rider position. We heard about mapping issues. And certainly within the bill that we advanced, there was some grant funding specifically to allow local entities to determine where the gaps were in the digital divide. So it just reaffirmed the work that this Committee is doing in the space of rural broadband, that we are right on target.

The CHAIRMAN. Yes, we are.

Mr. THOMPSON. And that is much appreciated, really encouraging USDA and Rural Utilities Service, who unfortunately has been allocated to a partnership role, but it looks like a minor role, certainly from a dollar perspective—when you look at \$65 billion or whatever it was and USDA gets \$2 billion of those dollars. I think that it demands that we as a Committee have a strong oversight role that we need to exercise in terms of bridging the digital

divide in essential or rural America. And that these partners, the witnesses we have heard from, local government, key stakeholders, we look forward to working with them and performing that role and certainly encouraged USDA and specifically the Rural Development and Rural Utilities Service to exercise some oversight as well of the other two partners on this.

And with that, thank you for the hearing, and I yield back.

The CHAIRMAN. And thank you. And, Ranking Member, I want to really, sincerely thank you. You and I decided early on at the very beginning that it was our top priority for our rural areas. It is a point of survival for our rural areas not just in terms of agriculture but in terms of the survival of many of our small, rural towns. We are losing too many of them. I was born in a rural town over in Aynor, South Carolina. You cannot get much more rural than there. And this bill means a lot. And I appreciate—thank you for our joint partnership on this. We couldn't have done it without your help and my help and working together.

And I want to thank my Committee because both Democrats and Republicans on this Committee, we said finally we are going to get rural broadband in place. And now we are depending upon—as you all are working with all the different agencies. Now is collaboration. It is working together. We got \$65 billion here. We are ready to go. And we appreciate all of our witnesses coming in and helping us to make sure that we have the FCC, the USDA, the NTIA, all of these other organizations at the Federal level. And then they have to work in collaboration with the state level. So we got a monumental task here, but this hearing is getting us off to a good start.

So we want to hear from everyone if there are areas where there is not collaboration, if there are things we can do in Congress to make sure we can smooth the paths and make sure everybody is working in good coordination, that is the way we are going to get done. Our rural communities are depending upon us, and we are going to succeed.

So once again, thank you. God bless you. And now I think I have to take care of this business.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions posed by a Member. And thank you once again for helping us to get to the floor. They are about to call votes now. Thank you.

This hearing of the Committee on Agriculture is adjourned.

[Whereupon, at 1:07 p.m., the Committee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUBMITTED LETTER BY HON. RICK W. ALLEN, A REPRESENTATIVE IN CONGRESS FROM
GEORGIA

July 09, 2021

Hon. JESSICA ROSENWORCEL,
Acting Chairwoman,
Federal Communications Commission,
Washington, D.C.

Dear Acting Chairwoman Rosenworcel:

We write to request quarterly updates from the Federal Communications Commission (FCC) on the development of a comprehensive, user-friendly dataset on broadband availability that considers input from state and local governments, Tribal nations, and consumers, supplementing information that the FCC gathers from carriers. On March 16, 2021, the FCC announced¹ the launch of this initiative, and we look forward to receiving an update on the status of its rollout. We also write to request a specific timeline of when you expect this project to be completed and for new and updated FCC broadband maps to be publicly available.

As you noted in your announcement, the accuracy of the broadband maps provided by the FCC have long been in question. One of the biggest concerns we hear from telephone cooperatives, electric membership cooperatives, and private companies is that FCC mapping, from which distribution of Federal grant and loan dollars is based, is inadequate and incorrect.

We applaud your action to implement the Broadband Deployment Accuracy and Technological Availability (DATA) Act, which is an important step towards providing a more granular, publicly available, and comprehensive look at internet access in America. We urge you to include data from the Georgia Broadband Map program² in the dataset used to develop these updated FCC maps. We also request an answer in writing as to whether you intend to use this data.

As requested, please provide a written response to the following:

1. Please provide Congress with quarterly, written updates on the status of the rollout of new FCC broadband mapping.
2. Please provide a timeline of when exactly we should expect new and updated FCC broadband maps to be publicly available.
3. Please confirm in writing if you will integrate data from the Georgia Broadband Map program into your new mapping program.

Thank you for your attention and for your service.

Sincerely,

Hon. RICK W. ALLEN,
Congressman

Hon. JON OSSOFF,
Senator

Hon. EARL L. "BUDDY" CARTER,
Congressman

Hon. RAPHAEL G. WARNOCK,
Senator

Hon. SANFORD D. BISHOP, JR.,
Congressman

Congressman

Hon. JODY B. HICE,
Congressman

SUPPLEMENTARY MATERIAL SUBMITTED BY HON. KOCHITL TORRES SMALL, UNDER
SECRETARY FOR RURAL DEVELOPMENT, U.S. DEPARTMENT OF AGRICULTURE

Insert 1

Ms. ADAMS. . . .

I have also heard from rural schools what happens when they aren't able to provide powerful internet connections to their students. They miss out on research opportunities, jobs, and a whole lot more. So, Madam Under Secretary, most states have a research and education network that provides high-speed internet access to schools, but not all schools are hooked up to those networks, and during our push to connect rural areas, what do you think we should do to ensure that our rural HBCUs and MSIs and Tribal colleges can access these critical networks?

Ms. TORRES SMALL. That is a great question. And I would love to follow up with you about specific outreach that we can do to HBCUs if they are lacking that high-speed internet connection right now because one of our focuses at Rural Development has been how do we reach out to potential partners? How do we make sure folks know how to navigate the ReConnect process, which can be challenging, and know about the other resources that are available as well? So I would love for us to be able to follow up with you to talk about how we can intentionally reach out to HBCUs.

USDA also has the Distance Learning & Telemedicine Program which supports connection to the internet and equipment to deliver distance learning programs. This is an excellent program used by many schools. It will help with providing distance education curriculums. A different Rural Development Program, Community Facilities Program is another resource for HBCU's and MSIs. These programs in their broad scope enhance educational institutions' connection to the internet.

Insert 2

Mr. LAMALFA. I am sorry. I am running out of time. Do you have concerns that linking with these other sources could somehow harm your own data mapping? Do you have any concerns about that?

Ms. TORRES SMALL. That is a really good question. I would love to follow up with you to see if there are—just to ask generally to my team. None have risen to me because we are sharing really well and because we are using multiple sources of information, and last, because we have that ground-checking capability so if there are conflicts about the different mapping, we can go on the ground and check to see if that service—but I will get back if we find any others.

USDA follows a trust but verify approach to review applications. The applications are checked to verify that the proposed service areas meet the non service eligibility requirements.

Insert 3

Ms. PINGREE. I just want to follow up a little bit because it is an issue I have brought up previously. It is an issue we have been hearing about over the years. We have been told that there are some technical assistance people that are called general field representatives that are meant to be there to help and support, but we often get the feedback that there aren't enough, that they are spread over a wide range. I don't know how many states each GFR covers. But again, I feel like every time I have this conversation—and I have great faith in you accomplishing this—we hear like, oh, that is going to come, we are working on it. Can you talk at all about anything else you might need? Should there be more language in the farm bill?

* * * * *

Mr. McCLEAN. No, thank you very much. And staffing is always an issue for us. We are a remarkably small agency that does a remarkable amount of work. There is at any given time about 100 or 20 telecom staffers that are delivering this massive program. We are very, very proud of that work. We have about 25 or so GFRs in telecom and about 23 or so in electric at any given time, and that is to cover the whole country. So we are not able to have a GFR in every single state, but we try to maximize our outreach. We use contract support. We have had webinars to try to help communities.

No additional information to add.

Insert 4

Mr. ROUZER. So with regard to ReConnect, the program has a number of administrative burdens, which make it a little difficult, time-consuming, and cumbersome for some—or actually many providers from what I hear. So the program requires—and this is an example. The program requires the provider to submit significant information regarding non-funded service areas. It also requires all environmental approvals to be obtained in sequential order rather than filed and reviewed concurrently. How are you all working through these burdens? And doesn't it make sense to streamline this and have these objectives reviewed concurrently?

* * * * *

Ms. TORRES SMALL. . . .

In terms of sequential environmental reviews, I will pass it over to Acting Administrator McLean.

Mr. McLEAN. Thank you very much. And another thing about round 1 and round 2 was the effect of the pandemic, particularly in those early months when it was a total lockdown. Historic preservation offices were closed at Tribal level and state level, so environmental review just elongated. So we worked very hard to try to expedite environmental review as much as possible. But it is it is a point well-taken and—

No additional information to add.

Insert 5

Ms. KUSTER. Great. One quick question and maybe you will need to submit in writing, but I strongly concur with your sentiments about how access to reliable telehealth services helps ease the provider gap in our rural communities and wondering if you could share insights that you have heard about how USDA broadband programs have opened up new telehealth options.

Ms. TORRES SMALL. Someone even went so far as to say it is a recruitment tool. A nurse who was trying to get other folks to apply to her rural hospital said once they were able to get the technology that worked with high-speed internet to be able to reach more people in their homes, the workforce was just more excited to be there because they could better do their job.

The Distance Learning and Telemedicine program helps rural communities use the unique capabilities of telecommunications to connect to each other and to the world, overcoming the effects of remoteness and low population density. For example, this program can link teachers and medical service providers in one area to students and patients in another. The broadband programs such as ReConnect provide the necessary and underlying broadband infrastructure that makes connection to the internet possible.

A year ago, USDA funded 86 projects through the *Distance Learning and Telemedicine* (DLT) grant program. The program helps rural education and health care entities remotely reach students, patients and outside expertise. These capabilities make world-class education and health care opportunities accessible in rural communities. The ability to use telehealth resources is critical, especially now during a global pandemic.

One example is in Georgia, where the Morehouse School of Medicine Inc. will use a \$997,194 grant to purchase interactive telecommunications, distance learning and telemedicine equipment. Equipment will be installed in service hubs in two counties in west-central Georgia. It will be used to provide a variety of health care services to residents in underserved rural areas of nine counties across the state. These services include mental health and substance abuse treatment and counseling; clinical services; referrals for specialty care; health education and career development to schools; and chronic disease diagnosis, treatment and management, including COVID-19.

Insert 6

Mr. ALLEN. Well, my home State of Georgia Broadband Map Program is the gold standard in the nation's broadband maps. It precisely maps out the availability of broadband services to every home and business in the state. Other states are following Georgia's lead in implementing similar programs. So we have the maps. We know the needs in Georgia. And of course, Madam Under Secretary, I believe you were in Georgia recently meeting with broadband providers, including my constituent, Steven Milner, with whom I have worked on many broadband rollout projects in my district. Could you provide us an update on how those meetings went and what your takeaway was? And I am out of time. You can submit that answer in writing. I would appreciate that. With that, Mr. Chairman, I yield back.

I greatly appreciated the opportunity to meet with stakeholders in Georgia and across the country to identify ways to continue to improve ReConnect and to use the funds as efficiently as possible to reach the hardest to serve areas. One of the key takeaways from the conversation in Georgia was from a broadband provider, who noted that sometimes we have to collaborate, or in his words "find a dancing partner," to make an investment in hard to reach places work.

Insert 7

Mrs. CAMMACK. So, to that point, and this will be my final follow-up because I am running short on time, I hear continuously from various stakeholders, and we have heard in past hearings that the lengthy process, the approval process for broadband loan applicants, it is too long. So how long is it taking on average for broadband funding to get out the door once the application window closes? And what can we do to expedite those funds getting out the door?

Ms. TORRES SMALL. This is the balance that we have been talking about. So we have a 5 year build-out, and that is the main—and just to answer your question quickly, the main thing is that ReConnect has a 5 year build-out. But we reimburse for expenses so that—

Once the application window closes, we proceed with our evaluation process which takes into account the project eligibility, scoring, technical and financial review of the applications, and verifications of broadband service within the proposed service Territory. This process generally takes 3–4 months from the time of submittal of all applications to an award decision. After the award is made and once all legal documents have been executed and the award closing has been completed—recipients have 5 years to complete their projects. Funding is advanced or reimbursed on an as needed basis through this 5 year period.

Insert 8

Mr. O'HALLERAN. Thank you very much. I also want to emphasize the importance of outreach to our local communities. You mentioned that a little bit. And I know you have stressed that time and time again. That is why you have been out in the field so much. But the underlying aspects of this are real. And people right now—we, as Congress, should be able to be out there all the time, making sure we are educating the public as much as possible. But what type of programs can we anticipate on a large scale for the public to be able to understand not only the programs but the timing mechanisms and all the other planning that is going to go into that?

Ms. TORRES SMALL. The outreach is crucial. That is why President Biden's Rural Partners Network is really exciting, focusing efforts in places that need it most.

Mr. O'HALLERAN. Thank you, Mr. Chairman. I yield back.

The CHAIRMAN. Could you please respond in writing? The gentleman's time is up, and we have a hard stop with votes coming.

Focused Outreach is led by the Rural Partners Network. The Rural Partners Network (RPN) is an all-of-government program that helps rural communities find resources and funding to create jobs, build infrastructure, and support long-term economic stability on their own terms. RPN leadership is Under Secretary for Rural Development Xochitl Torres Small, Farah Ahmad, Deputy Under Secretary for Rural Development and Lee Jones, Executive Director for the Rural Partners Network. RPN has a wide group of Federal department partners. This includes the White House, USDA, Departments of Treasury, Interior, Commerce, Health and Human Services, Housing and Urban Development, Labor, Transportation, Energy, Education, Veteran Affairs; and EPA, SBA Appalachian Regional Commission, Consumer Financial Protection Bureau, Social Security Administration, Delta Regional authority, Denali Commission, [Northern] Border Regional Commission, and Southeast Crescent Regional Commission.

Through the Rural Partners Network, rural people and communities benefit from collaborative partnerships among an association of Federal agencies, staff and programs. USDA Rural Development (RD) is leading the Rural Partners Network in collaboration with 20 Federal agencies and regional commissions through the Rural Prosperity Interagency Policy Council, co-led by the White House Domestic Policy Council and USDA.

Through the Rural Partners Network (RPN), the Biden-Harris Administration is taking action to transform the way the Federal Government partners with rural communities to spur inclusive, sustainable economic growth. The RPN creates an alliance of Federal agencies and civic partners working to expand rural prosperity through job creation, infrastructure development, and community improvement. The RPN will improve equitable access to Federal programs and funding, and help drive local economic development. With the RPN, Federal agencies are renewing their commitment to rural communities by expanding interagency collaboration and providing targeted staffing, tools, and resources.

SUPPLEMENTARY MATERIAL SUBMITTED BY B. LYNN FOLLANSBEE, J.D., VICE PRESIDENT STRATEGIC INITIATIVES AND PARTNERSHIPS, USTELECOM

Insert

Mr. THOMPSON. Very good. Well, I will just encourage any of our witnesses that would want to weigh in, in writing. Obviously, the ReConnect Program is still operating as a pilot. And I would love to hear from you why it is important for USDA's broadband programs to be statutorily authorized, the importance of that certainty, going forward.

But in the consideration of time, I will ask a reply from that, a future reply.

Given the advent of the once in a generation infrastructure funding for broadband it is important that the relevant agencies that oversee broadband funding take a holistic approach to the deployment, support and coordination of their broadband programs to ensure that government resources are not spent twice in the same area. One important piece of this coordination is for USDA and other coordinating entities to have a firm understanding of the ReConnect program projects that exist, as well as those that are underway. With the program's "pilot" designation come's less certainty about the future of the program for participants and government institutions alike.

SUPPLEMENTARY MATERIAL SUBMITTED BY HON. TARRYL CLARK, COMMISSIONER, FIRST DISTRICT, STEARNS COUNTY, MINNESOTA; CHAIR, TELECOMMUNICATIONS AND TECHNOLOGY POLICY STEERING COMMITTEE, NATIONAL ASSOCIATION OF COUNTIES

Insert

Mr. THOMPSON. Very good. Well, I will just encourage any of our witnesses that would want to weigh in, in writing. Obviously, the ReConnect Program is still operating as a pilot. And I would love to hear from you why it is important for USDA's broadband programs to be statutorily authorized, the importance of that certainty, going forward.

But in the consideration of time, I will ask a reply from that, a future reply.

The USDA has a clear and important role to play in the "broadbandification" of our country. As the saying goes, the USDA knows rural America best. Similar to

the role that the agency played in rural electrification throughout the early 20th century, there is a clear need for the USDA to continue to work as a steward for high-speed internet services for our rural communities that remain unconnected due to a lack of market incentive to build out internet infrastructure in remote or rural areas. The ReConnect Program has offered a key opportunity for local governments and other entities to directly apply for funds to build out high-speed networks in these target areas. Counties strongly support a continuation of the ReConnect Program through long-term authorization of the program and associated appropriations.

Counties similarly believe the USDA may have other opportunities to expand its authority and role in rural broadband deployment through programs that have been historically initiated in the farm bill. For example, the Middle Mile Infrastructure Program authorized in the 2018 Farm Bill has yet to be appropriated funds. The middle mile, or “backbone” of internet infrastructure offering interconnection between communities and an ability for open access to the network, is an essential component of broadband buildout that should be prioritized further. The USDA can supportive middle mile connectivity goals.

It is important for the USDA, in any future role in broadband, to coordinate closely with other Federal agencies as the collective desire to close the rural digital divide is pursued. This includes coordination with the National Telecommunications and Information Administration (NTIA), the U.S. Department of [the] Treasury (Treasury), and the Federal Communications Commission (FCC).

SUPPLEMENTARY MATERIAL SUBMITTED BY J. GARRETT HAWKINS, PRESIDENT,
MISSOURI FARM BUREAU; ON BEHALF OF AMERICAN FARM BUREAU FEDERATION

Insert

Mr. THOMPSON. Very good. Well, I will just encourage any of our witnesses that would want to weigh in, in writing. Obviously, the ReConnect Program is still operating as a pilot. And I would love to hear from you why it is important for USDA's broadband programs to be statutorily authorized, the importance of that certainty, going forward.

But in the consideration of time, I will ask a reply from that, a future reply.

The ReConnect Program has become a key component in USDA's effort to expand broadband across rural America. Since its inception, it has been consistently funded by Congress, even receiving a significant investment through the Infrastructure Investment and Jobs Act. While the program is the highest funded USDA broadband program, it continues to operate as a pilot program while other USDA broadband programs are authorized and examined through the farm bill.

Farm Bureau policy supports the ReConnect program and we believe it is critical to periodically examine how it is working, how it can be improved, and whether it is appropriately meeting its intended goal. Expanding access to broadband across rural America is a multiyear effort and requires significant investment. Statutorily authorizing programs provides certainty and consistency for those utilizing the program. It allows for users to prepare long-term and provides a better opportunity for stakeholder input on the efficacy of the program.

Every 5 years, Farm Bureau works with Congress to pass a new farm bill to meet the challenges of an ever-changing world and ensure that critical programs continue to work for farmers and ranchers and for rural communities working to stay competitive. The 2023 Farm Bill provides a ripe opportunity to provide statutory authority for the ReConnect Program.

SUBMITTED QUESTIONS

Response from Hon. Xochitl Torres Small, Under Secretary for Rural Development, U.S. Department of Agriculture

Question Submitted by Hon. Gregorio Kilili Camacho Sablan, a Delegate in Congress from Northern Mariana Islands

Question 1. Under Secretary Torres Small, in your written testimony, you mentioned that the Bipartisan Infrastructure Law provides \$2 billion for Rural Development's ReConnect program. These funds are intended to expand broadband services and infrastructure in rural and remote areas, like my district, the Northern Mariana Islands. Could you confirm how much ReConnect funding your Department has awarded to the Northern Marianas and other U.S. Territories?

Answer. For the first 3 ReConnect funding rounds, there were three awards in U.S. Territories: one in Puerto Rico for \$8,783,260, one in Palau for \$34,991,340, and one in Guam for \$29,767,352.

Question 2. Under Secretary Torres Small, under the National Telecommunications and Information Administration's new Broadband, Equity, Access, and Deployment Program, states and Territories will create and submit a proposal on how to utilize broadband funding. Has your Department at all engaged broadband agencies at the Territory level to inform their plans and accommodate the unique needs of their rural and remote areas?

Answer. USDA co-chairs the ABI which spans across many Federal agencies looking at a number of areas such as pole attachments, environmental concerns and permitting on Federal lands to name a few. In addition, USDA, through MOUs, meets bi-weekly with the FCC, NTIA and Treasury to ensure that we are all working together to clearly identify the areas where Federal awards are approved for broadband service to ensure that we are not duplicating efforts. Through these engagements, we are aware that FCC and NTIA have been engaging with state and Territorial governments on preparing to apply for funds under the Broadband, Equity, Access, and Deployment Program.

Question Submitted by Hon. Jimmy Panetta, a Representative in Congress from California

Question 1. The mapping tool in the environmental section of ReConnect's application process allows applicants to designate proposed zones to be utilized in the deployment process. Applicants' responses determine what documentation and environmental reviews must be subsequently completed. According to the Rural Utility Service, a lack of locational specificity in submitted construction plans could cause the application system to request additional, unnecessary environmental reviews.

For example, if a large area is marked off for fiber deployment instead of a single, narrow route, the applicant must submit relevant environmental documentation for entire zone—regardless of where fiber cables are eventually installed. Completing extraneous reviews will needlessly cost applicants time and resources—especially for those small communities that lack the resources needed to gather this data and map these spaces.

Under Secretary Torres Small, do you think the application process could be more accessible or streamlined?

Answer. Yes, although we have been making strides in improving the environmental review process, there is still room for improvements. USDA is working to fully automate the environmental review process which will make it easier for applicants to use. Environmental reviews are a necessary part of construction to ensure that all possible efforts are being made to address environmental concerns and that awardees are following applicable laws.

Question 1a. How does USDA–RD address these complaints?

Answer. With regards to the Environmental Review process, the ReConnect applications process is refined as we learn lessons and feedback is obtained from each round. From ReConnect Round 1 to ReConnect Round 4, considerable effort has been made to streamline the environmental procedures and add environmental review resources. This resulted in significant improvement in the time required for the review process. We have recognized the cost of necessary environmental reviews by an awardee by explicitly noting that environmental pre-application costs are includable with certain other application costs as part of a ReConnect award.

This illustrates USDA's dedication toward continuous improvement in the application process. It is also a reflection of suggestions from Members of Congress and feedback from rural communities and applicants.

Question 2. There are many broadband programs at the Federal level, and many agencies tasked with broadband programs. The FCC plays a large role in providing data to support USDA's efforts.

Congress passed the Broadband DATA Act to improve broadband maps, and we need everyone on the same page to make them as useful as possible.

How are agencies across the Administration working together to share data and ensure we have solid data to inform our decisions?

Answer. USDA, NTIA, Treasury and FCC collaborate on broadband data. These agencies have entered into a Memorandum of Understanding to share this information. Through this collaboration, our goal is to ensure that Federal dollars from each agency are not duplicating each other's efforts.

Question 2a. How does it collaborate with stakeholders outside the Federal Government?

Answer. USDA continuously seeks input from stakeholders through listening sessions, outreach, stakeholder events and webinars. The team of RUS Telecom General Field Representatives serving all states provide direct local contact on the ReConnect and other USDA broadband programs. In addition, Rural Development has 47 state offices with numerous additional offices within each state. The state staff are also direct points of contact with stakeholders throughout rural America. We also collaborate with State Broadband Offices. RUS makes special effort to collaborate with Tribal Governments and Native American communities working with the USDA Tribal Relations Team Lead & Tribal Coordinator.

Question 3. As I mentioned, differing rural definitions can create challenges and confusion for the rural areas that are caught in the middle. Sometimes they are counted as rural, and sometimes they are counted as non-rural.

Leaders from these places find that there is significant disagreement over whether they are designated as rural. The complexity of the rural definitions leads to frustration and wasted time for rural leaders who seek to access Federal programs and resources.

Under Secretary Torres Small, what is USDA doing to address this issue?

Answer. The rural definition for ReConnect is a statutory requirement. To implement this requirement, USDA has developed a GIS layer identifying the non-rural areas that are not eligible for the funding. This layer can be accessed on the ReConnect webpage.

Question 3a. What can we do in Congress, in the 2023 Farm Bill, to bring clarity to these rural leaders and make USDA Rural Development programs more accessible to communities stuck in the middle?

Answer. As the rural definition is a statutory requirement, Congress can further define and clarify the exact definition of rural area in the FY 2023 Farm Bill.

Question 4. My constituents have faced the issue of an inadequate rural definition for years.

Under Secretary Torres Small, why do you think it has taken this long for the contradiction among rural definitions to come to a head?

Answer. Although there are differing statutory requirements for many Rural Development programs, the rural definition for ReConnect has been constant since the beginning of the program. USDA ensures that the statutorily required rural definition is clearly defined in the ReConnect regulation and all of our outreach activities.

Question 4a. Why, if we know it's leaving behind our rural communities like the ones I represent, has USDA not administratively changed the way these rural definitions impact programs as important as ReConnect?

Answer. USDA respects the role of Congress in defining rural. We cannot change statutory requirements and look forward to any discussions that Congress would like to have with USDA to further develop this definition.

Question b. Do you need Congressional action to make this fix?

Answer. Congress has defined rural in each farm bill for each Rural Development Program. As rural area is defined in statute, Congressional action would be necessary to change the definition.

Question Submitted by Hon. Troy Balderson, a Representative in Congress from Ohio

Question 1. Under Secretary Torres Small, I am concerned that without using the FCC's maps, a significant amount of ReConnect funding could go to areas that are already considered served, or even to areas that will be funded by the FCC's RDOF program or the NTIA's BEAD Program. Can you tell me, specifically, how USDA is going to prevent duplication and overbuilding in ReConnect 4 when the program will not be using the same broadband maps as BEAD or RDOF?

Answer. We share your concerns regarding Federal funds and understand the responsibility of being good stewards of taxpayer dollars. USDA collaborates closely with our Federal partners, such as the Federal Communications Commission (FCC), the Department of Commerce's National Telecommunications Information Administration (NTIA) and Economic Development Administration, and the Department of [the] Treasury (Treasury), to coordinate Federal broadband funding efforts. On June 25, 2021, USDA, FCC, and NTIA, signed an interagency agreement to share information and coordinate on the distribution of Federal broadband funds USDA shares data with the NTIA to inform their National Broadband Availability Map (NBAM), which helps inform Federal funding decisions. NTIA built and updates NBAM with information provided by USDA, FCC, states, local governments, Tribal governments, owners and operators of broadband networks, educational institutions, nonprofits, and cooperatives. USDA is a co leader with NTIA on the American Broadband Initiative (ABI) Federal Funding Workstream group, which consists of more than 25

Federal agencies sharing strategies for increasing efficiency in government broadband programs.

Per our speed standards, USDA does not fund projects where there is sufficient access to broadband or in an area that has already received Federal financial assistance to fund sufficient access to broadband. As the FCC releases their Data Fabric, this fabric will also be used as part of the USDA's Service Area Validation process that is the final step in determining if broadband service is present in an area.

Question 2. Under Secretary Torres Small, as you know, a lot of precision agriculture technologies use a broadband connection. These technologies will require a strong wireless connection to be able to operate properly in the field. How are you working with the FCC and the NTIA to ensure that farmers will have access to robust wireless broadband that will allow for them to deploy state-of-the-art precision agriculture technologies?

Answer. USDA is an active participant in the FCC Precision Agriculture Task Force, provides expert consultation on precision agriculture, and follows the rapid development of precision agriculture and its broadband needs.

As wireless technologies continue to evolve USDA will work with our Federal partners to ensure sufficient bandwidth/frequencies are available for precision agriculture.

Question Submitted by Hon. Michael Cloud, a Representative in Congress from Texas

Question 1. Based on the ReConnect program's Evaluation Criteria, can you tell me off the top of your head what the average score—as determined by the program's evaluation criteria—has been for applicants who were awarded money from the program?

Answer. Each funding category is scored separately and does not compete against each other. For Round 3, the average score for 100% grants: 77.24; the average score for 50/50 combo: 70.5; the average score for 100% grant for Tribal government and SVC: 105.93.

Question 2. How did USDA go about assigning point values in ReConnect's Evaluation Criteria?

Answer. As all projects are different, we tried to balance the scoring criteria to be fair to all. We also took into account administrative directives to prioritize the hardest to serve areas in rural America.

Question 3. In the Evaluation Criteria, what were the recommendations provided to USDA on rurality being at least 100 miles from a community with a population of over 50,000? My hometown of Victoria has roughly 67,000 people, but some would argue that our county is rural and contains communities that lack access to service with speeds of 25/3 mbps.

Answer. Over the years, we have discovered that although rurality of an area is very important there is no perfect answer in addressing it. In order to connect the areas hardest to reach without government investment, USDA decided to establish two ways for a community to qualify as rural. First, communities can qualify if they are low density. Second, areas can qualify if they are somewhat more dense, but significantly removed from a larger population. This allowed us to serve distressed areas such as Alaskan/Tribal villages because they tend to be more dense in a small area of the village. With the two options, we believe we are reaching the most rural areas.

Question 4. In ReConnect's Evaluation Criteria, what was the reason for prioritizing local governments, nonprofits, and cooperatives over privately-owned, local utility providers? There are several of these providers in my district who have a long history of building reliable broadband networks, but they are at a disadvantage based on the Evaluation Criteria.

Answer. We are endeavoring to reach the hardest to serve places, connecting people where profit may not necessarily be a motivating factor. Historically the majority of ReConnect awards have gone to private companies and this was a way for USDA to encourage more participation on the part of nonprofits, county, state, and Tribal governments.

Response from B. Lynn Follansbee, J.D., Vice President Strategic Initiatives and Partnerships, USTelecom

Question Submitted by Hon. Eric A. "Rick" Crawford, a Representative in Congress from Arkansas

Question. I've heard from several companies that a lack of access to broadband has significant impacts on many aspects of their business. For example, Tyson Foods has a significant presence in my district, and as with many agribusinesses, has many facilities in primarily rural areas across the country. Those facilities are

not immune from poor internet and often face challenges with tasks as simple as operating scanners, querying databases, and joining Zoom calls. This impacts productivity, can cause delays, and generally makes doing business in these rural areas more difficult. Could you speak to the challenges businesses face with poor access to broadband in rural areas, and the effect these hurdles can have on the broader community?

Answer. In this day and age all businesses, including farmers rely on internet connected devices to run their businesses. Whether it is for traditional purposes such as inventory, shipping, accounting, employee communication or precision agriculture applications, it is nearly impossible to run a business large or small without internet connectivity. In an increasingly digital economy even the most rural business can compete nationally and globally, but only when they are connected with the highest broadband speeds. Instead of measuring the effectiveness of broadband grant programs only by the total number of locations served, a component of success must also be connecting the unconnected in order to ensure even the most remote communities are served.

Response from Hon. Tarryl Clark, Commissioner, First District, Stearns County, Minnesota; Chair, Telecommunications and Technology Policy Steering Committee, National Association of Counties

Question Submitted by Hon. Eric A. "Rick" Crawford, a Representative in Congress from Arkansas

Question. I've heard from several companies that a lack of access to broadband has significant impacts on many aspects of their business. For example, Tyson Foods has a significant presence in my district, and as with many agribusinesses, has many facilities in primarily rural areas across the country. Those facilities are not immune from poor internet and often face challenges with tasks as simple as operating scanners, querying databases, and joining Zoom calls. This impacts productivity, can cause delays, and generally makes doing business in these rural areas more difficult. Could you speak to the challenges businesses face with poor access to broadband in rural areas, and the effect these hurdles can have on the broader community?

Answer. The effect of a lack of connectivity in our rural communities has a distinct impact on the ability for businesses to thrive. As our economy continues to digitize and internet access is a necessity for competition, rural businesses continue to fall behind as high-speed internet infrastructure fails to reach our most unserved communities. This ongoing dilemma has led to a "brain-drain" in many of our rural communities, as businesses and human capital are incentivized to relocate to areas with better access to high-speed internet infrastructure to promote business growth. There has become an overwhelming need for rural communities to be equally treated with a level of service that will allow for businesses to actively participate in the digital economy without disruption. This necessitates a high standard of network performance for both wireline and wireless connectivity—as oftentimes, for agribusiness in particular, connectivity in the home is equally as important as connectivity in the field.

Response from J. Garrett Hawkins, President, Missouri Farm Bureau; on Behalf of American Farm Bureau Federation

Question Submitted by Hon. Eric A. "Rick" Crawford, a Representative in Congress from Arkansas

Question. I've heard from several companies that a lack of access to broadband has significant impacts on many aspects of their business. For example, Tyson Foods has a significant presence in my district, and as with many agribusinesses, has many facilities in primarily rural areas across the country. Those facilities are not immune from poor internet and often face challenges with tasks as simple as operating scanners, querying databases, and joining Zoom calls. This impacts productivity, can cause delays, and generally makes doing business in these rural areas more difficult. Could you speak to the challenges businesses face with poor access to broadband in rural areas, and the effect these hurdles can have on the broader community?

Answer. Broadband is important to our farms and businesses in many ways. Farmers and ranchers rely on broadband access to manage and operate successful businesses, the same as small businesses do in urban and suburban America. Access to broadband is essential for farmers and ranchers to follow commodity markets, communicate with their customers, gain access to new markets around the world and, increasingly, for regulatory compliance. Additionally, some small business accounting programs require us to download the latest tax data to do payroll and pre-

pare our taxes. We use broadband to place orders for inputs and often, if a connection is available, can check availability and pricing in real time. We would not be in business without access to broadband, and we cannot compete with businesses in more urban areas if we don't have connectivity.

One family I know operates a soil testing lab with customers worldwide. Until recently, they struggled to find affordable, reliable broadband service. They were paying hundreds of dollars a month for sub-par broadband to barely run their business. However, with the advancements and investments that have been made over the past few years, they are now able to access reliable service at their farm and at their lab, making it easier to conduct their global business.

Other families I know use online marketing tools to market their products throughout the country. Farms and agribusinesses utilize broadband every day to make their business model a success. Whether it is a business that provides an agricultural service to a local community or a company that ships products all over the country, this service is critical to our everyday life.

**A 2022 REVIEW OF THE FARM BILL
(STAKEHOLDER PERSPECTIVES ON TITLE II CONSERVATION
PROGRAMS)**

TUESDAY, SEPTEMBER 20, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON CONSERVATION AND FORESTRY,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 10:04 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Abigail Davis Spanberger [Chair of the Subcommittee] presiding.

Members present: Spanberger, Pingree, Kuster, O'Halleran, Pannetta, Schrier, LaMalfa, Allen, Johnson, Moore, and Thompson (*ex officio*).

Staff present: Paul Babbitt, Lyron Blum-Evitts, Kelcy Schaunaman, John Konya, John Busovsky, Ricki Schroeder, Patricia Straughn, and Dana Sandman.

**OPENING STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER,
A REPRESENTATIVE IN CONGRESS FROM VIRGINIA**

The CHAIR. This hearing of the Subcommittee on Conservation and Forestry entitled, *A 2022 Review of the Farm Bill: Stakeholder Perspectives on Title II Conservation Programs*, will come to order. Welcome, and thank you for joining today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open for questions. In consultation with the Ranking Member and pursuant to Rule XI(e), I want to make Members of the Subcommittee aware that other Members of the full Committee may join us today.

Good morning and thank you so much for being at this hearing. I am excited for today's hearing, emphasizing stakeholder perspectives on farm bill conservation programs. American farmers and producers have a long history of being among the best stewards of our land, and promoting conservation practices as a way of protecting our environment for generations to come. Ensuring that they have the tools they need to best take care of the land for today and for future generations is critical to the policy decisions that we make in this Committee. And I hope that we can use today's conversation as an opportunity to listen and learn from our producers and growers about what they need as we head into drafting the 2023 Farm Bill.

As part of today's hearing, we will hear how our conservation programs are currently working for producers, how investments in

conservation programs are addressing our resource needs, and how these programs can be utilized to help address the climate crisis. I am pleased that we are hearing from producers, conservation professionals, and advocates who understand today's evolving challenges from water scarcity to increased input costs in raising everything from cattle to wheat. I appreciate that today's witnesses have taken the time away from their important work to discuss the current state of farm bill conservation programs so that we can make informed policy decisions that will make the programs easier for producers to use to address their resource concerns while also providing environmental, social, climate, and overall economic benefits. I am eager to hear from our witnesses.

[The prepared statement of Ms. Spanberger follows:]

PREPARED STATEMENT OF HON. ABIGAIL DAVIS SPANBERGER, A REPRESENTATIVE IN
CONGRESS FROM VIRGINIA

Good morning, and welcome to today's hearing. I am excited for today's hearing emphasizing stakeholder perspectives on farm bill conservation programs. American farmers and producers have a long history of being among the best stewards of our land and promoting conservation practices as a way of protecting our environment for generations to come. Ensuring that they have the tools they need to best take care of the land, for today and for future generations, is critical to the policy decisions that we make in this Committee. I hope that we can use today's conversation as an opportunity to listen and learn from our producers and growers about what they need as we head into the drafting of the 2023 Farm Bill.

As a part of today's hearing, we will hear how our conservation programs are currently working for producers, how investments in conservation programs are addressing our resource needs, and how these programs can be utilized to help address the climate crisis.

I am pleased that we are hearing from producers, conservation professionals, and advocates who understand today's evolving challenges—from water scarcity to increased input costs—in raising everything from cattle to wheat. I appreciate that today's witnesses have taken the time away from their important work to discuss the current state of farm bill conservation programs—so that we can make informed policy decisions that will make the programs easier for producers to use to address their resource concerns while also providing environmental, social, and climate benefits.

I am eager to hear more from our witnesses.

The CHAIR. I would now like to welcome the distinguished Ranking Member, the gentleman from California, Mr. LaMalfa, for any opening remarks he would like to give.

**OPENING STATEMENT OF HON. DOUG LAMALFA, A
REPRESENTATIVE IN CONGRESS FROM CALIFORNIA**

Mr. LAMALFA. Thank you, Madam Chair, I appreciate it.

I am glad we got a chance one more time to discuss the 2018 Farm Bill Conservation Title. The Title II programs are voluntary and incentive-based, providing direct benefits to producers, their operations, and the land itself. The delivery of the farm bill's conservation programs is a proven model that we know works and will continue to be important for the long-term success of our farmers, ranchers, growers, and the rural areas nationwide.

Since the 1985 Farm Bill, conservation programs have continued to evolve to better support American agriculture with some of those significant reforms in just the past two reauthorizations. This includes program consolidation and streamlining, which have improved the delivery of conservation programs by making them simpler and easier for the producers to navigate.

The Committee has worked hard to keep these programs producer-first while protecting mandatory funding for essential programs. As this Committee begins crafting the next Conservation Title, I am hopeful we can build on these reforms and maintain the emphasis in support for working lands, programs, and farm infrastructure.

Since the beginning of this Congress, there has been a lot of attention placed on environmental regulations, soil health, and ways that farm conservation programs can help sequester more carbon. Through a variety of recent actions, significant new funding for so-called climate-smart activities and several main farm bill conservation programs has been made available or will be soon.

Specifically, this includes a \$3.5 billion Climate-Smart Practices Pilot Program USDA is currently administering. This funding is being released unilaterally and comes with no mandate, direction, or authorization from Congress on how to actually distribute it. In addition, this new funding comes on top of the most recent reconciliation package passed last month, which provided roughly \$20 billion for four conservation programs.

So since it is not clear how this new funding will be obligated or specifically utilized by the Department, this Committee must conduct oversight as USDA administers an enormous amount of taxpayer dollars, especially with a new farm bill on the horizon. In light of this, the House Agriculture Committee must be mindful of this massive amount of funding before amending programs and making policy changes that reorient conservation programs more towards climate mitigation.

Make no mistake, USDA conservation programs do provide numerous environmental benefits, including for soil health. However, no one natural resource concern should be prioritized over others, considering all the benefits and good work these programs presently support. Instead, Congress can't lose focus. It must maintain our support for the long-held promises of Title II programs to meet our broad environmental and conservation goals and the needs of the producers.

I would like to thank all of our witnesses for participating today. We look forward to the testimonies and a thorough conversation on Title II. Madam Chair, I yield back. Thank you.

The CHAIR. I now recognize Ranking Member Thompson of the full Committee for any opening comments he would like to make.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Madam Chair, Ranking Member, thank you both for holding this hearing. This is the work this Committee should be doing as we prepare for the next farm bill. I am excited to hear from stakeholders about what is working and what isn't and to hear more about what direction the title should take.

Now, I have been a longtime supporter of our farm bill conservation programs. I was honored to serve as Chairman of this Subcommittee during the 2014 Farm Bill process. And we can all be proud of the bipartisan work we did in this title in both 2014 and 2018. But I have to tell you, folks, the way the Majority and this Administration have gone on an unprecedented spending spree

with little to no input from Republicans and stakeholders have led to a situation where I think could endanger the bipartisan support of this title. And just the last month, Democrats have spent nearly \$20 billion on conservation programs, and then the Biden Administration has doubled down and spent \$3.5 billion from the CCC on projects to make our food system align with corporate climate agendas.

These actions are not good for the long-term viability of these programs. I hope that in the next Congress we can truly evaluate the funding needs for these programs, paired with an evaluation of the ability to effectively and judiciously deliver these funds to farmers. After making this evaluation, we can talk about what the real needs are for the title.

Now, I don't feel bound by the amount of funding or to the specific program allocation passed in the partisan Inflation Reduction Act (Pub. L. 117-169). I especially am worried about the earmarking of all the new money just for climate rather than letting the locally-led process work.

Let me talk about some of my goals for the title. First, the producer should be at the center of any discussion. We want the Conservation Title to work for the producer and help not only provide environmental outcomes, but also good economic sense. We should also ensure that these programs are easy for producers to understand and access. We should look at ways to streamline and simplify our conservation programs. We should improve upon those aspects in CSP and RCPP, but the Conservation Reserve Program should be a part of that discussion.

Second, I will not prioritize climate over every other natural resource concern, period.

Third, I would like to see innovative solutions, whether that is emphasizing technology such as precision agriculture like we have done in the PRECISE Act (H.R. 2518, Producing Responsible Energy and Conservation Incentives and Solutions for the Environment Act), or Mr. Davis's NO EMITS Act (H.R. 2508, Naturally Offsetting Emissions by Managing and Implementing Tillage Strategies Act of 2021) or my own SUSTAINS Act (H.R. 2606, Sponsoring USDA Sustainability Targets in Agriculture to Incentivize Natural Solutions Act of 2021). We as a party will be the party of solutions.

Fourth, we should emphasize working lands. Republicans have emphasized working lands programs for the last 2 decades, even before it became popular in the conservation community. EQIP has been the workhorse and most popular of all programs, and we should be judicious in any changes we make to EQIP.

Fifth, we should look at ways to improve our conservation delivery system. The Technical Service Provider Program is broken, and we should look at ways to improve that program to ensure that we have enough technical capacity on the ground or, quite frankly, in the fields.

Sixth, we should ensure private working forest lands are a part of our Conservation Title. And I will look for innovative ways to include working forests into these programs.

In closing, I look forward to hearing from our witnesses. We have a great panel of witnesses today, and I look forward to continued

oversight of these programs to evaluate how these programs can continue to provide the conservation benefits it has for decades and hopefully can do that in a bipartisan way. I believe we can and I look forward to that instead of what has happened over the last 2 years.

And with that, Madam Chair, thank you, and I yield back.

The CHAIR. Thank you very much, the Ranking Member of the full Committee, and thank you for always coming to our hearings, participating, and continuing to be so focused on this title and the programs that are a part of it.

I am pleased to welcome our witnesses to the Subcommittee on Conservation and Forestry of the full Agriculture Committee today. Our first witness today is Mr. Michael Crowder, who is the President of the National Association of Conservation Districts.

Our next witness is Ms. Nicole Berg, who is the President of the National Association of Wheat Growers.

Our third witness is Ms. Lori Faeth, who is the Senior Director of Government Relations at the Land Trust Alliance.

And our fourth and final witness today is Mr. Shayne Wiese, a rancher from Iowa, and he is testifying today on behalf of the Iowa Cattlemen's Association and the National Cattlemen's Beef Association.

Thank you all for joining us today. You will each have 5 minutes to deliver your testimony. There is a timer that should be visible in front of you, and it will count down to zero, at which point your time has expired.

Mr. Crowder, please begin when you are ready.

STATEMENT OF MICHAEL CROWDER, PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS, WASHINGTON, D.C.

Mr. CROWDER. Thank you, Chair Spanberger, Ranking Member LaMalfa, Ranking Member Thompson. Thank you for the opportunity to join you today to discuss farm bill conservation programs. My name is Michael Crowder, and I serve as President of the National Association of Conservation Districts.

NACD represents America's 3,000 conservation districts across the nation and the 17,000 men and women who serve on their governing boards. Conservation districts are local units of government that coordinate with many partners at all levels to help millions of cooperating landowners and operators implement conservation practices. Producers are on the frontlines of maintaining global food security and protecting our country's natural resources. Conservation districts play a critical role in achieving these goals by providing producers with the resources and assistance they need to implement effective conservation practices and enhance their operations.

If there is just one message I want you to take away from my testimony today it is that voluntary, locally-led incentive-based conservation works. USDA conservation programs have helped producers and private landowners across the country reduce soil erosion, enhance water quality, air quality, reduce carbon emissions, and so much more on millions of acres. These benefits extend well

beyond the farm and have improved the environmental health of entire communities and regions.

Earlier this year, NACD established a Farm Bill Task Force, for which I chair, to assess conservation programs and to help Congress with development of the upcoming farm bill. Like NACD, our task force represents a wide range of agricultural operations, social demographics, and regions from across our country. The task force has held nearly a dozen meetings, during which members have shared their perspectives on administration of conservation programs and suggestions to improve them. The task force has also developed NACD's farm bill principles to guide the development of our policy recommendations and have submitted these 11 principles as part of my testimony today.

Throughout our meetings, members frequently express the need to support locally determined priorities. Our country's vast private lands differ greatly in respect to natural resources, production systems, and environmental conditions. This diversity requires strong, knowledgeable local leadership and the ability to adapt conservation programs to best fit producers' operations. We believe providing maximum flexibility to enable locally-led approach and limiting nationwide carve-outs will best facilitate the success of conservation programs in all parts of the country.

The task force has also raised concerns with one-size-fits-all policies. EQIP allows producers to select between more than 160 eligible conservation practices. This allows Midwest row crop farmers to implement cover crops or no-till, while Louisiana or California rice farmers can adopt practices to increase irrigation efficiencies. To be successful, producers need access to a comprehensive suite of conservation systems and practices.

Members of the task force also expressed a desire for Congress to examine conservation practice payments rates. With rising costs of labor and inputs, we need to ensure that producers are compensated fairly and that the payment rates reflect the real-time cost of implementing practices.

We also identified a need to simplify conservation programs and make their application process as simple and as clear as possible. NACD has heard from stakeholders across the country that navigating the CSP and RCPP programs can be complicated and cumbersome from both a producer standpoint and from administrative perspectives.

I would be remiss if I didn't mention conservation technical assistance. CTA is the bedrock of our conservation delivery system. The successful administration of these critical USDA conservation programs relies on effective conservation planning, a strong conservation workforce, and other resources that are supported by conservation technical assistance. As this Committee works to develop the 2023 Farm Bill, NACD looks forward to working on a bipartisan basis to support and strengthen these programs.

Thank you for the opportunity to testify this morning, and I very much look forward to your questions. Thank you.

[The prepared statement of Mr. Crowder follows:]

PREPARED STATEMENT OF MICHAEL CROWDER, PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS, WASHINGTON, D.C.

Introduction

Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee—thank you for the opportunity to join you today to discuss farm bill conservation programs.

My name is Michael Crowder and I serve as the President of the National Association of Conservation Districts (NACD). I have been the General Manager of the Barker Ranch in Eastern Washington State for 22 years and graduated from Purdue University with a master's degree in wildlife science and a bachelor's degree in natural resources and environmental science. Since 2002, I have been a partner of my third-generation family farm in Indiana, as well as an owner of farmland and conservation easements in Illinois.

I have spent my entire career working on conservation, agriculture, and wildlife science issues. On the Barker Ranch, we work closely with the Natural Resources Conservation Service (NRCS) on wetland conservation easements and wildlife habitat, as well as other practices such as prescriptive grazing, riparian fencing, and irrigation water management. I also served as an Adjunct Professor at Washington State University Tri-Cities for 8 years and taught classes in wildlife science, ecology, and wetland restoration at both graduate and undergraduate levels.

National Association of Conservation Districts

NACD represents America's 3,000 conservation districts, their respective state and territory associations, and the 17,000 men and women who serve on their governing boards. Conservation districts are local units of government established under state law to help administer natural resource management programs and are the essential local component of our country's conservation delivery system. Districts work closely with Federal and state conservation agencies to help millions of cooperating landowners and agriculture producers protect land and water resources across the United States. NACD's mission is to promote voluntary, locally adapted conservation efforts and the responsible management of natural resources on all lands by supporting locally led conservation districts and their associations through grassroots advocacy, education, and partnerships. Working in close coordination with our national partners at NRCS, the National Association of State Conservation Agencies (NASCA), the National Conservation District Employees Association (NCDEA), and the National Association of Resource Conservation and Development Councils (NARC&DC), we strive to empower and equip local conservation districts to be the leader and voice for conservation within their communities.

If there was one message I would want you to take away from my testimony today, it is that voluntary, locally led, incentive-based conservation works. USDA's working lands conservation programs have helped producers and private landowners across the country reduce soil erosion, enhance water and air quality, restore and protect land and wildlife habitats, reduce carbon emissions, and conserve water on millions of acres. These benefits extend well beyond the lands on which conservation practices are applied, and have improved the environmental health of entire communities and regions. Private landowners have taken advantage of the many different forms of assistance offered by these programs—including cost-share, land rental, incentive payments, and conservation technical assistance—to adopt and maintain effective conservation practices.

It is also important to recognize the demand for and availability of farm bill conservation programs. Currently, only about 1/3 of the applications producers submit for USDA working lands conservation programs are accepted and funded each year. That means approximately seven out of ten farmers who want to invest in the long-term health of their operations, maximize the efficiency of their inputs, increase profitability, and improve the environment in their communities are unfortunately turned away.

The recently passed Inflation Reduction Act (IRA) provides historic investments in these oversubscribed, voluntary, and incentive-based conservation programs. Although I do wish this funding could have been provided on a bipartisan basis, NACD looks forward to working with both sides of the aisle throughout the development of the 2023 Farm Bill to ensure that this funding is allocated appropriately and has a positive, long-term effect on conservation. The IRA currently provides substantial funding for USDA conservation programs over the next 4 years, which may pose administrative challenges for USDA and their partners. The 2023 Farm Bill provides Congress with an important opportunity to spread these conservation investments over a longer period of time, and to consider innovative ways to improve and modernize our conservation delivery system.

Conservation Technical Assistance

Conservation technical assistance (CTA) is a bedrock of our conservation delivery system. While funding for NRCS programs is critical to helping producers implement effective conservation practices on working lands across the country, the successful administration of these programs relies on effective conservation planning, a strong conservation workforce, and other resources that are supported by CTA. In order to transform the historic IRA conservation investments into meaningful, on-the-ground conservation, CTA must now play an even larger role. It was critical that the IRA included \$1 billion for CTA to provide these important resources. Trained technical staff will also be critical to providing sound planning, guided decision-making, and support for the design and implementation of conservation systems and practices at the field level. These technical staff play an enormous role in helping landowners implement targeted practices to achieve meaningful, on-the-ground results.

While NRCS requires strong staffing capacity to administer conservation programs, we also believe that Federal technical assistance funding can leverage state and conservation district resources to extend the reach of trained personnel with local expertise in agricultural operations and natural resource conservation. The 17,000 local conservation district supervisors across the country play a critical role in connecting landowners to Federal conservation programs and providing technical assistance to guide program administration, facilitate conservation planning, and help producers implement the most effective practices. There are also additional conservation partners that can be leveraged to ensure that producers are provided with the technical support they need in all areas of the country.

Farm Bill Task Force

Earlier this year, NACD began its 2023 Farm Bill policy development process by establishing a Farm Bill Task Force. I am proud to serve as the Chair of this task force. Like NACD, the Farm Bill Task Force consists of members representing a wide range of agricultural operations, social demographics, and regions from across our country. The diversity of the Task Force will help to ensure a comprehensive review of Federal conservation programs and facilitate thoughtful consideration of policy changes to strengthen their administration. Overall, our mission is to help craft a 2023 Farm Bill that supports locally led conservation and supports producers in voluntarily implementing the best conservation practices on their lands.

In April, NACD's Farm Bill Task Force published a set of broad policy principles to guide the development of our farm bill policy recommendations. These principles are attached as part of my written testimony. Several of these principles are fundamental to NACD's mission. For example, our first principle; "The Locally Led, Voluntary Incentive-Based Conservation Model Works," reflects one of NACD's core beliefs. The task force also felt very strongly about including a principle focused on supporting diversity, equity, and inclusion in the upcoming farm bill. This principle reinforces our belief that farm bill conservation programs should be available to and accessible by people from all backgrounds and areas of our country. As producers continue to experience significant disruptions caused by market conditions, international conflict, and climate change, the Farm Bill Task Force also felt it was important to include a principle stating that agricultural operations need to be economically viable for our conservation model to be successful. With rising uncertainty, we also need to ensure that producers are provided a proper safety net.

NACD maintains a longstanding commitment to mitigate the serious threats posed by climate change and recognizes that conservation districts will continue to play a critical role in advancing solutions. Last year, NACD established a Climate Action Task Force to identify and support policies to expand the adoption of conservation practices that bolster resilience, reduce carbon emissions, and improve the health of ecosystems across the country. The task force found that providing additional support for conservation planning and technical capacity is critical to helping districts and landowners implement these conservation practices. To further support this goal, our Farm Bill Task Force adopted a principle supporting a 2023 Farm Bill that ensures farmers, ranchers, and forest owners are provided with the resources they need to implement and maintain practices that mitigate the impacts of climate change.

These principles also support an increase in conservation funding, a commitment to the working lands conservation programs, working to address climate change, effective education of and outreach to producers, and addressing administrative barriers in farm bill conservation program application processes, among other priorities. The Farm Bill Task Force has held nearly a dozen meetings, during which members have shared their perspectives on the administration and effectiveness of USDA conservation programs. Although the task force has not yet released final

2023 Farm Bill policy recommendations, I am happy to share some of the sentiments and suggestions that have been raised during our meetings, and outline some of NACD's existing policy positions. However, I will note that the perspectives I provide today do not represent the final, official positions of NACD's Farm Bill Task Force. NACD looks forward to providing comprehensive 2023 Farm Bill policy suggestions in the coming months.

2023 Farm Bill Policy

Throughout our Farm Bill Task Force discussions, members often expressed that specific carve-outs and limitations of practices within USDA conservation programs pose challenges for locally led conservation efforts. From Maine to Hawaii, and Alaska to Puerto Rico, America's vast private lands differ greatly in respects to their natural resources, production systems, and environmental conditions. This diversity requires strong local leadership and the ability to adapt conservation programs to best fit producers' farms, ranches, or forestlands. Providing maximum flexibility to enable a locally led approach and limiting nationwide carve-outs will best facilitate the success of Federal conservation programs in all parts of the country.

The task force also raised concerns with "one-size-fits-all" policies within Federal conservation programs. The Environmental Quality Incentives Program (EQIP) allows producers to select between more than 150 eligible conservation practices. This allows Midwest row crop farmers to implement cover crops or no-till, while Louisiana rice farmers can adopt practices to increase irrigation efficiency. We need producers to have access to a comprehensive suite of conservation systems and practices that can facilitate incremental improvements across distinct operations and environments.

Members of the task force also expressed a desire for Congress to examine conservation practice payment rates, and the methodology NRCS uses to determine rates across all programs. With rising prices, we need to ensure that producers are compensated fairly and that payment rates reflect the real-time costs of implementing practices over the course of multi-year contracts. This is particularly important to consider in the context of supporting beginning and socially disadvantaged farmers.

Below, I have provided additional perspectives that reflect NACD's existing policy and some of the Farm Bill Task Force's preliminary suggestions regarding specific USDA conservation programs. Again, it is important to note that these views do not represent NACD's final 2023 Farm Bill policy recommendations.

Environmental Quality Incentives Program

The Environmental Quality Incentives Program (EQIP) is currently the most popular and locally adaptable working lands program in NRCS' conservation toolbox. Considering its importance, NACD encourages this Committee to carefully consider any proposed changes to the program. We firmly believe that EQIP's success can be largely attributed to the program allowing local work groups and state technical committees to prioritize local natural resource concerns and identify the most effective practices to address them. Carve-outs within EQIP—even those targeting important conservation concerns and other issues—often make the program less flexible for producers in different parts of the country. While these carve-outs do help to address important resource concerns and can produce positive results, they often produce the unintended consequence of eroding the local decision-making process led by conservation districts. NACD strongly believes that local input and expertise must inform the prioritization of resource concerns within EQIP, as opposed to mandating nationwide priorities and requirements.

In the 2018 Farm Bill, Congress authorized Conservation Incentive Contracts (CIC) within EQIP, which have great potential to expand the adoption of effective climate-smart and drought resilience practices. While this new subprogram has only been fully available to producers this year, NACD believes that Congress should provide more direction for the program in the upcoming farm bill. Overall, we believe that the simplicity and on-farm scalability of the CIC program, paired with its longer-term contracts, provide great opportunities to help producers implement meaningful conservation practices.

Conservation Reserve Program

The Conservation Reserve Program (CRP) has been an essential tool in USDA's conservation tool belt for decades. Now, 37 years after the program was established, we believe Congress should evaluate its role to ensure that the program properly fits into a modern-day conservation title. Following recent economic challenges and disruptions to international food production, Congressional leaders have raised valid points regarding the inclusion of prime farmland in the program. While NACD does not support removing existing CRP acres, we must ensure that the focus of the pro-

gram continues to be enrolling only the most environmentally sensitive land and buffers that facilitate continued agriculture production on adjacent farmland.

NACD also believes that the program should expand producers' ability to utilize haying and grazing, and that emergency haying and grazing should be evaluated to ensure that it meets producers' critical forage needs in a timely manner, and without harming resources. We also need to ensure that the program is as locally led as possible, and that the enrollment supports producers' overarching conservation systems. CRP has been administered at the national level since the inception of the program and has provided a growing number of nationally defined administrative and statutory options for producers. Looking forward to the 2023 Farm Bill, we need to ensure that CRP provides adequate support for each state's unique needs.

Conservation Stewardship Program

NACD is a strong advocate for the Conservation Stewardship Program (CSP) and has longstanding policy supporting the program. CSP plays a critical role in maintaining and improving existing conservation systems by encouraging producers who have already adopted conservation on their lands to implement additional conservation practices that complement existing efforts and improve the efficiency of their operations as a whole.

However, our members have heard from administrators, partners, and producers across the country that the program can be extremely complicated and cumbersome from both a producer standpoint and from an administrative perspective. While the program has many positive qualities—including rewarding early adopters with payments and eligibility—producers have also expressed that the effectiveness of individual state and local offices plays an outsized role in facilitating a producer's participation in the program. Considering, it may be worthwhile for Congress to explore simplifying CSP's application process.

Regional Conservation Partnership Program

NACD and our Farm Bill Task Force members recognize the significant conservation benefits provided by the Regional Conservation Partnership Program (RCPP). When the RCPP was first proposed, stakeholders expressed concerns that projects could lack local involvement, and that some projects may not address the most appropriate local resource concerns. Today, a significant number of conservation districts are involved in RCPP projects as both sponsors and core partners with other organizations. The program's ability to leverage non-Federal resources, including staff and funding, has also increased conservation opportunities for our agricultural producers across the country. However, many partners have expressed that the program needs to be simplified and streamlined to reduce complexity and improve administration. One common critique of the program is that it takes too much time for accepted RCPP projects to break ground. NACD looks forward to working with partners and Congress to explore ways to expedite project implementation.

P.L. 83-566

NRCS' Watershed and Flood Prevention Program, commonly referred to as P.L. 83-566, authorizes local partners to plan and install watershed protection and improvement projects in watersheds across the country. The program has become an increasingly important tool in helping rural communities adapt to weather volatility, create climate resilience, and reduce risks posed by catastrophic weather events. The additional \$50 million in mandatory annual funding provided by the 2018 Farm Bill allowed NRCS and project sponsors to better plan and administer projects in many parts of the country. Conservation districts are an important partner in the administration of this program and have sponsored most of the P.L. 83-566 projects throughout the country. NACD supports the program and looks forward to working with partners to ensure that the P.L. 83-566 receives the funding and support it requires. As thousands of dams across the country reach or exceed their designed lifespans, it is also critical that we support NRCS' Watershed Rehabilitation Program in the 2023 Farm Bill.

Conclusion

The historic conservation funding included in the IRA has provided us with an unprecedented opportunity to strengthen agricultural operations, bolster resilience, reduce harmful emissions, and improve the quality of our water, land, and air. It is critical that we work on a bipartisan basis to develop a 2023 Farm Bill that supports strong and stable conservation policy, helps our producers, and protects the environment for all Americans. Farm bill conservation programs are critical to our nation's food security, biodiversity, and the sustainability of our farms, ranches, and

forests. This farm bill provides a once in a generation opportunity to strengthen conservation efforts on our working agricultural landscapes.

The historic funding in IRA also raises new administrative challenges. Overcoming these challenges will require close coordination between USDA, Congress, states, producers, and partners, including conservation districts. These new investments will also necessitate strengthening our Federal and local conservation workforces. As this Committee and Congress work to develop the 2023 Farm Bill, I would like to reemphasize that voluntary, locally led conservation works, and is the most viable way to support America's producers and protect our environment. NACD looks forward to working with Members of this Committee and all stakeholders to find ways to enhance the delivery of USDA conservation programs through the conservation title of the 2023 Farm Bill.

Again, thank you for the opportunity to testify today. I look forward to your questions.

ATTACHMENT

NACD Farm Bill Principles

Principle 1: The Locally-Led, Voluntary Incentive-Based Conservation Model Works

NACD strongly believes in the locally-led, voluntary, incentive-based model for addressing natural resource concerns; not a one-size-fits-all regulatory scheme. Farm bill conservation programs should be locally-led and resource-driven with sufficient flexibility to direct funding to local priorities and concerns. Program priorities, rules, and policies should be tailored and adapt to the natural resource needs of states and local areas. Local conservation district boards, local working groups, and state technical committees are essential to identifying local needs, maximizing conservation benefits, and setting priorities for program delivery.

Principle 2: Increase Conservation Title Funding in the Farm Bill

Farm bill conservation programs are key to addressing natural resource concerns like water quality and quantity, soil health, clean air, climate change, habitat protection, and more. Moreover, these locally-led, voluntary, incentive based programs increase the productivity of producers' operations and strengthen food security. Unfortunately, due to a lack of resources, these programs are unable to accept the vast majority of producers who apply to participate. Increased mandatory funding for the conservation title is critical to sustaining our nation's working lands and building a resilient food supply. NACD believes these proven, science-based programs need robust new funding.

Principle 3: Diversity, Equity, and Inclusion

Technical and financial assistance should be available to all agriculture producers, and barriers that prevent historically underserved producers from accessing these tools should be addressed. The farm bill should help historically underserved farmers, ranchers, and forest stewards access these resources by supporting effective program outreach, advanced payments, increased payment rates, regulatory and programmatic flexibilities, and other tools that incentivize and encourage participation. Outreach, program rules, and program policies for underserved communities should be prioritized and tailored to these communities.

Principle 4: Commitment to Working Lands

Landscapes across the nation vary in their resource concerns, and farm bill conservation programs must continue to meet the specialized needs of the agricultural producers who work these lands. Given that food security is directly tied to national security, programs must provide technical and financial assistance to implement or

maintain conservation practices on working lands that produce much needed food, fiber, forest products, and fuel while at the same time protecting our natural resources.

Principle 5: Technical Assistance and Conservation Planning are the Bedrock of the Conservation Model

Technical assistance and conservation planning are critical tools and the first steps in evaluating producers' resource needs. NRCS, with assistance from partners such as conservation districts, helps agricultural producers plan and apply conservation practices on the land. They develop conservation plans; plan, design, lay out, and install conservation practices; and inspect completed practices for certification. The farm bill must provide sufficient funding for technical assistance to deliver a full complement of science-based technical services to farm bill conservation program applicants and participants.

Principle 6: Agricultural Operations Need to be Economically Viable

In order for the locally-led, voluntary, incentive-based model to be successful, NACD believes agricultural operations need a strong safety net, robust marketing opportunities, and supportive farm policy. Without viable agricultural operations, districts will not be able to help install conservation practices on the ground. The farm bill must adapt to the agriculture production environment and work for each facet of the nation's diverse agriculture industry.

Principle 7: Climate Change

Climate change is threatening communities around the world and governments are prioritizing the development and implementation of policies to quickly address this serious issue. U.S. farmers, ranchers, and private forest landowners are on the frontlines of climate change. More frequent storms, longer droughts, larger wildfires, and more damaging floods pose serious threats to communities across the country, hurt producer's bottom lines, and threaten our food supply.

These producers, with the help of partners such as conservation districts, are uniquely positioned to be part of the solution and in many cases have already adopted conservation practices that promote resource sustainability, resiliency, carbon sequestration, and protect ecosystems. However, the vast majority of producers who step forward to implement these practices by applying to participate in voluntary USDA conservation programs are turned away because of insufficient resources. Congress should ensure that farmers, ranchers, and forest owners are provided with the resources they need to maintain and implement practices that mitigate the impacts of climate change.

Principle 8: Farm Bill Education and Outreach is Necessary

NACD believes conservation education is a necessary tool to drive more conservation adoption. If producers are not aware of the tools available to them, then the adoption of conservation practices will suffer. This is especially the case with beginning, socially disadvantaged, and limited resource farmers. NACD supports language within each Title II program directing technical assistance to advance local conservation adoption and outreach.

Principle 9: Streamline and Simplify Conservation Programs/Application Process to Reduce Administrative Burdens

Conservation programs and the application process should both be simple and easy to understand. Administrative burdens that disincentivize program participation and impair the timely adoption of conservation practices within the appropriate agriculture production cycle should be eliminated. Requirements that complicate the conservation delivery system, create lengthy approval processes, or take time away from NRCS staff, prevent producers with the greatest resource needs from applying for conservation programs.

Principle 10: Forestry

NACD supports a forestry title that addresses the unique complexities of forestry on nonindustrial, private forest land, and the effective management of Federal and state forest lands. NACD encourages an expansion of technical assistance and outreach to nonindustrial private forest owners, especially landowners not currently engaged in conservation or implementing a management plan on their lands. Land managers require support to ensure the full suite of management tools are available to improve the health and sustainability of our nation's forests and mitigate the threats posed by wildfires across the country. NACD also supports addressing issues identified by state forest resource assessments and state wildlife action plans, and supporting agroforestry through the farm bill.

Principle 11: New Approaches and New Technologies

Working lands conservation is not a static concept, but is constantly changing and adapting as new technologies are introduced and partnerships are formed. As such, the farm bill should reflect new developments in conservation, including those made in urban agriculture, drone technology, water conservation, and precision application.

The CHAIR. Thank you very much, Mr. Crowder.

Ms. Berg, please begin when you are ready. You have 5 minutes.

**STATEMENT OF NICOLE BERG, PRESIDENT, NATIONAL
ASSOCIATION OF WHEAT GROWERS, PATTERSON, WA**

Ms. BERG. Chair Spanberger and Ranking Member LaMalfa, thank you for the opportunity to testify today before the Subcommittee. I am Nicole Berg, a fourth-generation farmer from Paterson, Washington. I work in partnership with my father and my brothers, and we grow dryland irrigated winter wheat, blue grass seed, field corn, sweet corn, sweet peas, green beans, and alfalfa. I currently serve as President of the National Association of Wheat Growers, a federation of 20 state associations and other industry partners.

In my area in Washington, conservation is essential to our farming operation, living and farming in the driest area in the world that grows cereal grains. With only 6" of rainfall a year, conservation farming helps us maintain soil moisture and efficient use of natural resources. EQIP has helped us put in a fertilizer tank containment system and install irrigation water management equipment on our irrigated farmland. We utilize CRP on our dryland acres to create contours in the field, protecting the soils from wind erosion. In our dry, windy climate, we take multiple actions to protect the soil from erosion, including the use of no-till.

The 2018 Farm Bill maintained a strong commitment to voluntary, incentive-based conservation programs. The NRCS programs continue to be oversubscribed with less than ½ of all applicants receiving NRCS funding nationwide. Reviewing wheat growers' use of NRCS programs between 2018 and 2021, wheat farmers entered over 7,500 contracts. Over the same period, there were 5,000 valid applications from wheat growers that went unfunded.

There is continued demand and need for voluntary conservation programs in the farm bill, and we must make sure that the programs continue to be flexible and allow farmers to maintain economic viability in their farming operations.

The benefits of the farm bill conservation programs are significant in terms of the environmental benefits and the assistance to farmers. The technical assistance, planning and engineering, and financial assistance in the form of cost-share or incentives provide farmers with the knowledge and economic incentive to make a change in their operation or maintain a conservation practice. Some of the challenges for wheat growers in utilizing conservation programs are typically diversifying the crops grown, low rainfall, complexity of programs, and transparency of the program requirements.

Included in my written testimony is a list of concepts for the next farm bill, and I will highlight just a few. First, we would like to improve the flexibility of conservation programs and expand conservation opportunities to early adopters and conservation manage-

ment systems. Wheat is grown in almost every state in the U.S., but the crop rotations, climate, varieties of wheat, variety across each state, they vary differently. As you develop farm bill policy, please remember that one size does not fit all when it comes to conservation.

Second, clearly articulate program changes so farmers understand farm bill modifications and other administration changes. As policies are developed through the farm bill reauthorization process or even administration changes programs are implemented, these changes should be transparent and clearly articulated to farmers.

Third, recognize the diversity of cropping systems, benefits of crop rotations, and timing of planting. Over the past 2 years, USDA offered a Pandemic Cover Crop Program that provides a discount to crop insurance for planting cover crops. When this program was introduced, winter wheat producers were not eligible for the program because the cover crop had to be planted over the winter, the same time our wheat is in the ground.

Fourth, review cost-share rates and payment limits due to the rising cost of inputs. The cost of farming has increased, and it will continue to do so. While commodity prices have decreased recently, input costs remain high, with farmers facing higher costs in all areas of their operation, and the decision to adopt conservation practices can depend on the financial assistance the farm bill programs provide.

Fifth, expand training and mentoring and encourage retention of USDA field employees. The last few years have been difficult with the changes to the programs in the 2018 Farm Bill, some of which were substantial, maintaining through the COVID-19 and training new staff and the challenge of leadership in FSA offices.

In conclusion, Wheat Growers support continued access to voluntary incentive-based conservation programs in the farm bill. Wheat Growers, the environment, and society have benefited from these programs through improved water quality and quantity, air quality, soil health, and habitat. These would not be possible without the financial and technical assistance that the farm bill conservation programs provide.

Thank you again for the opportunity to testify.

[The prepared statement of Ms. Berg follows:]

PREPARED STATEMENT OF NICOLE BERG, PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS, PATTERSON, WA

Chair Spanberger and Ranking Member LaMalfa, thank you for the opportunity to testify today before the Conservation and Forestry Subcommittee of the House Agriculture Committee on behalf of the National Association of Wheat Growers (NAWG). I am Nicole Berg, President of the National Association of Wheat Growers and a fourth-generation farmer, working in partnership with my father and brothers on our family farm in Paterson, Washington. This year my nephews returned to the farm and are joining us in working on the family farm. On our operation, we grow dryland and irrigated winter wheat, blue grass seed, field corn, sweet corn, sweet peas, green beans, and alfalfa. I just recently ended my time on the Benton County conservation district, after over 10 years of serving on the board. In 2020, I was appointed to the Federal Crop Insurance Corporation Board of Directors, and I also serve on the Community First Bank Board of Directors.

NAWG is a federation of 20 state wheat grower associations and industry partners that work to represent the needs and interests of wheat producers before Congress and Federal agencies. Based in Washington, D.C., NAWG is grower governed and works in areas as diverse as Federal farm policy, environmental regulation, the

future commercialization of emerging technologies in wheat, and uniting the wheat industry around common goals. Our members feel it is important to provide testimony before the Conservation [and Forestry] Subcommittee of the House Agriculture Committee today as we reflect on the programs authorized under Title II of the Farm Bill. The conservation title of the farm bill plays an important role in establishing and funding voluntary, incentive-based conservation programs.

Conservation is essential to our farming operation. Living and farming in the driest area in the world that grows cereal grains—with only 6" of rainfall a year—conservation farming helps us maintain soil moisture and efficiently use our natural resources. Our farm used several different conservation programs over the years and while we see the benefits of participating in the programs, there are also challenges. The Environmental Quality Incentives Program (EQIP) helped us put in a containment fertilizer tank on the farm. This helps us protect the environment in case of any accidental spill which would be contained based on the design of the tank. The extra storage has also allowed us to manage through the high fertilizer prices and supply chain issues over the past 2 years. We also utilized the program to install irrigation water management equipment on our irrigated farmland. This new equipment allows us to have a more targeted water application and only use water where it is needed by managing water application in real time, mapping the soils and assessing the water needed. Prior to installation of this technology, we were only able to measure water capacity once a week. Real time water application assessment is, much more efficient, resulting in water savings. In my area of Washington State, we have hurricane to tropical storm force winds that blow across the farm, and we take multiple actions to protect our soil from erosion. We utilize the Conservation Reserve Program (CRP) on our dryland acres to create strip or contour farming with strips of CRP in the field, protecting the soils from wind erosion. We also practice no till farming on our dryland and irrigated operations.

Wheat Growers' Use of Conservation Programs.

The 2018 Farm Bill maintained the strong commitment to voluntary, incentive-based conservation programs. The [Environmental] Quality Incentives Program (EQIP), the Conservation Stewardship Program (CSP), the Conservation Reserve Program (CRP), and the Regional Conservation Partnership Program (RCP) have been utilized by wheat growers across the county. Reviewing wheat growers' use of the Natural Resources Conservation Service (NRCS) delivered programs over the last few years, we found that wheat growers predominantly use the EQIP and the CSP, with a few growers working through RCP projects. Between 2018 and 2021, wheat farmers entered over 7500 contracts with NRCS through these conservation programs. Looking at the use of these programs across all states, several of the top conservation practices wheat growers are adopting through the programs include cover crops, pest management, nutrient management, tillage management, terraces and grassed waterways. The flexibility and local decision making included in the farm bill conservation programs is vital to their success. The specific actions that individual wheat farmers take under those practices can vary across their specific operations. The way I manage my farm in Washington state, the crops in the rotation, the timing of planting, the weather conditions, the crop protection tools, and nutrient management strategies will vary from wheat farmers along the east coast in Virginia, or Texas or South Dakota.

Wheat farmers transitioned from traditional tillage to no-till by using CSP which provides support for growers to be able to purchase specialized drills for no till wheat planting. Growers can also transition to different spray nozzles to reduce spray drift during pesticide applications. Conservation programs aid in the transition to new technologies, GPS aided precision technology that allows us to be more efficient in our farming operations.

The EQIP continues to be popular with wheat growers by allowing growers to undertake specific conservation practices, develop management plans or utilize the new longer term incentive payments. EQIP has been the most flexible program, allowing growers to utilize one or multiple practices that make sense for their operation.

The CRP is an important option for growers in Washington State, but within our Association, can be controversial depending on the area of the country. Farmers do not want to compete with the Federal Government when renting land, and we must make sure that beginning farmers and ranchers have access to affordable land and CRP is often cited as competition for these new farmers. Focusing on enrolling environmentally sensitive, highly erodible land in CRP should allow for the protection of fragile lands at risk of erosion and allowing other lands to be farmed. The changes made in the 2018 Farm Bill lowered rental rates, capped cost-share for seed and eliminated financial assistance for mid contract management. Each of these

changes added costs to farmers to participate and with all these costs going up, the program is not getting the same interest from farmers it once did.

The benefits of the farm bill conservation programs are significant. The technical assistance, planning and engineering and financial assistance in the form of cost share or incentives, provide farmers with the knowledge and economic incentive to be able to make a change in their operation or maintain a conservation practice. Some conservation practices have an unknown impact on the farming operation or are too costly to undertake without financial assistance. The programs also provide substantial environmental benefits, helping to mitigate the impacts of climate change, providing healthier soil, clean air, clean water and improved habitat.

Some of the challenges for wheat growers in utilizing conservation programs is typically the diversity of the crops grown, low rainfall, complexity of programs and transparency of the program requirements (or changes from year to year). Growers are diversifying their farming operations and that diversity of crops and management systems can make implementing a conservation practice on an entire operation difficult. The low rainfall areas and dryland operations have limited options when participating in conservation programs. The diversity of small grains planted in northern regions and conservation crop rotations should be reviewed to make sure growers have continued access to conservation programs.

Many wheat farmers undertook the switch to no-till many years ago, investing in new equipment and managing their operations to protect the soil from wind and water erosion. Today, some of those same growers are seeing herbicide resistant weeds on their operation that could require different management strategies that may include tillage to eradicate the weeds. Growers must have continued access to a variety of herbicides and other crop protection tools to help maintain long term conservation practices.

Conservation programs also getting increasingly complex. The 2018 Farm Bill included significant changes to CRP and the changes to the program have not been transparent during the implementation. Additional outreach and education on the program changes and opportunities for growers is needed to aid in program enrollment. In addition to outreach for growers, we encourage USDA to ensure that Farm Service Agency (FSA) and NRCS have full understanding of the programs and any changes that are made to the program prior to sign-up. Some program changes are happening on an annual basis, making it difficult for both staff and growers to keep up with the changes.

The farm bill conservation programs continue to be popular, with less than ½ of all applications receiving NRCS funding. Wheat growers are no exception, with more wheat growers seeking assistance through the farm bill conservation programs than can be funded. Between Fiscal Years 2018 and 2021, there were 3,000 valid applications for EQIP by wheat growers that went unfunded. Over that same period there were over 2,000 valid applications for CSP by wheat growers that went unfunded. Additional applications through RCPP also went unfunded over those years. Clearly there is continued demand and need for voluntary conservation programs of the farm bill, but we must make sure that programs provide flexibility and allow growers to maintain economically viable farming operations.

Benefits of Growing Wheat

Wheat production across the United States is varied, from the climate, soil, rotations and most importantly the type of wheat and end-use markets for the wheat produced. As a crop that is primarily destined for the food supply the *quantity* and *quality* of the wheat we produce is equally important. The six classes of wheat have a variety of end-uses—whether it is pizza, pasta, bread, cakes, or crackers—each product has characteristics that rely on a different type of wheat and a different protein content in the wheat and flour. Some wheat—winter wheat—is planted in the fall and harvested in the following summer and some—spring wheat—is planted in the spring and harvested a few months later in the summer.

There are several benefits of growing wheat. Wheat improves soil quality, protects the soil from erosion and reduces weed pressure when added to a crop rotation. Winter wheat provides living plant cover over the winter months. The wheat straw residue left on the field provides a durable residue cover to protect the soil from wind and water erosion. In certain regions, winter wheat can be added to a corn-soy rotation adding a third crop over the 2 years and providing a living cover over winter and additional economic revenue from adding a wheat crop. Due to the war in Ukraine, USDA has been working in areas of the country to expand double cropping by increasing the flexibilities and applicability of crop insurance for double cropping counties.

Like many areas of U.S. agriculture, wheat growers are producing more with less. Over the last 100 years, wheat yields have increased 3½ times with about ⅔ the

acres in production. There is not a commercially available genetically modified wheat and we have not had the level of research and advancement in wheat research that other crops have experienced over the last 25 years. Wheat growers depend on different management strategies including diverse crop rotation, conservation practices, research and breeding including new hybrid wheat varieties, and crop protection tools. Technical assistance from Land-Grant University wheat research programs, extension programs, USDA and conservation district employees, and private agronomists are needed to make these systems work and allow growers to make ongoing improvements to their cropping systems.

Wheat growers value the long-term productivity of the soil and natural resources that sustain our farming operations. Climate-smart and regenerative agriculture cropping systems for wheat production must recognize the environmental and economic realities of individual farms, be regionally specific, provide for enhanced productivity or resource use efficiency and support the principles of soil health including minimizing soil disturbance, providing soil cover through crop residue, increasing diversity, maximizing the time with living roots and when applicable, incorporating livestock—all as appropriate for individual farms. We acknowledge that not all practices will work for all wheat growers and any policies must be flexible and recognize the uniqueness of each farming operation and the climate conditions and production systems of that operation.

As we look to develop new conservation, climate-smart, or regenerative agriculture policy and programs, these approaches must work in partnership with individual farms and help growers balance the economics with environmental and societal benefits by incentivizing new approaches and management systems. To foster long-term environmental benefits, farmers should also be incentivized to maintain and enhance these management practices over time. Regenerative agriculture systems on our operations means that wheat growers strive to:

- Maintain an economically viable and productive farming operation to pass to future generations.
- Maintain and build soil health.
- Enhance resource use efficiency.
- Utilize crop protection tools when necessary to treat weed, pest and disease infestations, combat weed resistance and manage conservation tillage systems.
- Provide societal benefits such as sequestering carbon, improving water quality, controlling soil erosion, and reducing overall inputs and energy use all while growing healthy, nutritious food

Preparing for the Next Farm Bill

Looking to the next farm bill, NAWG members are discussing recommended changes to the conservation programs. NAWG does not yet have specific policy recommendations finalized, but we are actively getting feedback and looking at policy options. Some of the elements of the programs that we have discussed so far are what might be considered the fundamental building blocks for the conservation title of the next farm bill:

- Maintain the voluntary, incentive-based conservation programs
- Improve the flexibility of the conservation programs
- Clearly articulate programmatic changes, so farmers understand farm bill modifications or other administrative changes
- Expand conservation opportunities for early adopters of conservation management systems
- Recognize the diversity in cropping systems, benefits of crop rotations and timing of planting
- Use the conservation title of the farm bill to deliver conservation assistance
- Avoid expansion of conservation compliance requirements
- Review cost-share rates and payment limits due to the rising cost of inputs
- Expand training and mentoring for USDA field employees
- Reliable access to crop protection tools is needed to maintain conservation systems

As outlined earlier in this testimony, wheat growers and other crop, livestock and forest landowners are seeking assistance through the voluntary conservation programs and there is a backlog of more growers seeking assistance than funding (and staff time) available. We recognize that the Inflation Reduction Act added a significant amount of funding to these programs and hopefully that backlog will be ad-

dressed, and we urge Congress to continue the commitment to voluntary, incentive-based conservation programs in the next farm bill.

Wheat is grown in most states in the U.S., but the crop rotations, climate and varieties of wheat vary greatly across the states. There are six different classes of wheat, with winter wheat making up the majority of the wheat grown in the U.S. For conservation programs to work well in each of these regions and states, they programs must provide a variety of options and be flexible to work within different types of farming operations. Dryland farming practices are lacking in conservation options because we have already adopted no till and several other practices. Conservation programs should be looking towards the next technology, innovation and practice to expand the conservation opportunities for early adopters of conservation management systems such as no till. Growers that adopted conservation tillage or no till several years ago are looking for the next option. As you develop farm bill policy, please remember that one size doesn't fit all when it comes to conservation (or even wheat production). Farmers need a variety of program and conservation practice options to allow them to find the conservation approach that makes economic and environmental sense for their operation.

As policies are developed through the farm bill reauthorization process, or even administrative changes to programs are implemented, those changes should be transparent and clearly articulated to growers. Explanations of programs and policy changes should be clear for growers to understand what elements have changed and why alterations were made. Some changes may impact a grower's eligibility, payment or cost share rates, or ranking during the application process. Helping growers understand the changes will ease any enrollment and manage expectations on all sides.

The conservation programs should be used to deliver conservation assistance and new requirements for conservation compliance, or additional conservation requirements on commodity programs should not be included in the farm bill. Voluntary incentive-based programs work the best for delivering and encouraging conservation practice adoptions and we urge Congress to maintain this system of conservation delivery.

The costs of farming are increasing. As farmers we are getting more efficient in producing a greater yield on fewer acres in production, but the costs of doing business are increasing. Land, equipment and repair costs, input supplies, fuel, seeds and labor costs are all increasing, as are our health insurance and other traditional business costs. Commodity prices have experienced unprecedented volatility in recent months. Winter wheat prices soared from \$7.32 in February to \$13.45 in mid-May, then crashing back down to \$8.19 in early July. This volatility has never been seen before and threatened the marketing infrastructure in place for farmers. While commodity prices have decreased, input costs have remained high. These high prices also carry over into the adoption of conservation practices. These high prices also carry over into the adoption of conservation practices. With farmers facing higher costs in all areas of their operations, the decision to adopt conservation practices can depend on the financial assistance that farm bill programs provide. The cost share rates of the conservation programs, where limited in the statute, should be reviewed and the payment limits in statute should also be reviewed. Several of these provisions have been in place for decades, through many Farm Bills and are not reflective of the costs of doing business on the farm. Growers are managing larger acreage to become more efficient and spread their operation costs over a greater acreage on the farm.

Conservation programs must provide options for growers of diverse cropping systems and be flexible to work within those systems. Farmers are diversifying their crop rotations and producing different crops for a variety of reasons, whether to meet market demands, keep their ground covered throughout the year or experiment with systems, but the policy set by the farm bill must be flexible enough to recognize these continued changes and USDA must have the ability to deliver the programs in a manner specific to each farming operation.

Cover crop programs must recognize the timing of planting of crops, including winter wheat. Over the past 2 years, USDA offered a pandemic cover crop program that provided a \$5 per acre discount on crop insurance for planting cover crops. When this program was introduced in 2021, winter wheat producers were not eligible for the program, because the cover crop had to be planted over winter—the same time that our wheat was in the ground, and cover crops that were planted at other times of the year were not eligible. Changes have been made to the program to recognize the different timing of cropping systems and that cover crops may be planted outside the winter timeframe.

The last few years have been difficult for most office employees and USDA field office staff are no different. However, with the changes to programs from the 2018

Farm Bill, some of which were substantial—managing through [COVID–19], training new staff and the change of leadership in FSA state offices—the pressures in many field offices have placed added stress on staff. USDA field office staff have traditionally been very customer service focused and working cooperatively with farmers, but we are now seeing employees that don't have the training and understanding of the programs and local farming operations. We encourage USDA to increase the training and mentoring of the new employees to maintain that strong working relationship with farmers.

In conclusion, wheat growers support continued access to the voluntary, incentive-based conservation programs of the farm bill. We have benefited from the programs through the implementation of new management systems, technology and approaches to more efficiently use natural resources and become more efficient in our operations. We also believe the environmental and natural resource benefits of the programs are significant, improving water quality and quantity, air quality, soil health and habitat. However, the programs are becoming more complex while wheat growers' operations are also becoming more diversified and may be facing new management challenges. Innovation in agriculture is also rapidly developing new options for producers and staff must continue to stay abreast of the changes in agriculture and conservation programs should adapt to these new options for growers. Staff training on programs and local cropping systems is needed to implement the flexibility established in the farm bill conservation programs. Wheat growers value the ability to work with USDA and the House Agriculture Committee on the development and implementation of these important programs and we look forward to the reauthorization of the farm bill.

The CHAIR. That was perfect timing, Ms. Berg.

Ms. BERG. I have good staff.

The CHAIR. Thank you so much for your testimony. And I now recognize Ms. Faeth for 5 minutes.

**STATEMENT OF LORI FAETH, SENIOR DIRECTOR OF
GOVERNMENT RELATIONS, LAND TRUST ALLIANCE,
WASHINGTON, D.C.**

Ms. FAETH. Great. Thank you, Chair Spanberger, Ranking Member LaMalfa, Members of the Subcommittee, and Ranking Member Thompson. It is an honor to testify on behalf of the Land Trust Alliance and our 950 member land trusts. We are the voice of voluntary private land conservation, unifying the American ideals premised on initiative, landowner empowerment, and individual private property rights. Our members work with willing landowners, including farmers, ranchers, and foresters to conserve their land. This not only allows landowners to fulfill their goals, it also boosts rural economies and ensures working lands remain in family hands.

Land trusts have a long history of partnering with the USDA to help landowners utilize farm bill conservation programs. This partnership is vital to ensuring that working lands continue to produce food and fiber, provide habitat, protect watersheds, and serve as part of the climate solution. Working agricultural and forest lands are central to our nation's productivity and food security.

Unfortunately, we are losing working lands at an alarming pace, which is why the farm bill conservation easement programs are so critical. While all the farm bill conservation programs are important, the easement programs, like the Agricultural Conservation Easement Program, are the only ones that offer voluntary incentives to ensure working lands are not converted to other uses in the future. The money generated from the easement enables the landowner to pay off debt and reinvest in their farm or ranch. In addition, it can often make it easier for the landowner to resist outside

development pressure and transfer the property to the next generation. Farm bill easement programs are a good investment and make a significant contribution to the economy.

The Alliance works through our Farm Bill Working Group to understand how farm bill programs are working and to develop recommendations for statutory and administrative changes. Our working group is comprised of more than 100 land trust practitioners from across the country, who utilize farm bill easement programs to help landowners conserve their lands. They bring firsthand experience to our recommendations.

The Alliance celebrated the passage of the 2018 Farm Bill, which increased funding for ACEP. We thank you for what was accomplished in that bill. And although you provided a substantial increase in funding, it is still not meeting the demand from willing landowners who want to conserve their working lands with an easement. We strongly support an increase in funding for the ACEP program in the 2023 Farm Bill to meet this demand.

Beyond much needed funding, the 2018 Farm Bill included important policy provisions to make the program more effective and efficient, such as flexibility with the match requirement and removing the onerous ALE Plan requirement. The Alliance urges Congress to retain these important provisions and to provide additional clarification of intent through report language.

In addition, we believe there is a need to make the certified entity application and enrollment process work more efficiently. This will leverage agency resources and provide a more efficient and streamlined path to conserving working lands. We further recommend recognizing certified entities across all NRCS easement programs.

ACEP is a crucial tool for conserving farms and ranches but does not address working forested lands. We recommend enhancing the Healthy Forest Reserve Program to establish a standalone forest conservation easement program that ensures private forest land remains intact and in production, allowing them to continue providing the numerous benefits to rural and urban communities. Conservation of our working forest lands is critical, and funding for forest conservation easements must be in addition to funding for ACEP.

The Land Trust Alliance supports the Regional Conservation Partnership Program. It is a key tool for land trust to help protect farm and ranch lands, grasslands, wetlands, and forested lands. We want to see consistency in how easements are implemented whether through ACEP or RCPP. There is concern from the land trust community about the time it takes to get an easement approved through that program. We believe that only one easement has been closed under RCPP in the 4 years since the last farm bill was signed. Our Farm Bill Working Group continues to meet and explore options on ways the administration of this program can be improved, and we hope to work with this Committee to ensure that goal.

While I focused my testimony on the protection of working farmland, rangeland, and forestland, the Alliance supports all the programs in the Conservation Title. These investments provide a comprehensive portfolio of programs, enabling our farmers, ranchers,

and forest landowners to be the best possible caretakers of our soil and water resources while sequestering carbon and providing food, fiber, wildlife habitat, and the clean air that we breathe. The Alliance is happy to provide our complete set of 2023 Farm Bill recommendations and looks forward to working with the Committee to draft a strong bill that will ensure the future of our working lands. Thank you.

[The prepared statement of Ms. Faeth follows:]

PREPARED STATEMENT OF LORI FAETH, SENIOR DIRECTOR OF GOVERNMENT
RELATIONS, LAND TRUST ALLIANCE, WASHINGTON, D.C.

Alliance Overview

On behalf of our 950 member land trusts, the Land Trust Alliance appreciates the opportunity to participate in this hearing and share lessons learned from the implementation of the 2018 Farm Bill and recommendations for the 2023 Farm Bill.

Founded in 1982, the Land Trust Alliance (the Alliance) is a nonprofit corporation and national land conservation organization based in Washington, D.C., that works to save the places people need and love by strengthening land conservation across America. We are the voice of private land conservation, unifying the American ideals premised on personal initiative, landowner empowerment and individual private property rights. Our members have worked with enthusiastic landowners, including farmers, ranchers and foresters, in their communities to voluntarily conserve more than 61 million acres of land across our country, boosting rural economies by helping to keep working lands in working hands.

Land trusts have a long history of partnering with the U.S. Department of Agriculture (USDA) to help landowners utilize farm bill conservation programs. This partnership is vital to ensuring that working lands—farms, forests and ranches—continue to produce food and fiber, provide habitat, protect watersheds and serve as part of the climate solution.

Why the Farm Bill Is So Important

The farm bill conservation programs, taken in total, are the largest single Federal source of funding for private land conservation. Farm bill programs create significant opportunities for land trusts to permanently protect working farm and ranch lands, grasslands, wetlands and forests.

Central to our nation's productivity and food security are our working agriculture and forest landscapes and the stewards of those lands. Unfortunately, we are losing working lands at an alarming pace, which is why the farm bill conservation easement programs are so critical. While all the farm bill conservation programs are important, easement programs are the only ones that offer voluntary incentives and cultivate partnerships to ensure working lands are not irrevocably converted to other uses in the future. The Alliance recognizes the value of these programs, such as the Agricultural Conservation Easement Program (ACEP), as a critical tool for farmers, ranchers and foresters who want to ensure their working lands are forever in family hands. The easement programs enable land conservation organizations and state and local governments to work with landowners to exercise their private property rights in the best interest of them and their families. They are also an excellent investment in food security, an important tool for addressing climate change, and they make a significant contribution to our economy.

In 2018 Colorado State University issued a report on a study assessing the economic impact of the Agricultural Conservation Easement Program-Agricultural Land Easement (ACEP-ALE) (and predecessor programs) from 2009-2017. The report showed that in addition to leveraging state and private funding, landowners with an easement were more likely to change their agricultural practices to improve things such as crop rotation and irrigation. In addition, the \$80 million investment in ACEP-ALE to conserve more than 129,000 acres of farm and ranch land created 1,102 jobs and generated \$174 million in economic activity across the state. Every NRCS easement dollar invested Colorado generated \$2.19 in direct, indirect and induced spending.

Earlier this year, the Montana Association of Land Trusts released a report, "Working for Montana Agriculture," which showed similar results. The report evaluated the economic impact of the 92 ALE easements in Montana since the implementation of the 2014 Farm Bill. The \$109 million ALE investment in these easements protected 289,000 acres of farm and ranch land, yielded \$182 million in economic activity, and supported 1,057 jobs, largely in rural Montana.

These programs are matched with other funding sources to compensate willing landowners for the value of a perpetual easement, thus ensuring the lands will never become a strip mall or housing development. Instead, the lands will remain in agriculture, securing their ability to provide food, fiber, plant and wildlife habitat and healthy watersheds for our nation. The money generated from an easement enables the landowner to pay off debt and reinvest in their farm or ranch. In addition, it can often make it easier for the landowner to resist outside development pressures and transfer the property to the next generation. Farm bill easement programs are a good investment for our country.

Farm Bill Lessons Learned

The Alliance celebrated the passage of the 2018 Farm Bill, which increased funding for ACEP from \$250 million/year to \$450 million/year. We thank you for taking this action. This increase in funding rectified a budgetary gimmick used in the 2014 Farm Bill whereby funding was cut in half in the last year of the bill. While it was a substantial increase in funding, it is still not currently meeting the demand from willing landowners who want to conserve their working lands with an easement.

Beyond much-needed funding, the 2018 Farm Bill included important policy provisions to make the program more effective and efficient. One key provision of the 2018 Farm Bill allows landowner donations and expenses to satisfy the ACEP–ALE match requirement. This was extremely important to states such as Kansas, Texas and Alabama that lack meaningful statewide conservation programs, making it challenging to secure the required match. This has allowed meaningful participation from these states. Unfortunately, the Natural Resources Conservation Service (NRCS) did not fully follow through with Congressional intent and made cash match a national ranking criteria, thereby giving projects with a cash match an unfair advantage.

Another key provision was removing the requirement for an ALE plan. While requiring an ALE plan may have sounded good, it ignored the fact that ACEP–ALE easements are perpetual real estate transactions. Management practices can and must change as landowners work to maintain working lands in an ever-changing world. In addition, NRCS did not implement the ALE plan requirement consistently, and, in many cases, state NRCS staff were demanding very prescriptive plans as part of this real estate transaction. Many important farm and ranch lands went unprotected because landowners did not want the Federal Government telling them how to run their operations through a required and approved plan. Congress recognized this and removed the ALE plan requirement in the 2018 Farm Bill. Unfortunately, when NRCS published the final ACEP rule it gave states the authority to make an ALE plan a state-ranking criteria, which undermines Congressional intent.

The Alliance strongly encourages Congress to retain these important provisions and to provide clarification of intent through report language. Ensuring the agency doesn't create administrative barriers and burdensome procedures is even more important with the much-needed infusion of funding from the recently signed Inflation Reduction Act (IRA).

2023 Farm Bill

In 2017, the Alliance created the Farm Bill Working Group (FBWG), which is now comprised of more than 100 land trust practitioners from across the country who utilize farm bill easement programs to help landowners conserve their lands. The FBWG played a strong role in the development of the Alliance's 2018 Farm Bill recommendations and in monitoring implementation through comments on rulemaking and navigating hurdles as they arose. We have been gearing up for the 2023 Farm Bill and earlier this year began socializing our updated recommendations. Our 2023 Farm Bill recommendations reflect lessons learned from the implementation of the 2018 Farm Bill and are forward-thinking as we strive to meet challenges we face today, including increased food security concerns and the impacts of a changing climate.

Funding

As previously stated, we strongly support a significant increase in funding for the ACEP–ALE program. The IRA provides an increase in funding for ACEP over the next 4 years. The 2023 Farm Bill provides Congress with an important opportunity to spread these conservation investments over a longer period of time and avoid a post-FY26 steep drop-off in funding.

Retain Farm Bill 2018 improvements

As mentioned earlier, we must maintain important improvements that were made in the 2018 Farm Bill, including matching funds flexibility and removal of the onerous ALE plans.

Clarify Certification process and benefits

We also recommend enhancements to make the certified entity application and enrollment process work more efficiently. Certified entities were established in the 2008 Farm Bill, yet to date there are fewer than seven certified entities. We recommend clarifying the certification application and enrollment process and ensuring that accredited land trusts have a streamlined path to certification. Congress should make clear that the certification designation results in greater efficiency for program delivery with less direct agency involvement in all easement acquisition processes. We further recommend recognizing certified entities across all NRCS easement programs. This recognition could go a long way toward streamlining and accelerating the pace of getting critical conservation projects done.

Reduce barriers faced by historically underserved landowners

The Alliance strongly supports efforts to increase access to farm bill conservation programs for historically underserved landowners. We recommend strengthening this work by providing set-asides in ACEP for beginning, limited-resourced and socially disadvantaged farmers. ACEP, unlike other programs in the Conservation Title, has no such provisions to ensure these farmers have a fair shot at funding. In addition, a reduction in the match requirement or increased government share for land trusts working with these specific landowners would create a greater incentive for entities to work with landowners who might not otherwise participate in farm bill programs.

Enhance Healthy Forest Reserve to establish a Forest Conservation Easement Program

ACEP-ALE is a crucial tool for conserving farms and ranches but does not address working forested lands. Private forests comprise 58 percent of all forested land in the U.S. While the total area of forestland in the U.S. has been largely stable historically, private forests now face significant threats, mainly from conversion to housing and urban development. We recommend enhancing the Healthy Forest Reserve Program by creating a stand-alone Forest Conservation Easement Program that ensures private forestland remains intact and in production, allowing them to continue providing numerous benefits to rural and urban communities. Conservation of our working forestlands is critical to the future of our country and funding for forest conservation easements must be in addition to funding for ACEP.

Ensure the Regional Conservation Partnership Program (RCP) works for easements

The Land Trust Alliance has fully supported the Regional Conservation Partnership Program (RCP) in past Farm Bills and will continue to do so. RCP is a key tool for land trusts to help protect farm and ranch lands, grasslands, wetlands and forested lands and provides much needed flexibility for specialized easements not available through ALE or Wetland Reserve. Land trusts want to see consistency in how easements are implemented whether through ACEP or RCP. One way would be to ensure certified entities have the same benefits in ACEP and RCP. There is also a concern from the land trust community regarding the time it has taken to get easements approved through RCP. To our knowledge, only one easement has been fully closed under RCP in the 4 years since the last farm bill was signed. Our Farm Bill Working Group continues to meet and explore options to improve the administration of RCP and we hope to work with this Committee to ensure that goal.

Exempt ACEP from the Adjusted Gross Income (AGI) limitation

Unlike other conservation or financial assistance payments, compensation for the purchase of a conservation easement is not a subsidy payment but a conveyance of a private real property right. This means the landowner must give up something of value in exchange for the program payment. The Alliance encourages exemption from the AGI limitation for ACEP. Doing so would eliminate a bureaucratic barrier to bringing projects to closure. In addition to being cumbersome, the limitation prevents critical and sensitive lands from being protected. Focus should be on the protection of working lands, not the current owner.

Conclusion

While I have focused most of my testimony on the protection of working farm-lands, ranch lands and forestlands, I would be remiss if I did not reiterate my introductory comments in support of all the programs in the Conservation title. These investments provide a comprehensive portfolio of programs enabling our farmers, ranchers and forest landowners to be the best possible caretakers of our soil and water resources while providing food, fiber, wildlife habitat, carbon sequestration and clean air. In your deliberations of the 2023 Farm Bill and consideration of the

implications of the IRA funding for these programs, we hope to continue to work with you in a bipartisan manner to strengthen the efficiency and effectiveness of the Conservation title programs to benefit our nation's working lands and the private land stewards of these resources. The Alliance is happy to provide our complete set of 2023 Farm Bill recommendations and looks forward to working with the Committee to draft a strong bill that will ensure the future of our working lands.

The CHAIR. Thank you very much, Ms. Faeth.

And, Mr. Wiese, I welcome you here as someone who represents many wonderful cattle farms. It is a pleasure to have you join us. I work so frequently with the Virginia Cattlemen's Association, so I look forward to your testimony, and thank you for being here.

STATEMENT OF SHAYNE WIESE, MANAGER, OPERATIONS, WIESE & SONS: GOOD DOIN' BULLS; MEMBER, IOWA CATTLEMEN'S ASSOCIATION; MEMBER, NATIONAL CATTLEMEN'S BEEF ASSOCIATION, MANNING, IA

Mr. WIESE. Well, good morning, Chair Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee. My name is Shayne Wiese, and I am honored to join you today. I am the fifth generation of my family's cattle ranch in west central Iowa, and we specialize in the production of high-quality Hereford bulls to sell to commercial cow-calf producers.

But beyond our production focus, our operation has a strong conservation history. Wiese & Sons, my family's cattle ranch, is even a past winner of the NCBA's Environmental Stewardship Award.

I am proud to represent NCBA and the Iowa Cattlemen's Association today. Cattlemen graze livestock on approximately 666 million acres across the United States, nearly $\frac{1}{3}$ of our nation's continental landmass. We strive to maximize the environmental, economic, and social sustainability of our operations. Through voluntary conservation programs, ranchers will continue to reach our shared conservation goals.

Conservation programs are one of the most visible and consistently important portions of the farm bill for cattle producers across the country. Many cattle producers' only nexus to farm bill-related services occur at their local NRCS and FSA offices. The 2018 Farm Bill created opportunities for cattle producers across the country but also new challenges.

Cattle producers employ various conservation practices, many of which were put in place by using NRCS programs such as EQIP. One important feature of EQIP has been its focus on livestock operations, and we appreciate the 50 percent funding designation for livestock-related practices in the 2018 Farm Bill. Federal funds spent on conservation are a good investment in our country's natural resources, and it is vital to ensure that livestock producers have access to these valuable resources for grazing and feeding management.

While the intent of EQIP is to make conservation funding and technical assistance as accessible to all producers, barriers to entry often disincentivize producers from using NRCS programs. Recently, my family's cattle ranch applied to receive EQIP cost-share funding, but after months of waiting, we gave up and completed a water infrastructure project without the assistance of the USDA. I see many other opportunities for our ranch to improve the land and environment with EQIP funding. By creating additional hurdles for

producers that want to use these programs, the Committee and USDA limit access while also limiting the government's ability to record our environmental improvements. I urge the Committee to support initiatives in the farm bill that allow NRCS programs to further innovation and commonsense land management.

Flexibility is key to ranchers' use of conservation programs. Ensuring that producers have the freedom to effectively manage their land goes beyond EQIP, stretching to other conservation programs like CRP. CRP has the potential to provide significant environmental benefit but currently fails to maximize its value. Changes made in the 2018 Farm Bill limit our ability to effectively manage CRP acreage with grazing.

Congress and the Administration have made clear their interest in integrating climate-smart practices in the agricultural industry. Grazing is a valuable tool in maximizing carbon sequestration, but it is not a tool that we are able to use on CRP acreage without penalty. Livestock graze mature, stagnant grasses and allow regrowth of green, carbon-capturing plants. Our ranch took some land out of CRP and transitioned it into our cattle rotational grazing system recently. We have seen improvements on all pastures due to more grazing options. Grazing access to CRP acreage will promote more opportunity for beginning ranchers to graze responsibly and provide existing pastures more rest and recovery during drought years. Furthermore, grazing should be included as a CRP mid-contract management tool. Cattle and other forms of livestock can and should be the sustainable solution to managing CRP acreage.

USDA's voluntary conservation programs have been a great asset to cattle producers, and it is important that these programs are implemented in a practical, producer-friendly, and voluntary manner for years to come. Ranchers across the country maintain open spaces, healthy range lands, provide wildlife habitat, and we feed the world.

I appreciate the opportunity to visit with you today. Thank you for your time, and I would welcome any questions you have.

[The prepared statement of Mr. Wiese follows:]

PREPARED STATEMENT OF SHAYNE WIESE, MANAGER, OPERATIONS, WIESE & SONS: GOOD DOIN' BULLS; MEMBER, IOWA CATTLEMEN'S ASSOCIATION; MEMBER, NATIONAL CATTLEMEN'S BEEF ASSOCIATION, MANNING, IA

Good morning, [Chair] Spanberger, Ranking Member LaMalfa, and Members of the Subcommittee. My name is Shayne Wiese, and I'm honored to join you today. I am the fifth generation of a cattle operation in west central Iowa that specializes in the production of high quality, productive Hereford bulls for commercial cow-calf producers. But beyond our production focus, our operation has a strong conservation history. Wiese & Sons are advocates for on-farm conservation and have utilized cover crops, CRP, water filtration buffers, and erosion reduction practices for decades. Wiese & Sons is a past winner of NCBA's Environmental Stewardship Award, which recognizes operations that go above and beyond to effectively manage not only their cattle, but their natural resources as well.

I am proud to represent the National Cattlemen's Beef Association and Iowa Cattlemen's Association today. The National Cattlemen's Beef Association is the nation's largest and oldest national trade association representing the U.S. beef cattle industry, with other 250,000 producers represented through both direct membership and 44 state affiliate associations. The Iowa Cattlemen's Association is an affiliate of NCBA, and represents nearly 8,000 producers and friends of the beef cattle industry through membership and its 97 county affiliate associations.

U.S. cattle producers own and manage considerably more land than any other segment of agriculture—or any other industry for that matter. Cattle producers graze

cattle on approximately 666.4 million acres across the United States—nearly $\frac{1}{3}$ of our nation's continental landmass. Additionally, acreage used to grow hay, feed grains, and food grains add millions more acres of land under cattlemen's stewardship and private ownership. Some of the biggest challenges and threats to our industry come from the loss or conversion of our natural resources. The livestock industry is threatened daily by urban encroachment, natural disasters, and government overreach that makes our stewardship harder—if not impossible. Since our livelihood is made on the land, through the utilization of our natural resources, being good stewards of the land not only makes good environmental sense; it is fundamental for our industry to remain strong. We strive to maximize the environmental, economic, and social sustainability of our operations, and it is through voluntary conservation programs that ranchers will continue to be a proud partner with the government to reach our environmental conservation goals.

Conservation programs are one of the most visible and consistently important portions of the farm bill for cattle producers across the country. Many cattle producers' only nexus to farm bill-related services occurs at their local NRCS or FSA office. Building and maintaining robust voluntary conservation resources must remain a top priority for USDA. The 2018 Farm Bill sent a strong signal to agricultural producers across the country that voluntary conservation is a top priority, we appreciate this Committee's commitment to continually improving these vital programs. Implementation of the 2018 Farm Bill created opportunities for cattle producers across the country, but also new challenges. I'm excited to discuss those opportunities and challenges with you today.

Cattle producers pride themselves on being good stewards of our country's natural resources. Cattle producers employ various conservation practices, many of which we put in place by utilizing NRCS programs, such as the Environmental Quality Incentives Program (or EQIP). EQIP is designed to assist producers in implementing conservation practices that will enhance the health of grazing lands, improving water quality, improving soil quality, and reducing soil erosion. One important feature of EQIP has been its focus on livestock operations, and we appreciated the 50 percent funding designation for livestock-related practices in the 2018 Farm Bill. Because crop production receives significant value from other working lands programs, like CSP, a livestock carve-out for EQIP funding ensures that resources are equitably distributed among producers. Federal funds spent on conservation are a good investment in our country's natural resources and the sustainability of agriculture and wildlife, and it is vital to ensure that livestock producers have access to these valuable resources for grazing and feeding management.

While the intent of EQIP is to make conservation funding and technical assistance accessible to all producers, barriers to entry often disincentivize producers from utilizing NRCS programs. Recently, I applied to receive EQIP cost-share funding for a water infrastructure project on my operation. After months of waiting with no approval, I finally gave up and completed the project without assistance from USDA. I see many other opportunities on our ranch to improve the land and environment with EQIP funding but simply do not have the confidence in the process to apply again. We could improve upon soil-health-building grazing practices, provide more erosion control, and promote cleaner water sources. I would rather budget responsibly and pay for it ourselves to help the ranch be environmentally progressive than wait for assistance and lose valuable time. I am not alone in this. Ranchers care about the environment and their livestock, and any improvement on the land is something we are unanimously proud of. By creating additional hurdles for producers that want to utilize these programs, the Committee and USDA limit access to these programs while simultaneously limiting the government's ability to record our environmental improvements. I urge the Committee to support initiatives in the farm bill that allow NRCS programs to support innovation and commonsense land management.

It is clear through my experience with NRCS and FSA that lack of funding for practice implementation is not an issue. Especially when it comes to EQIP, the 50 percent livestock carve-out is effective in ensuring that necessary monies are available. The most significant challenge for producers who want to take advantage of working lands programs is the inefficiency in technical assistance availability and funding distribution that allow us to accomplish a project. While this hurdle was acknowledged by Congress in the 2018 Farm Bill, few of the policies focused on increasing functionality.

Flexibility is key to ranchers' utilization of conservation programs. Ensuring that producers have the freedom to effectively manage their land goes beyond EQIP, stretching to other conservation programs like the Conservation Reserve Program (or CRP). CRP has the potential to provide significant environmental benefit, but currently fails to maximize its value. Changes made in the 2018 Farm Bill limit our

ability to effectively manage CRP acreage with grazing. Livestock graze mature, stagnate grasses and allow regrowth of green, carbon-capturing plants. Our ranch took some land out of CRP and transitioned it into our cattle rotational grazing system recently. We have seen improvements to all pastures due to more grazing options. We have successfully reduced the need for synthetic fertilizers near that land base and have seen less weed pressure with more green grass growth. If we allow more CRP grazing, we will promote more opportunity for beginning ranchers to graze animals responsibly and provide existing pastures more rest and recovery during drought years. This will be especially beneficial in areas where pasture is scarce and livestock production is rapidly dwindling like my home state of Iowa. Furthermore, mid-contract management within CRP includes carbon-emitting prescribed burns that are dangerous on drought years, spraying herbicides that terminate good and bad plant species, or tilling up the soil and reseeding which contradicts soil health improvements. Cattle and other forms of livestock can be the sustainable solution to managing CRP without the negative impact on the ecosystem while also helping ranchers economically.

Congress and the Administration have made clear their interest in building a climate-smart economy, including the integration of climate-smart practices into the agricultural industry. Grazing is a valuable tool in maximizing carbon sequestration but is not a tool that we are able to use on CRP acreage. This policy not only limits our ability to effectively manage our land but contradicts the Administration's climate-related priority. By allowing cattle to graze CRP acreage without a reduction in payment, we could greatly increase interest in CRP contracts, while simultaneously maximizing environmental value and economic benefit.

Voluntary conservation programs work because they are voluntary. Our operation has had success in using USDA conservation programs, but just because this system works for us does not mean it's right for everybody. Continuing to fund voluntary conservation programs, while keeping them voluntary, is critical to their continued success. A one-size fits all approach that accompanies top-down regulation does not work in the cattle industry. If these programs or practices were to become mandatory, the rules and regulations that farmers and ranchers would be subjected to would make it harder for them to utilize the unique conservation practices that help their individual operations thrive.

As policymakers consider the sustainability of the U.S. agricultural industry, environmental sustainability is only one leg of a three-legged stool. Cattle producers strive to balance environmental sustainability with economic viability and social consciousness—maintaining this balance is key to ensuring our long-term success. Economic prosperity, social awareness, and voluntary conservation go hand-in-hand and we are always looking for new, innovative conservation programs that will have tangible benefits for the environment and help to improve our ranching lands. USDA's voluntary conservation programs have been a great asset to cattle producers, and it is important that these programs are implemented in a practical, producer friendly, and voluntary manner for years to come to ensure that cattle producers will continue to have the ability to do what we do best—produce the world's safest, most nutritious, abundant, and affordable protein while operating in the most environmentally friendly way possible. Ranchers across the country maintain open spaces, healthy rangelands, provide wildlife habitat and feed the world. Together we can sustain our country's natural resources and economic prosperity, ensuring the viability of our way of life for future generations. I appreciate the opportunity to visit with you today. Thank you for your time, and I welcome any questions you have.

The CHAIR. Thank you very much for your testimony, Mr. Wiese.

At this time, Members will be recognized for questions in order of seniority, alternating between Majority and Minority Members. You will be recognized for 5 minutes each in order to allow for us to get to as many questions as possible. Please keep your microphones muted until you are recognized in order to minimize background noise.

And I now begin by recognizing myself for 5 minutes. And I want to begin with you, Mr. Wiese. I appreciated your testimony very much. And one of the things in your written testimony and again in your spoken testimony, you talk about some of the hurdles that you and your family experienced on your ranch. Could you just give us a brief rundown of what are some of those hurdles and how they

preclude you from being able to use these programs in the ways that you would want to optimally?

Mr. WIESE. Of course, thank you. For us, when we are deciding how to manage our cattle, we got to think of three things, and one is the environment, our cattle, our business, and even, I guess, our social life, our family life. So, some of the hurdles with like EQIP and CRP is just flexibility and timeliness. The EQIP program I referenced in my testimony, we were in a drought and we needed water infrastructure. We have to water our cattle. And, our biggest dilemma with it was I applied and we waited and waited. And finally, we just had to bite the bullet and do it. I am one of the spoiled few in the cattle business that has a generational ranch that is set up with land, resources, and capital, so I can do that process of just buying that outright. Beginning ranchers and farmers don't have that in this current state of the business. So that was probably the main thing is just the timeliness of EQIP.

In terms of CRP, we are really, really big fans of it, but always having that worry of penalty if we do have to emergency graze or hay and our county isn't approved for that, that is a hit to the business. It is a cash-flow hit. So I think anything that provides flexibility for business, anything that allows better grazing management from a cattle perspective, that is a win-win for everybody. The environment benefits, the producer benefits, and we benefit because we don't have the stress of dealing with drought or running out of grass and having to feed really expensive hay.

The CHAIR. Yes. And you know you have the benefit of the re-growth of that grass as you graze on other fields.

You also talked about just the overall benefits and how you view the program and the environmental, economic, and social sustainability of your operations. And I appreciated that commentary because so much of what it is that we are focused on with the Conservation Title, these voluntary programs, they are meant to do just that. They are meant to create opportunities for producers to be able to invest in their land, get support in kind of taking on new projects and programs that they might otherwise not be able to pursue that can have all of these significant benefits.

I hear you on just the timeliness of a response because you make an excellent point. If someone doesn't have the capital at the ready and you are constantly questioning how much and when do we just sort of pull the plug on the application and move forward doing what needs to be done?

One of the consistent concerns that we heard from all of the witnesses related to technical assistance and the CSP program, so I was wondering, Mr. Crowder, perhaps because you were the first to bring it up probably because you were the first to speak, could you speak to that a little bit? Notably, the Ranking Member also mentioned the shortcomings that we see in that program. What are some of the suggestions that you would bring to the Committee in terms of—is it an issue of resources? Is it an issue of training? Is it an issue of prioritizing the workforce? What are some of the things you would want us to know? Sorry, I think you need to turn your microphone on.

Mr. CROWDER. I am sorry.

The CHAIR. Thank you.

Mr. CROWDER. In May we had a conservation careers—

The CHAIR. Yes, thank you for being here for that then.

Mr. CROWDER. Yes. And we talked about the importance of the workforce. And during the hearing, the Committee recognized that in order to address our current and future conservation needs, we have to bring new generations forward. And at this point, I would like to plug that we have 13 members of our next-generation leadership institute right next door, so we are doing our part. But we have to bring those new folks forward to the workforce. We have worked with Chief Cosby and others at the NRCS on conservation technical assistance grants to make sure we put boots on the ground. And we are doing a lot of work in the field to make sure that we have people in line to fill those positions at districts and at the NRCS.

The CHAIR. Thank you very much. And as my time comes to a close, I just want to thank Ms. Berg for bringing the numbers to the table in terms of the 7,500 contracts that have been given but the 5,000 unfunded for wheat growers across the country who have applied for programs. I think for all of us looking at what is the demand on the ground, we frequently say they are oversubscribed and under-funded but noting that a significant number of growers across the country want to participate and want to benefit from these programs and simply can't I think is a good call to action for us into the future.

Thank you. My time has expired. And I now recognize Ranking Member LaMalfa for 5 minutes.

Mr. LAMALFA. Thank you again, Madam Chair.

Mr. Crowder, you mentioned in your testimony the importance of forest management on Federal, state, and private land. Please elaborate on how the farm bill programs can help support forest health. I find it interesting as I came into the building, somebody was having a seminar down the hall about wildfire. And this points out in this brochure, which covers a broad area even around the world, but the highlight at the top is the 1 million acre Dixie Fire, which occurred in my district last year, 1 million acres, 1 with six 0's behind it. I mean, that is many, many square miles of land. So can you please speak to us how the conservation programs that are in the farm bill or that could be improved in the next farm bill would be helpful on what indeed are catastrophes like this?

Mr. CROWDER. I would mention that Nicole and I live in Washington State, so we share your fear of wildfires at all times. Matter of fact, we have the smoke from California, Oregon, Washington. So we understand the fear of living that, and I have had the fire bombers come right over my house. So I understand.

Mr. LAMALFA. Ironically, that same smoke plume was making it all the way back here. You can see in New York, and they were talking about, don't go outside these days for health purposes for people who normally do exercise.

Mr. CROWDER. Absolutely, sir. But as far as—NACD supports our forest health completely. We have a Forestry Resource Policy Group that we work with the Forest Service and the NRCS. And we have a lot of work going on with good neighbor authority, good forest health practices. The Inflation Reduction Act had approximately \$5 billion for forestry work.

And as we go forward with the 2023 Farm Bill, we want to help in every way possible to make sure that forest health becomes the forefront. We cannot have the fires that we have had. I have lived in Washington State for 20 years. The first 10 years we had very few fires. In the last few years, they are bigger, earlier. It is terrifying. So anything that we can do to help with forest management practices, help with at the local district level, we have programs like Firewise that we used on my ranch where you come and evaluate and make sure that you get dead timber away from any combustibles, away from the house.

So there is a lot of work that is currently being done, but so much more that we can do to make sure that these giant fires are more controllable in the future. And if climate change or then more heat and dryness that we are seeing over the years continues, we are going to be fighting this for years to come.

Mr. LAMALFA. Indeed, no matter what weather terminology you want to attribute it to, if we are going through a heat cycle, then we need to be doing more on forest management with the right amount of trees per acre that it can sustain with the available water underground, as well as snowfall and such.

Mr. CROWDER. Yes, sir.

Mr. LAMALFA. So let me shift to Mr. Wiese, correct? In speaking to this topic here, I think I sense some frustration with the limitation of the livestock producers' ability to manage grazing on their acreage or even coming back to the forestry side of it and other Federal lands, getting the permits, I don't know how much that affects you in Iowa. But Federal land permits for grazing have really, really tightened up and we have seen this happen at the same time as fire. Fire acres have increased. Mr. Crowder has kind of mentioned that, too, is that we are seeing the number, a big fire used to be four digits or even five digits. Now, six digits is becoming routine. Touch on the grazing frustrations you might acknowledge for us on getting those grazing lands.

Mr. WIESE. Thank you.

As he was speaking of managing timber and things along those lines, I immediately went to cows. We can use cattle and livestock as tools. It is an awesome sight to see when cattle take brown, stagnant, mature grass, timber, whatever it is, they eat it, they clear it out, and the green regrowth that appears from that is beautiful. And I think on a forestry side of things, cattle and livestock are a great solution. And it doesn't have to be a long graze that can inhibit the grassland. It just needs to be a short, intensive rotation that can clear that out and everybody wins in that solution, the environment, the cattle, the business. Livestock are an incredible tool that we can use to help combat wildfire, promote photosynthesis to improve carbon sequestration. The cattle can be a tool, they aren't a hindrance, and I want to drive that fact.

Mr. LAMALFA. Indeed, I have seen ideas of having a pilot program where we will do some grazing on some land and see what the fire suppression effects of that are. Like I don't know, we need to be doing a pilot program where we can actually tell, you can see any place where a fire occurs or there is grazing right up to the fence, the fire stops where there was no grazing, big time. So thank you for that.

And I will yield back, Madam Chair.

The CHAIR. Thank you very much. Those questions were very interesting, as were the answers.

The Chair now recognizes Ms. Pingree for 5 minutes.

Ms. PINGREE. Thank you, Madam Chair. Thank you for having this hearing. It is such an important time to be discussing these programs as we look into the farm bill. And thank you to all the people testifying today, I really appreciate all of your thoughts. I am going to start with Ms. Faeth from the Land Trust Alliance. First, I just want to thank you generally for Land Trust Alliance. I come from the State of Maine, and they have played such an important role in all sizes of communities to preserve land that is important to those communities. And I just so much appreciate that you are there.

But I do want to specifically talk about the farmland, and you talked about losing farmland. This was part of your focus. And I did see a report from American Farmland Trust that showed from 2001 to 2016 our nation lost or compromised 2,000 acres of farmland, ranchland every day. So that is just a staggering number, and we know it is getting worse, not better.

So you talked a little bit about some of the conservation programs and the speed. What else can you say that you haven't already done that we could be doing in the farm bill to improve this? I know that funding is key, so feel free to mention that again, but any other things you want to talk about?

Ms. FAETH. Thank you. Yes, the conservation easement programs are really critical. And that is, as I mentioned, the one tool that will allow willing landowners as landowners who want to ensure that their working farm or forested lands remained in working lands in perpetuity. They are the key to food security in our country, and to conserving farms and ranches and slowing down that pace of conversion, so increased funding is something obviously that we are advocating for.

Other things would be simplifying and streamlining the certified entity application enrollment process. There are two changes that Congress could do as part of the 2023 Farm Bill, by clarifying the process to become a certified entity in statute, and recognizing certified entities across all easement programs. And we are talking with the agency about some administrative changes as well, so, you know making those programs work more effectively will require both statutory and administrative changes.

The staffing issue, the capacity issue at NRCS and across the Federal Government is part of the problem for getting these dollars out on the ground to conserving farms, ranches, and so, we encourage you to be thoughtful about that as you go forward.

And then clarification in the 2023 Farm Bill about some of the things that were achieved in the 2018 Farm Bill either in statute or report language, like around things like the ALE Plan, removing that onerous provision in the 2018 Farm Bill and the way matching funds are handled will help streamline the programs as well. Thank you.

Ms. PINGREE. Sure. Those are really, really helpful, and it would be great if you do follow up with more details to all of us. I think we are all interested in this.

I also was interested, you mentioned something about including forestry, a forest health set-aside. Do you want to talk a little bit about that, too? I thought that was an important idea. And so many of us have forest lands in our district. Maine is the most forested state in the nation with a lot of private forest land, so that is a big interest to us.

Ms. FAETH. Sure, thank you. In the 2018 Farm Bill, one of the things that wasn't addressed is the gap to provide an easement opportunity for working forested lands, so we are proposing enhancing the existing Healthy Forests Reserve Program to establish a new program called the Forest Conservation Easement Program. It would be a sister program to ACEP where there would be forestland easements, those would be entity-held easements, and then forest reserve easements focused on endangered species and restoration of those lands. And those would be U.S.-held easements. We think this is a much-needed and important complement to the farm bill conservation programs. We would like to see mandatory funding.

We want to be really, really clear that in making sure that there is a working program for working forested lands that we are not attempting to limit or reduce dollars for conservation on our farms and ranches. So we believe that any funding for a Forest Conservation Easement Program must be in addition to the funding for ACEP, and I would be happy to provide more information.

[The information referred to is located on p. 1583.]

Ms. PINGREE. Great. And thank you for that. I absolutely agree with you. We can't take money away from the farmland preservation.

Mr. Crowder, you already covered this quite a bit, but I know it keeps coming up about the staffing issues. And I am glad to hear you are mentioning young recruits. I don't have a lot of time, but anything else we need to do to support NRCS and having the capacity that it needs?

Mr. CROWDER. One of the big things is the direct hire authority for NRCS. That is critical that we get boots on the ground, and that always comes back to conservation technical assistance so we can do partnership work with districts and other organizations that can be those boots on the ground besides the NRCS folks.

Ms. PINGREE. Great. Well, I am very supportive of both of those things. So I will yield back. Thank you very much, Madam Chair.

The CHAIR. Thank you so much.

The Chair now recognizes Mr. Allen for 5 minutes.

Mr. ALLEN. Good. Chair Spanberger and Ranking Member LaMalfa, thank you for holding this hearing today. And to our witnesses, thank you for being here and sharing with us as well.

I would like to begin my remarks by recognizing our American farmers. They are the greatest conservationists in the world, and it is only with their lead that we can continue to protect our natural resources and habitats while also continuing to feed the world.

Mr. Wiese, I know a little bit about what you are dealing with. My dad managed the Georgia Hereford Farm right outside of Augusta, Georgia, when he returned from World War II. I was born and raised on that farm, and in fact I have a picture of my dad standing with their champion bull in the sales barn. And at that

time that bull was purchased, I believe, by a big farm in the Midwest. Any chance that you all bought a bull in 1949 outside of Augusta, Georgia?

The CHAIR. I recommend the witness just say yes.

Mr. WIESE. I would love to find that answer for you.

Mr. ALLEN. Yes. I want to know the answer.

Mr. WIESE. [inaudible].

Mr. ALLEN. Yes, and I have never could—I can't remember what my dad said that thing sold for, but it was a champion bull. But, I also understand what you are going through today. I mean, we have the White House combined with my colleagues, who are a real threat to the family farm today. And in the name of this climate god or this new world religion, while it is very clear in the first chapter of the scriptures that we know who is actually in charge of the climate, and of course, we know the planet is warming, but nobody can tell me what we are doing and how we are putting our economy and our farms at risk trying to bring that temperature down and how much they can bring it down, but that is another subject.

But you mentioned the CRP program and the flexibility. I have had the same problem. Is it Mr. Crowder? I have heard frequent complaints from my timber farmers that the CRP is too inflexible. And if landowners were provided the option to substitute land that is already under CRP contract with the same acreage of similarly environmental sensitive land, would there be cause for concern?

Mr. CROWDER. Mr. Allen, NACD supports CRP immensely. But I would say that we support that the most environmentally sensitive ground is prioritized. So prime farm ground would be of less priority in CRP. In Washington, we have some issues where CRP is oversubscribed in some counties due to sage grouse initiatives, and that is one thing that it is more of a localized issue. But CRP is a great tool for farmers.

Mr. ALLEN. It is, but we have to make it more flexible for them because things change.

Mr. CROWDER. I agree.

Mr. ALLEN. You put these things in a program for a long-term, but I have had problem after problem, people wanting to, for example, use the pine straw, people wanting to do other things. Like they have property that they need to flip and they were willing in this case to even give more property to CRP, but the government turned them down. And so we have to figure out in this next farm bill how to make that more flexible.

Ms. Berg, if EQIP funds were allowed to be used to help pay for precision ag technology, would this help farmers address natural resource concerns and deliver environmental benefits according to the purpose of the program?

Ms. BERG. Absolutely. EQIP is definitely a tool that farmers need out there to help integrate precision agriculture and technology to help manage the natural resources and promote soil health in our farming practices.

Mr. ALLEN. All right. And, of course, I want to talk about the feral hog problem, but, first, Mr. Wiese, I got to ask you, I mean, what kept you from being able to get the water from the ground or wherever to water your cattle? And I don't know, are you all irri-

gated out there or—so you are dryland? Okay. Well, in Georgia we have to irrigate. But anyway, what was the holdup? I mean, was it the Federal Government?

Mr. WIESE. Well, we water on a lot of ponds.

Mr. ALLEN. Yes.

Mr. WIESE. And ponds were running dry.

Mr. ALLEN. Yes.

Mr. WIESE. So we were looking to run a water line to make an extra tank into that particular pasture, and the holdup was just the process. We applied, did all the paperwork.

Mr. ALLEN. Who did you apply to, the state or—

Mr. WIESE. The state.

Mr. ALLEN. Okay.

Mr. WIESE. We waited and we waited and nothing ever came about of it. And we have to water livestock, so we just went ahead and bit the bullet and did it.

Mr. ALLEN. Yes.

Mr. WIESE. And, again, it wasn't ideal, but it is what we had to do.

Mr. ALLEN. All right. It sounds like you need some leadership in the State of Iowa. All right. Well, I yield back, Madam Chair.

The CHAIR. The chair now recognizes Mr. Panetta for 5 minutes.

Mr. PANETTA. Thank you, Madam Chair, Ranking Member, I appreciate this opportunity to have this type of discussion with these experts to talk about many of our Federal conservation programs, especially when it comes to protecting our farmlands and developing effective conservation practices.

I hail from the Central Coast of California, the area that I represent. And obviously, we have plenty of not just agriculture but specialty crops, including 50 percent organic crops within that. Obviously, with the unique makeup of our agricultural landscape comes unique conservation challenges, especially when it comes to access to technical information and the up-front cost. Yet, there is still plenty, plenty of work to do as we approach next year's farm bill to ensure that all growers, especially those left out of the *status quo* like my specialty crop producers, that they are included in these types of very, very important conversations.

Now, as we look to better protect our environment, of course, I firmly believe and I think most people around this dais firmly believe that farmers have a huge role to play, as well as our government, so that we can provide the resources, the knowledge, the intellect that is critical in regards to the support that is necessary for our farmers and ranchers, especially those that are most impacted by the threats of climate change and environmental degradation.

Now, I would also like to obviously highlight the fact that the IRA, the Inflation Reduction Act, provided close to \$20 billion in direct support for the USDA's conservation programs within NRCS, a long overdue investment that will hopefully help our producers. And I look forward to continuing to work with this Committee, with the Department of Agriculture so that we can make sure that all farmers are able to benefit from these types of solutions.

Mr. Crowder, obviously, you talk about certain programs, and you focus on obviously conservation, technical assistance, and you

hit on EQIP quite a bit in that. Obviously, I hear often with my specialty crop producers, one size does not fit all. And I think we understand that, and we believe that. Can you explain why programs should remain voluntary so that it is important and how it contributes to the success of the NRCS conservation programs?

Mr. CROWDER. Well, in our opinion, the voluntary aspect is the key. The government is not coming in telling any farmer what they need to do. The impacts that you get for these farmers to do water quality work, quantity work, benefits not only those farmers but the neighbors, the community, and the millions of acres that have gone on. It creates an environment that is good for the United States.

So one thing that comes to mind for your area and others is the access to the historically underserved. And one thing that I have been working on and talk to Chief Cosby and others is the signatory authority for conservation programs. And historically, you have Black farmers in the Southeast, you have Tribal members, Pacific Islanders and others, Latinos that can't sign the conservation programs because they don't have access to clear title to their farm. So that is one aspect that we are working on. But EQIP and other conservation programs are just key to making sure that producers have the access to the programs that they need to be successful.

Mr. PANETTA. Okay. Mr. Wiese, directing my questions towards you, obviously, the 2018 Farm Bill I would say empowered livestock producers to be better stewards of our natural resources. If given the chance, what would you want to see in the 2023 Farm Bill that would help us build on this work?

Mr. WIESE. Thank you. I think, in reference to the 2018 Farm Bill, there was a lot of good, but there were a couple of hurdles. For example, in terms of emergency haying and grazing CRP ground, if we hit a D3 drought, the ability to emergency graze and hay became more limited due to making sure there was proper amount of residual grass. So they swapped it over to payment per head. And by doing that, it almost formed inflation within the cattle business and just drove up the price of hay. So, we think we need to take a flexible approach where we have more options to graze, maybe reduce the penalty for grazing because that promotes better mid-contract management instead of taking a tractor and spraying chemical or promoting burning of CRP ground, we can use cattle to do that for us. I think we just need to take a holistic approach where again, the business, the cattle business, the conservation is there, the social aspects, the thing is there where all of it works together, so very subtle things. And obviously, I am not familiar with specifications, due to my occupation, but I think anything that helps promote young cattlemen and cattlemen and farmers and ranchers in general to have a business improvement and still make conservation a priority would be a win for everybody.

Mr. PANETTA. Fair enough, thank you. Thanks to all the witnesses. Madam Chair, I yield back.

The CHAIR. Not seeing a Minority Member on, we are going to go to Ms. Schrier next for 5 minutes.

Ms. SCHRIER. Thank you, Madam Chair, and welcome to all of our witnesses. I am particularly delighted to have two witnesses, Ms. Berg and Mr. Crowder, from my home State of Washington. It is wonderful to see you today. And you have both been excellent consultants and advisors for me and my staff.

I am excited to talk about these programs, which are so popular in my district because of their flexible, local-first approach, which really serves the diversity of Washington agriculture well.

Look, I don't think we need to reinvent the wheel here. What we need are commonsense adjustments to ensure that these programs are serving our producers and their land well. And as funding for these programs increases, I think we need to find ways to decrease the burden on our farmers and growers and also on conservation districts. I have heard from producers that the application process for these programs is complicated, and applying can feel like a full-time job in itself. And this is particularly frustrating given the low success rates of these applications. In fact, in 2020, only 30 percent of EQIP and 32 percent of CSP applications were accepted in Washington State.

So for farmers who are already busy, applying to a complicated oversubscribed program is just not the best use or an appropriate use of their limited time. So that is why many farmers depend on their local conservation districts for assistance, which puts pressure on them. They partner with NRCS and serve as the boots on the ground to make these programs work.

Mr. Crowder, I have a couple questions for you, and then I would like to pivot to Ms. Berg. First, what can Congress do to support conservation districts who are not only implementing projects but also assisting farmers with applications and doing outreach to their communities about what services they provide?

Mr. CROWDER. Good to see you again, Congresswoman Schrier. NACD has a fantastic working relationship with USDA NRCS, but one thing I have talked about already but I can't talk about enough is the conservation technical assistance and the conservation technical assistance grants that we implement through the NRCS funding throughout districts. And that has gone to 50 states and three U.S. Territories. And in the last 4 years, we have distributed about \$50 million to districts directly towards staffing to help NRCS put boots on the ground to make sure those conservation plans are written for those conservation programs. So that is one thing that I would say that we do a very good job of working with NRCS on.

Ms. SCHRIER. Thank you, and thank you for pointing out the need for staffing. Now, specifically with the application process, is there anything that we can do as we head toward the next year's farm bill for USDA and Congress to do to just simplify the application process to make it easier on farmers?

Mr. CROWDER. As far as NACD's farm bill principles, one of our principles is clarifying and simplifying the application process. So we are happy to work with this Committee, the full Agriculture Committee, and NRCS to make sure the applications for those programs are streamlined. You have so much money that is coming forward through farm bill, IRA, and infrastructure that it just simply has to be an easier process for farmers to make sure that their

applications are processed, going forward. And we are happy to work with this Committee and others to do that at NACD.

Ms. SCHRIER. Thank you. Last, I just want to highlight some challenges experienced by those using the CRP, which enrolls over 1.4 million acres in Washington State, which supports wildlife—you talked about the sage grouse—and reduces soil erosion.

Ms. BERG, you mentioned in your testimony that recent changes to the program like reducing cost-sharing and how rental rates are calculated, compounded by staffing shortages, made the most recent signup period even more complicated than normal. You also mentioned the need for additional training. What else can be done? How would you do this kind of training? What can we do in Congress to change these programs and make them better?

Ms. BERG. Thank you for the question, Congresswoman. And I do think that there can be some changes set forth in the CRP program. One thing happened a couple years ago. There was over 200 different changes to the program, and ever since then, we have had a problem in our state like interpreting the rules of the program, what are your expectations, laying out the expectations. And then also, I talked about staffing and trying to get the staff out to the farms or onto the CRP land and help us understand certified stands, how can we make the CRP a well-rounded part of our business plan? I don't have much time, so I will make it short.

Ms. SCHRIER. Thank you. I yield back.

The CHAIR. The chair now recognizes Mr. Johnson for 5 minutes.

Mr. JOHNSON. Thank you, Madam Chair. I will start with Mr. Crowder. And I think we have seen just incredible improvements, cover crop usage by American producers up 50 percent in recent decades. We have seen conservation tillage up 30 percent in recent decades. I certainly have seen a number of those evolutions on the ground in South Dakota.

So, Mr. Crowder, to what extent do we feel like it has been farm bill programs, conservation programs that have really driven that adaptation? Or are there other factors primarily to credit for that?

Mr. CROWDER. Well, I would say the farm bill programs are certainly the driving force for that. There are billions of dollars and millions of landowners that participate in that. A caveat is only 30 percent of the applications are funded, so there has to be a better avenue to fund those applications. We have to simplify the applications and make sure more of them are funded. Now, we have a lot of money coming from Inflation Reduction Act that will address that, and we will see, going forward, with the 2023 Farm Bill how that is incorporated or if it is incorporated and see how that money affects the conservation that goes on to the ground.

Mr. JOHNSON. So outside of the fact that only 30 percent are getting selected, what is the next largest barrier to further adoption of these conservation practices?

Mr. CROWDER. Boots on the ground. We need more NRCS folks and more district folks and more people that helped write conservation plans and process those applications. If your 70 percent are not getting funded, not getting done, we have to make sure those conservation plans are ready on these fields, and districts stand ready to help with that. There will be a lot of money coming forward here in the next 4 years for that, so if those conservation

plans are ready, you can use those parallel tracks of Inflation Reduction Act money and farm bill money to put that conservation on the ground.

Mr. JOHNSON. So I recently had a farm bill conservation roundtable in South Dakota, and I was surprised at the number of producers who told me at that round table that they felt like there had been so much turnover at NRCS and that so many of the new hires didn't really understand the conservation practices. They weren't really able to provide the level of technical assistance and advice that these producers were seeking. Mr. Crowder, do we hear that elsewhere or was that more of a localized problem?

Mr. CROWDER. No, sir, you will see that everywhere. And the Great Recession through COVID is real, and it is not just NRCS, it is McDonald's. Every business you deal with, you will see that. But I know Chief Cosby and NRCS are working very hard to bring in a direct hire authority. It would certainly help that. We need to help NRCS get those folks on the field. They need to go to my farm and Nicole's farm and Mr. Wiese's farm and make sure they understand the processes that it takes, what the farmer needs. So they need to understand how to write those programs, but also why us farmers, why us ranchers, why we need that.

So yes, I agree with you, there are challenges at the local field office, but we know that and we are working on that. And I know the NRCS is working on that very hard to make sure that we address the needs of farmers and ranchers and producers.

Mr. JOHNSON. Ms. Berg, with the minute I have left, any reactions to any of my questions or Mr. Crowder's statements?

Ms. BERG. Just my reaction, you asked the question, are we seeing the technical assistance challenges across the countryside in the wheat industry? Absolutely. That is one of the biggest complaints we hear through our association is the lack of technical assistance, boots on the ground. And then when they do get boots on the ground, we have actually tried to approach them and say, "Hey, let's do some mentoring, get some of these new staff members out to the farm. Let's go kick some dirt. Let's get them to understand the new technologies and the up-and-coming technologies that we would like to implement on our land." And some of these folks just need some training and need some help with some training.

Mr. JOHNSON. Very good. Mr. Wiese, anything you want to add?

Mr. WIESE. Thank you. Quickly, I think one thing we need to also consider is trying to avoid multi-county conservation offices. I know in Iowa there are a couple of counties that have to double dip or offices that have to double dip via counties, and I can only imagine in larger states like New Mexico or South Dakota where they have to travel very far to get to their NRCS office, that is a hindrance in terms of knowledge, too. Funding, I agree with everything we have stated. We have to get boots on the ground, inform everybody, and have less variability amongst offices.

Mr. JOHNSON. Thank you very much. Madam Chair, I yield back.

The CHAIR. The chair now recognizes Mr. O'Halleran for 5 minutes.

Mr. O'HALLERAN. Thank you, Madam Chair, Ranking Member, for holding this hearing today. I appreciate the opportunity to hear

more from our stakeholders and their experience with Title II conservation programs.

Conservation of our nation's natural resources continues to be a top priority of mine in the upcoming farm bill. And it should be no surprise to anybody that we are having a problem with getting personnel out in the field. We have gone through cuts after cuts after cuts over multiple years, and seeing that number decrease at the expense of conservation, of the rancher, the farmer, and others who need these programs with enough personnel to make them effective.

With the current conditions in the Colorado River Basin, Arizona continues to experience the worst drought in the past 1,200 years, very detrimental to our agriculture industry. And I fully expect the conditions may worsen considerably before they get better, which is why these conservation programs are even more important to farmers and ranchers in my district. We must provide farmers and ranchers the tools they need to continue to do good work and be good stewards of the land.

Mr. Crowder, farmers in my district tell me that they are making big changes to farms that increase resilience to extreme weather like drought takes a lot of time, often multiple seasons. What do you see as the best tools in the toolbox of the NRCS programs for addressing the length of time it takes to implement these changes?

Mr. CROWDER. Well, if I understand your question correctly, is—so can I have you clarify your question as far as the length of time? Is that how long it takes to get from application to on-the-ground conservation work?

Mr. O'HALLERAN. Exactly. Thank you.

Mr. CROWDER. Yes. Simply, that is more people on the ground. That is more people writing applications. And I don't want to sound like a broken record today, but direct hire authority for more employees at the NRCS and conservation technical assistance dollars NACD and other applicants. It is a process, and the government has an oversight to make sure that those funds are approved appropriately and that they are put on the ground appropriately, but we have been doing this a long time. NRCS has been doing this a long time. They they know what needs to be done as far as the practices on the ground. There are 167 practices, and we have priorities on that. And local working groups are great about prioritizing the highest needs in each area. So simply more people will help get conservation on the ground quicker.

Mr. O'HALLERAN. Thank you. And a follow-up, Mr. Crowder, from your experience, what program would you say is best positioned to help farmers in regions experiencing drought? And are there any adjustments that we could include in the next farm bill to improve upon this program and any other programs do you see need vast improvement?

Mr. CROWDER. Yes, sir. NACD, we support all of the conservation programs, but EQIP is the workhorse of the traditional conservation programs. CSP rewards early adopters, and you can take it to the next level. But EQIP is a program that can help with irrigation efficiencies and on and on, so that would be the workhorse of the conservation programs.

Mr. O'HALLERAN. Thank you very much. And I am going to end my remarks by just saying that I don't think any of us on this Committee are surprised by the fact that we need more personnel in the field, more people working faster to be able to get to the point where we are able to address the large amount of need out there on our farms and ranches across our country and conservation across our country.

And with that, Madam Chair, I yield.

The CHAIR. Thank you very much. In coordination with the Ranking Member, we are going to do a second round of questions. As of right now, it is the Ranking Member and I who are interested in another round. If any other Members want to express interest, please do let us know. But we are going to begin with Ranking Member LaMalfa. I recognize you for 5 minutes.

Mr. LAMALFA. Thank you again.

Ms. Berg, good to catch up with you here on the Committee. We obviously see the water issue in the West is very acute. And so we have had water conservation titles in the past in the farm bill. What do you see that we need to improve upon in 2023 to make—we need to talk about water infrastructure, certainly, but when we are talking on the conservation side, what can we do to make our water go farther so agriculture can continue to thrive and be at the table to receive more water?

Ms. BERG. Thank you for that question. I do have an irrigated farm and do have concerns about water and water levels. One of the things that I think that we could do through these Title II conservation programs through NRCS is do a better job of how do we document water savings. So if we did an irrigation conversion from like real flood irrigation to like a drip irrigation, there is water savings. So how can we move forward and have more of an inventory control through NRCS on how are we saving, what are we saving, and not just necessarily acres treated. And so I think that that could help us have a better picture of where are we saving water, how do these conservation programs—

Mr. LAMALFA. Are you diplomatically saying that farmers don't get a lot of credit for when they do something better like saving water or have more conservation practices that maybe produce less smoke when burning off stubble and things like that? Or do you think we need a little more credit for that? Is that kind of what you are saying?

Ms. BERG. I absolutely think we need more credit for that.

Mr. LAMALFA. Yes. Yes. I have noticed that myself in farming. Let's talk a little bit about the, I think it alluded to by Mr. Allen earlier, too, that we are having some problems with not enough of the—well, some of the staff that that deals directly with these programs understanding the system of farming and whether it is rotational practices, maybe not standard practices as they see it. What do you think we need to improve through the NRCS and others to help them have the flexibility installing the practices on their land that are actually tailored to what they need instead of maybe what the book says?

Ms. BERG. And that is a great question because farming, as you know, each year is different. Each season is different. And it is not in a book somewhere. And so I think through training and some

mentoring programs and whether it is through an association like ours that can filter down to other state associations and try to get some training and get those staff people out to the farms. I mean, I have always told anybody, if you want to come out to the farm and drive the tractor or combine, I will let you do it for free. And so get them out there and have them understand the practices and the technologies and where we want to go in technology because—

Mr. LAMALFA. Internships on the farm maybe? Is that what you are saying?

Ms. BERG. Yes, that is right.

Mr. LAMALFA. Yes. Okay. So I guess what we are really looking at is that sometimes you are running into inflexibility or lack of knowledge and so you got a hard-and-fast rule that doesn't allow the type of things that would be actually beneficial and towards the goals of the conservation but also help the farmers thrive, and you are finding that you are running into a wall sometimes?

Ms. BERG. Yes, like a good example would be the CRP program. And so you have a 10 year contract for CRP, you planted your CRP, you got it up, and then let's say you get into a drought situation. And so you are in this drought, your CRP is dying, and you don't really have much, whether it is technical assistance, financial assistance to help reestablish those plants that you planted, so then the farmers are led—now what? Now I am in trouble. I have no flexibility in the program, and I need to make sure that I either get it established or I have to pay it back. And so that becomes very difficult for farmers. And so there needs to be ways, especially when you have natural disasters, whether it is fire, wind, however you want to like categorize it. And so there definitely needs to be more flexibility in the programs and a little bit more assurances through quality assurances across state lines on how can we make these and how is it not one size fits all?

Mr. LAMALFA. Interesting, yes, because it is through no fault of their own but the conditions, maybe it is drought, maybe some other natural disaster, hurricane or whatever, tornado, earthquake where I am from, that could change their ability to fulfill as they would have desired to deal with, and all of a sudden they are in trouble. Well, I appreciate that. That gives us something to go with here. So please, anybody on the panel that was—you are nodding your head, too—send your thoughts along as I have run myself out of time here. But as we formulate the next farm bill and these conservation programs, help us to build in the flexibility and adaptability.* Nobody is trying to work around the program or take advantage of it in a malicious way. It is just things do happen. So thank you. I yield back.

The CHAIR. Thank you, I now recognize myself for an additional 5 minutes. And I just want to do some follow-up with some straightforward questions that I am asking more for the record than for anything else as we move into the future. Mr. Crowder, you have talked a lot about direct hire authority. Can you just give

* **Editor's note:** the responses to the information referred to are located: for Mr. Crowder, p. 1583; Ms. Faeth, p. 1584; and Mr. Wiese, p. 1585.

us a brief rundown of what that would mean and why that matters?

Mr. CROWDER. Madam Chair, I don't have the numbers in front of me but it is 700 to 1,000 NRCS employees that they are down. They have filled 500 or 600 a year, but the attrition rate—they are not gaining on attrition rate. So we have to have that authority through the NRCS to make sure that they can very quickly fill positions throughout the United States to make sure that those field offices are full.

And the other issue is not just direct hire authority but the amount that they are paying the folks in Washington State, a new employee would make \$24,000 more if they worked for the State of Washington than the NRCS. So they are losing engineers and other specific employees because there is not enough funds there to compete with the private or other Federal agencies.

The CHAIR. So it sounds like that needs to be a continued conversation about pay structure, pay bands, as well.

And now, Mr. Wiese, I am going to go to you with a bit of a follow-up. You said something in an answer I think it was to Mr. Allen's question where you were talking about the short intense graze and like what you have seen in terms of dead grass, worrisome terrain just getting eaten up and then new growth come in. Could you just speak to that a little bit? For those who maybe don't spend time either working the land with cattle or their crops in their district are not necessarily livestock and they don't spend a lot of time on ranches, could you just sort of walk through how some of these programs in the day-to-day function, and I am talking really like 101 discussion, again, for the record, how they facilitate what it is that you do with the added benefit of carbon sequestration and support to soil and also allow you to keep the waterways clear.

Mr. WIESE. Thank you. I think cattle are underappreciated for their value to upcycle nutrients. They are taking fiber, cellulose in the plants and digesting it, which we cannot do, and they are turning it into a nutritious protein source for us. And while they do that, they are providing nutrients back into the soil to promote organic matter and prosperity.

So, for us in terms of rotating cattle, there is a lot of benefit in terms of what they call take half, leave half in terms of plants. So how our cattle ranch operates is we turn cattle in to a pasture. It is a lot of visual appraisal and making sure that we don't graze it down to the dirt. And after about anywhere from 5 to 10 days, we move them to a different pasture. And it is a constant cycle depending on the growing season. If you have cool season grasses *versus* warm season grasses, you have to adjust that all year long. And we truly are promoting that the root systems to go deeper. We are promoting green leaf blades to emerge to capture sunlight. That is key in carbon sequestration. And it is really not that complicated if you look at it just from a cattleman's perspective. It doesn't have to be this real scientific process.

So I would invite anybody if they would love to come witness this at our cattle operation, we intensively graze as long as we can fall, spring, summer grazing, and it is something I think a lot of young cattlemen and -women can integrate into their business to become more profitable.

The CHAIR. It is quite a sight to really spend time on a cattle operation and to see exactly what you are talking about, and even going back to your opening comments in terms of the balance of environmental benefits and benefits to the operation, social benefits, all the rest, even just the ability to know where your cattle are at any given time and be able to rotate them through smaller pastures. The folks on the ground have been just so vital. And I thank all of the cattlemen across Virginia who have spent a lot of time educating me on the benefits that their work has to the local economy, culture, society, and ultimately to our food sources.

The Ranking Member has a dueling hearing, has excused himself, so I am going to continue forward towards adjournment. And he is foregoing a closing statement but again conveys his appreciation, as do I. Thank you. To follow up on what Ranking Member LaMalfa was saying, I do want to thank all of our farmers. I think that farmers do need a lot more credit, as do foresters, for the work that they do to protect our natural resources, the work that they do looking after the land and frankly, the work that they do to feed our fellow Americans.

I want to thank all of you for being here today. You have provided really thoughtful insights regarding the USDA's conservation programs. And certainly, as we look ahead to the 2023 Farm Bill, we want to make sure that we are informing any changes, adjustments, modifications to these programs based on what is working, what is not working. And I think that we have all heard very loud and clear timelines, responsiveness, flexibility, hiring flexibility, recognition that different areas, regions, and in fact, types of crops produced really might dictate the needs for flexibility so that producers on the ground can make the most of these programs.

Your thoughts on what is working and is not working is so helpful to us as we try to make these policies stronger, as we work to ensure that they do work for producers, and as we are looking to find on-farm efficiencies, boost the bottom line for producers, and make sure that we have an eye on combating the climate crisis with nature's—well, the first conservationists, who, of course, are our nation's farmers and producers.

So with that, I would like to thank you all for your time today. And under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any questions posed by a Member.

This hearing of the Subcommittee on Conservation and Forestry is now adjourned.

[Whereupon, at 11:33 a.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY MICHAEL CROWDER, PRESIDENT,
NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

Insert

Mr. LAMALFA. . . . So I guess what we are really looking at is that sometimes you are running into inflexibility or lack of knowledge and so you got a hard-and-fast rule that doesn't allow the type of things that would be actually beneficial and towards the goals of the conservation but also help the farmers thrive, and you are finding that you are running into a wall sometimes?

* * * * *

Mr. LAMALFA. . . . So please, anybody on the panel that was—you are nodding your head, too—send your thoughts along as I have run myself out of time here. But as we formulate the next farm bill and these conservation programs, help us to build in the flexibility and adaptability.

NACD believes that providing flexibility within USDA conservation programs allows producers to implement the most effective conservation practices that best fit their unique locations and operations. For example, EQIP permits producers to select between more than 150 eligible conservation practices, which allows Midwest row crop farmers to implement cover crops or no-till, while Louisiana rice farmers can adopt practices to increase irrigation efficiency.

NACD's Farm Bill Task Force has identified some areas within Federal conservation programs where additional flexibility may improve outcomes for producers. For example, the task force believes that CRP should provide more flexibility for producers to utilize haying and grazing in order to meet needs in a timely manner. Generally, NACD believes that encouraging a locally informed and led approach across all conservation programs will provide producers with the flexibility to best meet their needs and put good conservation practices on the ground.

GOVERNMENT RELATIONS, LAND TRUST ALLIANCE

Insert 1

Ms. PINGREE. Sure. Those are really, really helpful, and it would be great if you do follow up with more details to all of us. I think we are all interested in this.

I also was interested, you mentioned something about including forestry, a forest health set-aside. Do you want to talk a little bit about that, too? I thought that was an important idea. And so many of us have forest lands in our district. Maine is the most forested state in the nation with a lot of private forest land, so that is a big interest to us.

Ms. FAETH. Sure, thank you. In the 2018 Farm Bill, one of the things that wasn't addressed is the gap to provide an easement opportunity for working forested lands, so we are proposing enhancing the existing Healthy Forests Reserve Program to establish a new program called the Forest Conservation Easement Program. It would be a sister program to ACEP where there would be forestland easements, those would be entity-held easements, and then forest reserve easements focused on endangered species and restoration of those lands. And those would be U.S.-held easements. We think this is a much-needed and important complement to the farm bill conservation programs. We would like to see mandatory funding.

We want to be really, really clear that in making sure that there is a working program for working forested lands that we are not attempting to limit or reduce dollars for conservation on our farms and ranches. So we believe that any funding for a Forest Conservation Easement Program must be in addition to the funding for ACEP, and I would be happy to provide more information.

The Alliance believes that the current Agricultural Conservation Easement Program is oversubscribed and under-funded. This is the reason why we will advocate for additional funds for ACEP. Currently, forestland is only eligible through the Regional Conservation Partnership Program. Outside of that, forestland is only allowed in ACEP when it is incidental to the prime farmland or grasslands of special significance priorities within the Agricultural Land Easement Program. Recognizing the threat to our productive farms is real, it is important that the ACEP funding is fully consumed within the priorities of the program. Redirecting any of the ACEP funds specifically to forest interests would undermine the effectiveness and unmet needs of these programs.

We believe our nation's prime forest resources are under a similar threat to development and subdivision as our prime farm and ranchlands. The Healthy Forest Reserve Program is typically deliberated within the forestry title where it is in contention with a huge number of public, state, and private forestry authorities, and only receives discretionary funding authority which has been minimal in recent years. We believe moving the HFRP authority into the conservation title, expanding it to include a component for entity-held easements, and providing mandatory funding can fill the forestry portfolio gap in conservation. Hopefully, with the infusion of IRA funding and the significant role forests play in overall climate and environmental health, the Committee will be able to take up this proposal without reducing the current farm bill mandatory funding levels for ACEP.

The Forest Conservation Easement Program (FCEP) would be a successor to and an expansion of the existing Healthy Forests Reserve Program. FCEP's purpose is to keep private forest land in forest use through conservation easements that purchase development rights from private landowners to prevent conversion to non-forest uses while maintaining working forests, a key strategy for protecting the U.S. forest carbon sink.

FCEP is designed to: (1) significantly improve and enhance the ability of the NRCS to effectively conserve working forests at scale through conservation easements; (2) prioritize keeping forests as forests, which will continue to provide a multitude of environmental, economic, and societal benefits; (3) help landowners restore, enhance and protect habitat for at-risk species while increasing carbon sequestration; and (4) provide landowners with two proven options for placing voluntary conservation easements on their land, with one held by the Federal Government and one held by eligible entities and land trusts. It accomplishes this via two program components: Forest Land Easements (modeled after Agricultural Land Easements under ACEP) and Forest Reserve Easements (as the successor to the Healthy Forests Reserve Program).

The creation of FCEP will not modify ACEP and must not take money away from ACEP. The NRCS easement programs are an important tool for conserving our working lands and must be adequately funded. We believe Congress should significantly increase funding for ACEP in the 2023 Farm Bill while establishing and funding, at a meaningful level, the Forest Conservation Easement Program.

Insert 2

Mr. LAMALFA. . . . So I guess what we are really looking at is that sometimes you are running into inflexibility or lack of knowledge and so you got a hard-and-fast rule that doesn't allow the type of things that would be actually beneficial and towards the goals of the conservation but also help the farmers thrive, and you are finding that you are running into a wall sometimes?

* * * * *

Mr. LAMALFA. . . . So please, anybody on the panel that was—you are nodding your head, too—send your thoughts along as I have run myself out of time here. But as we formulate the next farm bill and these conservation programs, help us to build in the flexibility and adaptability.

Yes, the whole process for ACEP and RCPP easements has become cumbersome in approving and closing easements. What used to be a 6–8 month process is now well over 18 months which is difficult for our farmers and ranchers to comprehend. Many of our member land trusts hold many more easements than those acquired through USDA funding. We think the Agricultural Land Easement program should provide as much flexibility as possible to the more experienced land trusts. One way to do that is through clarifying the certified entity program to streamline the implementation of entity-held easements for land trusts who meet certain criteria. Since being introduced into the farm bill in 2008, only six entities have received certified status. We believe there is great opportunity to increase the number of trusted partners who meet certification criteria and leverage NRCS resources to help more landowners conserve their working lands. We believe that the certification process and the benefits that certified entities receive could be clarified and streamlined.

In addition to that, we would like to see certified entities recognized across all NRCS easement programs including the Regional Conservation Partnership Program (RCPP). We believe RCPP is a logical place to allow more flexibility, especially with certified entities who have a proven track record of success in the program.

Thank you for your time. We would be glad to provide additional information on any of the questions.

SUPPLEMENTARY MATERIAL SUBMITTED BY SHAYNE WIESE, MANAGER, OPERATIONS,
WIESE & SONS: GOOD DOIN' BULLS; MEMBER, IOWA CATTLEMEN'S ASSOCIATION;
MEMBER, NATIONAL CATTLEMEN'S BEEF ASSOCIATION

Mr. LAMALFA. . . . So I guess what we are really looking at is that sometimes you are running into inflexibility or lack of knowledge and so you got a hard-and-fast rule that doesn't allow the type of things that would be actually beneficial and towards the goals of the conservation but also help the farmers thrive, and you are finding that you are running into a wall sometimes?

* * * * *

Mr. LAMALFA. . . . So please, anybody on the panel that was—you are nodding your head, too—send your thoughts along as I have run myself out of time here. But as we formulate the next farm bill and these conservation programs, help us to build in the flexibility and adaptability.

November 11, 2022

Dear Rep. LaMalfa and Members of the House Agriculture Subcommittee on Conservation and Forestry:

Agricultural producers, and specifically cattle producers, are often multi-generational. This means that we understand the land on which we operate, and how to improve efficiency, almost better than anyone. National conservation practice standards do well to take this into account, allowing flexibility for producer innovation and specific on-farm needs. However, lack of local personnel means that NRCS is unable to effectively implement these practices in a timely manner.

As stated in my written testimony, I approached NRCS seeking cost-share assistance for implementation of a water infrastructure project and gave up after a months-long waiting game. Often, when a farmer or rancher seeks cost-share, it's for a necessary project on their operation. In these instances, a producer does not have the luxury of waiting months to hear back from USDA.

During the hearing, Ms. Berg from the National Association of Wheat Growers stated, "Farming, as you know, is . . . each year's different. Each season's different. And it's not in a book somewhere." The same sentiment applies to cattle producers. We welcome opportunities for USDA staff to visit our farms and ranches; it's critically important for them to understand why some practices make more sense for producers to implement than others. For example, burning CRP for mid contract management on my farm would not have been a viable option for me this year. We're in the middle of a drought—why not encourage grazing as a management practice instead?

Increases in personnel and reducing paperwork burdens are key to ensuring that NRCS can respond to cost-share applicants in a timely manner and provide more direct support through technical assistance to producers. As the Committee begins to work on the next farm bill, I urge Members to consider policies that will provide local staff as much flexibility as possible.

Respectfully,

SHAYNE WIESE,
Rancher,
Iowa Cattlemen's Association,
National Cattlemen's Beef Association.

SUBMITTED STATEMENT BY ENVIRONMENTAL DEFENSE FUND, *ET AL.**

The above-named conservation organization appreciate the opportunity to submit written testimony to the Conservation and Forestry Subcommittee after the productive hearing of September 20, 2022 on reauthorization of the Farm Bill's Conservation Title. Our organizations are actively working with producers in the Colorado River Basin to both sustain their agricultural operations in the face of water scarcity and to improve working lands' resilience to drought. The overwhelming consensus from the September 20th hearing was the importance of meeting producers' needs with the reauthorization of the Conservation Title. **Our organizations also support this focus.** Particularly, we write today to emphasize the need expressed during the September 20th hearing:

*Environmental Defense Fund, National Audubon Society, Theodore Roosevelt Conservation Partnership, and Trout Unlimited.

- **to reduce administrative barriers to producers' access to conservation title programs; and,**
- **to increase effective, relevant technical assistance for producers.**

Below, we make several specific recommendations for the Subcommittee's consideration on both of these points.

In addition, as Representative Tom O'Halleran (D-AZ, 1st Dist) raised during the hearing, drought is detrimental to Arizona's agricultural industry. Farmers and ranchers in Arizona and other western states need help with drought resilience practices. As hearing witness Nicole Berg, *President, National Association of Wheat Growers*, recounted as one example, drought can impact wetland plants growing on enrolled CRP (Conservation Reserve Program) acres, and producers need technical assistance in re-establishing good habitat conditions post-drought. We believe that the Farm Bill's Conservation Title must include a focus on programs that can help farms, ranches, and private forest lands:

- **be sustainable and adaptable to long-term droughts and hotter and drier climates.**

I. Producers' Needs in the West.

The western United States' farms, ranches, and private forest lands are confronting new challenges that require immediate and long-term attention. It is undeniable that agriculture and forestry practices have inherent risks. But in recent years, the increasingly extreme weather patterns have become harsher and much more difficult to predict. This has increased the need for rapid mitigation and adaptation in the face of changing conditions. This is especially true in the Colorado River Basin, which has become hotter and drier relative to other parts of the West and is facing a more severe stored water shortage as a result.

Farming and ranching in the Colorado River Basin provide a significant source of food supply for the entire country, and forests serve as the primary source of clean water and natural storage in the Basin's headwaters. However, higher temperatures and prolonged and extreme droughts in the Basin over the past 2 decades have exacerbated wildfire dangers in public forests and private lands, forced a number of ranchers to reduce herd size or exit ranching altogether, and required farmers to navigate significant threats from dry soils, pests, fires, and freezes, among others.

Both farming and forestry systems need to build substantial drought mitigation and resilience to the changing conditions and realities of a hotter, drier climate. The Department of the Interior has a presence and role to help allocate and manage limited water supplies throughout the West. But Interior's programs alone are not enough to provide the drought mitigation and resilience that farming, ranching and forestry require to adjust to the changing conditions seen in the West. The Farm Bill's Conservation Title also plays an important role. Specifically, we urge the Subcommittee to:

- **maintain Conservation Title baseline funding;**
- **maintain the *Inflation Reduction Act's* Conservation Title funding through covered programs to support climate-smart practices;**
- **maintain and improve implementation of the 2018 Farm Bill's western-facing provisions; and**
- **provide drought resilience assistance to producers.**

II. Key Concepts for Improving Producers' Access to Conservation Title Funding and Technical Assistance.

The 2018 Farm Bill created a highly-successful example of efficient delivery of applied conservation to producers with partners through the Conservation Innovation Grants' (CIG) new *On-Farm Conservation Innovation Trials*¹ program. The \$25 million in annual funding to the On-Farm Conservation Innovation Trials program goes directly to partners, which in turn provide technical assistance and payments to producers to implement innovative approaches on their lands. In contrast to the Regional Conservation Partnership Program (RCPP), the CIG On-Farm Trials program has rolled out smoothly, minimized administrative burdens on NRCS staff, partners, and producers, and has already created a track-record of success. In addition, the statutory authority for the CIG On-Farm Trials program is a model for amending the RCPP to reduce the complex administrative barriers and burdens of RCPP.

¹<https://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/programs/financial/cig/?cid=nrcseprd1459039>.

RCPP, Regional Conservation Partnership Program: The new Salesforce-supported RCPP portal for application submission launched since the passage of the 2018 Farm Bill has added to the workload and time required to apply to RCPP. More significant, however, than the barriers to the application are the significant delays and time required to finalize funding award contracts between partners and the NRCS, particularly around the provision of Technical Assistance. Renewals of prior, successful RCPP proposals were given a streamlined process to receive a second round of funding under the 2018 Farm Bill, but instead encountered years-long delays. In short, RCPP, since the 2018 Farm Bill, has increased administrative burdens on NRCS staff and partners alike, and, has failed to offer a streamlined approach to getting financial and technical assistance to producers. Our conservation organizations have proposed RCPP amendments to adopt the CIG On-Farm Trials contracting and administrative vehicles to streamline RCPP and enhance delivery of technical and financial assistance to producers. We look forward to discussion of these proposed amendments.

P.L. 83-566, Watershed and Flood Prevention Operations: The 2018 Farm Bill recognized the years-long process required to initiate and complete a required Watershed Plan before project implementation and construction for a “P.L. 83-566” project under the Watershed and Flood Prevention Operations program. An approach tried under the 2018 Farm Bill was to authorize the Secretary to grant a discretionary waiver of a Watershed Plan where a Plan is “unnecessary or duplicative,” such as where environmental and cultural resource compliance activities have been completed by another Federal agency. Report language describes this waiver as intended to be used “. . . for work which is categorically excluded from more significant USDA or other Federal agency review, or where adequate planning has already been conducted.” No waivers have been awarded under this 2018 Farm Bill provision (as far as we are aware), and the availability of P.L. 83-566 authority under RCPP has been under-utilized for such activities as small-scale stream restoration to promote drought resilience or multi-benefit irrigation efficiency projects with watershed health and drought resilience benefits. Modernizing the P.L. 83-566 statutory authority to prioritize these types of projects and resilience outcomes is another priority for improving program delivery to producers, especially in the West.

Stand Alone Conservation Innovation Grant (CIG) On-Farm Trials: Make the CIG “On-Farm Trials” a fully-funded, stand-alone program on par with RCPP (\$300 million/year) with a focus on reducing producers’ risk from extreme weather events. This approach would fund and amplify partners’ abilities to provide technical assistance, and in the West, specifically support priorities such as: range restoration/drought resilience through nature-based solutions; soil health improvement; and multi-stakeholder project planning/enhanced Technical Assistance for multi-benefit WME (Water Management Entity) irrigation system efficiency modernization. Support for the latter would produce projects that meet the statutory sideboards of “watershed-wide water conservation,” or “fish and wildlife habitat benefits,” or “environmental drought mitigation.” In particular, CIG’s could focus on solutions that bridge the economic gap between up-front transition costs and long-term economic benefits of adopting the types of practices outlined above to reduce producers’ risk from extreme weather events, including flood, drought, and wildfire.

III. Key Concepts for Improving Producers’ Resilience to Drought.

CREP Drought Pilot: The 2018 Farm Bill created a drought CREP authority in Section 2202(e) (“Drought and Water Conservation Agreements”) to allow compensation for producers’ reduction in consumptive water use. The Farm Service Agency (FSA) determined in its NEPA review that the FSA would not implement this discretionary authority. As drought conditions have deepened in the Colorado River Basin, Klamath, and other areas of the West, the importance and timeliness of this 2018 authority has become apparent. As western states consider actions to reduce consumptive water use, launching a CREP drought pilot could become a priority even before 2023 Farm Bill reauthorization. The CREP drought pilot should also potentially include more flexible arrangements to encourage CREP participation, such as expanding eligible land enrollment to encompass dryland agricultural uses or water-conserving crops, and to transition the CREP-enrolled lands to alternative agricultural or management uses that are sustainable over the long-term in light of water scarcity.

Water Management Entities: The 2018 Farm Bill created a new EQIP provision authorizing “water management entities” (WME) to enter into EQIP contracts with NRCS to implement “watershed-wide” projects that “effectively conserve water” and “provide fish and wildlife habitat or provide for drought-related environmental mitigation” through modernization of irrigation water delivery infrastructure. (*codified at 16 U.S.C. 3839aa-2(h)*). Unfortunately, this new provision not only remains un-

supported by technical assistance but there is little policy guidance on qualifying project types or how WME's can apply for EQIP funds. Based on a survey by Trout Unlimited and the Theodore Roosevelt Conservation Partnership of WME participants, other barriers include NRCS' failure to develop a streamlined application process, requiring applicants to obtain signatures from all water users/landowners within WME boundaries to support the application, and generally a lack of NRCS capacity/expertise in implementing the program.

Water Conservation Practices: The 2018 Farm Bill directed the NRCS to make available to producers "water conservation" practices through EQIP, such as "water conservation scheduling, soil moisture monitoring, transition to water-conserving crops, water-conserving crop rotations, or deficit irrigation." (16 U.S.C. 3839aa–2(h)). This directive remains unsupported by technical assistance. In addition, there is no policy guidance on qualifying EQIP conservation practice standards, or a call for CIG proposals, for example, to develop new conservation practice standards to implement the enumerated water conservation practices.

Forestry Title—Prioritize Nature-Based Solutions: The Forestry Title presents opportunities to advance drought resilience strategies such as science-based forest management through reauthorization and increased funding for the Watershed Condition Framework, and nature-based approaches, including restoration of source water wetlands and riverscapes. With regard to the Water Source Protection Program, the 2023 Farm Bill could reauthorize the program, could specifically include stream, riparian, and wetland restoration within the definition of "forest management activities" under 16 U.S.C. § 6542(e)(1), and reduce the match requirement to enhance program participation and accessibility.

Rural Development Title—Nature-Based Approaches for Drought Resilience: While not in this Subcommittee's jurisdiction, we mention the opportunity to work with the Rural Development Title to align some drought resilience goals. The Rural Development Title establishes, amends, and reauthorizes programs administered by the Rural Development agency within USDA. Rural Development Title programs include, among other things, financial and technical assistance for rural water and wastewater infrastructure and rural economic development. One potential area of drought resilience alignment would be to amend rural water and waste wastewater programs to include green and natural infrastructure projects, and expanding the rural water circuit rider program to include technical support for natural infrastructure.

Conclusion

We appreciate the Subcommittee's focus on reauthorization of the Conservation Title with producers' needs at its center. We hope this written testimony is helpful to the Subcommittee, particularly for meeting the needs of producers in the West. Our organizations look forward to working with Members and staff of the Subcommittee to further develop these key concepts and associated elements to support the drought resilience of working lands in the West.

SUBMITTED QUESTION

Question Submitted by Hon. Tom O'Halleran, a Representative in Congress from Arizona

Response from Lori Faeth, Senior Director of Government Relations, Land Trust Alliance

Question. Ms. Faeth, in your testimony, you focused on your support of easement programs. You also referenced a 2018 report from Colorado State University that showed that landowners with an easement were more likely to change their agricultural practices to improve things such as irrigation.

Could you explain how easements can help preserve groundwater?

Answer. Our member land trusts acquiring and supporting USDA's easement programs set priorities for preserving the agricultural land and the opportunity for the land to continue in production not only economically but also environmentally for future generations.

There is a great example of how easements can help preserve groundwater in the Williamson Valley in Arizona. The owner of Bar Triangle Ranch has placed an NRCS easement over 640 acres of his property. His goal is to place the entire 6,000 acre ranch under an agricultural easement, and he is working with the Central Arizona Land Trust to do so. The easement ties the water rights to the land, meaning it will be forever a part of the ranch and cannot be severed or transferred. That means the surface and ground water will be in place to the benefit of agriculture and the habitat. The benefits of easements are even evident on ranches with rel-

atively low water use because it prevents the ranch from being converted to a higher water use such as a commercial or industrial property. There are other examples of easements protecting groundwater across the West and the country.

Where irrigation is integral to the agriculture production system, we are supportive of continued improvement in the irrigation system's infrastructure and management to promote efficient water use for operation. Programs like Environmental Quality Incentives Program and Conservation Stewardship Program can be used to improve the efficiency and use of irrigation water delivery. We believe landowners of eased lands should have priority access to these programs.

A 2022 REVIEW OF THE FARM BILL
(TITLE XII—DEPARTMENT OPERATIONS AND OUTREACH)

THURSDAY, SEPTEMBER 29, 2022

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON NUTRITION, OVERSIGHT, AND DEPARTMENT
OPERATIONS,
COMMITTEE ON AGRICULTURE,
Washington, D.C.

The Subcommittee met, pursuant to call, at 9:31 a.m., in Room 1300 of the Longworth House Office Building and via Zoom, Hon. Jahana Hayes [Chairwoman of the Subcommittee] presiding.

Members present: Hayes, McGovern, Brown, Carbajal, Lawson, Kuster, Panetta, DesJarlais, Baird, Cloud, Cammack, Finstad, and Thompson (*ex officio*).

Staff present: Caitlin Balagula, Amar Nair, Lisa Shelton, Katherine Stewart, Caleb Crosswhite, Patricia Straughn, Jennifer Tiller, Erin Wilson, and Dana Sandman.

**OPENING STATEMENT OF HON. JAHANA HAYES, A
REPRESENTATIVE IN CONGRESS FROM CONNECTICUT**

The CHAIRWOMAN. This hearing of the Subcommittee on Nutrition, Oversight, and Department Operations entitled, *A 2022 Review of the Farm Bill: Title XII—Department Operations and Outreach*, will come to order.

Welcome, and thank you for joining today's hearing. After brief opening remarks, Members will receive testimony from our witnesses today, and then the hearing will be open to questions. Thank you to the Under Secretary and to the Administrator for joining today's hearing, which is another in our series of hearings to review the 2018 Farm Bill and prepare for the 2023 Farm Bill. I appreciate you both taking the time to be here and offer your expertise. I especially thank you for being here in person.

During this hearing, we will hear from the USDA about the implementation of the 2018 Farm Bill provisions and the impact on Department operations and outreach programs like the Beginning Farmers and Ranchers Development Program. This is also an opportunity to learn how the COVID-19 pandemic and other events over the past 4 years have impacted the Department and these important programs. Today's testimony will be critical as we craft the 2023 Farm Bill and will help to ensure that we do so with an eye on how the structure and operations of USDA impact our nation's farmers, ranchers, and all those the Department serves.

USDA is comprised of 29 agencies and offices with more than 100,000 employees. And there are more than 4,500 USDA offices in the U.S. and across the world. Ensuring that Congress properly funds, supports, and oversees USDA operations so that the Department operates effectively, meaning both that it is fully staffed and its programs operate properly, is critical to maintaining the American food supply and feeding our nation for years to come. It is also critical to ensure that USDA's external-facing operations are running smoothly, and that USDA farm programs are reaching all of our country's producers, which is where the outreach programs serve a crucial role.

We know our nation's producers are getting older. As of 2017, more than $\frac{1}{3}$ of America's farmers were 65 or older. The average age of producers in the U.S. is about 58, up from previous years in the Agricultural Census, a continuing trend we have been seeing for some time. In Connecticut 5, which is my District, 32 percent of farmers are 65 or older, so we are doing slightly better than the nation as a whole. But, like the country, we are still in dire need of more new and beginning farmers.

To strengthen the future of agriculture in America, it is important that USDA programs are accessible to all producers. Supporting our new and beginning farmers who are in the first 10 years of operation is key to cultivating the future of American agriculture. Encouraging more people from every background to go into farming is also key to ensuring we have a strong agricultural system for many decades to come. That is why USDA outreach to underserved communities like farmers of color, women, veterans is critical to ensuring these communities have the resources they need to succeed.

According to the 2017 Census of Agriculture, only 1.7 percent of all producers identified as American Indian or Alaska Native, 0.6 percent identified as Asian, 1.3 percent as Black or African American, 0.1 percent as Native Hawaiian or other Pacific Islander, 0.8 percent as more than one race, and 3.3 percent as Hispanic, Latino, or Spanish origin. Only about 11 percent of farmers served in the military, and about 36 percent of producers are women. We can and we must do better.

I look forward to hearing more today about the programs that perform outreach into these communities, including the Outreach and Assistance for Socially Disadvantaged and Veteran Farmers and Ranchers Program, also known as Sec. 2501 Program and the Beginning Farmers and Ranchers Development Program, and how they support today's producers while cultivating the next generation of farmers.

I want to thank again the Members and the witnesses for joining us today. I sincerely look forward to hearing today's testimony about the importance of USDA outreach programs and the status of Department operations issues, like staffing, IT, and much more.

[The prepared statement of Mrs. Hayes follows:]

PREPARED STATEMENT OF HON. JAHANA HAYES, A REPRESENTATIVE IN CONGRESS
FROM CONNECTICUT

Thank you to the Under Secretary and to the Administrator for joining today's hearing, which is another in our series of hearings to review the 2018 Farm Bill

and prepare for the 2023 Farm Bill. I appreciate you both taking time out of your schedules to us with your expertise.

During this hearing, we will hear from USDA about the implementation of 2018 Farm Bill provisions and the impact on Department operations and outreach programs, like the Beginning Farmers and Ranchers Development Program. This is also an opportunity to learn how the COVID-19 pandemic and other events over the past 4 years have impacted the Department and these important programs.

Today's testimony will be critical as we craft the 2023 Farm Bill, and will help to ensure that we do so with an eye on how the structure and operations of USDA impact our country's farmers, ranchers, and all those the Department serves.

USDA is comprised of 29 agencies and offices with more than 100,000 employees, and there are more than 4,500 USDA offices in the U.S. and across the world. Ensuring that Congress properly funds, supports, and oversees USDA's operations so that the Department operates effectively—meaning both that it is fully staffed and that its programs operate properly—is critical to maintaining the American food supply and feeding our nation for years to come.

It is also critical to ensure that USDA's external-facing operations are running smoothly and that USDA's farm programs are reaching all of our country's producers, which is where the outreach programs serve a crucial role.

We know our nation's producers are getting older. As of 2017, more than 1/3 of America's farmers were age 65 or older. The average age of producers in the U.S. is about 58, up more than a year from the previous Agricultural Census, continuing a trend we have been seeing for a long time.

In CT-5, my District, 32 percent of farmers are 65 or older, so we are doing slightly better than the nation as a whole, but like the country at-large, we are still in dire need of more new and beginning farmers.

To strengthen the future of agriculture in America, it is important that USDA programs are accessible to all producers. Supporting our beginning farmers—farmers who are in their first 10 years of operation—is key to cultivating the future of American agriculture.

Encouraging more people from every type of background to go into farming is also key to ensuring we have a strong agricultural economy for many decades to come. That is why USDA's outreach to underserved communities—like farmers of color and women and veteran farmers—is critical to ensuring these communities have the resources they need to succeed.

According to the 2017 Census of Agriculture, only 1.7 percent of all producers identified as American Indian or Alaska Native, 0.6 percent identified as Asian, 1.3 percent as Black or African American, 0.1 percent as Native Hawaiian or other Pacific Islander, 0.8 percent as more than one race, and 3.3 percent as of Hispanic, Latino, or Spanish origin. Only about 11 percent of farmers served in the military and about 36 percent of producers were women. We can do better!

I look forward to hearing more today about the programs that perform outreach to these communities, including the 'Outreach and Assistance for Socially Disadvantaged and Veteran Farmers and Ranchers Program'—also known as the 2501 Program—and the Beginning Farmer and Rancher Development Program, and how they support today's producers while cultivating the next generation of farmers.

Thank you again to our Members and witnesses for joining us today. I sincerely look forward to hearing today's testimony about the importance of USDA outreach programs and the status of Department operations issues, like staffing, IT, and much more.

The CHAIRWOMAN. Unfortunately, our Ranking Member from Nebraska, Mr. Bacon, is unable to join us today. We wish him well and hope that he is feeling better. I am sure that he will be tuned in, and if he has questions, he will reach out. I now recognize Chairman Scott if he is here for any opening comments that he would like to make. I don't believe the Chairman is here, so I will recognize the Ranking Member, Mr. Thompson, if you would like to make any opening remarks.

**OPENING STATEMENT OF HON. GLENN THOMPSON, A
REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA**

Mr. THOMPSON. Well, good morning, everybody. And thank you, Chairwoman Hayes, for hosting this hearing to discuss the Miscellaneous Title of the farm bill. And while Title XII is literally a

large title that includes a variety of provisions, we are focused today on a few select provisions that impact Department operations and outreach. And as we prepare for the next farm bill, it is important to ensure young, beginning, socially disadvantaged, and veteran farmers know about and have access to USDA programs and the benefits they provide.

If we are serious about restoring a robust rural economy, it is important to evaluate the programs and outreach that impact our farmers, ranchers, foresters, and those living in rural America, or, as I like to call it, essential America because everything that a family needs—and whether they live down a country lane or in a densely populated city, those things that are essential come from that part of our nation and families, the hardworking families that provide it.

And I look forward to hearing from USDA about how they are implementing some of the new positions and existing programs authorized in the 2018 Farm Bill. I would like to thank Under Secretary Jacobs-Young and Administrator Ducheneaux for taking the time to be with us today. Dr. Jacobs-Young, I look forward to having you back before the Committee to talk about the important work you are spearheading in the Research, Education, and Economics mission area as well.

So, with that, Madam Chairwoman, thank you so much, and I yield back.

The CHAIRWOMAN. Thank you, Mr. Thompson.

The chair would request that other Members submit their opening statements for the record so witnesses may begin their testimony and to ensure there is ample time for questioning.

Today, we are joined by two witnesses from USDA. Our first witness is Dr. Chavonda Jacobs-Young, the Under Secretary for Research, Education, and Economics, or REE, and Chief Scientist at USDA. Prior to being confirmed as REE Under Secretary, Dr. Jacobs-Young served in various roles at USDA for 2 decades, including most recently as Administrator for USDA's Agricultural Research Services from 2014 to 2022. Dr. Jacobs-Young holds a B.S., an M.S., and a Ph.D. from North Carolina State University and was the first Black woman in the U.S. to earn a doctorate in wood and paper science.

Our second witness is Mr. Zach Ducheneaux, the Administrator of the Farm Service Agency at the U.S. Department of Agriculture. Mr. Ducheneaux previously served as the Executive Director of the Intertribal Agricultural Council, an organization he worked at for over 2 decades. His family operates a fourth-generation ranch in the Cheyenne River Sioux Reservation.

Welcome to our witnesses today. We thank you so much for being here. We will now proceed to hearing your testimony. You will each have 5 minutes. The timer should be visible to you and will count down to zero, at which point your time has expired. Dr. Jacobs-Young, please begin when you are ready. You have 5 minutes for testimony.

**STATEMENT OF HON. CHAVONDA JACOBS-YOUNG, PH.D.,
UNDER SECRETARY FOR RESEARCH, EDUCATION, AND
ECONOMICS AND CHIEF SCIENTIST, U.S. DEPARTMENT OF
AGRICULTURE, WASHINGTON, D.C.**

Dr. JACOBS-YOUNG. Chairwoman Hayes, Ranking Member Bacon, and Members of the Committee, thank you for the opportunity to come before you today to discuss Title XII of the farm bill. As Under Secretary for the United States Department of Agriculture's Research, Education, and Economics mission area, I am excited to be here today to discuss REE's equity and outreach efforts.

The REE mission area is rooted in partnerships, partnerships with technical assistance providers, including the Cooperative Extension System, that gives producers the tools they need to adapt as they feed the world; with institutions to support the next generation of agricultural scientists; and with Congress to ensure that decision-makers have the tools they need to support farmers or ranchers across the country.

Production agriculture requires constant innovation and adaptations as farmers and ranchers pursue climate-smart solutions to extreme weather, rural businesses seek markets, and underserved communities seek trusted partners to tackle systemic issues. Outreach and access to information underpins each of these objectives, and when appropriately resourced, REE is well-positioned to be a partner in providing timely outreach, research, training, extension, and economic analysis to support informed decisions.

The challenges faced in agriculture, human and animal health, food supply, and conservation are immense, and helping producers tackle these issues is critical. We must meet those challenges head on and need a robust and diverse agricultural workforce to do so and leverage existing partnerships to help achieve that outcome. First, this means ensuring that the REE workforce feel supported and able to carry out their mission to provide outreach to producers. REE faced significant staff losses over the past 5 years, and rebuilding that capacity is a key priority for the mission area. It has never been more critical to restore our employees' voices and support their efforts to advance the agency's mission.

The President and Secretary have both been very clear: This new workforce must look like America, particularly to ensure that we are conducting equitable outreach to producers. Investing in inclusion, diversity, and inspiring future generations through formal and informal learning is critical for the future. As an agricultural scientist myself, I know that talent must be inspired, nurtured, and advanced across the country if the United States is to maintain its global leadership in science and technology.

That is why Secretary Vilsack recently announced \$250 million for minority-serving institutions that create career development opportunities in agriculture through the From Learning to Leading: Cultivating the Next Generation of Diverse Food and Agriculture Professionals, and we call it the NEXTGEN program. This competitive program opportunity made possible through investments provided in the American Rescue Plan Act (Pub. L. 117-2), ARPA Section 1006, as amended by Section 22007 of the Inflation Reduction Act (117-169), is aimed at attracting, inspiring, and retaining diverse and talented students at minority-serving institutions for ca-

reers in food, agriculture, and related disciplines with an emphasis on Federal Government sector employment.

USDA is dedicated to ensuring equity across its agencies and developing a diverse workforce. At REE we know that supporting 1890 land-grant universities is vital to make a strong, life-changing impact towards Secretary Vilsack's vision. In Fiscal Year 2021, the National Institute of Food and Agriculture administered 16 programs specifically for minority-serving institutions, with over \$250 million in funding and over \$974 million in total grant awards to 1890 institutions in the past 5 years.

The Beginning Farmer and Rancher Development Program is a key component of NIFA's Title XII outreach. This program provides unique educational training and assistance and outreach opportunities to help ensure that there will be a next generation of farmers and ranchers, regardless of age or production choice.

In my time leading REE and in my 20 years in Federal service, I have had the opportunity to travel across the country and meet with many of the people we serve. I have witnessed states in every region of the country and many of your districts meeting with the people you represent. They are optimistic about the future of agriculture, and so am I. President Biden, Secretary Vilsack, and REE are poised to support transformation in agriculture. We can meet and expand our commitment to leveling the playing field for farmers and ranchers as they work to feed the world, and I look forward to working with the Subcommittee and full Committee to support this mission.

[The joint prepared statement of Ms. Jacobs-Young and Mr. Ducheneaux follows:]

JOINT PREPARED STATEMENT OF HON. CHAVONDA JACOBS-YOUNG, PH.D., UNDER SECRETARY FOR RESEARCH, EDUCATION, AND ECONOMICS AND CHIEF SCIENTIST, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.; ZACH DUCHENEAX, ADMINISTRATOR, FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Chairwoman Hayes, Ranking Member Bacon, and Members of the Committee, thank you for the opportunity to come before you today to discuss Title XII of the farm bill with a specific focus on the Department's equity and outreach efforts. As the Under Secretary for the United States Department of Agriculture's Research, Education, and Economics (REE) mission area and the Administrator of the Farm Service Agency, we have seen the commitment of our staff across the nation, from our employees who work directly with Indian Country to our staff working in the Deep South, each coast, and many places in between. We have witnessed, firsthand, our employees' commitment to providing equitable access to and delivery of USDA programs and services including our farm loan programs, standing and *ad hoc* disaster assistance programs, partnerships with Minority-Serving Institutions, and commitment to developing a diverse workforce.

Production agriculture requires constant innovation and adaptation as farmers and ranchers pursue climate-smart solutions to extreme weather, rural businesses seek new markets, and underserved communities seek trusted partners to tackle systemic issues. Access to information and outreach underpins each of these objectives, and REE and FSA are well-positioned to be partners in providing timely research, tools, extension, and technical support producers need.

We know that family farms and ranchers want to stay on their land, like they often have for generations. That's why we are pleased that President Biden and Secretary Vilsack are strongly committed to supporting equitable outreach to producers, which we believe will define agriculture for coming decades. In August, the Department announced availability of up to \$550 million in American Rescue Plan Act funding to support projects that enable underserved producers to access land, capital, and markets, and train the next diverse generation of agricultural profes-

sionals. These provisions aim to help ensure underserved producers have the resources, tools, programs, and technical support that they need to succeed.

National Institute of Food and Agriculture (NIFA)

The challenges facing agriculture, human and animal health, food supply and conservation are immense, and helping producers tackle these issues is critical. We must meet those challenges head on and need a robust and diverse agricultural workforce to do so and leverage existing partnerships to help achieve that outcome.

First, this means ensuring that the REE workforce feels supported and able to carry out their mission to provide outreach to producers. REE faced significant staff losses over the past 5 years, and rebuilding that capacity is a key priority for the mission area. Rebuilding capacity will improve our ability to support the nation's farmers, producers, and consumers from the farm to the dinner table. It's never been more critical to restore our employees' voices and support their efforts to advance the Agency's mission. The President and Secretary have both been very clear—this new workforce must look like America, particularly to ensure that we are conducting equitable outreach to producers. Investing in inclusion, diversity, and inspiring future generations through formal and informal learning is critical for the future. As an agricultural scientist myself, I know that talent must be inspired, nurtured, and advanced across the country if the United States is to maintain its global leadership in science and technology. That's why Secretary Vilsack recently announced \$250 million for Minority-Serving Institutions that create career development opportunities in agriculture for the From Learning to Leading: Cultivating the Next Generation of Diverse Food and Agriculture Professionals (NEXTGEN) program. This competitive funding opportunity, made possible through investments provided in the American Rescue Plan Act (ARPA) Section 1006, as amended by Section 22007 of the Inflation Reduction Act, is aimed at attracting, inspiring, and retaining diverse and talented students at minority-serving institutions for careers in food, agriculture, and related disciplines, with an emphasis on Federal Government sector employment. USDA is dedicated to ensuring equity across its agencies and developing a diverse workforce at all levels.

At NIFA, we know that supporting 1890 Land-grant Universities is vital to making strong, life-changing impact toward Secretary Vilsack's vision. In Fiscal Year 2021, NIFA administered 16 programs specifically for Minority Serving Institutions with over \$250 million in funding; and over \$974 million in total grant awards to 1890 Institutions in the past 5 years. Our 1890 Scholarship program has also invested over \$19 million to support undergraduates majoring in food and agriculture-related degree programs to increase the Next Gen Workforce in food and agriculture. In addition to the scholarships, NIFA also provided \$6 million in support of four Centers of Excellence and more than \$20 million in recent capacity-building grants, ensuring our 1890 Institutions will continue to make major advancements in research, education and Extension. In May, we announced another \$4 million investment in two additional 1890 Centers of Excellence.

The Beginning Farmer and Rancher Development Program is also a key component of NIFA's Title XII outreach. This program provides unique educational, training assistance and outreach opportunities to help ensure there will be a new generation of farmers and ranchers—regardless of age or production choice. During Fiscal Year 2021, NIFA awarded over \$50 million for 85 newly funded grants and 55 continuation Beginning Farmer and Rancher Development Program projects. NIFA is also home to the Enhancing Agricultural Opportunities for Military Veterans Program, which provides grants to nonprofit organizations to increase the number of military veterans gaining knowledge and skills through comprehensive, hands-on and immersive model farm and ranch programs. The program encourages the development of training opportunities specifically designed for military veterans. AgVets projects offer onsite, hands-on training and classroom education leading to a comprehensive understanding of successful farm and ranch operations and management practices. Projects may also offer workforce readiness and employment prospects for service-disabled veterans as well.

Farm Service Agency

As we continue to increase and improve access to programs and services, FSA has identified and taken advantage of opportunities to advance equity through our programs and services. We began by establishing an Equity Officer position which sits in the Administrator's Office. This position provides guidance and the equitable review of the Agency's overall programs and services, including farm program and farm loan program implementation, along with agency efforts focused on supporting and uplifting urban agriculture, beginning farmer and ranchers, heirs' property and fractionated land issues, and Justice40. The Justice40 Initiative aims to ensure that

Federal investments benefit communities that are marginalized, underserved, and overburdened by the effects of climate change and underinvestment. The Equity Officer also helps guide the Administrator in ensuring our County Committees approach their work with an equity lens; supporting diverse hiring, recruitment, and retention; and improving the customer experience of all producers who seek assistance from the FSA. In addition to the Equity Officer, FSA will have six equity analysts working in our Outreach Office. These individuals will also work with the Equity Officer and FSA Outreach Director as they work to integrate into their respective Deputy Administrator areas at FSA. Collectively they will:

- conduct data analysis to ensure programs are administered equitably;
- participate in the development of programmatic policies and procedures to avoid unintended consequences in program outreach and delivery; and
- provide detailed analyses of recruitment and retention efforts to ensure the continuation of the best work force in the Federal Government.

We've already mentioned FSA's Outreach Office. This office plays a crucial role in coordinating and implementing our Agency-wide activities. These include not just our outreach efforts but also our technical assistance, education, and producer engagement efforts. The FSA Outreach Office also administers millions of dollars in cooperative agreements and partnerships with stakeholders. Our goal is to increase producer participation in FSA programs, with targeted outreach to underserved producers and communities including minority, young, and beginning farmers, ranchers, landowners, and operators who have not participated in or have received limited, and sometimes, zero benefits from FSA programs. This level of targeted outreach will improve and increase access to and participation in FSA, and even other USDA agencies' programs.

One of the many ways we have implemented targeted outreach is through our work across FSA to support beginning farmers and ranchers. At FSA, and throughout USDA, we understand that ensuring the success of beginning farmers and ranchers is critical to the future of the agriculture industry. USDA has a long history of recruiting and supporting the next generation of farmers and ranchers, especially the viability of beginning farmers and ranchers. FSA supports this work by providing dedicated staff to support field employees in reaching new farmers, providing ongoing trainings to employees, creating educational materials targeting beginning farmers, and by collaborating with agencies to reduce barriers to program participation.

This work is underscored by the announcement of our most recent land access program—the Increasing Land, Capital, and Market Access Program, through which FSA will administer up to \$300 million in grants and cooperative agreements as authorized by the American Rescue Plan Act Section 1006, as amended by Section 22007 of the Inflation Reduction Act. Through this program FSA will fund land access projects that help underserved producers by increasing their land access, capital access, and/or market access.

We'll conclude with this: what we have provided is only a brief look into the work we are doing at FSA to ensure equity and increase and improve outreach. We have a full suite of projects and programs that are either currently in the works or will soon be established to meet the diverse needs of our producers and stakeholders. Whether we are addressing Taxpayer Education, utilizing Limited English Proficiency tools to connect with producers, or expanding our programs to meet the needs of urban and suburban producers, FSA is excited about the incredible work our dedicated staff at headquarters and across the nation conduct daily to reach current and future FSA and USDA customers.

Conclusion

In our time leading our respective agencies, we have had the opportunity to travel across the country and meet with many of the people we serve. We have visited states in every region of the country—including in many of your districts—and met with the producers and communities you represent. They are optimistic about the future of agriculture, and so are we. President Biden, Secretary Vilsack, our mission areas, and the rest of the team at USDA are all poised to support a transformation in agriculture—through which we can meet and expand our commitment to leveling the playing field for farmers and ranchers as they work to feed the world. I look forward to working with the Subcommittee and full Committee to support this mission.

The CHAIRWOMAN. Thank you.

Mr. Ducheneaux, when you are ready, you can begin your testimony. You have 5 minutes.

STATEMENT OF ZACH DUCHENEAX, ADMINISTRATOR, FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE, WASHINGTON, D.C.

Mr. DUCHENEAX. Thank you. Chairwoman Hayes, Ranking Member Bacon, Members of the Subcommittee, it is truly an honor and a privilege to appear before this august body as your Farm Service Agency Administrator and to visit about the work that I have the further honor and privilege to lead. I am Zach Ducheneaux, and I have been in this role since February of 2021. Prior to this, I was the third generation on my family's ranch on the Cheyenne River Sioux Reservation, and I am proud to have raised the fourth generation on the ranch and even prouder to have recently welcomed the fifth generation to that same place where my ancestors lived and produced food since time immemorial.

As a former rancher and a lifelong advocate for underserved people, I have approached my work at the FSA with a personal understanding of where we have room for improvement and also some of the places where, through partnerships, we can double and triple the impact of our work, particularly in underserved communities. By bringing new producers and partners into the fold, we can move towards the goals that we all should share, to help producers access more and better markets, to build resilience, to mitigate the market impacts that linger after what we hope is a once-in-a-generation pandemic, to quickly recover from the more frequent and more severe natural disasters, and to be part of a climate solution through a strength that is inherent in diversity of people, production, ideas, and solutions.

I have had the good fortune to visit with our FSA employees across the country, and in every county office, I have tried to take time to listen and gain more understanding of the passion that drives them as they work tirelessly to deliver our *ad hoc* pandemic and disaster assistance programs, to say nothing of their normal role in providing vital standing programs and services. I have witnessed firsthand many of our employees' commitment to providing equitable access to and delivery of USDA programs and services across rural, urban, and suburban communities. Looking ahead, my goal is to weave the ethic of equity into the DNA of the Farm Service Agency so that it is organic in every interaction we have with producers, every program we deliver, and every service we provide.

I would be doing a great disservice if I didn't use a portion of this time with you to thank our staff for their tireless efforts and to encourage all of you to do the same the next time when you are back in your district, driving by one of our over 2,100 county offices. I am pleased to share some of the work with you that we are doing now.

First, equity starts at the top. That is why under the leadership and guidance of Secretary Vilsack we have established an Equity Officer position in the Administrator's office. Latrice Hill brings decades of experience to this role and significant expertise, and I look forward to working with her to make sure that my office is helping to guide the equitable review of every aspect of our work.

In addition, we will also have six equity analysts working in the outreach office who will work with the Equity Officer and the Outreach Director to bring this important effort closer to the producers through immersion in each of our Deputy Administrator areas here at the Farm Service Agency. That outreach office also plays a critical role in coordinating and implementing agency-wide activities. These include not just our own outreach efforts but also support technical assistance, education, and producer engagement efforts through millions of dollars in cooperatives agreements, partnerships with stakeholder groups of all kinds.

Our goal is to increase producer participation in our programs, with targeted outreach to underserved producers and communities, including women, veterans, minority, young and beginning producers who have not participated in or receive limited and sometimes zero benefits from our programs.

Currently, at the direction of Congress, the office is at various stages of implementing historic levels of agreements, programs, and opportunities in the next fiscal year that will have hundreds of millions of dollars of impact. Of note, Section 1006 of the American Rescue Plan Act authorized over \$1 billion for the Secretary of Agriculture to provide assistance and support for underserved producers through technical assistance and cooperative development training. From this funding, FSA has established the Increasing Land, Capital, and Market Access Program, providing up to \$300 million to work with stakeholder groups and advanced system changing solutions to improve access to land capital and markets for underserved producers.

Because our workforce should reflect the producers we serve and the next generation of leaders that we hope to cultivate, we have expanded our use of special hiring authorities and implemented several new recruitment efforts. This year, FSA is funding scholar and intern programs with targeted outreach to our 1890 and 1994 land-grant institutions, in addition to our existing Pathways Student Internship Program, where participation has also markedly increased in the last year.

There are many more efforts underway that I hope to visit with you about, and I thank you again for the opportunity to be here in front of this body.

The CHAIRWOMAN. Thank you both so much for your testimony.

At this time, Members will be recognized for questioning in order of seniority, alternating between Majority and Minority Members. You will each be recognized for 5 minutes in order to allow us to get to as many questions as possible. Please keep your microphones muted until you are recognized so that we can minimize background noise.

I now recognize Chairman McGovern. You have 5 minutes for questioning. You may begin.

Mr. MCGOVERN. Well, thank you very much. And thank you to our witnesses for joining us today. And Chairman Hayes, again, thank you for convening this hearing.

Title XII doesn't often get the spotlight, but it gets to the heart of how we can build a more just and inclusive food system. How ambitious we are about empowering farmers, especially those who are new to agriculture or have historically not had a seat at the

table, will be a key measure of whether the next farm bill is a success.

So, I want to focus my time on USDA's outreach efforts. And I appreciate that both of our witnesses affirmed that it is a priority for the Department. In August, I hosted my annual district farm tour, visiting over a dozen Massachusetts farms over 2 days and hearing directly from our farmers. Something that came up at every farm was the challenge of applying to USDA or state programs. Farmers, especially small farmers, have so much on their plate. And even if they are perfect candidates for a USDA grant or cooperative agreement, even if they know about the existence of a program, they may not have the capacity to engage in the application process.

So, I have two questions for both of you. First, could you please elaborate on the ways that USDA is working to expand outreach efforts, especially to small, independent, diversified operations, beginning farmers, and socially disadvantaged farmers? And second, do you believe that there are holistic changes that we can incorporate into the next farm bill to expand programming accessibility?

Dr. JACOBS-YOUNG. Thank you for the question, Representative McGovern. And yes, it is so important for us to be on the ground and working and witnessing the producers and learning from them what their highest priorities are. We have been very fortunate to receive funding from Congress that has supported us in our efforts to increase the amount of technical assistance and outreach that we give to these small farmers. I just spent last Monday, Monday of last week, I did a small conference, a small farmers conference in Hattiesburg, Mississippi, talking to a group of small farmers and learning from them what their highest priorities are. And you are absolutely correct. And these organizations that we are partnering with, with new funding, are helping us reach out to those farmers to learn more about the programs and services that we have at USDA and providing that technical assistance and bridging the gap between their day-to-day experiences and the services that they are eligible for. And so, I think that that is a very important point. And I know the Administrator here with his agency are doing a lot of work on the ground, and so I am going to turn to the floor to Zach.

Mr. DUCHENEUX. Thank you. Very good question. My background is in outreach and technical assistance. And the reality is many of our stakeholders do not have the capacity to leverage the trust that they have built in their communities of stakeholders to help them get into our programs. You are exactly right. Our programs often miss folks that are ideally situated to be those that we serve.

One of the things that we are doing to address that is to engage in multiyear agreements with these cooperators so that they know that they will be able to bring that staff on that can help us with that outreach effort, retain them, and train them as we work to meet producers where they are at, at the agency. We are streamlining our processes. We are reducing the size of our farm loan application, which is critical to producers being able to get in there and participate meaningfully. And we are exploring all of the flexibility that we can within all of our programs in order to try to meet

the need of those particular producers, who we should be reaching out more to serve.

Mr. MCGOVERN. Thank you very much. I yield back, Madam Chairwoman.

The CHAIRWOMAN. Thank you, Chairman McGovern.

I now recognize the gentleman from Pennsylvania. Mr. Thompson, you have 5 minutes for questioning.

Mr. THOMPSON. Thank you, Madam Chairwoman. Administrator Ducheneaux, thank you so much for your leadership and for your staff. As I travel around the country from time to time, I stop in and cold call FSA offices. I don't really introduce myself until I find out what they think. But then I always take the time to thank them for what they do, all of our USDA offices. I appreciate that staff.

I would like to discuss the role of the FSA county committees. From my perspective, my constituents and people I talk with across the country generally like having some of these decisions made at the local level rather than relying on a state officer or, worse yet, Washington having to adjudicate issues that they may have. Can you speak to the role that FSA county committees play in delivering FSA programs, and do you have thoughts on the Equity Commission's recommendation that USDA should consider termination of the county committee system?

Mr. DUCHENEAX. Thank you, Ranking Member Thompson. As I have gone around the country in the last year and a half, I have been a staunch proponent of participation in this opportunity. To me, in the county committee system, I see an opportunity for our producers to be a meaningfully part of the process of delivery of our programs and services. The challenges in some of our communities where producers don't have historic access to those programs, they are not able to get on the ballot and get selected to serve there. We are working with our counterparts and the Deputy Administrator for Field Operations to examine how we can improve outreach to producers so that they are aware of that opportunity to serve and share in that. I don't think that exists anywhere else in the Federal Government, so it is really a unique opportunity that we should capitalize on.

With respect to the Equity Commission's recommendation, I haven't seen it verbatim, but I understand that it asks about an analysis of what a world without county committees would look like. And the work that the Equity Commission is engaged in is at the direction of Congress, and their job is to take an outside look at the realities of the delivery of services all across the Department. And I think they are even reaching broader than that, looking across the Federal Government to see how the work and equity can be amplified.

Given that, and the fact that it is chartered by Congress, we will give every recommendation that they make due consideration and try to find a way to improve the work that we do to get at the ultimate end goal for all of us, which is equitable participation, equitable delivery of services, and equitable representation on the county committees.

Mr. THOMPSON. Yes, which I see—eliminating county committees, that eliminates opportunities for people, more diverse individ-

uals to be a part of those positions, you concentrate power at the state level, or here in Washington, it is just counterintuitive to what this—I find it hard to believe the Equity Commission came up or is even talking about that as a proposal.

I would be remiss if I didn't recognize the role that land-grant universities play in creating the next generation of agriculturalists and providing outreach to the agriculture industry. I had the privilege over the past couple of weeks of visiting a couple of schools, one on the East Coast, one in Texas, and it is just impressive, the amount of the quality of individuals, not just the faculty, but certainly with students, graduate and undergraduate.

So, while some states have only one land-grant university, other states have two or three. Under Secretary, can you talk about how these land-grant universities coordinate with USDA to ensure producers in every corner of every state can be reached?

Dr. JACOBS-YOUNG. Absolutely. In recognizing our partnership with USDA and the land-grant university system, we were actually created to be partners, long-term partners over 150 years ago. And the big jewel we have in the United States that I have talked with many international colleagues about is the Extension Service. So, we conduct research. ARS, NIFA provide funding for research. Land-grant universities produce a lot of research. And Extension Service and the partners and the cooperatives that they have take all of that research and they translate it into tools that people can use. And so, it is a beautiful system when it is properly resourced and it works, that we have I would say the full supply chain of conducting the research and disseminating it to the producers in every corner of this country.

Mr. THOMPSON. Yes, it seems like while some program and research stays within the halls of the university at the end of the day, that is not agricultural research. It almost without exception goes for the greater good. So, thank you so much.

Dr. JACOBS-YOUNG. Right.

Mr. THOMPSON. Thank you, Madam Chairwoman.

The CHAIRWOMAN. Thank you, Ranking Member Thompson.

I now recognize the gentleman from California, Mr. Carbajal. You have 5 minutes for questioning.

Mr. CARBAJAL. Thank you, Madam Chairwoman. And thank you, Dr. Jacobs-Young and Administrator Ducheneaux, for your testimony today. And thank you for the great work you do for our country, day in and day out.

USDA offers so many beneficial programs and grants to farmers and ranchers. These programs aren't very helpful if people don't know about them. I am glad to hear about the work being done through the Beginning Farmers and Ranchers Development Program. It is obviously very vital that we prepare the next generation of farmers, especially for beginning, underserved, and veteran farmers. However, it is equally important that existing farmers and ranchers are also aware of the programs and resources available at the USDA.

Administrator Ducheneaux, Section 12306 of the 2018 Farm Bill provided additional support for veteran farmers across USDA programs, including FSA down payment loans, reduced interest rates on guaranteed loans, and increased coverage under the Emergency

Assistance for Livestock, Honeybees, and Farm-Raised Fish Program, ELAP. I know that is a mouthful. Earlier this year, FSA issued a final rule implementing some of those adjustments. Can you please speak to any improved outcomes that you have seen for veterans as a result? And are there other ways that Congress and USDA can better support veteran farmers and producers?

Mr. DUCHENEAUX. Yes, sir, and thank you for the question. This one is really near and dear to me. My father was a veteran of the Marine Corps, and I have had a chance to work with a lot of the veteran farmers and ranchers across the country. I worked very closely with Gary Matteson at the National Veteran Farmer Coalition. One of the challenges that we have with regard to serving underserved populations like veterans, minorities, and what have you, we don't have any programs within FSA that are specifically designed for their unique circumstances. We will set aside some of our funding for those programs, but they still have to come in the door and qualify just like everybody else, on the same terms as everybody else.

And with respect to veterans, sir, we did make those announcements about the ELAP program. And I am not going to go through the whole jargon there that you did, but I agree that is a challenging mouthful to say. We had a veteran call us. He is a Vietnam veteran. And he said, "You did this additional benefit to veterans." And this is in our forage hauling that we announced last year to help producers mitigate the impacts of the drought. He said, "But, I am being told I don't qualify." So, I thought, well, that seems like a really simple fix. So, I went to work, and I worked with OGC and the Department, and it turns out we can't fix that. There is a statutory prohibition that limits our ability to address veteran issues in those programs. They have to be a veteran within the last 10 years, have to be no more than 10 years in farming or brand new to farming. So, for some of the existing veterans, it is really challenging to participate. But we guide our staff to treat everybody as though we need them in the building to work. We are pushing our boundaries for inclusion and not exclusion, so we were able to find other ways to help veterans who don't meet those three criteria in that section of the code.

Mr. CARBAJAL. Thank you. Administrator Ducheneaux, can you also speak to the current outreach FSA does to existing farmers to make them aware of the programs and the resources offered by USDA, especially after a major piece of legislation like the farm bill is signed into law? And how can Congress help improve this outreach?

Mr. DUCHENEAUX. Absolutely. As we have started our work with the guidance of Secretary Vilsack, we were told to engage with stakeholders early and often. And as you saw through the pandemic assistance programs and the Emergency Relief Program that we have administered in the last year and a half, we did reach out to stakeholders very early, got them involved in the process for building those programs. And I think that we have demonstrated that there is a lot of satisfaction there. That doesn't mean that all the work is done. As I mentioned in my oral testimony, there is a lot of work to do yet. We continue to look for opportunities to en-

gage with Congress and our stakeholder groups to improve our outreach and get it down there at a more granular level.

Mr. CARBAJAL. Thank you. I am going to ask this last question, but I know I am running out of time, so if you could submit something in writing, I would appreciate it. Administrator Ducheneaux, when conducting outreach to individuals, whether farmers, ranchers, or someone else seeking assistance from USDA, do you have a program to employ someone like *promotoras* that serve Latino communities? I don't know if you are familiar with that concept.

The CHAIRWOMAN. Thank you, Mr. Carbajal. Mr. Ducheneaux, if you can submit that question, we will make sure that you get it.

Mr. CARBAJAL. Thank you.

The CHAIRWOMAN. Thank you.

I now recognize the gentleman from Indiana, Mr. Baird, who is joining us virtually. You can unmute and ask your questions. You have 5 minutes.

Mr. BAIRD. Thank you, Madam Chairwoman. I really appreciate the opportunity to have this discussion. And I really appreciate Under Secretary Jacobs-Young for her new appointment and look forward to working with her in the future.

So, my question really deals with the fact that she and I are both graduates of the undergraduate land-grant system and fully understand and appreciate and recognize the importance the system plays in educating our next generation of agriculture and training our next generation of farmers and ranchers.

So, Madam Under Secretary, are there any specific programs or topics mentioned under the Beginning Farmers and Ranchers Development Program that you would like to see prioritized in the 2023 Farm Bill as we work through that?

Dr. JACOBS-YOUNG. Thank you, Representative Baird, and thank you for taking time to meet with me earlier this month.

The Beginning Farmers and Ranchers Development Program, as you all are aware, is so critically important to helping us create an agriculture enterprise that is climate-smart, robust, culturally responsive, equitable, and most importantly, resilient and enables our farmers and producers to be economically successful. The Beginning Farmers and Ranchers Development Program has been critically important in recognizing—and we just had a question about the veterans—recognizing that there are many who are serving in the military who returned to their homes, and the rural economies have disproportionate number of military folks represented in the military. And so, we want to be able to help those folks reintegrate back into the United States. If they want to return to farming, we want to help them. And if they are new to farming, we want to help them in that case, too. So, there are some special programs that support the veterans, that support underrepresented groups and organizations. And so, we want to make sure that we have a five percent set-aside for our veterans so that we can make sure that we can support them to come back into farming or to enter farming.

We have NIFA's Agency AgVets Program (Enhancing Agricultural Opportunities for Military Veterans) that supports farming no matter how many years they have been in farming. So that is a different program than Beginning Farmers and Ranchers. And then

we have the AgrAbility Program that really is important for helping our disabled farmers stay on the land and continue to be successful, and that helps provide assistive technologies, I mean, all these cases, being able to help with financial planning and overall just to increase economic, environmental, and social sustainability of those farms. And so, we are just very thankful. And we are here to support Congress as you prepare the next farm bill with technical assistance and being able to provide any information that is needed to draft that new, important piece of legislation.

Mr. BAIRD. I really appreciate your perspective on that. And I do think it is important for helping our veterans that are interested in this kind of a program and maybe agriculture to move back into the civilian world. And this kind of a program can be very helpful. And I think from their perspective being out on the land and being in agriculture would be a real asset, so I certainly appreciate your perspective on that, and I appreciate your willingness to work with us to make sure we get that portion of the next farm bill correct. So, thank you very much, Under Secretary.

I would like to move to Administrator Ducheneaux then and talk about this outreach program for beginning farmers and ranchers. And, the 2018 Farm Bill, as you have already mentioned, said to create a team of state beginning farmer and rancher coordinators. So, could you elaborate on the implementation of that program and how you feel that is going?

Mr. DUCHENEAUX. Yes, sir. We have a beginning farmer and rancher development coordinator, or beginning farmer and rancher coordinator rather in the agency. Sarah Campbell is doing good work, working across the Department to make sure that we are coordinating efforts with our friends at NIFA, Rural Development, and what have you. The work that is so critical to beginning farmers and ranchers is getting them in the door, getting them that first interaction. And oftentimes, we don't have the chance to get that second impression. Many of these folks need that second impression, so it is important that we develop the capacity of our co-operators so that they can stay out there and advocate on our behalf.

Mr. BAIRD. I really think you hit on a key issue there. Sometimes looking at the Farm Service Agency or some of the programs that are available, and if you go on the website, you could get lost. So, I think it is really beneficial that we have people to help some of these beginning young farmers get started and get active.

And, one of the things that I see going on in the present time is some of these folks that want to know where their food is coming from, so it is the only opportunity that I have seen in my years to have young farmers get involved because they can go into this specialty, either foods or specialty crops provided to a local restaurant or something, so FSA's help there would be good.

The CHAIRWOMAN. The gentleman's time has expired.

Mr. BAIRD. I am sorry. Thank you, and I yield back.

The CHAIRWOMAN. Thank you so much, Mr. Baird, although I was enjoying listening.

Mr. BAIRD. Didn't mean to bother you.

The CHAIRWOMAN. I now recognize the gentleman from California. Mr. Panetta, you have 5 minutes for questioning.

Mr. PANETTA. Thank you, Madam Chairwoman. I appreciate that and always appreciate the questioning of my good friend, or statement of my good friend, Mr. Baird from Indiana.

Look, let me let me thank you, Madam Chairwoman, for holding this hearing today. Obviously, we have had a lot of hearings on the farm bill, and this type of discussion on how the USDA and its agencies execute Congressional policies and interact with our consumers, with our farmers, with our ranchers, and our partners is absolutely critical. And I think it has been made clear just from the short time of this hearing that at our two witnesses today represent two of the agencies at USDA that really are at the heart and soul of that type of implementation, from training and transitioning our beginning farmers and ranchers, to staffing our USDA offices around the country, to reducing food waste. The leadership and strategic direction that our witnesses provide to American agriculture is absolutely paramount.

And so, we obviously know that there have been challenges, especially with staffing during the pandemic, but also the difficulties of setting up a new Administration, to providing adequate technical assistance to local FSA offices, to supporting many of the programs that this Congress and Administration have rolled out. But those growing pains can be positive if we continue to work through it and if we continue to have discussions like this where we know that we have to work together and we know that we have to listen to the people we represent, especially our farmers, farmworkers, and producers and what they need and what they expect of the USDA.

Now, obviously, when we talk about equity and outreach, we have to talk about everybody responsible for producing our agriculture, our farmers and our farmworkers, our essential farmworkers. And Mr. Ducheneaux, first of all, let me congratulate you on your excellent decision to—on your recent choice for chief of staff. Obviously, that is something that is going to help not just you, not just your office, but going to help all of American agriculture. So good on you for that.

But I also understand that the FSA is standing up a pilot program, and part of that work will help us address our labor shortage, something that I think everybody in this hearing, everybody on the Agriculture Committee, and a lot of people in USDA understand. And so, we have to improve our labor standards for our farmworkers especially. Can you talk about this program's pilot that obviously deals with the labor shortage but also improves our standards for farmworkers?

Mr. DUCHENEAUX. Yes, sir. And, as you are well aware, there are people that know a lot more about this than I, but I am very well-prepared by those folks. As we travel the countryside and look at the realities of our food system that have been so clearly laid bare by the pandemic, we saw grocery stores that didn't have shelves full of meat when there are cows grazing 5 miles away. We saw produce shelves empty. And this Administration has really taken an interest in addressing what causes those shortages because food shortage is a national security issue.

One of those that we hear about every time we go out and talk with a producer or stakeholder group is farm labor. The lack of farm labor is a challenge. Rather than sit back and gnash our teeth

about the program, the Secretary went to work and found a solution, and he is working with our farmworker groups to identify ways to streamline and assist with getting H-2A visa workers in the country to do this work. And we are using \$65 million of ARPA funding to get at that through the stakeholder agreements. We had three listening sessions yesterday to ensure that we are getting it as close to right as possible. But it is important to note, another of the strengths of this Administration is that we don't mind making an adjustment if we don't get it exactly right the first time. And we have demonstrated that in the last year and a half as we roll out some of our other innovative programs in the disaster realm.

Mr. PANETTA. Look, I think you know the H-2A program right now, unfortunately, is the only game in town when it comes to ag labor, and so I appreciate you leaning into this issue, and I also appreciate the fact that you understand the emergency aspect of this issue and that basically, our producers, our farmers need those farmworkers. And obviously, we have to ensure the proper standards for those farmworkers as well. So, thank you for your work on this, and, more importantly, thank you for your continued work on this.

Madam Chairwoman, I yield back.

The CHAIRWOMAN. Thank you, Mr. Panetta.

I now recognize the gentleman from Tennessee joining us on the platform. Mr. DesJarlais, you have 5 minutes for questioning. Please unmute and begin your questions.

Mr. DESJARLAIS. Thank you, Madam Chairwoman.

Administrator and Under Secretary, I just was curious whether you had a strategy to deal with the crisis at the southern border in terms of the influx of several million illegal immigrants, many who will be applying for SNAP benefits under either asylum or because they are under 18.

Mr. DUCHENEAUX. Thank you, Congressman DesJarlais. It is a good and important question in these times. I think it is important to note that people with full bellies are satisfied and happy and contribute to the society. And when we have folks that are hungry, the American people have always stood up and helped to feed them. And it is no less important to feed those folks that are trying to get into this country to be part of the system than it is to feed those that are overseas or in our own rural and urban communities.

Mr. DESJARLAIS. Okay. Do you have any kind of numbers yet? We are getting ready to write a farm bill, and we have to fund the program. Do you have any numbers for us in terms of how many asylum seekers there are or how many children that we will be needing to feed?

Mr. DUCHENEAUX. Sir, I do not have any of those numbers, but I do have faith in the American farmers and ranchers to be able to stand up to the challenge and feed them.

Mr. DESJARLAIS. Okay. Who could get that number for me? Because we have gone through this a few times in this Subcommittee. And you agree that it is going to put a strain on the program, correct?

Mr. DUCHENEAUX. Sir, I don't have the numbers, and that is a little bit outside of the bailiwick of the Farm Service Agency, but I can work with our friends at the Food and Nutrition Service to ensure that you get those numbers.

[The information referred to is located on p. 1619.]

Mr. DESJARLAIS. Okay. Under Secretary, do you have anything that you would like to add to my concerns regarding this problem?

Dr. JACOBS-YOUNG. I would like to add that I think that we should definitely take this back to the Department and work to submit some responses for the record. Administrator Ducheneaux and myself, we are not the experts in this area. However, we have lots of experts at the Department, and we would be happy to provide some responses for the record.

Mr. DESJARLAIS. I would appreciate that. Thank you both for your attendance, and I yield back.

The CHAIRWOMAN. Thank you, Mr. DesJarlais.

I now recognize the gentleman from Florida. Mr. Lawson, you have 5 minutes. Please unmute and begin your questioning.

Mr. LAWSON. Thank you very much. And welcome, everyone, to the Committee. I have a question that is centered around some of the things that Congressman Thompson talked about. Veterans make up 70 percent of agricultural producers with Florida leading as one of the top five states for producers with military service. The 2018 Farm Bill amended the definition of *veteran*, promised to give them the same benefit as beginning farmers and ranchers. Madam Under Secretary, have these updates to Section 12306 increased the enrollment and participation of veteran producers in USDA programs?

Dr. JACOBS-YOUNG. Thank you for your question, sir. So, one of the things I know from the mission area that I am the Under Secretary for in terms of the National Institute of Food and Agriculture, we have significant investments in terms of support for our veteran farmers. And it is for those who are beginning farmers and ranchers, and it is support for those who have been in the farming or ranching industry for quite some time. And working to ensure that we can expand awareness and access and remove barriers to our programs and services, we have been working with many different cooperative organizations to really just help echo some of the work that we are conducting both internal to USDA with our land-grant partners and our Extension Service. And so, we are putting all hands on deck to be able to reach the people who can benefit from the services because with the status of our farmers' average age 58, some of us resemble that remark. We recognize that if we don't have a pipeline primed and prepared to come onto the lands and continue to grow the food and to raise the animals and provide the fiber and fuel that we all enjoy, which enables me to sit here at this table today, that we will be in trouble in terms of protecting the food supply for our country. And so, the veterans are an incredibly important piece of this puzzle, and so we are more than excited about some of the new investments that Congress has entrusted us with, and we want to do the best we can to ensure that all people know about what is available to them and that it is as efficient and effective as possible.

Mr. LAWSON. Okay. Thank you very much. And earlier, you mentioned about land-grant universities as a lifeline for agricultural research, innovation, and development. These institutions educate the next generation of farmers, ranchers, and citizens and really form the backbone of our nation's network of agricultural extension and experiments.

The Chairman of this Committee, and I, have worked a great deal in providing scholarship funding to HBCUs to educate farmers and to get young farmers involved in agriculture.

And so, the question would be the agriculture youth organization coordinators were hired in 2019 to build awareness among youth in agriculture and engage with land-grant universities. Under Secretary, could you expand upon what sort of projects the coordinators have been engaged in with land-grant universities to make this successful?

Dr. JACOBS-YOUNG. So, sir, I would like a clarification. Are we talking about the liaisons to the 1890 institutions?

Mr. LAWSON. Yes. How have they played a role since we are talking about the research that the land-grant institutions are doing? And then at the same time—my time might run out—but agriculture has provided scholarship funding to educate young people at HBCUs in order for them to get a bigger interest in farming and stay in agriculture industry?

Dr. JACOBS-YOUNG. Yes, absolutely. So, I know—in the interest of time—so on last Tuesday, I had an opportunity to visit Alcorn State University and meet with our 1890 scholars, our USDA 1890 scholars, and many of them are off on their way to a professional career in agriculture. And I wish I had more time because I would tell you about some of the exciting things that we shared, and that was all worked through the 1890 liaison who is stationed there at Alcorn State University that helps recruit and retain and helps train and helps provide internship opportunities by working back with the Department. So those coordinators are extremely important, those liaisons. We call them the 1890 liaisons. They are critically important for helping us prepare the next generation of students out of the 1890 institutions.

Mr. LAWSON. Madam Chairwoman, as I yield back, I think this is something that we need a little bit more elaboration on in your Committee. I yield back.

The CHAIRWOMAN. Thank you, Mr. Lawson. And I would agree, 5 minutes is not enough time to hear about all the exciting things that are happening at these land-grant institutions.

I now recognize the gentleman from Texas, Mr. Cloud. You have 5 minutes for questioning.

Mr. CLOUD. Thank you, Madam Chairwoman, I appreciate it. Thank you all for being here today. And I just wanted to start off by thanking Administrator Ducheneaux for helping us with the redfish issue we had after the Texas freeze. I know there is still an issue going on with the pricing. But, first of all, I just wanted to say I was visiting the farms 3 weeks ago, things are still going, and so really appreciate the help with getting that wrapped into ELAP.

Now, my understanding is there is still some discrepancy on the pricing issue. And we are waiting, I guess, on the FSA to kind of

respond at this point and to give their analysis. Do you know when we could expect that? Is there a timeline on that?

Mr. DUCHENEAUX. Yes, so the redfish producers exercised their appeal rights to go to the National Appeals Division to seek a determination on whether or not we used the right information. We got that NAD appeal determination this summer, and we are working on getting back to Mr. Ekstrom and the redfish folks here in the next couple of weeks with our answer.

Mr. CLOUD. Okay. Well, I appreciate it. Thanks so much.

When I am talking to our folks in the ag industry, the thing that I hear most often—other than things on, “Hey, next year’s farm bill”—still have to do with staffing issues in Texas in the FSA offices. And so, I was wanting to see if we can get an update and ask for an update. And then we had a phone call and then we were going to get some—we were expecting a letter would be provided after that phone call, and we hadn’t received any information yet from that. So, I was just wondering where the bottleneck is at the moment. Is it in recruiting? Is it training? Do we have retirements? I guess, in the perspective of our ag workers, what is taking so long to get this issue solved?

Mr. DUCHENEAUX. Well, as of just yesterday, we were at 95 percent fully staffed. And when you consider that that is over 10,000 employees just in the Farm Service Agency, there is some attrition as folks go out and it takes time to onboard.

Mr. CLOUD. Sure.

Mr. DUCHENEAUX. So, honestly, a five percent gap isn’t that bad when you think about the—

Mr. CLOUD. Is everybody back in the office working?

Mr. DUCHENEAUX. Everybody is back in the office. We continue to monitor local COVID realities and take steps to keep folks safe, but every office is open. You may not get to see the smile on faces in a few places because we will wear a mask when there is community spread, but the offices are back open. The biggest challenge that we see in retaining staff is the workload doesn’t match the compensation. We are asking our folks to do yeoman’s work, working overtime, and oftentimes, the wages that they receive in exchange for that time don’t match the responsibility or the importance of the work, sir.

Mr. CLOUD. Okay. Are you looking into ways to automate processes as well? And some of that can be done through technology and updating old systems. I know government is notably—and this isn’t just your agency, this is everywhere—just—[inaudible] behind when it comes to—

Mr. DUCHENEAUX. Yes. I am a big fan of automation, but I am bridging that generation where the folks older than me, they want a person in front of them to talk to, and that is critical that we maintain that county office presence. But at the same time, if we take advantage of technology, we can streamline the processes. We are taking our farm loan application, for example, down from around 35 pages, a lot of which doesn’t matter anyway, down to about 12 pages and getting to the meat of the issue so that we can better use not only the producer’s time but also our employees’ time. And we are taking the lessons we learned in deploying the Emergency Livestock Relief Program and the Emergency Relief

Program phase 1 where we are using information we have already got to deliver those programs to producers out there in the countryside.

Mr. CLOUD. One other challenge I heard that I wanted to bring up was just the issue of cross-agency jurisdictions that happen a lot. There are three or four examples, and maybe we can get you some of these in writing. But, for example, the plains cotton farmers said they would get a form from the ERP in the mail and then when they would try to verify the information for accuracy, FSA would say that your insurance provider had to make that corrected information, but then they go to the RMA and RMA says, no, that is FSA's. And so, it leaves the farmer stuck in limbo there. And we have three or four examples of other things like that where it is cross-agency jurisdiction, which ends up being the farmer *versus* the bureaucracy. At least that is how they feel, and just trying to get an answer and move forward for them is difficult sometimes.

Mr. DUCHENEAUX. Yes, sir. And, as with any new approach, there are growing pains, and we are interested in seeing all of those realities and making adjustments as we go out. But if you would give me the list of those, I will make sure that we get some attention to them.

Mr. CLOUD. Thank you very much.

Mr. DUCHENEAUX. Thank you, sir.

Mr. CLOUD. Thank you, Madam Chairwoman. I yield back.

The CHAIRWOMAN. Thank you, Mr. Cloud.

I now recognize the gentlewoman from Ohio. Ms. Brown, you have 5 minutes. Please unmute and begin your questioning.

Ms. BROWN. Thank you, Chairwoman Hayes, for hosting this timely hearing as Congress continues to prepare for farm bill reauthorization.

Many of the programs and agency-wide initiatives that we have discussed in hearings this year rely on strong departmental operations and effective outreach. It is vital that we continue to support these efforts. So, Dr. Jacobs-Young, how does the USDA measure the impact of its outreach grants and the activities those grants fund beyond the numbers of producers' reached, number of grants, and dollars awarded?

Dr. JACOBS-YOUNG. Thank you for your question. And most recently, Secretary Vilsack announced the \$250 million NEXTGEN program. And in that program where we are working specifically with minority-serving institutions, we are asking on each one of those applications for robust evaluation plans. We also plan to engage with each one of the applicants who are selected for awards throughout the tenure of those award processes. And so, we want to be able to work cooperatively with the minority-serving institutions that will receive the \$250 million in funding.

So now let's talk a little bit about the question: how do we know we have been successful? I think that is what I hear you saying. And one of the things that I would love to see as an agency administrator, when I was Administrator for the Agricultural Research Service, continuing to look at our demographics, and the higher you get to the executive and what we call the GS scale in government, the numbers decreased. So let me say we see a lot of diversity at

the certain GS level, and then the higher you go, we see those numbers reduced.

And so, for me as an Administrator or now as Under Secretary, to me, the success is when I look across my staff and I look at my staff at all levels and they look like America. And so that is why I think it is so important, Congresswoman, that you get to see people that look like me, that get to see people who look like the Administrator, and that get to see people who look like America in leadership roles so that we can encourage them to continue. So, whether they—I just talked to a group of fifth graders this Monday in Denver. And let's just say talking to a whole room of fifth graders is a bit challenging, but Congresswoman Hayes has been in this position before, I am sure. Keeping their attention was a full-time job. But I hope that those kids walked—there were a group of Brown, lovely, lovely kids of color. And I hope that they walked away with an idea that they can be me because I can't be here forever. And I am hoping that if I convinced even one or two of those children to continue their education in agriculture and at least 75 percent of them to continue to go on to college and to grad school, then I would have been successful. But I will see it and I will know it when I see it in the numbers that we experience in our agencies across the country.

Ms. BROWN. Thank you so much.

Mr. Ducheneaux, in your testimony you mentioned about the work of the equity officer, equity analysis analyst, and the Justice40 initiative in combating discrimination within the agriculture sector. What metrics are you using to assess the success of these positions and efforts?

Mr. DUCHENEAUX. Thank you very much for the question. As a former Executive Director of an organization that participated in some of these agreements, I can tell you that it is rigorously and frequently that the USDA asks for information about the success and outcomes for our cooperators, oftentimes, more than their capacity will allow. It is why capacity development for our cooperators is so important.

But if you want to look at an example of how that can happen and how Federal investment in knowing better information, you need look no further than the National Agricultural Statistics Service. In 2002, they made a concerted effort to get out there and do a better accounting of Indian Country. The Navajo Nation went from one producer magically to tens of thousands of producers because they made the effort and they got out there and tracked it. So that Federal investment leveraged into better information, just like the information with the cooperators will. Many of our cooperators who have been able to develop that additional capacity also have stepped now into tracking outcomes and program participation on behalf of the Federal Government, for instance, tracking loan participation rates, loan success rates, conservation program success rates, and even import investment leveraging of capital.

Ms. BROWN. Well, thank you. I see, Madam Chairwoman, that my time has expired. So, with that, I want to thank the witnesses for their testimony before us today, and I will yield back.

The CHAIRWOMAN. Thank you, Ms. Brown. I will just say that you are speaking my language when you are talking about ag pro-

grams in schools. I would like to see more of those programs offered to students much sooner, much younger because we can capture their creativity and their innovation. And, like you said, they will begin to believe that they can, too, be engaged in agriculture and see themselves in these roles.

I now recognize the gentlelady from Florida, Mrs. Cammack. You have 5 minutes. Please unmute and begin your questioning.

Mrs. CAMMACK. All right. Well, thank you, Chairwoman Hayes, Ranking Member Bacon. And I will just jump right into it. Thank you to you both for appearing before the Committee today.

Administrator Ducheneaux, thank you for highlighting the work of the Farm Service Agency. Now, as you continue to explore ways to serve producers, how is the Department thinking about ways to improve technology needed to ease the burdens related to reporting and program enrollments, *et cetera*? That has been a common comment and complaint that we have heard amongst our FSA folks.

Mr. DUCHENEAUX. We get that same complaint as we go out and talk to producers in the countryside and our county office staff as well. Every program that we roll out, we have to do a Paperwork Reduction Act and a time burden analysis, and we are working to bring those down and working to streamline our programs. And we are really taking the lessons learned, as I mentioned previously, from the Emergency Relief Program where producers receive that pre-populated form and are able to sign and verify, commit to the 2 years of linkage that we are required in the statute, and receive the benefits that they are entitled to.

In the Emergency Livestock Relief Program, we actually used information that we had using the Livestock Forage Disaster Program and acreage reports and simply made a payment to producers that were eligible for that program with no paper transactions at all. And the challenge is to do so in a way that maintains program integrity because it is important to fulfill our role as stewards of the taxpayer dollar as we deliver these programs and ensure that they get where Congress intended them to go as we do this.

The Livestock Forage Program is one that we are looking specifically at, how can we automate that so that when the Drought Monitor triggers that disaster assistance, we should be able to automatically make the payment like we did with the Emergency Livestock Relief Program. So, we are trying to find that balance between streamlining but maintain program integrity because we want to make sure that we are being good stewards of the money.

Mrs. CAMMACK. Right. Thank you for that. And while we are on the subject of FSA, Administrator, the county committees, as you know, are a direct link between the farm community and the Department of Agriculture. And my colleague, Ranking Member Thompson, brought up earlier USDA's Equity Commission recently recommended that USDA seriously consider termination of the FSA county committee system to, quote, "design a more equitable alternative for all farmers." Now, I am concerned by the many claims and reporting that county committees are responsible for minority farmers not being able to access loans. That is serious. But it is also my understanding that the county committee does not have any say in the loan approval process. Is that the case? Yes?

Mr. DUCHENEAUX. That is the case.

Mrs. CAMMACK. Okay. So, they have no say in the approval process. So, as Administrator, then what are you doing to ensure that the Equity Commission members have an educated understanding about what the county committees can and cannot do?

Mr. DUCHENEAUX. That is a very good question.

Mrs. CAMMACK. Thank you.

Mr. DUCHENEAUX. We have participated at every opportunity with the members of the Equity Commission. But we have to understand that we are working to overcome decades and generations of when that was actually the case, when county committee members did weigh in on loan applications. Those are very recent changes in the grand spectrum of time of this, but the county committees are integral in the delivery of the billions of dollars of programs that we administer annually. They are responsible for making determinations about producer eligibility and making assessments about prices in that particular region.

Mrs. CAMMACK. Right

Mr. DUCHENEAUX. So, it is important that they are truly representative of those that are producing.

Mrs. CAMMACK. Well, and I am running short on time, so I am sorry to cut you off a little bit there. When was the change made?

Mr. DUCHENEAUX. I don't know that off the top of my head, but I will get it to you. It is sometime in the last few decades.

[The information referred to is located on p. 1619.]

Mrs. CAMMACK. Okay. So, I mean, decades. Okay. There has clearly been time to educate these committee members about the fact that they are not the final say or a part of the approval process, so it kind of seems to me that USDA, with this recommendation, is throwing the baby out with the bath water. And I got to tell you, I am speaking with producers all up and down my State of Florida, and we have just been battered by the worst hurricane in Florida's history. As you know, Florida is home to over 300 specialty crops, and it is the number two economic driver of our state. So, we have real serious challenges. And our FSA committees, those county committees are a key part to the Agriculture Committee as a whole, but they will be a major component to recovery.

So, I think the last thing that they want to hear is that the FSA or USDA in the days and weeks after this disaster is possibly going to do a wholesale reconfiguration of how these agencies they have relied on will work moving forward based on—and I am just going to call a spade a spade here. It seems like virtue signaling and some woke ideology. But I would like to continue this conversation. I know my time has expired, so in the interest of doing what is best for the these county committees and our producers around the country, I will follow up with you later, but thank you.

And, Madam Chairwoman, I yield back.

Mr. DUCHENEAUX. I would appreciate the follow-up. Thank you.

The CHAIRWOMAN. Thank you, Mrs. Cammack.

I now recognize myself for 5 minutes.

Before I begin my questions, I first want to say to Administrator Ducheneaux, you spoke to my heart when you said people with full bellies contribute to our communities because that is really where I see my role in this work. Yesterday, as many of you know, the White House convened a conference on hunger, and farmers will be

critical to any plan that we have moving forward to address hunger and food security issues in this country. So, I think that this hearing is both timely and relevant to the work that has to be done.

I have said since the day I came to Washington, hungry kids don't learn. I know that, and that can extend to any other community on any other topic. But we must be invested in feeding people in this country. And the idea that we have so many farmers and ranchers locally who are not being utilized is something that we have to really look at differently.

Dr. Jacobs-Young, in my district, only nine percent of farmers are younger than 35, and $\frac{1}{3}$ are older than 65, which aligns closely to the long-term trends. So, I know how critical it is, as I said before, to get more younger, beginning farmers involved in agriculture and to share the importance of programs like Beginning Farmers and Ranchers Development Program. What changes to the 2018 Farm Bill have improved access, and has NIFA received more applications as a result? If not, what should we be doing differently as we move forward?

Dr. JACOBS-YOUNG. Thank you for the question, Chairwoman Hayes. So, the number of applications received by the Beginning Farmers and Ranchers Development Program is one that I will have to provide following this hearing today.

I do want to talk a little bit about in your home state, some of the work that has been happening with the Beginning Farmers and Ranchers Development Program, working with the University of Connecticut Extension Service, and they are working with a program called Solid Ground (Solid Ground, a Program for New Farms and Farmers). And I love that—well, I don't know if we want it so solid. We need it a little bit aerated, soft, and tilled at some points. But Solid Ground program where they are working with the beginning farmers to do expert training, they are setting up peer networks, that they are doing things like technology, awareness, building robots, which helps them after they harvest their production to be able to reduce the amount of loss that is experienced, and so really being able to introduce them to some of the technology. And then importantly as well, they are talking about farmer wellness. And this is something I had a chance to talk to the small farmers about last Monday because if we don't take care of ourselves, if we don't look at our diet and our nutrition and we are not healthy, we are not going to be at our best either. And so, this program also looks at farmer wellness. And so, I think that those are some very important facets.

What I will say is we just want to thank you all for the support that we have received for this program because it has been so helpful, and it has engaged so many across the country to really do this important work of making sure that those who venture into farming can be successful. And so that is something that I just want to thank you all for, for your support with that, and we will follow up with those numbers for the record.

The CHAIRWOMAN. Thank you for that. And you can take me down a rabbit hole on this one because I have seen at many of our VOAG training programs where young people who are interested in technology didn't realize that drone research could contribute to agriculture, and it was a way that they can have gainful employment

in the field in just so many different areas, so very excited to hear you shout out my state.

In my last minute, I have a question for you, Mr. Ducheneaux. As of 2017, only five percent of farmers in the U.S. were Black, Latino, Hispanic, Asian, Native or Pacific Islander, or identified with multiple races. In my district, it is only about 2 percent. Without reaching these communities who make up more than 40 percent of our country, we are going to really struggle to address the need for more farmers. Given the urgency of this issue, do the Farm Service Agency and the 2501 Program work together to support farmers of color and farmers with prior military service?

Mr. DUCHENEAUX. Thank you, ma'am. All things being equal over the span of time, we wouldn't even be sitting here talking about equity. But the fact of the matter is that nearly 40 percent of this country is minority, less than 12 percent, actually 11 point something percent are minority farmers. So, there is tremendous inequity just in who is farming. But, if you take a closer look at the numbers, there is a disparity of about two percent in farm program payments between farmers that aren't farmers of color and farmers that are. We have to reach those farmers and at least bring equity to the proportion of program participation and the proportion of existing farmers while we work to increase opportunity for producers so that our farming population can better represent our national population.

The CHAIRWOMAN. Thank you, sir. We all benefit when we have honest conversations and commit to finding solutions to these problems. And I think that is where we have to go from here.

Seeing no other Members on the platform or in the Committee room, I will now—oh, I probably should have yielded back for my question. I don't know. Usually, I am over there.

I want to thank our witnesses for taking the time to join us today. We really appreciate your time and expertise. I will ask that you—there are so many other things that I would have loved to hear about. We had some questions from Mr. Carbajal, Mr. DesJarlais, Mr. Cloud, Mrs. Cammack, and even myself that I would love to follow up on. This really requires a much more extensive conversation because I truly believe that we have the ability and the capacity to close these gaps and do better moving forward. Your insights on the 2018 Farm Bill provisions related to USDA Department operations and outreach programs and the impact of COVID-19 on the Department and its programs and everything else mentioned here today will inform us as we begin the process of drafting the 2023 Farm Bill.

We have really just seen how incredibly important our agricultural sector is not only to our country but to the global economy. We have seen that amplified over the last few years, and I think more people are hyperaware of the role that local farmers and ranchers play. And as legislators, I think we are hyperaware of what we have to do to support this industry.

Working together, we can ensure that the structure and operations of the Department serves farms and ranches of all sizes. That is very important to me because in my State of Connecticut I deal with many smaller farmers for who one bad season, one missed crop, one bad market, and they are out of business for good.

So, we really have to make sure that our programs reach farmers of all sizes from the largest that we have in our country to the smallest family farms that that we serve.

So, I thank you again, Under Secretary Jacobs-Young and Administrator Ducheneaux, for your expertise in these areas and your commitment to the work that you do. I think that your presence here really speaks volumes just about the subject of this hearing, that we are trying as a country and as an Administration to expand our efforts to reach into other communities, to close the gaps that we know exist. So, it is very important. It is very important that you are representing the Department and that you bring such unique and varied experiences, and that your work will help guide it and inform us moving forward.

I guess that serves as my closing statement. Our Ranking Member isn't here but our—I am sorry, my Ranking Member isn't here, but the Ranking Member of the full Committee, Mr. Thompson, is here, so I welcome you to give closing remarks if you would like.

Mr. THOMPSON. Well, no, just thank you so much for your continued service and your leadership. This was a good hearing, good information. One of the things I would like to follow up with you, one, this entire issue is I would love to have the data from the root cause analysis the USDA must have done in order to come to the conclusion for the actions that they have taken, really using the data to look at what are the variables of why some succeed and some don't succeed, even in just having access. Is it some systemic race issue from decades ago? How much of a role does the size of the farm operation, the access to capital? There are just so many things out there. And I am sure, given the amount of money and emphasis that USDA has taken, there has to be a really good root cause analysis that has been done other than just looking at demographics of the industry. And so that would be great. Thank you for your continued leadership.

And, Madam Chairwoman, thank you for the hearing.

The CHAIRWOMAN. Thank you, sir. Thank you for joining us. You are always such a tremendous contributor to all of the hearings on this Committee.

Under the Rules of the Committee, the record of today's hearing will remain open for 10 calendar days to receive additional material and supplementary written responses from the witnesses to any of the questions posed by a Member.

This hearing of the Subcommittee on Nutrition, Oversight, and Department Operations is now adjourned.

[Whereupon, at 10:51 a.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

SUPPLEMENTARY MATERIAL SUBMITTED BY ZACH DUCHENEAX, ADMINISTRATOR,
FARM SERVICE AGENCY, U.S. DEPARTMENT OF AGRICULTURE

Insert 1

Mr. DESJARLAIS. . . .

Administrator and Under Secretary, I just was curious whether you had a strategy to deal with the crisis at the southern border in terms of the influx of several million illegal immigrants, many who will be applying for SNAP benefits under either asylum or because they are under 18.

* * * * *

Mr. DUCHENEAX. Sir, I do not have any of those numbers, but I do have faith in the American farmers and ranchers to be able to stand up to the challenge and feed them.

Mr. DESJARLAIS. Okay. Who could get that number for me? Because we have gone through this a few times in this Subcommittee. And you agree that it is going to put a strain on the program, correct?

Mr. DUCHENEAX. Sir, I don't have the numbers, and that is a little bit outside of the bailiwick of the Farm Service Agency, but I can work with our friends at the Food and Nutrition Service to ensure that you get those numbers.

Although this matter is not within the purview of FSA, FSA conferred with USDA's Food and Nutrition Service (FNS) on this question and provides in response the latest data relevant and available from FNS, which is from Fiscal Year 2019. A total of 37.2 million individuals received Supplemental Nutrition Assistance Program (SNAP) benefits on average each month in FY 2019. The citizenship breakdown of these individuals is as follows:

- 33.9 million (91.1%) are U.S.-born citizens;
- 1.9 million (5.0%) are naturalized U.S. citizens;
- 295,000 (0.8%) are refugees, asylees, or individuals given a stay of deportation; and
- 1.1 million (3.1%) are other noncitizens—*e.g.*, a legal permanent resident with 40 quarters of work (which is typically 10 years of work history), military service, 5 years legal U.S. residency, disability, or under age 18.
- Included in the above groups are 2.5 million U.S. citizen children *who* are living with non-citizen adults (adults may or may not be SNAP participants).

Insert 2

Mrs. CAMMACK. Okay. So, they have no say in the approval process. So, as Administrator, then what are you doing to ensure that the Equity Commission members have an educated understanding about what the county committees can and cannot do?

* * * * *

Mrs. CAMMACK. . . . When was the change made?

Mr. DUCHENEAX. I don't know that off the top of my head, but I will get it to you. It is sometime in the last few decades.

I appreciate your question regarding FSA County Committee involvement in reviewing farm loan program applications. While since removed, Sec. 332 of the Consolidated Farm and Rural Development Act (Con Act) established county committees at the former Farmers Home Administration (FmHA) and Sec. 333(2) established the requirement that those FmHA committees certify farm loan eligibility in writing. In October of 1994, Public Law 103-354 subsequently removed sections 332 and 333(2), which in turn removed farm loan eligibility certification authorities from the county committees.

Several notices have since clarified the role of county committees in this process, particularly as the FmHA and the Agricultural Stabilization and Conservation Services (ASCS) merged into the current Farm Service Agency (FSA). Notably:

- FC-5 dated 11/9/95 required that former ASCS State Executive Directors (SEDs) delegate all authorities held by FmHA County Committee to "Ag Credit Team" members with loan approval authority. (Note: this change took place after a portion of the former FmHA merged with former ASCS to form FSA, and the former FmHA teams with loan approval authority—known as Ag Credit Teams—became the loan approval officials in FSA).
- FC-158 dated 12/24/97 eliminated requirement of former FmHA Committees to determine eligibility for *guaranteed loan* requests.

- FC-205 dated 8/5/98 replaced FC-158 and eliminated the requirement for former FmHA Committees to determine eligibility for *both direct and guaranteed loan* requests.
- FLP-37 dated 3/11/99 replaced FC-205 and eliminated former FmHA Committees from borrower training as well as direct and guaranteed loan eligibility based on Civil Rights Action team recommendation.

Since these changes, no FSA County Committees or their historic predecessors have had authorities to determine eligibility for farm loan programs or approve farm loans.

SUBMITTED QUESTIONS

Response from Hon. Chavonda Jacobs-Young, Ph.D., Under Secretary for Research, Education, and Economics and Chief Scientist, U.S. Department of Agriculture

Question Submitted by Hon. Jahana Hayes, a Representative in Congress from Connecticut

Question 1. The long-term national trend shows that American producers and farmers are getting older on average. As the agriculture industry continues to deal with rising temperatures and rising costs, it is important we continue to elevate agriculture as a viable and sustainable career for the next generation.

I'm proud to see the Agricultural Youth Organization Coordinator is supporting young adults who are invested in the agriculture industry. How early does the coordinator suggest engaging with K-12 children and how can these children be supported through a pipeline of programs through adulthood?

Answer. The 2018 Farm Bill established the position of Agricultural Youth Organization Coordinator to promote the role of youth-serving organizations and school-based agricultural education. The Office of Partnerships and Public Engagement's (OPPE) team supports the Youth Coordinator in building youth awareness of the reach and importance of agriculture across a diversity of fields and disciplines.

The first few years of life lay the foundation for resilient, safe, healthy, and economically secure children. Access to high-quality child-care and early learning opportunities strengthens this foundation and directly supports the success and well-being of rural families. USDA Rural Development encourages continued investment in high-quality, affordable child-care and early learning opportunities as a critical component of building and strengthening economic prosperity in rural communities.

USDA's child nutrition programs help ensure that children receive nutritious meals and snacks that promote their health and educational readiness. The USDA Farm to School Program joins schools, farms, and community organizations across the country to positively impact kids from pre-K through high school and plays an important role in getting healthy, locally grown foods onto children's trays. This fiscal year, USDA will award Farm to School Grants through a competitive process that provides bonus points to projects operated by and serving communities that are underserved, marginalized, or adversely affected by poverty and inequality. We know from research that if children get that solid start, they will pay more attention in school, they will be less likely to arrive late to school, and they will be less likely to not go to school at all. As a result, they are more likely to perform better and, in fact, over the length of their school years, they are more likely to graduate from high school.

From grade school to graduate school, the USDA National Institute of Food and Agriculture funded programs to promote education in the food and agricultural sciences. From Learning to Leading the Next Generation of Diverse Food and Agriculture Professionals Program (NEXTGEN) will enable 1890 institutions, 1994 institutions, Alaska Native-serving institutions and Native Hawaiian-serving institutions, Hispanic-serving institutions and insular area institutions of higher education located in the U.S. territories, to build and sustain the next generation of the food, agriculture, natural resources, and human sciences workforce including the future USDA workforce primarily through providing student scholarship support, meaningful paid internships, fellowships, and job opportunity matching, and also facilitating opportunities to learn the processes and pathways leading to training and employment in the Federal sector.

USDA offers Federal internship and employment opportunities for current students, recent graduates, recent veterans, and those with advanced degrees. We also offer internships for students with disabilities, and partner with third party internship programs including: The Thurgood Marshall College Fund (TMCFF); the Hispanic Association of Colleges and Universities (HACU); The American Indian High-

er Education Consortium (AIHEC); The High School Equivalency Program (HEP); and The College Assistance Migrant Program (CAMP). USDA also partners with several student organizations to provide a range of programs to assist youth to meet and exceed their potential and unlock countless career paths in agriculture.

Question 1a. Is the coordinator ensuring that children from underserved communities are also included in agriculture education?

Answer. Within the Office of Partnerships and Public Engagement's the Youth Coordinator position is closely aligned with our education initiatives and programs serving the 1890 historically Black land-grant colleges and universities, 1994 Tribal land-grant colleges and universities, and Hispanic-serving institutions. The Youth Coordinator will work closely with the USDA Liaisons that advise and assist communities, students, faculty, universities and colleges, farmers, ranchers, foresters, and others on USDA programs and initiatives and to build a pipeline of students studying agriculture and entering USDA. USDA liaisons develop and maintain partnerships with key USDA stakeholders to enhance outreach between USDA stakeholders and USDA agencies, mission areas, and staff offices. This alignment fosters OPPE's coordination and collaboration efforts across USDA to better prepare underserved students and ag professionals for success. This supports USDA's historic commitment to root out generations of systemic racism; center equity in decision-making and policymaking; have a diverse, modern, and inclusive workforce; lower barriers to access; and ensure USDA programming is inclusive of all employees and all customers.

Response from Zach Ducheneaux, Administrator, Farm Service Agency, U.S. Department of Agriculture

Question Submitted by Hon. Salud O. Carbajal, a Representative in Congress from California

Question. Administrator Ducheneaux, when conducting outreach to individuals, whether farmers, ranchers, or someone else seeking assistance from USDA, do you have a program to employ someone like *promotoras* that serve Latino communities? I don't know if you are familiar with that concept. *Promotores de salud*, also known as *promotoras*, is the Spanish term for "community health workers". *Promotores* are trusted members of their community who help individuals navigate health care or teach the community about resources, like where to get vaccinated and why. Would something like this be beneficial to help Latino and other minority communities access USDA programs and re-build trust?

Answer. Currently, the Farm Service Agency has a team headquartered in Washington, D.C., as well as State Outreach Coordinators and County Office Coordinators, who work to provide outreach, education and technical assistance. Each staff member across FSA is also responsible for providing these resources as well. FSA has a network of over 2,000 Service Centers around the country to work closely within the communities they serve. In addition, the USDA has Beginning Farmer and Rancher Coordinators at the national and state levels who specifically focus on helping new farmers gain access to USDA's valuable resources. As USDA works with new and beginning farmers, these coordinators also focus on making sure their services are available in multiple languages to make sure all potential customers can understand and ultimately take advantage of the resources that USDA has to offer for the next generation of farmers and ranchers. USDA also has an array of cooperative agreements to support technical service providers, who provide instrumental hands-on technical assistance in communities where they have built strong relationships and trust at the local level. While USDA does not have *promotoras*, we will continue to look for ways to enhance our efforts and work within USDA and through our cooperative agreement partners to ensure we have individuals in place to provide equitable service. I appreciate your question and also welcome the opportunity for continued discussion and collaboration to make sure the farmers, ranchers, and farmworkers you represent have the knowledge and resources they need to access USDA programs and services.
